The result tells you which tables to query to discover which stored object `DEFINER` values exist and which objects have a particular `DEFINER` value:

- To identify which `DEFINER` values exist in each table, use these queries:

```
SELECT DISTINCT DEFINER FROM INFORMATION_SCHEMA.EVENTS;
SELECT DISTINCT DEFINER FROM INFORMATION_SCHEMA.ROUTINES;
SELECT DISTINCT DEFINER FROM INFORMATION_SCHEMA.TRIGGERS;
SELECT DISTINCT DEFINER FROM INFORMATION_SCHEMA.VIEWS;
```

The query results are significant for any account displayed as follows:

- If the account exists, dropping or renaming it causes stored objects to become orphaned. If you plan to drop or rename the account, consider first dropping its associated stored objects or redefining them to have a different definer.
- If the account does not exist, creating it causes it to adopt currently orphaned stored objects. If you plan to create the account, consider whether the orphaned objects should be associated with it. If not, redefine them to have a different definer.

To redefine an object with a different definer, you can use `ALTER EVENT` or `ALTER VIEW` to directly modify the `DEFINER` account of events and views. For stored procedures and functions and for triggers, you must drop the object and re-create it to assign a different `DEFINER` account

- To identify which objects have a given `DEFINER` account, use these queries, substituting the account of interest for `user_name@host_name`:

```
SELECT EVENT_SCHEMA, EVENT_NAME FROM INFORMATION_SCHEMA.EVENTS
WHERE DEFINER = 'user_name@host_name';
SELECT ROUTINE_SCHEMA, ROUTINE_NAME, ROUTINE_TYPE
FROM INFORMATION_SCHEMA.ROUTINES
WHERE DEFINER = 'user_name@host_name';
SELECT TRIGGER_SCHEMA, TRIGGER_NAME FROM INFORMATION_SCHEMA.TRIGGERS
WHERE DEFINER = 'user_name@host_name';
SELECT TABLE_SCHEMA, TABLE_NAME FROM INFORMATION_SCHEMA.VIEWS
WHERE DEFINER = 'user_name@host_name';
```

For the `ROUTINES` table, the query includes the `ROUTINE_TYPE` column so that output rows distinguish whether the `DEFINER` is for a stored procedure or stored function.

If the account you are searching for does not exist, any objects displayed by those queries are orphan objects.

## Risk-Minimization Guidelines

To minimize the risk potential for stored object creation and use, follow these guidelines:

- Do not create orphan stored objects; that is, objects for which the `DEFINER` attribute names a nonexistent account. Do not cause stored objects to become orphaned by dropping or renaming an account named by the `DEFINER` attribute of any existing object.
- For a stored routine or view, use `SQL SECURITY INVOKER` in the object definition when possible so that it can be used only by users with permissions appropriate for the operations performed by the object.
- If you create definer-context stored objects while using an account that has the `SET_USER_ID` privilege (or the deprecated `SUPER` privilege), specify an explicit `DEFINER` attribute that names an account possessing only the privileges required for the operations performed by the object. Specify a highly privileged `DEFINER` account only when absolutely necessary.
- Administrators can prevent users from creating stored objects that specify highly privileged `DEFINER` accounts by not granting them the `SET_USER_ID` privilege (or the deprecated `SUPER` privilege).
- Definer-context objects should be written keeping in mind that they may be able to access data for which the invoking user has no privileges. In some cases, you can prevent references to these objects by not granting unauthorized users particular privileges:
  - A stored routine cannot be referenced by a user who does not have the `EXECUTE` privilege for it.

- A view cannot be referenced by a user who does not have the appropriate privilege for it ([SELECT](#) to select from it, [INSERT](#) to insert into it, and so forth).

However, no such control exists for triggers and events because they always execute in definer context. The server invokes these objects automatically as necessary, and users do not reference them directly:

- A trigger is activated by access to the table with which it is associated, even ordinary table accesses by users with no special privileges.
- An event is executed by the server on a scheduled basis.

In both cases, if the [DEFINER](#) account is highly privileged, the object may be able to perform sensitive or dangerous operations. This remains true if the privileges needed to create the object are revoked from the account of the user who created it. Administrators should be especially careful about granting users object-creation privileges.

## 25.7 Stored Program Binary Logging

The binary log contains information about SQL statements that modify database contents. This information is stored in the form of “events” that describe the modifications. (Binary log events differ from scheduled event stored objects.) The binary log has two important purposes:

- For replication, the binary log is used on source replication servers as a record of the statements to be sent to replica servers. The source sends the events contained in its binary log to its replicas, which execute those events to make the same data changes that were made on the source. See [Section 17.2, “Replication Implementation”](#).
- Certain data recovery operations require use of the binary log. After a backup file has been restored, the events in the binary log that were recorded after the backup was made are re-executed. These events bring databases up to date from the point of the backup. See [Section 7.3.2, “Using Backups for Recovery”](#).

However, if logging occurs at the statement level, there are certain binary logging issues with respect to stored programs (stored procedures and functions, triggers, and events):

- In some cases, a statement might affect different sets of rows on source and replica.
- Replicated statements executed on a replica are processed by the replica's applier thread. Unless you implement replication privilege checks, which are available from MySQL 8.0.18 (see [Section 17.3.3, “Replication Privilege Checks”](#)), the applier thread has full privileges. In this situation, it is possible for a procedure to follow different execution paths on source and replica servers, so a user could write a routine containing a dangerous statement that executes only on the replica.
- If a stored program that modifies data is nondeterministic, it is not repeatable. This can result in different data on source and replica, or cause restored data to differ from the original data.

This section describes how MySQL handles binary logging for stored programs. It states the current conditions that the implementation places on the use of stored programs, and what you can do to avoid logging problems. It also provides additional information about the reasons for these conditions.

Unless noted otherwise, the remarks here assume that binary logging is enabled on the server (see [Section 5.4.4, “The Binary Log”](#).) If the binary log is not enabled, replication is not possible, nor is the binary log available for data recovery. From MySQL 8.0, binary logging is enabled by default, and is only disabled if you specify the `--skip-log-bin` or `--disable-log-bin` option at startup.

In general, the issues described here result when binary logging occurs at the SQL statement level (statement-based binary logging). If you use row-based binary logging, the log contains changes made to individual rows as a result of executing SQL statements. When routines or triggers execute, row changes are logged, not the statements that make the changes. For stored procedures, this means

that the `CALL` statement is not logged. For stored functions, row changes made within the function are logged, not the function invocation. For triggers, row changes made by the trigger are logged. On the replica side, only the row changes are seen, not the stored program invocation.

Mixed format binary logging (`binlog_format=MIXED`) uses statement-based binary logging, except for cases where only row-based binary logging is guaranteed to lead to proper results. With mixed format, when a stored function, stored procedure, trigger, event, or prepared statement contains anything that is not safe for statement-based binary logging, the entire statement is marked as unsafe and logged in row format. The statements used to create and drop procedures, functions, triggers, and events are always safe, and are logged in statement format. For more information about row-based, mixed, and statement-based logging, and how safe and unsafe statements are determined, see [Section 17.2.1, “Replication Formats”](#).

The conditions on the use of stored functions in MySQL can be summarized as follows. These conditions do not apply to stored procedures or Event Scheduler events and they do not apply unless binary logging is enabled.

- To create or alter a stored function, you must have the `SET_USER_ID` privilege (or the deprecated `SUPER` privilege), in addition to the `CREATE ROUTINE` or `ALTER ROUTINE` privilege that is normally required. (Depending on the `DEFINER` value in the function definition, `SET_USER_ID` or `SUPER` might be required regardless of whether binary logging is enabled. See [Section 13.1.17, “CREATE PROCEDURE and CREATE FUNCTION Statements”](#).)
- When you create a stored function, you must declare either that it is deterministic or that it does not modify data. Otherwise, it may be unsafe for data recovery or replication.

By default, for a `CREATE FUNCTION` statement to be accepted, at least one of `DETERMINISTIC`, `NO SQL`, or `READS SQL DATA` must be specified explicitly. Otherwise an error occurs:

```
ERROR 1418 (HY000): This function has none of DETERMINISTIC, NO SQL,
or READS SQL DATA in its declaration and binary logging is enabled
(you *might* want to use the less safe log_bin_trust_function_creators
variable)
```

This function is deterministic (and does not modify data), so it is safe:

```
CREATE FUNCTION f1(i INT)
RETURNS INT
DETERMINISTIC
READS SQL DATA
BEGIN
 RETURN i;
END;
```

This function uses `UUID()`, which is not deterministic, so the function also is not deterministic and is not safe:

```
CREATE FUNCTION f2()
RETURNS CHAR(36) CHARACTER SET utf8
BEGIN
 RETURN UUID();
END;
```

This function modifies data, so it may not be safe:

```
CREATE FUNCTION f3(p_id INT)
RETURNS INT
BEGIN
 UPDATE t SET modtime = NOW() WHERE id = p_id;
 RETURN ROW_COUNT();
END;
```

Assessment of the nature of a function is based on the “honesty” of the creator. MySQL does not check that a function declared `DETERMINISTIC` is free of statements that produce nondeterministic results.

- When you attempt to execute a stored function, if `binlog_format=STATEMENT` is set, the `DETERMINISTIC` keyword must be specified in the function definition. If this is not the case, an error is generated and the function does not run, unless `log_bin_trust_function_creators=1` is specified to override this check (see below). For recursive function calls, the `DETERMINISTIC` keyword is required on the outermost call only. If row-based or mixed binary logging is in use, the statement is accepted and replicated even if the function was defined without the `DETERMINISTIC` keyword.
- Because MySQL does not check if a function really is deterministic at creation time, the invocation of a stored function with the `DETERMINISTIC` keyword might carry out an action that is unsafe for statement-based logging, or invoke a function or procedure containing unsafe statements. If this occurs when `binlog_format=STATEMENT` is set, a warning message is issued. If row-based or mixed binary logging is in use, no warning is issued, and the statement is replicated in row-based format.
- To relax the preceding conditions on function creation (that you must have the `SUPER` privilege and that a function must be declared deterministic or to not modify data), set the global `log_bin_trust_function_creators` system variable to 1. By default, this variable has a value of 0, but you can change it like this:

```
mysql> SET GLOBAL log_bin_trust_function_creators = 1;
```

You can also set this variable at server startup.

If binary logging is not enabled, `log_bin_trust_function_creators` does not apply. `SUPER` is not required for function creation unless, as described previously, the `DEFINER` value in the function definition requires it.

- For information about built-in functions that may be unsafe for replication (and thus cause stored functions that use them to be unsafe as well), see [Section 17.5.1, “Replication Features and Issues”](#).

Triggers are similar to stored functions, so the preceding remarks regarding functions also apply to triggers with the following exception: `CREATE TRIGGER` does not have an optional `DETERMINISTIC` characteristic, so triggers are assumed to be always deterministic. However, this assumption might be invalid in some cases. For example, the `UUID()` function is nondeterministic (and does not replicate). Be careful about using such functions in triggers.

Triggers can update tables, so error messages similar to those for stored functions occur with `CREATE TRIGGER` if you do not have the required privileges. On the replica side, the replica uses the trigger `DEFINER` attribute to determine which user is considered to be the creator of the trigger.

The rest of this section provides additional detail about the logging implementation and its implications. You need not read it unless you are interested in the background on the rationale for the current logging-related conditions on stored routine use. This discussion applies only for statement-based logging, and not for row-based logging, with the exception of the first item: `CREATE` and `DROP` statements are logged as statements regardless of the logging mode.

- The server writes `CREATE EVENT`, `CREATE PROCEDURE`, `CREATE FUNCTION`, `ALTER EVENT`, `ALTER PROCEDURE`, `ALTER FUNCTION`, `DROP EVENT`, `DROP PROCEDURE`, and `DROP FUNCTION` statements to the binary log.
- A stored function invocation is logged as a `SELECT` statement if the function changes data and occurs within a statement that would not otherwise be logged. This prevents nonreplication of data changes that result from use of stored functions in nonlogged statements. For example, `SELECT` statements are not written to the binary log, but a `SELECT` might invoke a stored function that makes changes. To handle this, a `SELECT func_name()` statement is written to the binary log when the given function makes a change. Suppose that the following statements are executed on the source server:

```
CREATE FUNCTION f1(a INT) RETURNS INT
BEGIN
```

```

IF (a < 3) THEN
 INSERT INTO t2 VALUES (a);
END IF;
RETURN 0;
END;

CREATE TABLE t1 (a INT);
INSERT INTO t1 VALUES (1),(2),(3);

SELECT f1(a) FROM t1;

```

When the `SELECT` statement executes, the function `f1()` is invoked three times. Two of those invocations insert a row, and MySQL logs a `SELECT` statement for each of them. That is, MySQL writes the following statements to the binary log:

```

SELECT f1(1);
SELECT f1(2);

```

The server also logs a `SELECT` statement for a stored function invocation when the function invokes a stored procedure that causes an error. In this case, the server writes the `SELECT` statement to the log along with the expected error code. On the replica, if the same error occurs, that is the expected result and replication continues. Otherwise, replication stops.

- Logging stored function invocations rather than the statements executed by a function has a security implication for replication, which arises from two factors:
  - It is possible for a function to follow different execution paths on source and replica servers.
  - Statements executed on a replica are processed by the replica's applier thread. Unless you implement replication privilege checks, which are available from MySQL 8.0.18 (see [Section 17.3.3, "Replication Privilege Checks"](#)), the applier thread has full privileges.

The implication is that although a user must have the `CREATE ROUTINE` privilege to create a function, the user can write a function containing a dangerous statement that executes only on the replica where it is processed by a thread that has full privileges. For example, if the source and replica servers have server ID values of 1 and 2, respectively, a user on the source server could create and invoke an unsafe function `unsafe_func()` as follows:

```

mysql> delimiter //
mysql> CREATE FUNCTION unsafe_func () RETURNS INT
-> BEGIN
-> IF @@server_id=2 THEN dangerous_statement; END IF;
-> RETURN 1;
-> END;
-> //
mysql> delimiter ;
mysql> INSERT INTO t VALUES(unsafe_func());

```

The `CREATE FUNCTION` and `INSERT` statements are written to the binary log, so the replica executes them. Because the replica's applier thread has full privileges, it executes the dangerous statement. Thus, the function invocation has different effects on the source and replica and is not replication-safe.

To guard against this danger for servers that have binary logging enabled, stored function creators must have the `SUPER` privilege, in addition to the usual `CREATE ROUTINE` privilege that is required. Similarly, to use `ALTER FUNCTION`, you must have the `SUPER` privilege in addition to the `ALTER ROUTINE` privilege. Without the `SUPER` privilege, an error occurs:

```

ERROR 1419 (HY000): You do not have the SUPER privilege and
binary logging is enabled (you *might* want to use the less safe
log_bin_trust_function_creators variable)

```

If you do not want to require function creators to have the `SUPER` privilege (for example, if all users with the `CREATE ROUTINE` privilege on your system are experienced application developers), set the global `log_bin_trust_function_creators` system variable to 1. You can also set this

variable at server startup. If binary logging is not enabled, `log_bin_trust_function_creators` does not apply. `SUPER` is not required for function creation unless, as described previously, the `DEFINER` value in the function definition requires it.

- The use of replication privilege checks where available (from MySQL 8.0.18) is recommended whatever choice you make about privileges for function creators. Replication privilege checks can be set up to ensure that only expected and relevant operations are authorized for the replication channel. For instructions to do this, see [Section 17.3.3, “Replication Privilege Checks”](#).
- If a function that performs updates is nondeterministic, it is not repeatable. This can have two undesirable effects:
  - It causes a replica to differ from the source.
  - Restored data does not match the original data.

To deal with these problems, MySQL enforces the following requirement: On a source server, creation and alteration of a function is refused unless you declare the function to be deterministic or to not modify data. Two sets of function characteristics apply here:

- The `DETERMINISTIC` and `NOT DETERMINISTIC` characteristics indicate whether a function always produces the same result for given inputs. The default is `NOT DETERMINISTIC` if neither characteristic is given. To declare that a function is deterministic, you must specify `DETERMINISTIC` explicitly.
- The `CONTAINS SQL`, `NO SQL`, `READS SQL DATA`, and `MODIFIES SQL DATA` characteristics provide information about whether the function reads or writes data. Either `NO SQL` or `READS SQL DATA` indicates that a function does not change data, but you must specify one of these explicitly because the default is `CONTAINS SQL` if no characteristic is given.

By default, for a `CREATE FUNCTION` statement to be accepted, at least one of `DETERMINISTIC`, `NO SQL`, or `READS SQL DATA` must be specified explicitly. Otherwise an error occurs:

```
ERROR 1418 (HY000): This function has none of DETERMINISTIC, NO SQL,
or READS SQL DATA in its declaration and binary logging is enabled
(you *might* want to use the less safe log_bin_trust_function_creators
variable)
```

If you set `log_bin_trust_function_creators` to 1, the requirement that functions be deterministic or not modify data is dropped.

- Stored procedure calls are logged at the statement level rather than at the `CALL` level. That is, the server does not log the `CALL` statement, it logs those statements within the procedure that actually execute. As a result, the same changes that occur on the source server also occur on replicas. This prevents problems that could result from a procedure having different execution paths on different machines.

In general, statements executed within a stored procedure are written to the binary log using the same rules that would apply were the statements to be executed in standalone fashion. Some special care is taken when logging procedure statements because statement execution within procedures is not quite the same as in nonprocedure context:

- A statement to be logged might contain references to local procedure variables. These variables do not exist outside of stored procedure context, so a statement that refers to such a variable cannot be logged literally. Instead, each reference to a local variable is replaced by this construct for logging purposes:

```
NAME_CONST(var_name, var_value)
```

*var\_name* is the local variable name, and *var\_value* is a constant indicating the value that the variable has at the time the statement is logged. `NAME_CONST()` has a value of *var\_value*, and a “name” of *var\_name*. Thus, if you invoke this function directly, you get a result like this:

```
mysql> SELECT NAME_CONST('myname', 14);
+-----+
| myname |
+-----+
| 14 |
+-----+
```

`NAME_CONST()` enables a logged standalone statement to be executed on a replica with the same effect as the original statement that was executed on the source within a stored procedure.

The use of `NAME_CONST()` can result in a problem for `CREATE TABLE ... SELECT` statements when the source column expressions refer to local variables. Converting these references to `NAME_CONST()` expressions can result in column names that are different on the source and replica servers, or names that are too long to be legal column identifiers. A workaround is to supply aliases for columns that refer to local variables. Consider this statement when `myvar` has a value of 1:

```
CREATE TABLE t1 SELECT myvar;
```

This is rewritten as follows:

```
CREATE TABLE t1 SELECT NAME_CONST(myvar, 1);
```

To ensure that the source and replica tables have the same column names, write the statement like this:

```
CREATE TABLE t1 SELECT myvar AS myvar;
```

The rewritten statement becomes:

```
CREATE TABLE t1 SELECT NAME_CONST(myvar, 1) AS myvar;
```

- A statement to be logged might contain references to user-defined variables. To handle this, MySQL writes a `SET` statement to the binary log to make sure that the variable exists on the replica with the same value as on the source. For example, if a statement refers to a variable `@my_var`, that statement is preceded in the binary log by the following statement, where `value` is the value of `@my_var` on the source:

```
SET @my_var = value;
```

- Procedure calls can occur within a committed or rolled-back transaction. Transactional context is accounted for so that the transactional aspects of procedure execution are replicated correctly. That is, the server logs those statements within the procedure that actually execute and modify data, and also logs `BEGIN`, `COMMIT`, and `ROLLBACK` statements as necessary. For example, if a procedure updates only transactional tables and is executed within a transaction that is rolled back, those updates are not logged. If the procedure occurs within a committed transaction, `BEGIN` and `COMMIT` statements are logged with the updates. For a procedure that executes within a rolled-back transaction, its statements are logged using the same rules that would apply if the statements were executed in standalone fashion:
  - Updates to transactional tables are not logged.
  - Updates to nontransactional tables are logged because rollback does not cancel them.
  - Updates to a mix of transactional and nontransactional tables are logged surrounded by `BEGIN` and `ROLLBACK` so that replicas make the same changes and rollbacks as on the source.
- A stored procedure call is *not* written to the binary log at the statement level if the procedure is invoked from within a stored function. In that case, the only thing logged is the statement that invokes the function (if it occurs within a statement that is logged) or a `DO` statement (if it occurs within a statement that is not logged). For this reason, care should be exercised in the use of stored functions that invoke a procedure, even if the procedure is otherwise safe in itself.

## 25.8 Restrictions on Stored Programs

- [SQL Statements Not Permitted in Stored Routines](#)
- [Restrictions for Stored Functions](#)
- [Restrictions for Triggers](#)
- [Name Conflicts within Stored Routines](#)
- [Replication Considerations](#)
- [Debugging Considerations](#)
- [Unsupported Syntax from the SQL:2003 Standard](#)
- [Stored Routine Concurrency Considerations](#)
- [Event Scheduler Restrictions](#)
- [Stored routines and triggers in NDB Cluster](#)

These restrictions apply to the features described in [Chapter 25, \*Stored Objects\*](#).

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. There are also some [restrictions specific to stored functions](#) but not to stored procedures.

The restrictions for stored functions also apply to triggers. There are also some [restrictions specific to triggers](#).

The restrictions for stored procedures also apply to the `DO` clause of Event Scheduler event definitions. There are also some [restrictions specific to events](#).

### SQL Statements Not Permitted in Stored Routines

Stored routines cannot contain arbitrary SQL statements. The following statements are not permitted:

- The locking statements `LOCK TABLES` and `UNLOCK TABLES`.
- `ALTER VIEW`.
- `LOAD DATA` and `LOAD XML`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`) can be used in stored procedures, but not stored functions or triggers. Thus, stored functions and triggers cannot use dynamic SQL (where you construct statements as strings and then execute them).
- Generally, statements not permitted in SQL prepared statements are also not permitted in stored programs. For a list of statements supported as prepared statements, see [Section 13.5, “Prepared Statements”](#). Exceptions are `SIGNAL`, `RESIGNAL`, and `GET DIAGNOSTICS`, which are not permissible as prepared statements but are permitted in stored programs.
- Because local variables are in scope only during stored program execution, references to them are not permitted in prepared statements created within a stored program. Prepared statement scope is the current session, not the stored program, so the statement could be executed after the program ends, at which point the variables would no longer be in scope. For example, `SELECT ... INTO local_var` cannot be used as a prepared statement. This restriction also applies to stored procedure and function parameters. See [Section 13.5.1, “PREPARE Statement”](#).
- Within all stored programs (stored procedures and functions, triggers, and events), the parser treats `BEGIN [WORK]` as the beginning of a `BEGIN ... END` block. To begin a transaction in this context, use `START TRANSACTION` instead.

## Restrictions for Stored Functions

The following additional statements or operations are not permitted within stored functions. They are permitted within stored procedures, except stored procedures that are invoked from within a stored function or trigger. For example, if you use `FLUSH` in a stored procedure, that stored procedure cannot be called from a stored function or trigger.

- Statements that perform explicit or implicit commit or rollback. Support for these statements is not required by the SQL standard, which states that each DBMS vendor may decide whether to permit them.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO var_list` clause and other statements such as `SHOW`, `EXPLAIN`, and `CHECK TABLE`. A function can process a result set either with `SELECT ... INTO var_list` or by using a cursor and `FETCH` statements. See [Section 13.2.10.1, “SELECT ... INTO Statement”](#), and [Section 13.6.6, “Cursors”](#).
- `FLUSH` statements.
- Stored functions cannot be used recursively.
- A stored function or trigger cannot modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.
- If you refer to a temporary table multiple times in a stored function under different aliases, a `Can't reopen table: 'tbl_name'` error occurs, even if the references occur in different statements within the function.
- `HANDLER ... READ` statements that invoke stored functions can cause replication errors and are disallowed.

## Restrictions for Triggers

For triggers, the following additional restrictions apply:

- Triggers are not activated by foreign key actions.
- When using row-based replication, triggers on the replica are not activated by statements originating on the source. The triggers on the replica are activated when using statement-based replication. For more information, see [Section 17.5.1.36, “Replication and Triggers”](#).
- The `RETURN` statement is not permitted in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not permitted on tables in the `mysql` database. Nor are they permitted on `INFORMATION_SCHEMA` or `performance_schema` tables. Those tables are actually views and triggers are not permitted on views.
- The trigger cache does not detect when metadata of the underlying objects has changed. If a trigger uses a table and the table has changed since the trigger was loaded into the cache, the trigger operates using the outdated metadata.

## Name Conflicts within Stored Routines

The same identifier might be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
 DECLARE i INT DEFAULT 0;
 SELECT i FROM t;
BEGIN
```

```
DECLARE i INT DEFAULT 1;
SELECT i FROM t;
END;
END;
```

In such cases, the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column.
- A routine parameter takes precedence over a table column.
- A local variable in an inner block takes precedence over a local variable in an outer block.

The behavior that variables take precedence over table columns is nonstandard.

## Replication Considerations

Use of stored routines can cause replication problems. This issue is discussed further in [Section 25.7, “Stored Program Binary Logging”](#).

The `--replicate-wild-do-table=db_name.tbl_name` option applies to tables, views, and triggers. It does not apply to stored procedures and functions, or events. To filter statements operating on the latter objects, use one or more of the `--replicate-*-db` options.

## Debugging Considerations

There are no stored routine debugging facilities.

## Unsupported Syntax from the SQL:2003 Standard

The MySQL stored routine syntax is based on the SQL:2003 standard. The following items from that standard are not currently supported:

- `UNDO` handlers
- `FOR` loops

## Stored Routine Concurrency Considerations

To prevent problems of interaction between sessions, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. While the statement executes, it does not see changes to routines performed by other sessions.

For maximum concurrency, stored functions should minimize their side-effects; in particular, updating a table within a stored function can reduce concurrent operations on that table. A stored function acquires table locks before executing, to avoid inconsistency in the binary log due to mismatch of the order in which statements execute and when they appear in the log. When statement-based binary logging is used, statements that invoke a function are recorded rather than the statements executed within the function. Consequently, stored functions that update the same underlying tables do not execute in parallel. In contrast, stored procedures do not acquire table-level locks. All statements executed within stored procedures are written to the binary log, even for statement-based binary logging. See [Section 25.7, “Stored Program Binary Logging”](#).

## Event Scheduler Restrictions

The following limitations are specific to the Event Scheduler:

- Event names are handled in case-insensitive fashion. For example, you cannot have two events in the same database with the names `anEvent` and `AnEvent`.

- An event may not be created, altered, or dropped from within a stored program, if the event name is specified by means of a variable. An event also may not create, alter, or drop stored routines or triggers.
- DDL statements on events are prohibited while a `LOCK TABLES` statement is in effect.
- Event timings using the intervals `YEAR`, `QUARTER`, `MONTH`, and `YEAR_MONTH` are resolved in months; those using any other interval are resolved in seconds. There is no way to cause events scheduled to occur at the same second to execute in a given order. In addition—due to rounding, the nature of threaded applications, and the fact that a nonzero length of time is required to create events and to signal their execution—events may be delayed by as much as 1 or 2 seconds. However, the time shown in the `INFORMATION_SCHEMA.EVENTS` table's `LAST_EXECUTED` column is always accurate to within one second of the actual event execution time. (See also Bug #16522.)
- Each execution of the statements contained in the body of an event takes place in a new connection; thus, these statements have no effect in a given user session on the server's statement counts such as `Com_select` and `Com_insert` that are displayed by `SHOW STATUS`. However, such counts are updated in the global scope. (Bug #16422)
- Events do not support times later than the end of the Unix Epoch; this is approximately the beginning of the year 2038. Such dates are specifically not permitted by the Event Scheduler. (Bug #16396)
- References to stored functions, loadable functions, and tables in the `ON SCHEDULE` clauses of `CREATE EVENT` and `ALTER EVENT` statements are not supported. These sorts of references are not permitted. (See Bug #22830 for more information.)

## Stored routines and triggers in NDB Cluster

While stored procedures, stored functions, triggers, and scheduled events are all supported by tables using the `NDB` storage engine, you must keep in mind that these do *not* propagate automatically between MySQL Servers acting as Cluster SQL nodes. This is because stored routine and trigger definitions are stored in tables in the `mysql` system database using `InnoDB` tables, which are not copied between Cluster nodes.

Any stored routine or trigger that interacts with MySQL Cluster tables must be re-created by running the appropriate `CREATE PROCEDURE`, `CREATE FUNCTION`, or `CREATE TRIGGER` statements on each MySQL Server that participates in the cluster where you wish to use the stored routine or trigger. Similarly, any changes to existing stored routines or triggers must be carried out explicitly on all Cluster SQL nodes, using the appropriate `ALTER` or `DROP` statements on each MySQL Server accessing the cluster.

### Warning

Do *not* attempt to work around the issue just described by converting any `mysql` database tables to use the `NDB` storage engine. *Altering the system tables in the `mysql` database is not supported* and is very likely to produce undesirable results.

## 25.9 Restrictions on Views

The maximum number of tables that can be referenced in the definition of a view is 61.

View processing is not optimized:

- It is not possible to create an index on a view.
- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

There is a general principle that you cannot modify a table and select from the same table in a subquery. See [Section 13.2.11.12, “Restrictions on Subqueries”](#).

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);

UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case, the view is stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it at the same time. (This is another reason you might wish to force MySQL to use the temptable algorithm by specifying `ALGORITHM = TEMPTABLE` in the view definition.)

You can use `DROP TABLE` or `ALTER TABLE` to drop or alter a table that is used in a view definition. No warning results from the `DROP` or `ALTER` operation, even though this invalidates the view. Instead, an error occurs later, when the view is used. `CHECK TABLE` can be used to check for views that have been invalidated by `DROP` or `ALTER` operations.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. MySQL as quickly as possible. Many theoretically updatable views can be updated now, but limitations still exist. For details, see [Section 25.5.3, “Updatable and Insertable Views”](#).

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the `CREATE VIEW` and `SELECT` privileges), that user cannot call `SHOW CREATE VIEW` on that object unless the user is also granted the `SHOW VIEW` privilege.

That shortcoming can lead to problems backing up a database with `mysqldump`, which may fail due to insufficient privileges. This problem is described in Bug #22062.

The workaround to the problem is for the administrator to manually grant the `SHOW VIEW` privilege to users who are granted `CREATE VIEW`, since MySQL doesn't grant it implicitly when views are created.

Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is not permitted.

`SHOW CREATE VIEW` displays view definitions using an `AS alias_name` clause for each column. If a column is created from an expression, the default alias is the expression text, which can be quite long. Aliases for column names in `CREATE VIEW` statements are checked against the maximum column length of 64 characters (not the maximum alias length of 256 characters). As a result, views created from the output of `SHOW CREATE VIEW` fail if any column alias exceeds 64 characters. This can cause problems in the following circumstances for views with too-long aliases:

- View definitions fail to replicate to newer replicas that enforce the column-length restriction.
- Dump files created with `mysqldump` cannot be loaded into servers that enforce the column-length restriction.

A workaround for either problem is to modify each problematic view definition to use aliases that provide shorter column names. Then the view replicates properly, and can be dumped and reloaded without causing an error. To modify the definition, drop and create the view again with `DROP VIEW` and `CREATE VIEW`, or replace the definition with `CREATE OR REPLACE VIEW`.

For problems that occur when reloading view definitions in dump files, another workaround is to edit the dump file to modify its `CREATE VIEW` statements. However, this does not change the original view definitions, which may cause problems for subsequent dump operations.

---

## INFORMATION\_SCHEMA Usage Notes

`INFORMATION_SCHEMA` is a database within each MySQL instance, the place that stores information about all the other databases that the MySQL server maintains. The `INFORMATION_SCHEMA` database contains several read-only tables. They are actually views, not base tables, so there are no files associated with them, and you cannot set triggers on them. Also, there is no database directory with that name.

Although you can select `INFORMATION_SCHEMA` as the default database with a `USE` statement, you can only read the contents of tables, not perform `INSERT`, `UPDATE`, or `DELETE` operations on them.

Here is an example of a statement that retrieves information from `INFORMATION_SCHEMA`:

```
mysql> SELECT table_name, table_type, engine
 FROM information_schema.tables
 WHERE table_schema = 'db5'
 ORDER BY table_name;
```

| table_name | table_type | engine |
|------------|------------|--------|
| fk         | BASE TABLE | InnoDB |
| fk2        | BASE TABLE | InnoDB |
| goto       | BASE TABLE | MyISAM |
| into       | BASE TABLE | MyISAM |
| k          | BASE TABLE | MyISAM |
| kurs       | BASE TABLE | MyISAM |
| loop       | BASE TABLE | MyISAM |
| pk         | BASE TABLE | InnoDB |
| t          | BASE TABLE | MyISAM |
| t2         | BASE TABLE | MyISAM |
| t3         | BASE TABLE | MyISAM |
| t7         | BASE TABLE | MyISAM |
| tables     | BASE TABLE | MyISAM |
| v          | VIEW       | NULL   |
| v2         | VIEW       | NULL   |
| v3         | VIEW       | NULL   |
| v56        | VIEW       | NULL   |

17 rows in set (0.01 sec)

Explanation: The statement requests a list of all the tables in database `db5`, showing just three pieces of information: the name of the table, its type, and its storage engine.

## Character Set Considerations

The definition for character columns (for example, `TABLES.TABLE_NAME`) is generally `VARCHAR(N) CHARACTER SET utf8` where `N` is at least 64. MySQL uses the default collation for this character set (`utf8_general_ci`) for all searches, sorts, comparisons, and other string operations on such columns.

Because some MySQL objects are represented as files, searches in `INFORMATION_SCHEMA` string columns can be affected by file system case sensitivity. For more information, see [Section 10.8.7, “Using Collation in INFORMATION\\_SCHEMA Searches”](#).

## INFORMATION\_SCHEMA as Alternative to SHOW Statements

The `SELECT ... FROM INFORMATION_SCHEMA` statement is intended as a more consistent way to provide access to the information provided by the various `SHOW` statements that MySQL supports (`SHOW DATABASES`, `SHOW TABLES`, and so forth). Using `SELECT` has these advantages, compared to `SHOW`:

- It conforms to Codd's rules, because all access is done on tables.
- You can use the familiar syntax of the `SELECT` statement, and only need to learn some table and column names.
- The implementor need not worry about adding keywords.
- You can filter, sort, concatenate, and transform the results from `INFORMATION_SCHEMA` queries into whatever format your application needs, such as a data structure or a text representation to parse.
- This technique is more interoperable with other database systems. For example, Oracle Database users are familiar with querying tables in the Oracle data dictionary.

Because `SHOW` is familiar and widely used, the `SHOW` statements remain as an alternative. In fact, along with the implementation of `INFORMATION_SCHEMA`, there are enhancements to `SHOW` as described in [Section 26.8, “Extensions to SHOW Statements”](#).

## INFORMATION\_SCHEMA and Privileges

For most `INFORMATION_SCHEMA` tables, each MySQL user has the right to access them, but can see only the rows in the tables that correspond to objects for which the user has the proper access privileges. In some cases (for example, the `ROUTINE_DEFINITION` column in the `INFORMATION_SCHEMA ROUTINES` table), users who have insufficient privileges see `NULL`. Some tables have different privilege requirements; for these, the requirements are mentioned in the applicable table descriptions. For example, `InnoDB` tables (tables with names that begin with `INNODB_`) require the `PROCESS` privilege.

The same privileges apply to selecting information from `INFORMATION_SCHEMA` and viewing the same information through `SHOW` statements. In either case, you must have some privilege on an object to see information about it.

## Performance Considerations

`INFORMATION_SCHEMA` queries that search for information from more than one database might take a long time and impact performance. To check the efficiency of a query, you can use `EXPLAIN`. For information about using `EXPLAIN` output to tune `INFORMATION_SCHEMA` queries, see [Section 8.2.3, “Optimizing INFORMATION\\_SCHEMA Queries”](#).

## Standards Considerations

The implementation for the `INFORMATION_SCHEMA` table structures in MySQL follows the ANSI/ISO SQL:2003 standard Part 11 *Schemata*. Our intent is approximate compliance with SQL:2003 core feature F021 *Basic information schema*.

Users of SQL Server 2000 (which also follows the standard) may notice a strong similarity. However, MySQL has omitted many columns that are not relevant for our implementation, and added columns that are MySQL-specific. One such added column is the `ENGINE` column in the `INFORMATION_SCHEMA TABLES` table.

Although other DBMSs use a variety of names, like `syscat` or `system`, the standard name is `INFORMATION_SCHEMA`.

To avoid using any name that is reserved in the standard or in DB2, SQL Server, or Oracle, we changed the names of some columns marked “MySQL extension”. (For example, we changed `COLLATION` to `TABLE_COLLATION` in the `TABLES` table.) See the list of reserved words near the end of this article: <https://web.archive.org/web/20070428032454/http://www.dbazine.com/db2/db2-disarticles/gulutzan5>.

## Conventions in the INFORMATION\_SCHEMA Reference Sections

The following sections describe each of the tables and columns in `INFORMATION_SCHEMA`. For each column, there are three pieces of information:

- “`INFORMATION_SCHEMA` Name” indicates the name for the column in the `INFORMATION_SCHEMA` table. This corresponds to the standard SQL name unless the “Remarks” field says “MySQL extension.”
- “`SHOW` Name” indicates the equivalent field name in the closest `SHOW` statement, if there is one.
- “Remarks” provides additional information where applicable. If this field is `NULL`, it means that the value of the column is always `NULL`. If this field says “MySQL extension,” the column is a MySQL extension to standard SQL.

Many sections indicate what `SHOW` statement is equivalent to a `SELECT` that retrieves information from `INFORMATION_SCHEMA`. For `SHOW` statements that display information for the default database if you omit a `FROM db_name` clause, you can often select information for the default database by adding an `AND TABLE_SCHEMA = SCHEMA()` condition to the `WHERE` clause of a query that retrieves information from an `INFORMATION_SCHEMA` table.

## Related Information

These sections discuss additional `INFORMATION_SCHEMA`-related topics:

- information about `INFORMATION_SCHEMA` tables specific to the `InnoDB` storage engine: [Section 26.4, “INFORMATION\\_SCHEMA InnoDB Tables”](#)
- information about `INFORMATION_SCHEMA` tables specific to the thread pool plugin: [Section 26.5, “INFORMATION\\_SCHEMA Thread Pool Tables”](#)
- information about `INFORMATION_SCHEMA` tables specific to the `CONNECTION_CONTROL` plugin: [Section 26.6, “INFORMATION\\_SCHEMA Connection-Control Tables”](#)
- Answers to questions that are often asked concerning the `INFORMATION_SCHEMA` database: [Section A.7, “MySQL 8.0 FAQ: INFORMATION\\_SCHEMA”](#)
- `INFORMATION_SCHEMA` queries and the optimizer: [Section 8.2.3, “Optimizing INFORMATION\\_SCHEMA Queries”](#)
- The effect of collation on `INFORMATION_SCHEMA` comparisons: [Section 10.8.7, “Using Collation in INFORMATION\\_SCHEMA Searches”](#)

## 26.2 INFORMATION\_SCHEMA Table Reference

The following table summarizes all available `INFORMATION_SCHEMA` tables. For greater detail, see the individual table descriptions.

**Table 26.1 INFORMATION\_SCHEMA Tables**

| Table Name                      | Description                                       | Introduced | Deprecated |
|---------------------------------|---------------------------------------------------|------------|------------|
| <code>ADMINISTRABLE_ROLE</code> | Grantable users or roles for current user or role | 8.0.19     |            |
| <code>APPLICABLE_ROLES</code>   | Applicable roles for current user                 | 8.0.19     |            |

| Table Name                                         | Description                                                           | Introduced | Deprecated |
|----------------------------------------------------|-----------------------------------------------------------------------|------------|------------|
| <a href="#">CHARACTER_SETS</a>                     | Available character sets                                              |            |            |
| <a href="#">CHECK_CONSTRAINTS</a>                  | Table and column CHECK constraints                                    | 8.0.16     |            |
| <a href="#">COLLATION_CHARACTER_SET_APPLICABLE</a> | Character set applicable to each collation                            |            |            |
| <a href="#">COLLATIONS</a>                         | Collations for each character set                                     |            |            |
| <a href="#">COLUMN_PRIVILEGES</a>                  | Privileges defined on columns                                         |            |            |
| <a href="#">COLUMN_STATISTICS</a>                  | Histogram statistics for column values                                |            |            |
| <a href="#">COLUMNS</a>                            | Columns in each table                                                 |            |            |
| <a href="#">COLUMNS_EXTENSIONS</a>                 | Column attributes for primary and secondary storage engines           | 8.0.21     |            |
| <a href="#">CONNECTION_CONTROL</a>                 | Current number of consecutive failed connection attempts per account  |            |            |
| <a href="#">ENABLED_ROLES</a>                      | Roles enabled within current session                                  | 8.0.19     |            |
| <a href="#">ENGINES</a>                            | Storage engine properties                                             |            |            |
| <a href="#">EVENTS</a>                             | Event Manager events                                                  |            |            |
| <a href="#">FILES</a>                              | Files that store tablespace data                                      |            |            |
| <a href="#">INNODB_BUFFER_PAGE</a>                 | Pages in InnoDB buffer pool                                           |            |            |

| <a href="#">VIEWS</a>              | View information               |            |            |

## 26.3 INFORMATION\_SCHEMA General Tables

The following sections describe what may be denoted as the “general” set of [INFORMATION\\_SCHEMA](#) tables. These are the tables not associated with particular storage engines, components, or plugins.

### 26.3.1 INFORMATION\_SCHEMA General Table Reference

The following table summarizes [INFORMATION\\_SCHEMA](#) general tables. For greater detail, see the individual table descriptions.

**Table 26.2 INFORMATION\_SCHEMA General Tables**

| Table Name                                            | Description                                                 | Introduced |
|-------------------------------------------------------|-------------------------------------------------------------|------------|
| <a href="#">ADMINISTRABLE_ROLE_AUTHORS</a>            | Grantable users or roles for current user or role           | 8.0.19     |
| <a href="#">APPLICABLE_ROLES</a>                      | Applicable roles for current user                           | 8.0.19     |
| <a href="#">CHARACTER_SETS</a>                        | Available character sets                                    |            |
| <a href="#">CHECK_CONSTRAINTS</a>                     | Table and column CHECK constraints                          | 8.0.16     |
| <a href="#">COLLATION_CHARACTER_SET_APPLICABILITY</a> | Character set applicable to each collation                  |            |
| <a href="#">COLLATIONS</a>                            | Collations for each character set                           |            |
| <a href="#">COLUMN_PRIVILEGES</a>                     | Privileges defined on columns                               |            |
| <a href="#">COLUMN_STATISTICS</a>                     | Histogram statistics for column values                      |            |
| <a href="#">COLUMNS</a>                               | Columns in each table                                       |            |
| <a href="#">COLUMNS_EXTENSIONS</a>                    | Column attributes for primary and secondary storage engines | 8.0.21     |
| <a href="#">ENABLED_ROLES</a>                         | Roles enabled within current session                        | 8.0.19     |
| <a href="#">ENGINES</a>                               | Storage engine properties                                   |            |
| <a href="#">EVENTS</a>                                | Event Manager events                                        |            |
| <a href="#">FILES</a>                                 | Files that store tablespace data                            |            |
| <a href="#">KEY_COLUMN_USAGE</a>                      | Which key columns have constraints                          |            |
| <a href="#">KEYWORDS</a>                              | MySQL keywords                                              |            |
| <a href="#">ndb_transid_mysql_connect</a>             | NDB transaction information                                 |            |
| <a href="#">OPTIMIZER_TRACE</a>                       | Information produced by optimizer trace activity            |            |
| <a href="#">PARAMETERS</a>                            | Stored routine parameters and stored function return values |            |
| <a href="#">PARTITIONS</a>                            | Table partition information                                 |            |

| Table Name                   | Description                                                                     | Introduced |
|------------------------------|---------------------------------------------------------------------------------|------------|
| PLUGINS                      | Plugin information                                                              |            |
| PROCESSLIST                  | Information about currently executing threads                                   |            |
| PROFILING                    | Statement profiling information                                                 |            |
| REFERENTIAL_CONSTRAINTS      | Foreign key information                                                         |            |
| RESOURCE_GROUPS              | Resource group information                                                      |            |
| ROLE_COLUMN_GRANTS           | Column privileges for roles available to or granted by currently enabled roles  | 8.0.19     |
| ROLE_ROUTINE_GRANTS          | Routine privileges for roles available to or granted by currently enabled roles | 8.0.19     |
| ROLE_TABLE_GRANTS            | Table privileges for roles available to or granted by currently enabled roles   | 8.0.19     |
| ROUTINES                     | Stored routine information                                                      |            |
| SCHEMA_PRIVILEGES            | Privileges defined on schemas                                                   |            |
| SCHEMATA                     | Schema information                                                              |            |
| SCHEMATA_EXTENSIONS          | Schema options                                                                  | 8.0.22     |
| ST_GEOMETRY_COLUMNS          | Columns in each table that store spatial data                                   |            |
| ST_SPATIAL_REFERENCE_SYSTEMS | Available spatial reference systems                                             |            |
| ST_UNITS_OF_MEASURE          | Acceptable units for ST_Distance()                                              | 8.0.14     |
| STATISTICS                   | Table index statistics                                                          |            |
| TABLE_CONSTRAINTS            | Which tables have constraints                                                   |            |
| TABLE_CONSTRAINTS_EXTENSIONS | Table constraint attributes for primary and secondary storage engines           | 8.0.21     |
| TABLE_PRIVILEGES             | Privileges defined on tables                                                    |            |
| TABLES                       | Table information                                                               |            |
| TABLES_EXTENSIONS            | Table attributes for primary and secondary storage engines                      | 8.0.21     |
| TABLESPACES                  | Tablespace information                                                          |            |
| TABLESPACES_EXTENSIONS       | Tablespace attributes for primary storage engines                               | 8.0.21     |
| TRIGGERS                     | Trigger information                                                             |            |
| USER_ATTRIBUTES              | User comments and attributes                                                    | 8.0.21     |
| USER_PRIVILEGES              | Privileges defined globally per user                                            |            |
| VIEW_ROUTINE_USAGE           | Stored functions used in views                                                  | 8.0.13     |
| VIEW_TABLE_USAGE             | Tables and views used in views                                                  | 8.0.13     |
| VIEWS                        | View information                                                                |            |

## 26.3.2 The INFORMATION\_SCHEMA ADMINISTRABLE\_ROLE\_AUTHORIZATIONS Table

The [ADMINISTRABLE\\_ROLE\\_AUTHORIZATIONS](#) table (available as of MySQL 8.0.19) provides information about which roles applicable for the current user or role can be granted to other users or roles.

The [ADMINISTRABLE\\_ROLE\\_AUTHORIZATIONS](#) table has these columns:

- [USER](#)

The user name part of the current user account.

- [HOST](#)

The host name part of the current user account.

- [GRANTEE](#)

The user name part of the account to which the role is granted.

- [GRANTEE\\_HOST](#)

The host name part of the account to which the role is granted.

- [ROLE\\_NAME](#)

The user name part of the granted role.

- [ROLE\\_HOST](#)

The host name part of the granted role.

- [IS\\_GRANTABLE](#)

[YES](#) or [NO](#), depending on whether the role is grantable to other accounts.

- [IS\\_DEFAULT](#)

[YES](#) or [NO](#), depending on whether the role is a default role.

- [IS\\_MANDATORY](#)

[YES](#) or [NO](#), depending on whether the role is mandatory.

## 26.3.3 The INFORMATION\_SCHEMA APPLICABLE\_ROLES Table

The [APPLICABLE\\_ROLES](#) table (available as of MySQL 8.0.19) provides information about the roles that are applicable for the current user.

The [APPLICABLE\\_ROLES](#) table has these columns:

- [USER](#)

The user name part of the current user account.

- [HOST](#)

The host name part of the current user account.

- [GRANTEE](#)

The user name part of the account to which the role is granted.

- [GRANTEE\\_HOST](#)

The host name part of the account to which the role is granted.

- [ROLE\\_NAME](#)

The user name part of the granted role.

- [ROLE\\_HOST](#)

The host name part of the granted role.

- [IS\\_GRANTABLE](#)

[YES](#) or [NO](#), depending on whether the role is grantable to other accounts.

- [IS\\_DEFAULT](#)

[YES](#) or [NO](#), depending on whether the role is a default role.

- [IS\\_MANDATORY](#)

[YES](#) or [NO](#), depending on whether the role is mandatory.

## 26.3.4 The INFORMATION\_SCHEMA CHARACTER\_SETS Table

The [CHARACTER\\_SETS](#) table provides information about available character sets.

The [CHARACTER\\_SETS](#) table has these columns:

- [CHARACTER\\_SET\\_NAME](#)

The character set name.

- [DEFAULT\\_COLLATE\\_NAME](#)

The default collation for the character set.

- [DESCRIPTION](#)

A description of the character set.

- [MAXLEN](#)

The maximum number of bytes required to store one character.

### Notes

Character set information is also available from the [SHOW CHARACTER SET](#) statement. See [Section 13.7.7.3, “SHOW CHARACTER SET Statement”](#). The following statements are equivalent:

```
SELECT * FROM INFORMATION_SCHEMA.CHARACTER_SETS
[WHERE CHARACTER_SET_NAME LIKE 'wild']

SHOW CHARACTER SET
[LIKE 'wild']
```

## 26.3.5 The INFORMATION\_SCHEMA CHECK\_CONSTRAINTS Table

As of MySQL 8.0.16, [CREATE TABLE](#) permits the core features of table and column [CHECK](#) constraints, and the [CHECK\\_CONSTRAINTS](#) table provides information about these constraints.

The [CHECK\\_CONSTRAINTS](#) table has these columns:

- [CONSTRAINT\\_CATALOG](#)

The name of the catalog to which the constraint belongs. This value is always `def`.

- [CONSTRAINT\\_SCHEMA](#)

The name of the schema (database) to which the constraint belongs.

- [CONSTRAINT\\_NAME](#)

The name of the constraint.

- [CHECK\\_CLAUSE](#)

The expression that specifies the constraint condition.

## 26.3.6 The INFORMATION\_SCHEMA COLLATIONS Table

The [COLLATIONS](#) table provides information about collations for each character set.

The [COLLATIONS](#) table has these columns:

- [COLLATION\\_NAME](#)

The collation name.

- [CHARACTER\\_SET\\_NAME](#)

The name of the character set with which the collation is associated.

- [ID](#)

The collation ID.

- [IS\\_DEFAULT](#)

Whether the collation is the default for its character set.

- [IS\\_COMPILED](#)

Whether the character set is compiled into the server.

- [SORTLEN](#)

This is related to the amount of memory required to sort strings expressed in the character set.

- [PAD\\_ATTRIBUTE](#)

The collation pad attribute, either `NO PAD` or `PAD SPACE`. This attribute affects whether trailing spaces are significant in string comparisons; see [Trailing Space Handling in Comparisons](#).

### Notes

Collation information is also available from the `SHOW COLLATION` statement. See [Section 13.7.7.4, “SHOW COLLATION Statement”](#). The following statements are equivalent:

```
SELECT COLLATION_NAME FROM INFORMATION_SCHEMA.COLLATIONS
 [WHERE COLLATION_NAME LIKE 'wild']

SHOW COLLATION
 [LIKE 'wild']
```

## 26.3.7 The INFORMATION\_SCHEMA COLLATION\_CHARACTER\_SET\_APPLICABILITY Table

The [COLLATION\\_CHARACTER\\_SET\\_APPLICABILITY](#) table indicates what character set is applicable for what collation.

The [COLLATION\\_CHARACTER\\_SET\\_APPLICABILITY](#) table has these columns:

- [COLLATION\\_NAME](#)

The collation name.

- [CHARACTER\\_SET\\_NAME](#)

The name of the character set with which the collation is associated.

## Notes

The [COLLATION\\_CHARACTER\\_SET\\_APPLICABILITY](#) columns are equivalent to the first two columns displayed by the [SHOW COLLATION](#) statement.

## 26.3.8 The INFORMATION\_SCHEMA COLUMNS Table

The [COLUMNS](#) table provides information about columns in tables. The related [ST\\_GEOMETRY\\_COLUMNS](#) table provides information about table columns that store spatial data. See [Section 26.3.35](#), “The INFORMATION\_SCHEMA ST\_GEOMETRY\_COLUMNS Table”.

The [COLUMNS](#) table has these columns:

- [TABLE\\_CATALOG](#)

The name of the catalog to which the table containing the column belongs. This value is always [def](#).

- [TABLE\\_SCHEMA](#)

The name of the schema (database) to which the table containing the column belongs.

- [TABLE\\_NAME](#)

The name of the table containing the column.

- [COLUMN\\_NAME](#)

The name of the column.

- [ORDINAL\\_POSITION](#)

The position of the column within the table. [ORDINAL\\_POSITION](#) is necessary because you might want to say [ORDER BY ORDINAL\\_POSITION](#). Unlike [SHOW COLUMNS](#), [SELECT](#) from the [COLUMNS](#) table does not have automatic ordering.

- [COLUMN\\_DEFAULT](#)

The default value for the column. This is [NULL](#) if the column has an explicit default of [NULL](#), or if the column definition includes no [DEFAULT](#) clause.

- [IS\\_NULLABLE](#)

The column nullability. The value is [YES](#) if [NULL](#) values can be stored in the column, [NO](#) if not.

- [DATA\\_TYPE](#)

The column data type.

The [DATA\\_TYPE](#) value is the type name only with no other information. The [COLUMN\\_TYPE](#) value contains the type name and possibly other information such as the precision or length.

- [CHARACTER\\_MAXIMUM\\_LENGTH](#)

For string columns, the maximum length in characters.

- `CHARACTER_OCTET_LENGTH`

For string columns, the maximum length in bytes.

- `NUMERIC_PRECISION`

For numeric columns, the numeric precision.

- `NUMERIC_SCALE`

For numeric columns, the numeric scale.

- `DATETIME_PRECISION`

For temporal columns, the fractional seconds precision.

- `CHARACTER_SET_NAME`

For character string columns, the character set name.

- `COLLATION_NAME`

For character string columns, the collation name.

- `COLUMN_TYPE`

The column data type.

The `DATA_TYPE` value is the type name only with no other information. The `COLUMN_TYPE` value contains the type name and possibly other information such as the precision or length.

- `COLUMN_KEY`

Whether the column is indexed:

- If `COLUMN_KEY` is empty, the column either is not indexed or is indexed only as a secondary column in a multiple-column, nonunique index.
- If `COLUMN_KEY` is `PRI`, the column is a `PRIMARY KEY` or is one of the columns in a multiple-column `PRIMARY KEY`.
- If `COLUMN_KEY` is `UNI`, the column is the first column of a `UNIQUE` index. (A `UNIQUE` index permits multiple `NULL` values, but you can tell whether the column permits `NULL` by checking the `Null` column.)
- If `COLUMN_KEY` is `MUL`, the column is the first column of a nonunique index in which multiple occurrences of a given value are permitted within the column.

If more than one of the `COLUMN_KEY` values applies to a given column of a table, `COLUMN_KEY` displays the one with the highest priority, in the order `PRI`, `UNI`, `MUL`.

A `UNIQUE` index may be displayed as `PRI` if it cannot contain `NULL` values and there is no `PRIMARY KEY` in the table. A `UNIQUE` index may display as `MUL` if several columns form a composite `UNIQUE` index; although the combination of the columns is unique, each column can still hold multiple occurrences of a given value.

- `EXTRA`

Any additional information that is available about a given column. The value is nonempty in these cases:

- `auto_increment` for columns that have the `AUTO_INCREMENT` attribute.
- `on update CURRENT_TIMESTAMP` for `TIMESTAMP` or `DATETIME` columns that have the `ON UPDATE CURRENT_TIMESTAMP` attribute.
- `STORED GENERATED` or `VIRTUAL GENERATED` for generated columns.
- `DEFAULT_GENERATED` for columns that have an expression default value.
- `PRIVILEGES`  
The privileges you have for the column.
- `COLUMN_COMMENT`  
Any comment included in the column definition.
- `GENERATION_EXPRESSION`  
For generated columns, displays the expression used to compute column values. Empty for nongenerated columns. For information about generated columns, see [Section 13.1.20.8, “CREATE TABLE and Generated Columns”](#).
- `SRS_ID`  
This value applies to spatial columns. It contains the column `SRID` value that indicates the spatial reference system for values stored in the column. See [Section 11.4.1, “Spatial Data Types”](#), and [Section 11.4.5, “Spatial Reference System Support”](#). The value is `NULL` for nonspatial columns and spatial columns with no `SRID` attribute.

## Notes

- In `SHOW COLUMNS`, the `Type` display includes values from several different `COLUMNS` columns.
- `CHARACTER_OCTET_LENGTH` should be the same as `CHARACTER_MAXIMUM_LENGTH`, except for multibyte character sets.
- `CHARACTER_SET_NAME` can be derived from `COLLATION_NAME`. For example, if you say `SHOW FULL COLUMNS FROM t`, and you see in the `COLLATION_NAME` column a value of `utf8_swedish_ci`, the character set is what is before the first underscore: `utf8`.

Column information is also available from the `SHOW COLUMNS` statement. See [Section 13.7.7.5, “SHOW COLUMNS Statement”](#). The following statements are nearly equivalent:

```
SELECT COLUMN_NAME, DATA_TYPE, IS_NULLABLE, COLUMN_DEFAULT
FROM INFORMATION_SCHEMA.COLUMNS
WHERE table_name = 'tbl_name'
[AND table_schema = 'db_name']
[AND column_name LIKE 'wild']

SHOW COLUMNS
FROM tbl_name
[FROM db_name]
[LIKE 'wild']
```

## 26.3.9 The INFORMATION\_SCHEMA COLUMNS\_EXTENSIONS Table

The `COLUMNS_EXTENSIONS` table (available as of MySQL 8.0.21) provides information about column attributes defined for primary and secondary storage engines.

### Note

The `COLUMNS_EXTENSIONS` table is reserved for future use.

The `COLUMNS_EXTENSIONS` table has these columns:

- `TABLE_CATALOG`

The name of the catalog to which the table belongs. This value is always `def`.

- `TABLE_SCHEMA`

The name of the schema (database) to which the table belongs.

- `TABLE_NAME`

The name of the table.

- `COLUMN_NAME`

The name of the column.

- `ENGINE_ATTRIBUTE`

Column attributes defined for the primary storage engine. Reserved for future use.

- `SECONDARY_ENGINE_ATTRIBUTE`

Column attributes defined for the secondary storage engine. Reserved for future use.

## 26.3.10 The INFORMATION\_SCHEMA COLUMN\_PRIVILEGES Table

The `COLUMN_PRIVILEGES` table provides information about column privileges. It takes its values from the `mysql.columns_priv` system table.

The `COLUMN_PRIVILEGES` table has these columns:

- `GRANTEE`

The name of the account to which the privilege is granted, in `'user_name'@'host_name'` format.

- `TABLE_CATALOG`

The name of the catalog to which the table containing the column belongs. This value is always `def`.

- `TABLE_SCHEMA`

The name of the schema (database) to which the table containing the column belongs.

- `TABLE_NAME`

The name of the table containing the column.

- `COLUMN_NAME`

The name of the column.

- `PRIVILEGE_TYPE`

The privilege granted. The value can be any privilege that can be granted at the column level; see [Section 13.7.1.6, “GRANT Statement”](#). Each row lists a single privilege, so there is one row per column privilege held by the grantee.

In the output from `SHOW FULL COLUMNS`, the privileges are all in one column and in lowercase, for example, `select,insert,update,references`. In `COLUMN_PRIVILEGES`, there is one privilege per row, in uppercase.

- `IS_GRANTABLE`

**YES** if the user has the **GRANT OPTION** privilege, **NO** otherwise. The output does not list **GRANT OPTION** as a separate row with **PRIVILEGE\_TYPE= 'GRANT OPTION'**.

## Notes

- **COLUMN\_PRIVILEGES** is a nonstandard **INFORMATION\_SCHEMA** table.

The following statements are *not* equivalent:

```
SELECT ... FROM INFORMATION_SCHEMA.COLUMN_PRIVILEGES

SHOW GRANTS ...
```

## 26.3.11 The INFORMATION\_SCHEMA COLUMN\_STATISTICS Table

The **COLUMN\_STATISTICS** table provides access to histogram statistics for column values.

For information about histogram statistics, see [Section 8.9.6, “Optimizer Statistics”](#), and [Section 13.7.3.1, “ANALYZE TABLE Statement”](#).

You can see information only for columns for which you have some privilege.

The **COLUMN\_STATISTICS** table has these columns:

- **SCHEMA\_NAME**

The names of the schema for which the statistics apply.

- **TABLE\_NAME**

The names of the column for which the statistics apply.

- **COLUMN\_NAME**

The names of the column for which the statistics apply.

- **HISTOGRAM**

A **JSON** object describing the column statistics, stored as a histogram.

## 26.3.12 The INFORMATION\_SCHEMA ENABLED\_ROLES Table

The **ENABLED\_ROLES** table (available as of MySQL 8.0.19) provides information about the roles that are enabled within the current session.

The **ENABLED\_ROLES** table has these columns:

- **ROLE\_NAME**

The user name part of the granted role.

- **ROLE\_HOST**

The host name part of the granted role.

- **IS\_DEFAULT**

**YES** or **NO**, depending on whether the role is a default role.

- **IS\_MANDATORY**

**YES** or **NO**, depending on whether the role is mandatory.

### 26.3.13 The INFORMATION\_SCHEMA ENGINES Table

The `ENGINES` table provides information about storage engines. This is particularly useful for checking whether a storage engine is supported, or to see what the default engine is.

The `ENGINES` table has these columns:

- `ENGINE`

The name of the storage engine.

- `SUPPORT`

The server's level of support for the storage engine, as shown in the following table.

| Value                 | Meaning                                                 |
|-----------------------|---------------------------------------------------------|
| <code>YES</code>      | The engine is supported and is active                   |
| <code>DEFAULT</code>  | Like <code>YES</code> , plus this is the default engine |
| <code>NO</code>       | The engine is not supported                             |
| <code>DISABLED</code> | The engine is supported but has been disabled           |

A value of `NO` means that the server was compiled without support for the engine, so it cannot be enabled at runtime.

A value of `DISABLED` occurs either because the server was started with an option that disables the engine, or because not all options required to enable it were given. In the latter case, the error log should contain a reason indicating why the option is disabled. See [Section 5.4.2, “The Error Log”](#).

You might also see `DISABLED` for a storage engine if the server was compiled to support it, but was started with a `--skip-engine_name` option. For the `NDB` storage engine, `DISABLED` means the server was compiled with support for NDB Cluster, but was not started with the `--ndbcluster` option.

All MySQL servers support `MyISAM` tables. It is not possible to disable `MyISAM`.

- `COMMENT`

A brief description of the storage engine.

- `TRANSACTIONS`

Whether the storage engine supports transactions.

- `XA`

Whether the storage engine supports XA transactions.

- `SAVEPOINTS`

Whether the storage engine supports savepoints.

#### Notes

- `ENGINES` is a nonstandard `INFORMATION_SCHEMA` table.

Storage engine information is also available from the `SHOW ENGINES` statement. See [Section 13.7.7.16, “SHOW ENGINES Statement”](#). The following statements are equivalent:

```
SELECT * FROM INFORMATION_SCHEMA.ENGINES
SHOW ENGINES
```

## 26.3.14 The INFORMATION\_SCHEMA EVENTS Table

The `EVENTS` table provides information about Event Manager events, which are discussed in [Section 25.4, “Using the Event Scheduler”](#).

The `EVENTS` table has these columns:

- `EVENT_CATALOG`

The name of the catalog to which the event belongs. This value is always `def`.

- `EVENT_SCHEMA`

The name of the schema (database) to which the event belongs.

- `EVENT_NAME`

The name of the event.

- `DEFINER`

The account named in the `DEFINER` clause (often the user who created the event), in `'user_name'@'host_name'` format.

- `TIME_ZONE`

The event time zone, which is the time zone used for scheduling the event and that is in effect within the event as it executes. The default value is `SYSTEM`.

- `EVENT_BODY`

The language used for the statements in the event's `DO` clause. The value is always `SQL`.

- `EVENT_DEFINITION`

The text of the SQL statement making up the event's `DO` clause; in other words, the statement executed by this event.

- `EVENT_TYPE`

The event repetition type, either `ONE TIME` (transient) or `RECURRING` (repeating).

- `EXECUTE_AT`

For a one-time event, this is the `DATETIME` value specified in the `AT` clause of the `CREATE EVENT` statement used to create the event, or of the last `ALTER EVENT` statement that modified the event. The value shown in this column reflects the addition or subtraction of any `INTERVAL` value included in the event's `AT` clause. For example, if an event is created using `ON SCHEDULE AT CURRENT_TIMESTAMP + '1:6' DAY_HOUR`, and the event was created at 2018-02-09 14:05:30, the value shown in this column would be `'2018-02-10 20:05:30'`. If the event's timing is determined by an `EVERY` clause instead of an `AT` clause (that is, if the event is recurring), the value of this column is `NULL`.

- `INTERVAL_VALUE`

For a recurring event, the number of intervals to wait between event executions. For a transient event, the value is always `NULL`.

- `INTERVAL_FIELD`

The time units used for the interval which a recurring event waits before repeating. For a transient event, the value is always `NULL`.

- [SQL\\_MODE](#)

The SQL mode in effect when the event was created or altered, and under which the event executes. For the permitted values, see [Section 5.1.11, “Server SQL Modes”](#).

- [STARTS](#)

The start date and time for a recurring event. This is displayed as a [DATETIME](#) value, and is [NULL](#) if no start date and time are defined for the event. For a transient event, this column is always [NULL](#). For a recurring event whose definition includes a [STARTS](#) clause, this column contains the corresponding [DATETIME](#) value. As with the [EXECUTE\\_AT](#) column, this value resolves any expressions used. If there is no [STARTS](#) clause affecting the timing of the event, this column is [NULL](#).

- [ENDS](#)

For a recurring event whose definition includes a [ENDS](#) clause, this column contains the corresponding [DATETIME](#) value. As with the [EXECUTE\\_AT](#) column, this value resolves any expressions used. If there is no [ENDS](#) clause affecting the timing of the event, this column is [NULL](#).

- [STATUS](#)

The event status. One of [ENABLED](#), [DISABLED](#), or [SLAVESIDE\\_DISABLED](#). [SLAVESIDE\\_DISABLED](#) indicates that the creation of the event occurred on another MySQL server acting as a replication source and replicated to the current MySQL server which is acting as a replica, but the event is not presently being executed on the replica. For more information, see [Section 17.5.1.16, “Replication of Invoked Features”](#). information.

- [ON\\_COMPLETION](#)

One of the two values [PRESERVE](#) or [NOT PRESERVE](#).

- [CREATED](#)

The date and time when the event was created. This is a [TIMESTAMP](#) value.

- [LAST\\_ALTERED](#)

The date and time when the event was last modified. This is a [TIMESTAMP](#) value. If the event has not been modified since its creation, this value is the same as the [CREATED](#) value.

- [LAST\\_EXECUTED](#)

The date and time when the event last executed. This is a [DATETIME](#) value. If the event has never executed, this column is [NULL](#).

[LAST\\_EXECUTED](#) indicates when the event started. As a result, the [ENDS](#) column is never less than [LAST\\_EXECUTED](#).

- [EVENT\\_COMMENT](#)

The text of the comment, if the event has one. If not, this value is empty.

- [ORIGINATOR](#)

The server ID of the MySQL server on which the event was created; used in replication. This value may be updated by [ALTER EVENT](#) to the server ID of the server on which that statement occurs, if executed on a replication source. The default value is 0.

- [CHARACTER\\_SET\\_CLIENT](#)

The session value of the [character\\_set\\_client](#) system variable when the event was created.

- [COLLATION\\_CONNECTION](#)

The session value of the `collation_connection` system variable when the event was created.

- `DATABASE_COLLATION`

The collation of the database with which the event is associated.

## Notes

- `EVENTS` is a nonstandard `INFORMATION_SCHEMA` table.
- Times in the `EVENTS` table are displayed using the event time zone, the current session time zone, or UTC, as described in [Section 25.4.4, “Event Metadata”](#).
- For more information about `SLAVESIDE_DISABLED` and the `ORIGINATOR` column, see [Section 17.5.1.16, “Replication of Invoked Features”](#).

## Example

Suppose that the user `'jon'@'ghidora'` creates an event named `e_daily`, and then modifies it a few minutes later using an `ALTER EVENT` statement, as shown here:

```
DELIMITER |

CREATE EVENT e_daily
 ON SCHEDULE
 EVERY 1 DAY
 COMMENT 'Saves total number of sessions then clears the table each day'
 DO
 BEGIN
 INSERT INTO site_activity.totals (time, total)
 SELECT CURRENT_TIMESTAMP, COUNT(*)
 FROM site_activity.sessions;
 DELETE FROM site_activity.sessions;
 END |

DELIMITER ;

ALTER EVENT e_daily
 ENABLE;
```

(Note that comments can span multiple lines.)

This user can then run the following `SELECT` statement, and obtain the output shown:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.EVENTS
 WHERE EVENT_NAME = 'e_daily'
 AND EVENT_SCHEMA = 'myschema'\G
***** 1. row *****
EVENT_CATALOG: def
EVENT_SCHEMA: myschema
EVENT_NAME: e_daily
DEFINER: jon@ghidora
TIME_ZONE: SYSTEM
EVENT_BODY: SQL
EVENT_DEFINITION: BEGIN
 INSERT INTO site_activity.totals (time, total)
 SELECT CURRENT_TIMESTAMP, COUNT(*)
 FROM site_activity.sessions;
 DELETE FROM site_activity.sessions;
END
EVENT_TYPE: RECURRING
EXECUTE_AT: NULL
INTERVAL_VALUE: 1
INTERVAL_FIELD: DAY
SQL_MODE: ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,
 NO_ZERO_IN_DATE,NO_ZERO_DATE,
 ERROR_FOR_DIVISION_BY_ZERO,
 NO_ENGINE_SUBSTITUTION
STARTS: 2018-08-08 11:06:34
```

```

 ENDS: NULL
 STATUS: ENABLED
ON_COMPLETION: NOT PRESERVE
 CREATED: 2018-08-08 11:06:34
 LAST_ALTERED: 2018-08-08 11:06:34
 LAST_EXECUTED: 2018-08-08 16:06:34
 EVENT_COMMENT: Saves total number of sessions then clears the
 table each day
 ORIGINATOR: 1
CHARACTER_SET_CLIENT: utf8mb4
COLLATION_CONNECTION: utf8mb4_0900_ai_ci
DATABASE_COLLATION: utf8mb4_0900_ai_ci

```

Event information is also available from the `SHOW EVENTS` statement. See [Section 13.7.7.18, “SHOW EVENTS Statement”](#). The following statements are equivalent:

```

SELECT
 EVENT_SCHEMA, EVENT_NAME, DEFINER, TIME_ZONE, EVENT_TYPE, EXECUTE_AT,
 INTERVAL_VALUE, INTERVAL_FIELD, STARTS, ENDS, STATUS, ORIGINATOR,
 CHARACTER_SET_CLIENT, COLLATION_CONNECTION, DATABASE_COLLATION
FROM INFORMATION_SCHEMA.EVENTS
WHERE table_schema = 'db_name'
[AND column_name LIKE 'wild']

SHOW EVENTS
[FROM db_name]
[LIKE 'wild']

```

## 26.3.15 The INFORMATION\_SCHEMA FILES Table

The `FILES` table provides information about the files in which MySQL tablespace data is stored.

The `FILES` table provides information about [InnoDB](#) data files. In NDB Cluster, this table also provides information about the files in which NDB Cluster Disk Data tables are stored. For additional information specific to [InnoDB](#), see [InnoDB Notes](#), later in this section; for additional information specific to NDB Cluster, see [NDB Notes](#).

The `FILES` table has these columns:

- `FILE_ID`

For [InnoDB](#): The tablespace ID, also referred to as the `space_id` or `fil_space_t::id`.

For [NDB](#): A file identifier. `FILE_ID` column values are auto-generated.

- `FILE_NAME`

For [InnoDB](#): The name of the data file. File-per-table and general tablespaces have an `.ibd` file name extension. Undo tablespaces are prefixed by `undo`. The system tablespace is prefixed by `ibdata`. The global temporary tablespace is prefixed by `ibttmp`. The file name includes the file path, which may be relative to the MySQL data directory (the value of the `datadir` system variable).

For [NDB](#): The name of an undo log file created by `CREATE LOGFILE GROUP` or `ALTER LOGFILE GROUP`, or of a data file created by `CREATE TABLESPACE` or `ALTER TABLESPACE`. In NDB 8.0, the file name is shown with a relative path; for an undo log file, this path is relative to the directory `DataDir/ndb_NodeId_fs/LG`; for a data file, it is relative to the directory `DataDir/ndb_NodeId_fs/TS`. This means, for example, that the name of a data file created with `ALTER TABLESPACE ts ADD DATAFILE 'data_2.dat' INITIAL SIZE 256M` is shown as `./data_2.dat`.

- `FILE_TYPE`

For [InnoDB](#): The tablespace file type. There are three possible file types for [InnoDB](#) files. `TABLESPACE` is the file type for any system, general, or file-per-table tablespace file that holds tables, indexes, or other forms of user data. `TEMPORARY` is the file type for temporary tablespaces. `UNDO LOG` is the file type for undo tablespaces, which hold undo records.

For **NDB**: One of the values **UNDO LOG** or **DATAFILE**. Prior to NDB 8.0.13, **TABLESPACE** was also a possible value.

- **TABLESPACE\_NAME**

The name of the tablespace with which the file is associated.

For **InnoDB**: General tablespace names are as specified when created. File-per-table tablespace names are shown in the following format: *schema\_name/table\_name*. The **InnoDB** system tablespace name is **innodb\_system**. The global temporary tablespace name is **innodb\_temporary**. Default undo tablespace names are **innodb\_undo\_001** and **innodb\_undo\_002**. User-created undo tablespace names are as specified when created.

- **TABLE\_CATALOG**

This value is always empty.

- **TABLE\_SCHEMA**

This is always **NULL**.

- **TABLE\_NAME**

This is always **NULL**.

- **LOGFILE\_GROUP\_NAME**

For **InnoDB**: This is always **NULL**.

For **NDB**: The name of the log file group to which the log file or data file belongs.

- **LOGFILE\_GROUP\_NUMBER**

For **InnoDB**: This is always **NULL**.

For **NDB**: For a Disk Data undo log file, the auto-generated ID number of the log file group to which the log file belongs. This is the same as the value shown for the **id** column in the **ndbinfo.dict\_obj\_info** table and the **log\_id** column in the **ndbinfo.logspaces** and **ndbinfo.logspaces** tables for this undo log file.

- **ENGINE**

For **InnoDB**: This value is always **InnoDB**.

For **NDB**: This value is always **ndbcluster**.

- **FULLTEXT\_KEYS**

This is always **NULL**.

- **DELETED\_ROWS**

This is always **NULL**.

- **UPDATE\_COUNT**

This is always **NULL**.

- **FREE\_EXTENTS**

For **InnoDB**: The number of fully free extents in the current data file.

For **NDB**: The number of extents which have not yet been used by the file.

- `TOTAL_EXTENTS`

For `InnoDB`: The number of full extents used in the current data file. Any partial extent at the end of the file is not counted.

For `NDB`: The total number of extents allocated to the file.

- `EXTENT_SIZE`

For `InnoDB`: Extent size is 1048576 (1MB) for files with a 4KB, 8KB, or 16KB page size. Extent size is 2097152 bytes (2MB) for files with a 32KB page size, and 4194304 (4MB) for files with a 64KB page size. `FILES` does not report `InnoDB` page size. Page size is defined by the `innodb_page_size` system variable. Extent size information can also be retrieved from the `INNODB_TABLESPACES` table where `FILES.FILE_ID = INNODB_TABLESPACES.SPACE`.

For `NDB`: The size of an extent for the file in bytes.

- `INITIAL_SIZE`

For `InnoDB`: The initial size of the file in bytes.

For `NDB`: The size of the file in bytes. This is the same value that was used in the `INITIAL_SIZE` clause of the `CREATE LOGFILE GROUP`, `ALTER LOGFILE GROUP`, `CREATE TABLESPACE`, or `ALTER TABLESPACE` statement used to create the file.

- `MAXIMUM_SIZE`

For `InnoDB`: The maximum number of bytes permitted in the file. The value is `NULL` for all data files except for predefined system tablespace data files. Maximum system tablespace file size is defined by `innodb_data_file_path`. Maximum global temporary tablespace file size is defined by `innodb_temp_data_file_path`. A `NULL` value for a predefined system tablespace data file indicates that a file size limit was not defined explicitly.

For `NDB`: This value is always the same as the `INITIAL_SIZE` value.

- `AUTOEXTEND_SIZE`

The auto-extend size of the tablespace. For `NDB`, `AUTOEXTEND_SIZE` is always `NULL`.

- `CREATION_TIME`

This is always `NULL`.

- `LAST_UPDATE_TIME`

This is always `NULL`.

- `LAST_ACCESS_TIME`

This is always `NULL`.

- `RECOVER_TIME`

This is always `NULL`.

- `TRANSACTION_COUNTER`

This is always `NULL`.

- `VERSION`

For `InnoDB`: This is always `NULL`.

For `NDB`: The version number of the file.

- `ROW_FORMAT`

For `InnoDB`: This is always `NULL`.

For `NDB`: One of `FIXED` or `DYNAMIC`.

- `TABLE_ROWS`

This is always `NULL`.

- `AVG_ROW_LENGTH`

This is always `NULL`.

- `DATA_LENGTH`

This is always `NULL`.

- `MAX_DATA_LENGTH`

This is always `NULL`.

- `INDEX_LENGTH`

This is always `NULL`.

- `DATA_FREE`

For `InnoDB`: The total amount of free space (in bytes) for the entire tablespace. Predefined system tablespaces, which include the system tablespace and temporary table tablespaces, may have one or more data files.

For `NDB`: This is always `NULL`.

- `CREATE_TIME`

This is always `NULL`.

- `UPDATE_TIME`

This is always `NULL`.

- `CHECK_TIME`

This is always `NULL`.

- `CHECKSUM`

This is always `NULL`.

- `STATUS`

For `InnoDB`: This value is `NORMAL` by default. `InnoDB` file-per-table tablespaces may report `IMPORTING`, which indicates that the tablespace is not yet available.

For `NDB`: For `NDB Cluster Disk Data` files, this value is always `NORMAL`.

- `EXTRA`

For `InnoDB`: This is always `NULL`.

For `NDB`: (*NDB 8.0.15 and later*) For undo log files, this column shows the undo log buffer size; for data files, it is always `NULL`. A more detailed explanation is provided in the next few paragraphs.

**NDBCLUSTER** stores a copy of each data file and each undo log file on each data node in the cluster. In NDB 8.0.13 and later, the **FILES** table contains only one row for each such file. Suppose that you run the following two statements on an NDB Cluster with four data nodes:

```
CREATE LOGFILE GROUP mygroup
 ADD UNDOFILE 'new_undo.dat'
 INITIAL_SIZE 2G
 ENGINE NDBCLUSTER;

CREATE TABLESPACE myts
 ADD DATAFILE 'data_1.dat'
 USE LOGFILE GROUP mygroup
 INITIAL_SIZE 256M
 ENGINE NDBCLUSTER;
```

After running these two statements successfully, you should see a result similar to the one shown here for this query against the **FILES** table:

```
mysql> SELECT LOGFILE_GROUP_NAME, FILE_TYPE, EXTRA
-> FROM INFORMATION_SCHEMA.FILES
-> WHERE ENGINE = 'ndbcluster';
```

| LOGFILE_GROUP_NAME | FILE_TYPE | EXTRA                    |
|--------------------|-----------|--------------------------|
| mygroup            | UNDO LOG  | UNDO_BUFFER_SIZE=8388608 |
| mygroup            | DATAFILE  | NULL                     |

The undo log buffer size information was inadvertently removed in NDB 8.0.13, but was restored in NDB 8.0.15. (Bug #92796, Bug #28800252)

Prior to NDB 8.0.13, the **FILES** table contained a row for each of these files on each data node the file belonged to, as well as the size of its undo buffer. In these versions, the result of the same query contains one row per data node, as shown here:

| LOGFILE_GROUP_NAME | FILE_TYPE | EXTRA                                   |
|--------------------|-----------|-----------------------------------------|
| mygroup            | UNDO LOG  | CLUSTER_NODE=5;UNDO_BUFFER_SIZE=8388608 |
| mygroup            | UNDO LOG  | CLUSTER_NODE=6;UNDO_BUFFER_SIZE=8388608 |
| mygroup            | UNDO LOG  | CLUSTER_NODE=7;UNDO_BUFFER_SIZE=8388608 |
| mygroup            | UNDO LOG  | CLUSTER_NODE=8;UNDO_BUFFER_SIZE=8388608 |
| mygroup            | DATAFILE  | CLUSTER_NODE=5                          |
| mygroup            | DATAFILE  | CLUSTER_NODE=6                          |
| mygroup            | DATAFILE  | CLUSTER_NODE=7                          |
| mygroup            | DATAFILE  | CLUSTER_NODE=8                          |

## Notes

- FILES** is a nonstandard **INFORMATION\_SCHEMA** table.
- As of MySQL 8.0.21, you must have the **PROCESS** privilege to query this table.

## InnoDB Notes

The following notes apply to **InnoDB** data files.

- Data reported by **FILES** is reported from the **InnoDB** in-memory cache for open files. By comparison, **INNODB\_DATAFILES** reports data from the **InnoDB SYS\_DATAFILES** internal data dictionary table.
- The data reported by **FILES** includes global temporary tablespace data. This data is not available in the **InnoDB SYS\_DATAFILES** internal data dictionary table, and is therefore not reported by **INNODB\_DATAFILES**.

- Undo tablespace data is reported by [FILES](#) when separate undo tablespaces are present, which they are by default in MySQL 8.0
- The following query returns all data pertinent to [InnoDB](#) tablespaces.

```
SELECT
 FILE_ID, FILE_NAME, FILE_TYPE, TABLESPACE_NAME, FREE_EXTENTS,
 TOTAL_EXTENTS, EXTENT_SIZE, INITIAL_SIZE, MAXIMUM_SIZE,
 AUTOEXTEND_SIZE, DATA_FREE, STATUS
FROM INFORMATION_SCHEMA.FILES WHERE ENGINE='InnoDB'\G
```

## NDB Notes

- The [FILES](#) table provides information about Disk Data *files* only; you cannot use it for determining disk space allocation or availability for individual [NDB](#) tables. However, it is possible to see how much space is allocated for each [NDB](#) table having data stored on disk—as well as how much remains available for storage of data on disk for that table—using [ndb\\_desc](#).
- The [CREATION\\_TIME](#), [LAST\\_UPDATE\\_TIME](#), and [LAST\\_ACCESSED](#) values are as reported by the operating system, and are not supplied by the [NDB](#) storage engine. Where no value is provided by the operating system, these columns display [NULL](#).
- The difference between the [TOTAL\\_EXTENTS](#) and [FREE\\_EXTENTS](#) columns is the number of extents currently in use by the file:

```
SELECT TOTAL_EXTENTS - FREE_EXTENTS AS extents_used
FROM INFORMATION_SCHEMA.FILES
WHERE FILE_NAME = './myfile.dat';
```

To approximate the amount of disk space in use by the file, multiply that difference by the value of the [EXTENT\\_SIZE](#) column, which gives the size of an extent for the file in bytes:

```
SELECT (TOTAL_EXTENTS - FREE_EXTENTS) * EXTENT_SIZE AS bytes_used
FROM INFORMATION_SCHEMA.FILES
WHERE FILE_NAME = './myfile.dat';
```

Similarly, you can estimate the amount of space that remains available in a given file by multiplying [FREE\\_EXTENTS](#) by [EXTENT\\_SIZE](#):

```
SELECT FREE_EXTENTS * EXTENT_SIZE AS bytes_free
FROM INFORMATION_SCHEMA.FILES
WHERE FILE_NAME = './myfile.dat';
```

### Important

The byte values produced by the preceding queries are approximations only, and their precision is inversely proportional to the value of [EXTENT\\_SIZE](#). That is, the larger [EXTENT\\_SIZE](#) becomes, the less accurate the approximations are.

It is also important to remember that once an extent is used, it cannot be freed again without dropping the data file of which it is a part. This means that deletes from a Disk Data table do *not* release disk space.

The extent size can be set in a [CREATE TABLESPACE](#) statement. For more information, see [Section 13.1.21, “CREATE TABLESPACE Statement”](#).

- Prior to NDB 8.0.13, an additional row was present in the [FILES](#) table following the creation of a logfile group, having [NULL](#) in the [FILE\\_NAME](#) column. In NDB 8.0.13 and later, this row—which did not correspond to any file—is no longer shown, and it is necessary to query the [ndbinfo.logspaces](#) table to obtain undo log file usage information. See the description of this table as well as [Section 23.5.10.1, “NDB Cluster Disk Data Objects”](#), for more information.

The remainder of the discussion in this item applies only to NDB 8.0.12 and earlier. For the row having `NULL` in the `FILE_NAME` column, the value of the `FILE_ID` column is always 0, that of the `FILE_TYPE` column is always `UNDO LOG`, and that of the `STATUS` column is always `NORMAL`. The value of the `ENGINE` column is always `ndbcluster`.

The `FREE_EXTENTS` column in this row shows the total number of free extents available to all undo files belonging to a given log file group whose name and number are shown in the `LOGFILE_GROUP_NAME` and `LOGFILE_GROUP_NUMBER` columns, respectively.

Suppose there are no existing log file groups on your NDB Cluster, and you create one using the following statement:

```
mysql> CREATE LOGFILE GROUP lg1
 ADD UNDOFILE 'undofile.dat'
 INITIAL_SIZE = 16M
 UNDO_BUFFER_SIZE = 1M
 ENGINE = NDB;
```

You can now see this `NULL` row when you query the `FILES` table:

```
mysql> SELECT DISTINCT
 FILE_NAME AS File,
 FREE_EXTENTS AS Free,
 TOTAL_EXTENTS AS Total,
 EXTENT_SIZE AS Size,
 INITIAL_SIZE AS Initial
 FROM INFORMATION_SCHEMA.FILES;
```

| File         | Free    | Total   | Size | Initial  |
|--------------|---------|---------|------|----------|
| undofile.dat | NULL    | 4194304 | 4    | 16777216 |
| NULL         | 4184068 | NULL    | 4    | NULL     |

The total number of free extents available for undo logging is always somewhat less than the sum of the `TOTAL_EXTENTS` column values for all undo files in the log file group due to overhead required for maintaining the undo files. This can be seen by adding a second undo file to the log file group, then repeating the previous query against the `FILES` table:

```
mysql> ALTER LOGFILE GROUP lg1
 ADD UNDOFILE 'undofile02.dat'
 INITIAL_SIZE = 4M
 ENGINE = NDB;
```

```
mysql> SELECT DISTINCT
 FILE_NAME AS File,
 FREE_EXTENTS AS Free,
 TOTAL_EXTENTS AS Total,
 EXTENT_SIZE AS Size,
 INITIAL_SIZE AS Initial
 FROM INFORMATION_SCHEMA.FILES;
```

| File           | Free    | Total   | Size | Initial  |
|----------------|---------|---------|------|----------|
| undofile.dat   | NULL    | 4194304 | 4    | 16777216 |
| undofile02.dat | NULL    | 1048576 | 4    | 4194304  |
| NULL           | 5223944 | NULL    | 4    | NULL     |

The amount of free space in bytes which is available for undo logging by Disk Data tables using this log file group can be approximated by multiplying the number of free extents by the initial size:

```
mysql> SELECT
 FREE_EXTENTS AS 'Free Extents',
 FREE_EXTENTS * EXTENT_SIZE AS 'Free Bytes'
 FROM INFORMATION_SCHEMA.FILES
 WHERE LOGFILE_GROUP_NAME = 'lg1'
```

```

AND FILE_NAME IS NULL;
+-----+-----+
| Free Extents | Free Bytes |
+-----+-----+
| 5223944 | 20895776 |
+-----+-----+

```

If you create an NDB Cluster Disk Data table and then insert some rows into it, you can see approximately how much space remains for undo logging afterward, for example:

```

mysql> CREATE TABLESPACE ts1
 ADD DATAFILE 'data1.dat'
 USE LOGFILE GROUP lg1
 INITIAL_SIZE 512M
 ENGINE = NDB;

mysql> CREATE TABLE dd (
 c1 INT NOT NULL PRIMARY KEY,
 c2 INT,
 c3 DATE
)
 TABLESPACE ts1 STORAGE DISK
 ENGINE = NDB;

mysql> INSERT INTO dd VALUES
 (NULL, 1234567890, '2007-02-02'),
 (NULL, 1126789005, '2007-02-03'),
 (NULL, 1357924680, '2007-02-04'),
 (NULL, 1642097531, '2007-02-05');

mysql> SELECT
 FREE_EXTENTS AS 'Free Extents',
 FREE_EXTENTS * EXTENT_SIZE AS 'Free Bytes'
 FROM INFORMATION_SCHEMA.FILES
 WHERE LOGFILE_GROUP_NAME = 'lg1'
 AND FILE_NAME IS NULL;
+-----+-----+
| Free Extents | Free Bytes |
+-----+-----+
| 5207565 | 20830260 |
+-----+-----+

```

- Prior to NDB 8.0.13, an additional row was present in the `FILES` table for each NDB Cluster Disk Data tablespace. Because it did not correspond to an actual file, it was removed in NDB 8.0.13. This row had `NULL` for the value of the `FILE_NAME` column, the value of the `FILE_ID` column was always 0, that of the `FILE_TYPE` column was always `TABLESPACE`, that of the `STATUS` column was always `NORMAL`, and the value of the `ENGINE` column is always `NDBCLUSTER`.

In NDB 8.0.13 and later, you can obtain information about Disk Data tablespaces using the `ndb_desc` utility. For more information, see [Section 23.5.10.1, “NDB Cluster Disk Data Objects”](#), as well as the description of `ndb_desc`.

- For additional information, and examples of creating, dropping, and obtaining information about NDB Cluster Disk Data objects, see [Section 23.5.10, “NDB Cluster Disk Data Tables”](#).

## 26.3.16 The INFORMATION\_SCHEMA KEY\_COLUMN\_USAGE Table

The `KEY_COLUMN_USAGE` table describes which key columns have constraints. This table provides no information about functional key parts because they are expressions and the table provides information only about columns.

The `KEY_COLUMN_USAGE` table has these columns:

- `CONSTRAINT_CATALOG`

The name of the catalog to which the constraint belongs. This value is always `def`.

- `CONSTRAINT_SCHEMA`

The name of the schema (database) to which the constraint belongs.

- [CONSTRAINT\\_NAME](#)

The name of the constraint.

- [TABLE\\_CATALOG](#)

The name of the catalog to which the table belongs. This value is always [def](#).

- [TABLE\\_SCHEMA](#)

The name of the schema (database) to which the table belongs.

- [TABLE\\_NAME](#)

The name of the table that has the constraint.

- [COLUMN\\_NAME](#)

The name of the column that has the constraint.

If the constraint is a foreign key, then this is the column of the foreign key, not the column that the foreign key references.

- [ORDINAL\\_POSITION](#)

The column's position within the constraint, not the column's position within the table. Column positions are numbered beginning with 1.

- [POSITION\\_IN\\_UNIQUE\\_CONSTRAINT](#)

[NULL](#) for unique and primary-key constraints. For foreign-key constraints, this column is the ordinal position in key of the table that is being referenced.

- [REFERENCED\\_TABLE\\_SCHEMA](#)

The name of the schema referenced by the constraint.

- [REFERENCED\\_TABLE\\_NAME](#)

The name of the table referenced by the constraint.

- [REFERENCED\\_COLUMN\\_NAME](#)

The name of the column referenced by the constraint.

Suppose that there are two tables name [t1](#) and [t3](#) that have the following definitions:

```
CREATE TABLE t1
(
 s1 INT,
 s2 INT,
 s3 INT,
 PRIMARY KEY(s3)
) ENGINE=InnoDB;

CREATE TABLE t3
(
 s1 INT,
 s2 INT,
 s3 INT,
 KEY(s1),
 CONSTRAINT CO FOREIGN KEY (s2) REFERENCES t1(s3)
) ENGINE=InnoDB;
```

For those two tables, the `KEY_COLUMN_USAGE` table has two rows:

- One row with `CONSTRAINT_NAME = 'PRIMARY'`, `TABLE_NAME = 't1'`, `COLUMN_NAME = 's3'`, `ORDINAL_POSITION = 1`, `POSITION_IN_UNIQUE_CONSTRAINT = NULL`.

For `NDB`: This value is always `NULL`.

- One row with `CONSTRAINT_NAME = 'CO'`, `TABLE_NAME = 't3'`, `COLUMN_NAME = 's2'`, `ORDINAL_POSITION = 1`, `POSITION_IN_UNIQUE_CONSTRAINT = 1`.

### 26.3.17 The INFORMATION\_SCHEMA KEYWORDS Table

The `KEYWORDS` table lists the words considered keywords by MySQL and, for each one, indicates whether it is reserved. Reserved keywords may require special treatment in some contexts, such as special quoting when used as identifiers (see [Section 9.3, “Keywords and Reserved Words”](#)). This table provides applications a runtime source of MySQL keyword information.

Prior to MySQL 8.0.13, selecting from the `KEYWORDS` table with no default database selected produced an error. (Bug #90160, Bug #27729859)

The `KEYWORDS` table has these columns:

- `WORD`

The keyword.

- `RESERVED`

An integer indicating whether the keyword is reserved (1) or nonreserved (0).

These queries lists all keywords, all reserved keywords, and all nonreserved keywords, respectively:

```
SELECT * FROM INFORMATION_SCHEMA.KEYWORDS;
SELECT WORD FROM INFORMATION_SCHEMA.KEYWORDS WHERE RESERVED = 1;
SELECT WORD FROM INFORMATION_SCHEMA.KEYWORDS WHERE RESERVED = 0;
```

The latter two queries are equivalent to:

```
SELECT WORD FROM INFORMATION_SCHEMA.KEYWORDS WHERE RESERVED;
SELECT WORD FROM INFORMATION_SCHEMA.KEYWORDS WHERE NOT RESERVED;
```

If you build MySQL from source, the build process generates a `keyword_list.h` header file containing an array of keywords and their reserved status. This file can be found in the `sql` directory under the build directory. This file may be useful for applications that require a static source for the keyword list.

### 26.3.18 The INFORMATION\_SCHEMA ndb\_transid\_mysql\_connection\_map Table

The `ndb_transid_mysql_connection_map` table provides a mapping between `NDB` transactions, `NDB` transaction coordinators, and MySQL Servers attached to an `NDB` Cluster as API nodes. This information is used when populating the `server_operations` and `server_transactions` tables of the `ndbinfo` `NDB` Cluster information database.

| INFORMATION_SCHEMA Name          | SHOW Name | Remarks                         |
|----------------------------------|-----------|---------------------------------|
| <code>mysql_connection_id</code> |           | MySQL Server connection ID      |
| <code>node_id</code>             |           | Transaction coordinator node ID |
| <code>ndb_transid</code>         |           | <code>NDB</code> transaction ID |

The `mysql_connection_id` is the same as the connection or session ID shown in the output of `SHOW PROCESSLIST`.

There are no [SHOW](#) statements associated with this table.

This is a nonstandard table, specific to NDB Cluster. It is implemented as an [INFORMATION\\_SCHEMA](#) plugin; you can verify that it is supported by checking the output of [SHOW PLUGINS](#). If [ndb\\_transid\\_mysql\\_connection\\_map](#) support is enabled, the output from this statement includes a plugin having this name, of type [INFORMATION\\_SCHEMA](#), and having status [ACTIVE](#), as shown here (using emphasized text):

```
mysql> SHOW PLUGINS;
```

| Name                                    | Status        | Type                      | Library     | License    |
|-----------------------------------------|---------------|---------------------------|-------------|------------|
| binlog                                  | ACTIVE        | STORAGE ENGINE            | NULL        | GPL        |
| mysql_native_password                   | ACTIVE        | AUTHENTICATION            | NULL        | GPL        |
| CSV                                     | ACTIVE        | STORAGE ENGINE            | NULL        | GPL        |
| MEMORY                                  | ACTIVE        | STORAGE ENGINE            | NULL        | GPL        |
| MRG_MYISAM                              | ACTIVE        | STORAGE ENGINE            | NULL        | GPL        |
| MyISAM                                  | ACTIVE        | STORAGE ENGINE            | NULL        | GPL        |
| PERFORMANCE_SCHEMA                      | ACTIVE        | STORAGE ENGINE            | NULL        | GPL        |
| BLACKHOLE                               | ACTIVE        | STORAGE ENGINE            | NULL        | GPL        |
| ARCHIVE                                 | ACTIVE        | STORAGE ENGINE            | NULL        | GPL        |
| ndbcluster                              | ACTIVE        | STORAGE ENGINE            | NULL        | GPL        |
| ndbinfo                                 | ACTIVE        | STORAGE ENGINE            | NULL        | GPL        |
| <b>ndb_transid_mysql_connection_map</b> | <b>ACTIVE</b> | <b>INFORMATION_SCHEMA</b> | <b>NULL</b> | <b>GPL</b> |
| InnoDB                                  | ACTIVE        | STORAGE ENGINE            | NULL        | GPL        |
| INNODB_TRX                              | ACTIVE        | INFORMATION_SCHEMA        | NULL        | GPL        |
| INNODB_LOCKS                            | ACTIVE        | INFORMATION_SCHEMA        | NULL        | GPL        |
| INNODB_LOCK_WAITS                       | ACTIVE        | INFORMATION_SCHEMA        | NULL        | GPL        |
| INNODB_CMP                              | ACTIVE        | INFORMATION_SCHEMA        | NULL        | GPL        |
| INNODB_CMP_RESET                        | ACTIVE        | INFORMATION_SCHEMA        | NULL        | GPL        |
| INNODB_CMPMEM                           | ACTIVE        | INFORMATION_SCHEMA        | NULL        | GPL        |
| INNODB_CMPMEM_RESET                     | ACTIVE        | INFORMATION_SCHEMA        | NULL        | GPL        |
| partition                               | ACTIVE        | STORAGE ENGINE            | NULL        | GPL        |

22 rows in set (0.00 sec)

The plugin is enabled by default. You can disable it (or force the server not to run unless the plugin starts) by starting the server with the [--ndb-transid-mysql-connection-map](#) option. If the plugin is disabled, the status is shown by [SHOW PLUGINS](#) as [DISABLED](#). The plugin cannot be enabled or disabled at runtime.

Although the names of this table and its columns are displayed using lowercase, you can use uppercase or lowercase when referring to them in SQL statements.

For this table to be created, the MySQL Server must be a binary supplied with the NDB Cluster distribution, or one built from the NDB Cluster sources with [NDB](#) storage engine support enabled. It is not available in the standard MySQL 8.0 Server.

## 26.3.19 The INFORMATION\_SCHEMA OPTIMIZER\_TRACE Table

The [OPTIMIZER\\_TRACE](#) table provides information produced by the optimizer tracing capability for traced statements. To enable tracking, use the [optimizer\\_trace](#) system variable. For details, see [MySQL Internals: Tracing the Optimizer](#).

The [OPTIMIZER\\_TRACE](#) table has these columns:

- [QUERY](#)

The text of the traced statement.

- [TRACE](#)

The trace, in [JSON](#) format.

- [MISSING\\_BYTES\\_BEYOND\\_MAX\\_MEM\\_SIZE](#)

Each remembered trace is a string that is extended as optimization progresses and appends data to it. The `optimizer_trace_max_mem_size` variable sets a limit on the total amount of memory used by all currently remembered traces. If this limit is reached, the current trace is not extended (and thus is incomplete), and the `MISSING_BYTES_BEYOND_MAX_MEM_SIZE` column shows the number of bytes missing from the trace.

- `INSUFFICIENT_PRIVILEGES`

If a traced query uses views or stored routines that have `SQL SECURITY` with a value of `DEFINER`, it may be that a user other than the definer is denied from seeing the trace of the query. In that case, the trace is shown as empty and `INSUFFICIENT_PRIVILEGES` has a value of 1. Otherwise, the value is 0.

## 26.3.20 The INFORMATION\_SCHEMA PARAMETERS Table

The `PARAMETERS` table provides information about parameters for stored routines (stored procedures and stored functions), and about return values for stored functions. The `PARAMETERS` table does not include built-in (native) functions or loadable functions.

The `PARAMETERS` table has these columns:

- `SPECIFIC_CATALOG`

The name of the catalog to which the routine containing the parameter belongs. This value is always `def`.

- `SPECIFIC_SCHEMA`

The name of the schema (database) to which the routine containing the parameter belongs.

- `SPECIFIC_NAME`

The name of the routine containing the parameter.

- `ORDINAL_POSITION`

For successive parameters of a stored procedure or function, the `ORDINAL_POSITION` values are 1, 2, 3, and so forth. For a stored function, there is also a row that applies to the function return value (as described by the `RETURNS` clause). The return value is not a true parameter, so the row that describes it has these unique characteristics:

- The `ORDINAL_POSITION` value is 0.
- The `PARAMETER_NAME` and `PARAMETER_MODE` values are `NULL` because the return value has no name and the mode does not apply.

- `PARAMETER_MODE`

The mode of the parameter. This value is one of `IN`, `OUT`, or `INOUT`. For a stored function return value, this value is `NULL`.

- `PARAMETER_NAME`

The name of the parameter. For a stored function return value, this value is `NULL`.

- `DATA_TYPE`

The parameter data type.

The `DATA_TYPE` value is the type name only with no other information. The `DTD_IDENTIFIER` value contains the type name and possibly other information such as the precision or length.

- [CHARACTER\\_MAXIMUM\\_LENGTH](#)

For string parameters, the maximum length in characters.

- [CHARACTER\\_OCTET\\_LENGTH](#)

For string parameters, the maximum length in bytes.

- [NUMERIC\\_PRECISION](#)

For numeric parameters, the numeric precision.

- [NUMERIC\\_SCALE](#)

For numeric parameters, the numeric scale.

- [DATETIME\\_PRECISION](#)

For temporal parameters, the fractional seconds precision.

- [CHARACTER\\_SET\\_NAME](#)

For character string parameters, the character set name.

- [COLLATION\\_NAME](#)

For character string parameters, the collation name.

- [DTD\\_IDENTIFIER](#)

The parameter data type.

The [DATA\\_TYPE](#) value is the type name only with no other information. The [DTD\\_IDENTIFIER](#) value contains the type name and possibly other information such as the precision or length.

- [ROUTINE\\_TYPE](#)

[PROCEDURE](#) for stored procedures, [FUNCTION](#) for stored functions.

## 26.3.21 The INFORMATION\_SCHEMA PARTITIONS Table

The [PARTITIONS](#) table provides information about table partitions. Each row in this table corresponds to an individual partition or subpartition of a partitioned table. For more information about partitioning tables, see [Chapter 24, Partitioning](#).

The [PARTITIONS](#) table has these columns:

- [TABLE\\_CATALOG](#)

The name of the catalog to which the table belongs. This value is always `def`.

- [TABLE\\_SCHEMA](#)

The name of the schema (database) to which the table belongs.

- [TABLE\\_NAME](#)

The name of the table containing the partition.

- [PARTITION\\_NAME](#)

The name of the partition.

- [SUBPARTITION\\_NAME](#)

If the `PARTITIONS` table row represents a subpartition, the name of subpartition; otherwise `NULL`.

For `NDB`: This value is always `NULL`.

- `PARTITION_ORDINAL_POSITION`

All partitions are indexed in the same order as they are defined, with `1` being the number assigned to the first partition. The indexing can change as partitions are added, dropped, and reorganized; the number shown in this column reflects the current order, taking into account any indexing changes.

- `SUBPARTITION_ORDINAL_POSITION`

Subpartitions within a given partition are also indexed and reindexed in the same manner as partitions are indexed within a table.

- `PARTITION_METHOD`

One of the values `RANGE`, `LIST`, `HASH`, `LINEAR HASH`, `KEY`, or `LINEAR KEY`; that is, one of the available partitioning types as discussed in [Section 24.2, “Partitioning Types”](#).

- `SUBPARTITION_METHOD`

One of the values `HASH`, `LINEAR HASH`, `KEY`, or `LINEAR KEY`; that is, one of the available subpartitioning types as discussed in [Section 24.2.6, “Subpartitioning”](#).

- `PARTITION_EXPRESSION`

The expression for the partitioning function used in the `CREATE TABLE` or `ALTER TABLE` statement that created the table's current partitioning scheme.

For example, consider a partitioned table created in the `test` database using this statement:

```
CREATE TABLE tp (
 c1 INT,
 c2 INT,
 c3 VARCHAR(25)
)
PARTITION BY HASH(c1 + c2)
PARTITIONS 4;
```

The `PARTITION_EXPRESSION` column in a `PARTITIONS` table row for a partition from this table displays `c1 + c2`, as shown here:

```
mysql> SELECT DISTINCT PARTITION_EXPRESSION
FROM INFORMATION_SCHEMA.PARTITIONS
WHERE TABLE_NAME='tp' AND TABLE_SCHEMA='test';
+-----+
| PARTITION_EXPRESSION |
+-----+
| c1 + c2 |
+-----+
```

- `SUBPARTITION_EXPRESSION`

This works in the same fashion for the subpartitioning expression that defines the subpartitioning for a table as `PARTITION_EXPRESSION` does for the partitioning expression used to define a table's partitioning.

If the table has no subpartitions, this column is `NULL`.

- `PARTITION_DESCRIPTION`

This column is used for `RANGE` and `LIST` partitions. For a `RANGE` partition, it contains the value set in the partition's `VALUES LESS THAN` clause, which can be either an integer or `MAXVALUE`. For a

**LIST** partition, this column contains the values defined in the partition's **VALUES IN** clause, which is a list of comma-separated integer values.

For partitions whose **PARTITION\_METHOD** is other than **RANGE** or **LIST**, this column is always **NULL**.

- **TABLE\_ROWS**

The number of table rows in the partition.

For partitioned **InnoDB** tables, the row count given in the **TABLE\_ROWS** column is only an estimated value used in SQL optimization, and may not always be exact.

For **NDB** tables, you can also obtain this information using the **ndb\_desc** utility.

- **AVG\_ROW\_LENGTH**

The average length of the rows stored in this partition or subpartition, in bytes. This is the same as **DATA\_LENGTH** divided by **TABLE\_ROWS**.

For **NDB** tables, you can also obtain this information using the **ndb\_desc** utility.

- **DATA\_LENGTH**

The total length of all rows stored in this partition or subpartition, in bytes; that is, the total number of bytes stored in the partition or subpartition.

For **NDB** tables, you can also obtain this information using the **ndb\_desc** utility.

- **MAX\_DATA\_LENGTH**

The maximum number of bytes that can be stored in this partition or subpartition.

For **NDB** tables, you can also obtain this information using the **ndb\_desc** utility.

- **INDEX\_LENGTH**

The length of the index file for this partition or subpartition, in bytes.

For partitions of **NDB** tables, whether the tables use implicit or explicit partitioning, the **INDEX\_LENGTH** column value is always 0. However, you can obtain equivalent information using the **ndb\_desc** utility.

- **DATA\_FREE**

The number of bytes allocated to the partition or subpartition but not used.

For **NDB** tables, you can also obtain this information using the **ndb\_desc** utility.

- **CREATE\_TIME**

The time that the partition or subpartition was created.

- **UPDATE\_TIME**

The time that the partition or subpartition was last modified.

- **CHECK\_TIME**

The last time that the table to which this partition or subpartition belongs was checked.

For partitioned **InnoDB** tables, the value is always **NULL**.

- **CHECKSUM**

The checksum value, if any; otherwise `NULL`.

- `PARTITION_COMMENT`

The text of the comment, if the partition has one. If not, this value is empty.

The maximum length for a partition comment is defined as 1024 characters, and the display width of the `PARTITION_COMMENT` column is also 1024, characters to match this limit.

- `NODEGROUP`

This is the nodegroup to which the partition belongs. This is relevant only to NDB Cluster tables; otherwise, the value is always `0`.

- `TABLESPACE_NAME`

The name of the tablespace to which the partition belongs. The value is always `DEFAULT`, unless the table uses the `NDB` storage engine (see the *Notes* at the end of this section).

## Notes

- `PARTITIONS` is a nonstandard `INFORMATION_SCHEMA` table.
- A table using any storage engine other than `NDB` and which is not partitioned has one row in the `PARTITIONS` table. However, the values of the `PARTITION_NAME`, `SUBPARTITION_NAME`, `PARTITION_ORDINAL_POSITION`, `SUBPARTITION_ORDINAL_POSITION`, `PARTITION_METHOD`, `SUBPARTITION_METHOD`, `PARTITION_EXPRESSION`, `SUBPARTITION_EXPRESSION`, and `PARTITION_DESCRIPTION` columns are all `NULL`. Also, the `PARTITION_COMMENT` column in this case is blank.
- An `NDB` table which is not explicitly partitioned has one row in the `PARTITIONS` table for each data node in the NDB cluster. For each such row:
  - The `SUBPARTITION_NAME`, `SUBPARTITION_ORDINAL_POSITION`, `SUBPARTITION_METHOD`, `PARTITION_EXPRESSION`, `SUBPARTITION_EXPRESSION`, `CREATE_TIME`, `UPDATE_TIME`, `CHECK_TIME`, `CHECKSUM`, and `TABLESPACE_NAME` columns are all `NULL`.
  - The `PARTITION_METHOD` is always `AUTO`.
  - The `NODEGROUP` column is `default`.
  - The `PARTITION_EXPRESSION` and `PARTITION_COMMENT` columns are empty.

## 26.3.22 The INFORMATION\_SCHEMA PLUGINS Table

The `PLUGINS` table provides information about server plugins.

The `PLUGINS` table has these columns:

- `PLUGIN_NAME`

The name used to refer to the plugin in statements such as `INSTALL PLUGIN` and `UNINSTALL PLUGIN`.

- `PLUGIN_VERSION`

The version from the plugin's general type descriptor.

- `PLUGIN_STATUS`

The plugin status, one of `ACTIVE`, `INACTIVE`, `DISABLED`, `DELETING`, or `DELETED`.

- `PLUGIN_TYPE`

The type of plugin, such as `STORAGE ENGINE`, `INFORMATION_SCHEMA`, or `AUTHENTICATION`.

- `PLUGIN_TYPE_VERSION`

The version from the plugin's type-specific descriptor.

- `PLUGIN_LIBRARY`

The name of the plugin shared library file. This is the name used to refer to the plugin file in statements such as `INSTALL PLUGIN` and `UNINSTALL PLUGIN`. This file is located in the directory named by the `plugin_dir` system variable. If the library name is `NULL`, the plugin is compiled in and cannot be uninstalled with `UNINSTALL PLUGIN`.

- `PLUGIN_LIBRARY_VERSION`

The plugin API interface version.

- `PLUGIN_AUTHOR`

The plugin author.

- `PLUGIN_DESCRIPTION`

A short description of the plugin.

- `PLUGIN_LICENSE`

How the plugin is licensed (for example, `GPL`).

- `LOAD_OPTION`

How the plugin was loaded. The value is `OFF`, `ON`, `FORCE`, or `FORCE_PLUS_PERMANENT`. See [Section 5.6.1, “Installing and Uninstalling Plugins”](#).

## Notes

- `PLUGINS` is a nonstandard `INFORMATION_SCHEMA` table.
- For plugins installed with `INSTALL PLUGIN`, the `PLUGIN_NAME` and `PLUGIN_LIBRARY` values are also registered in the `mysql.plugin` table.
- For information about plugin data structures that form the basis of the information in the `PLUGINS` table, see [The MySQL Plugin API](#).

Plugin information is also available from the `SHOW PLUGINS` statement. See [Section 13.7.7.25, “SHOW PLUGINS Statement”](#). These statements are equivalent:

```
SELECT
 PLUGIN_NAME, PLUGIN_STATUS, PLUGIN_TYPE,
 PLUGIN_LIBRARY, PLUGIN_LICENSE
FROM INFORMATION_SCHEMA.PLUGINS;

SHOW PLUGINS;
```

## 26.3.23 The INFORMATION\_SCHEMA PROCESSLIST Table

The MySQL process list indicates the operations currently being performed by the set of threads executing within the server. The `PROCESSLIST` table is one source of process information. For a comparison of this table with other sources, see [Sources of Process Information](#).

The `PROCESSLIST` table has these columns:

- `ID`

The connection identifier. This is the same value displayed in the `Id` column of the `SHOW PROCESSLIST` statement, displayed in the `PROCESSLIST_ID` column of the Performance Schema `threads` table, and returned by the `CONNECTION_ID()` function within the thread.

- **USER**

The MySQL user who issued the statement. A value of `system user` refers to a nonclient thread spawned by the server to handle tasks internally, for example, a delayed-row handler thread or an I/O or SQL thread used on replica hosts. For `system user`, there is no host specified in the `Host` column. `unauthenticated user` refers to a thread that has become associated with a client connection but for which authentication of the client user has not yet occurred. `event_scheduler` refers to the thread that monitors scheduled events (see [Section 25.4, “Using the Event Scheduler”](#)).

**Note**

A `USER` value of `system user` is distinct from the `SYSTEM_USER` privilege. The former designates internal threads. The latter distinguishes the system user and regular user account categories (see [Section 6.2.11, “Account Categories”](#)).

- **HOST**

The host name of the client issuing the statement (except for `system user`, for which there is no host). The host name for TCP/IP connections is reported in `host_name:client_port` format to make it easier to determine which client is doing what.

- **DB**

The default database for the thread, or `NULL` if none has been selected.

- **COMMAND**

The type of command the thread is executing on behalf of the client, or `Sleep` if the session is idle. For descriptions of thread commands, see [Section 8.14, “Examining Server Thread \(Process\) Information”](#). The value of this column corresponds to the `COM_xxx` commands of the client/server protocol and `Com_xxx` status variables. See [Section 5.1.10, “Server Status Variables”](#).

- **TIME**

The time in seconds that the thread has been in its current state. For a replica SQL thread, the value is the number of seconds between the timestamp of the last replicated event and the real time of the replica host. See [Section 17.2.3, “Replication Threads”](#).

- **STATE**

An action, event, or state that indicates what the thread is doing. For descriptions of `STATE` values, see [Section 8.14, “Examining Server Thread \(Process\) Information”](#).

Most states correspond to very quick operations. If a thread stays in a given state for many seconds, there might be a problem that needs to be investigated.

- **INFO**

The statement the thread is executing, or `NULL` if it is executing no statement. The statement might be the one sent to the server, or an innermost statement if the statement executes other statements. For example, if a `CALL` statement executes a stored procedure that is executing a `SELECT` statement, the `INFO` value shows the `SELECT` statement.

## Notes

- `PROCESSLIST` is a nonstandard `INFORMATION_SCHEMA` table.

- Like the output from the `SHOW PROCESSLIST` statement, the `PROCESSLIST` table provides information about all threads, even those belonging to other users, if you have the `PROCESS` privilege. Otherwise (without the `PROCESS` privilege), nonanonymous users have access to information about their own threads but not threads for other users, and anonymous users have no access to thread information.
- If an SQL statement refers to the `PROCESSLIST` table, MySQL populates the entire table once, when statement execution begins, so there is read consistency during the statement. There is no read consistency for a multi-statement transaction.

The following statements are equivalent:

```
SELECT * FROM INFORMATION_SCHEMA.PROCESSLIST

SHOW FULL PROCESSLIST
```

## 26.3.24 The INFORMATION\_SCHEMA PROFILING Table

The `PROFILING` table provides statement profiling information. Its contents correspond to the information produced by the `SHOW PROFILE` and `SHOW PROFILES` statements (see [Section 13.7.7.30](#), “`SHOW PROFILE` Statement”). The table is empty unless the `profiling` session variable is set to 1.

### Note

This table is deprecated; expect it to be removed in a future MySQL release. Use the [Performance Schema](#) instead; see [Section 27.19.1](#), “Query Profiling Using Performance Schema”.

The `PROFILING` table has these columns:

- `QUERY_ID`  
A numeric statement identifier.
- `SEQ`  
A sequence number indicating the display order for rows with the same `QUERY_ID` value.
- `STATE`  
The profiling state to which the row measurements apply.
- `DURATION`  
How long statement execution remained in the given state, in seconds.
- `CPU_USER`, `CPU_SYSTEM`  
User and system CPU use, in seconds.
- `CONTEXT_VOLUNTARY`, `CONTEXT_INVOLUNTARY`  
How many voluntary and involuntary context switches occurred.
- `BLOCK_OPS_IN`, `BLOCK_OPS_OUT`  
The number of block input and output operations.
- `MESSAGES_SENT`, `MESSAGES_RECEIVED`  
The number of communication messages sent and received.
- `PAGE_FAULTS_MAJOR`, `PAGE_FAULTS_MINOR`  
The number of major and minor page faults.

- [SWAPS](#)

How many swaps occurred.

- [SOURCE\\_FUNCTION](#), [SOURCE\\_FILE](#), and [SOURCE\\_LINE](#)

Information indicating where in the source code the profiled state executes.

## Notes

- [PROFILING](#) is a nonstandard [INFORMATION\\_SCHEMA](#) table.

Profiling information is also available from the [SHOW PROFILE](#) and [SHOW PROFILES](#) statements. See [Section 13.7.7.30, “SHOW PROFILE Statement”](#). For example, the following queries are equivalent:

```
SHOW PROFILE FOR QUERY 2;

SELECT STATE, FORMAT(DURATION, 6) AS DURATION
FROM INFORMATION_SCHEMA.PROFILING
WHERE QUERY_ID = 2 ORDER BY SEQ;
```

## 26.3.25 The INFORMATION\_SCHEMA REFERENTIAL\_CONSTRAINTS Table

The [REFERENTIAL\\_CONSTRAINTS](#) table provides information about foreign keys.

The [REFERENTIAL\\_CONSTRAINTS](#) table has these columns:

- [CONSTRAINT\\_CATALOG](#)

The name of the catalog to which the constraint belongs. This value is always [def](#).

- [CONSTRAINT\\_SCHEMA](#)

The name of the schema (database) to which the constraint belongs.

- [CONSTRAINT\\_NAME](#)

The name of the constraint.

- [UNIQUE\\_CONSTRAINT\\_CATALOG](#)

The name of the catalog containing the unique constraint that the constraint references. This value is always [def](#).

- [UNIQUE\\_CONSTRAINT\\_SCHEMA](#)

The name of the schema containing the unique constraint that the constraint references.

- [UNIQUE\\_CONSTRAINT\\_NAME](#)

The name of the unique constraint that the constraint references.

- [MATCH\\_OPTION](#)

The value of the constraint [MATCH](#) attribute. The only valid value at this time is [NONE](#).

- [UPDATE\\_RULE](#)

The value of the constraint [ON UPDATE](#) attribute. The possible values are [CASCADE](#), [SET NULL](#), [SET DEFAULT](#), [RESTRICT](#), [NO ACTION](#).

- [DELETE\\_RULE](#)

The value of the constraint [ON DELETE](#) attribute. The possible values are [CASCADE](#), [SET NULL](#), [SET DEFAULT](#), [RESTRICT](#), [NO ACTION](#).

- [TABLE\\_NAME](#)

The name of the table. This value is the same as in the [TABLE\\_CONSTRAINTS](#) table.

- [REFERENCED\\_TABLE\\_NAME](#)

The name of the table referenced by the constraint.

## 26.3.26 The INFORMATION\_SCHEMA RESOURCE\_GROUPS Table

The [RESOURCE\\_GROUPS](#) table provides access to information about resource groups. For general discussion of the resource group capability, see [Section 5.1.16, “Resource Groups”](#).

You can see information only for columns for which you have some privilege.

The [RESOURCE\\_GROUPS](#) table has these columns:

- [RESOURCE\\_GROUP\\_NAME](#)

The name of the resource group.

- [RESOURCE\\_GROUP\\_TYPE](#)

The resource group type, either [SYSTEM](#) or [USER](#).

- [RESOURCE\\_GROUP\\_ENABLED](#)

Whether the resource group is enabled (1) or disabled (0);

- [VCPU\\_IDS](#)

The CPU affinity; that is, the set of virtual CPUs that the resource group can use. The value is a list of comma-separated CPU numbers or ranges.

- [THREAD\\_PRIORITY](#)

The priority for threads assigned to the resource group. The priority ranges from -20 (highest priority) to 19 (lowest priority). System resource groups have a priority that ranges from -20 to 0. User resource groups have a priority that ranges from 0 to 19.

## 26.3.27 The INFORMATION\_SCHEMA ROLE\_COLUMN\_GRANTS Table

The [ROLE\\_COLUMN\\_GRANTS](#) table (available as of MySQL 8.0.19) provides information about the column privileges for roles that are available to or granted by the currently enabled roles.

The [ROLE\\_COLUMN\\_GRANTS](#) table has these columns:

- [GRANTOR](#)

The user name part of the account that granted the role.

- [GRANTOR\\_HOST](#)

The host name part of the account that granted the role.

- [GRANTEE](#)

The user name part of the account to which the role is granted.

- [GRANTEE\\_HOST](#)

The host name part of the account to which the role is granted.

- [TABLE\\_CATALOG](#)

The name of the catalog to which the role applies. This value is always [def](#).

- [TABLE\\_SCHEMA](#)

The name of the schema (database) to which the role applies.

- [TABLE\\_NAME](#)

The name of the table to which the role applies.

- [COLUMN\\_NAME](#)

The name of the column to which the role applies.

- [PRIVILEGE\\_TYPE](#)

The privilege granted. The value can be any privilege that can be granted at the column level; see [Section 13.7.1.6, “GRANT Statement”](#). Each row lists a single privilege, so there is one row per column privilege held by the grantee.

- [IS\\_GRANTABLE](#)

[YES](#) or [NO](#), depending on whether the role is grantable to other accounts.

## 26.3.28 The INFORMATION\_SCHEMA ROLE\_ROUTINE\_GRANTS Table

The [ROLE\\_ROUTINE\\_GRANTS](#) table (available as of MySQL 8.0.19) provides information about the routine privileges for roles that are available to or granted by the currently enabled roles.

The [ROLE\\_ROUTINE\\_GRANTS](#) table has these columns:

- [GRANTOR](#)

The user name part of the account that granted the role.

- [GRANTOR\\_HOST](#)

The host name part of the account that granted the role.

- [GRANTEE](#)

The user name part of the account to which the role is granted.

- [GRANTEE\\_HOST](#)

The host name part of the account to which the role is granted.

- [SPECIFIC\\_CATALOG](#)

The name of the catalog to which the routine belongs. This value is always [def](#).

- [SPECIFIC\\_SCHEMA](#)

The name of the schema (database) to which the routine belongs.

- [SPECIFIC\\_NAME](#)

The name of the routine.

- [ROUTINE\\_CATALOG](#)

The name of the catalog to which the routine belongs. This value is always [def](#).

- [ROUTINE\\_SCHEMA](#)

The name of the schema (database) to which the routine belongs.

- [ROUTINE\\_NAME](#)

The name of the routine.

- [PRIVILEGE\\_TYPE](#)

The privilege granted. The value can be any privilege that can be granted at the routine level; see [Section 13.7.1.6, “GRANT Statement”](#). Each row lists a single privilege, so there is one row per column privilege held by the grantee.

- [IS\\_GRANTABLE](#)

[YES](#) or [NO](#), depending on whether the role is grantable to other accounts.

## 26.3.29 The INFORMATION\_SCHEMA ROLE\_TABLE\_GRANTS Table

The [ROLE\\_TABLE\\_GRANTS](#) table (available as of MySQL 8.0.19) provides information about the table privileges for roles that are available to or granted by the currently enabled roles.

The [ROLE\\_TABLE\\_GRANTS](#) table has these columns:

- [GRANTOR](#)

The user name part of the account that granted the role.

- [GRANTOR\\_HOST](#)

The host name part of the account that granted the role.

- [GRANTEE](#)

The user name part of the account to which the role is granted.

- [GRANTEE\\_HOST](#)

The host name part of the account to which the role is granted.

- [TABLE\\_CATALOG](#)

The name of the catalog to which the role applies. This value is always [def](#).

- [TABLE\\_SCHEMA](#)

The name of the schema (database) to which the role applies.

- [TABLE\\_NAME](#)

The name of the table to which the role applies.

- [PRIVILEGE\\_TYPE](#)

The privilege granted. The value can be any privilege that can be granted at the table level; see [Section 13.7.1.6, “GRANT Statement”](#). Each row lists a single privilege, so there is one row per column privilege held by the grantee.

- [IS\\_GRANTABLE](#)

[YES](#) or [NO](#), depending on whether the role is grantable to other accounts.

## 26.3.30 The INFORMATION\_SCHEMA ROUTINES Table

The [ROUTINES](#) table provides information about stored routines (stored procedures and stored functions). The [ROUTINES](#) table does not include built-in (native) functions or loadable functions.

The [ROUTINES](#) table has these columns:

- [SPECIFIC\\_NAME](#)

The name of the routine.

- [ROUTINE\\_CATALOG](#)

The name of the catalog to which the routine belongs. This value is always `def`.

- [ROUTINE\\_SCHEMA](#)

The name of the schema (database) to which the routine belongs.

- [ROUTINE\\_NAME](#)

The name of the routine.

- [ROUTINE\\_TYPE](#)

[PROCEDURE](#) for stored procedures, [FUNCTION](#) for stored functions.

- [DATA\\_TYPE](#)

If the routine is a stored function, the return value data type. If the routine is a stored procedure, this value is empty.

The [DATA\\_TYPE](#) value is the type name only with no other information. The [DTD\\_IDENTIFIER](#) value contains the type name and possibly other information such as the precision or length.

- [CHARACTER\\_MAXIMUM\\_LENGTH](#)

For stored function string return values, the maximum length in characters. If the routine is a stored procedure, this value is `NULL`.

- [CHARACTER\\_OCTET\\_LENGTH](#)

For stored function string return values, the maximum length in bytes. If the routine is a stored procedure, this value is `NULL`.

- [NUMERIC\\_PRECISION](#)

For stored function numeric return values, the numeric precision. If the routine is a stored procedure, this value is `NULL`.

- [NUMERIC\\_SCALE](#)

For stored function numeric return values, the numeric scale. If the routine is a stored procedure, this value is `NULL`.

- [DATETIME\\_PRECISION](#)

For stored function temporal return values, the fractional seconds precision. If the routine is a stored procedure, this value is `NULL`.

- [CHARACTER\\_SET\\_NAME](#)

For stored function character string return values, the character set name. If the routine is a stored procedure, this value is `NULL`.

- [COLLATION\\_NAME](#)

For stored function character string return values, the collation name. If the routine is a stored procedure, this value is [NULL](#).

- [DTD\\_IDENTIFIER](#)

If the routine is a stored function, the return value data type. If the routine is a stored procedure, this value is empty.

The [DATA\\_TYPE](#) value is the type name only with no other information. The [DTD\\_IDENTIFIER](#) value contains the type name and possibly other information such as the precision or length.

- [ROUTINE\\_BODY](#)

The language used for the routine definition. This value is always [SQL](#).

- [ROUTINE\\_DEFINITION](#)

The text of the SQL statement executed by the routine.

- [EXTERNAL\\_NAME](#)

This value is always [NULL](#).

- [EXTERNAL\\_LANGUAGE](#)

The language of the stored routine. The value is read from the [external\\_language](#) column of the [mysql.routines](#) data dictionary table.

- [PARAMETER\\_STYLE](#)

This value is always [SQL](#).

- [IS\\_DETERMINISTIC](#)

[YES](#) or [NO](#), depending on whether the routine is defined with the [DETERMINISTIC](#) characteristic.

- [SQL\\_DATA\\_ACCESS](#)

The data access characteristic for the routine. The value is one of [CONTAINS SQL](#), [NO SQL](#), [READS SQL DATA](#), or [MODIFIES SQL DATA](#).

- [SQL\\_PATH](#)

This value is always [NULL](#).

- [SECURITY\\_TYPE](#)

The routine [SQL SECURITY](#) characteristic. The value is one of [DEFINER](#) or [INVOKER](#).

- [CREATED](#)

The date and time when the routine was created. This is a [TIMESTAMP](#) value.

- [LAST\\_ALTERED](#)

The date and time when the routine was last modified. This is a [TIMESTAMP](#) value. If the routine has not been modified since its creation, this value is the same as the [CREATED](#) value.

- [SQL\\_MODE](#)

The SQL mode in effect when the routine was created or altered, and under which the routine executes. For the permitted values, see [Section 5.1.11, “Server SQL Modes”](#).

- [ROUTINE\\_COMMENT](#)

The text of the comment, if the routine has one. If not, this value is empty.

- [DEFINER](#)

The account named in the [DEFINER](#) clause (often the user who created the routine), in `'user_name'@'host_name'` format.

- [CHARACTER\\_SET\\_CLIENT](#)

The session value of the [character\\_set\\_client](#) system variable when the routine was created.

- [COLLATION\\_CONNECTION](#)

The session value of the [collation\\_connection](#) system variable when the routine was created.

- [DATABASE\\_COLLATION](#)

The collation of the database with which the routine is associated.

## Notes

- To see information about a routine, you must be the user named as the routine [DEFINER](#), have the [SHOW\\_ROUTINE](#) privilege, have the [SELECT](#) privilege at the global level, or have the [CREATE ROUTINE](#), [ALTER ROUTINE](#), or [EXECUTE](#) privilege granted at a scope that includes the routine. The [ROUTINE\\_DEFINITION](#) column is [NULL](#) if you have only [CREATE ROUTINE](#), [ALTER ROUTINE](#), or [EXECUTE](#).
- Information about stored function return values is also available in the [PARAMETERS](#) table. The return value row for a stored function can be identified as the row that has an [ORDINAL\\_POSITION](#) value of 0.

### 26.3.31 The INFORMATION\_SCHEMA SCHEMATA Table

A schema is a database, so the [SCHEMATA](#) table provides information about databases.

The [SCHEMATA](#) table has these columns:

- [CATALOG\\_NAME](#)

The name of the catalog to which the schema belongs. This value is always [def](#).

- [SCHEMA\\_NAME](#)

The name of the schema.

- [DEFAULT\\_CHARACTER\\_SET\\_NAME](#)

The schema default character set.

- [DEFAULT\\_COLLATION\\_NAME](#)

The schema default collation.

- [SQL\\_PATH](#)

This value is always [NULL](#).

- [DEFAULT\\_ENCRYPTION](#)

The schema default encryption. This column was added in MySQL 8.0.16.

Schema names are also available from the [SHOW DATABASES](#) statement. See [Section 13.7.7.14, “SHOW DATABASES Statement”](#). The following statements are equivalent:

```
SELECT SCHEMA_NAME AS `Database`
FROM INFORMATION_SCHEMA.SCHEMATA
[WHERE SCHEMA_NAME LIKE 'wild']

SHOW DATABASES
[LIKE 'wild']
```

You see only those databases for which you have some kind of privilege, unless you have the global `SHOW DATABASES` privilege.

### Caution

Because any static global privilege is considered a privilege for all databases, any static global privilege enables a user to see all database names with `SHOW DATABASES` or by examining the `SCHEMATA` table of `INFORMATION_SCHEMA`, except databases that have been restricted at the database level by partial revokes.

## Notes

- The `SCHEMATA_EXTENSIONS` table augments the `SCHEMATA` table with information about schema options.

## 26.3.32 The INFORMATION\_SCHEMA SCHEMATA\_EXTENSIONS Table

The `SCHEMATA_EXTENSIONS` table (available as of MySQL 8.0.22) augments the `SCHEMATA` table with information about schema options.

The `SCHEMATA_EXTENSIONS` table has these columns:

- `CATALOG_NAME`

The name of the catalog to which the schema belongs. This value is always `def`.

- `SCHEMA_NAME`

The name of the schema.

- `OPTIONS`

The options for the schema. If the schema is read only, the value contains `READ ONLY=1`. If the schema is not read only, no `READ ONLY` option appears.

## Example

```
mysql> ALTER SCHEMA mydb READ ONLY = 1;
mysql> SELECT * FROM INFORMATION_SCHEMA.SCHEMATA_EXTENSIONS
 WHERE SCHEMA_NAME = 'mydb';

+-----+-----+-----+
| CATALOG_NAME | SCHEMA_NAME | OPTIONS |
+-----+-----+-----+
| def | mydb | READ ONLY=1 |
+-----+-----+-----+

mysql> ALTER SCHEMA mydb READ ONLY = 0;
mysql> SELECT * FROM INFORMATION_SCHEMA.SCHEMATA_EXTENSIONS
 WHERE SCHEMA_NAME = 'mydb';

+-----+-----+-----+
| CATALOG_NAME | SCHEMA_NAME | OPTIONS |
+-----+-----+-----+
| def | mydb | |
+-----+-----+-----+
```

## Notes

- `SCHEMATA_EXTENSIONS` is a nonstandard `INFORMATION_SCHEMA` table.

### 26.3.33 The INFORMATION\_SCHEMA SCHEMA\_PRIVILEGES Table

The `SCHEMA_PRIVILEGES` table provides information about schema (database) privileges. It takes its values from the `mysql.db` system table.

The `SCHEMA_PRIVILEGES` table has these columns:

- `GRANTEE`

The name of the account to which the privilege is granted, in `'user_name'@'host_name'` format.

- `TABLE_CATALOG`

The name of the catalog to which the schema belongs. This value is always `def`.

- `TABLE_SCHEMA`

The name of the schema.

- `PRIVILEGE_TYPE`

The privilege granted. The value can be any privilege that can be granted at the schema level; see [Section 13.7.1.6, “GRANT Statement”](#). Each row lists a single privilege, so there is one row per schema privilege held by the grantee.

- `IS_GRANTABLE`

`YES` if the user has the `GRANT OPTION` privilege, `NO` otherwise. The output does not list `GRANT OPTION` as a separate row with `PRIVILEGE_TYPE= 'GRANT OPTION'`.

#### Notes

- `SCHEMA_PRIVILEGES` is a nonstandard `INFORMATION_SCHEMA` table.

The following statements are *not* equivalent:

```
SELECT ... FROM INFORMATION_SCHEMA.SCHEMA_PRIVILEGES
SHOW GRANTS ...
```

### 26.3.34 The INFORMATION\_SCHEMA STATISTICS Table

The `STATISTICS` table provides information about table indexes.

Columns in `STATISTICS` that represent table statistics hold cached values. The `information_schema_stats_expiry` system variable defines the period of time before cached table statistics expire. The default is 86400 seconds (24 hours). If there are no cached statistics or statistics have expired, statistics are retrieved from storage engines when querying table statistics columns. To update cached values at any time for a given table, use `ANALYZE TABLE`. To always retrieve the latest statistics directly from storage engines, set `information_schema_stats_expiry=0`. For more information, see [Section 8.2.3, “Optimizing INFORMATION\\_SCHEMA Queries”](#).

#### Note

If the `innodb_read_only` system variable is enabled, `ANALYZE TABLE` may fail because it cannot update statistics tables in the data dictionary, which use InnoDB. For `ANALYZE TABLE` operations that update the key distribution, failure may occur even if the operation updates the table itself (for example, if it is a `MyISAM` table). To obtain the updated distribution statistics, set `information_schema_stats_expiry=0`.

The `STATISTICS` table has these columns:

- `TABLE_CATALOG`

The name of the catalog to which the table containing the index belongs. This value is always `def`.

- `TABLE_SCHEMA`

The name of the schema (database) to which the table containing the index belongs.

- `TABLE_NAME`

The name of the table containing the index.

- `NON_UNIQUE`

0 if the index cannot contain duplicates, 1 if it can.

- `INDEX_SCHEMA`

The name of the schema (database) to which the index belongs.

- `INDEX_NAME`

The name of the index. If the index is the primary key, the name is always `PRIMARY`.

- `SEQ_IN_INDEX`

The column sequence number in the index, starting with 1.

- `COLUMN_NAME`

The column name. See also the description for the `EXPRESSION` column.

- `COLLATION`

How the column is sorted in the index. This can have values `A` (ascending), `D` (descending), or `NULL` (not sorted).

- `CARDINALITY`

An estimate of the number of unique values in the index. To update this number, run `ANALYZE TABLE` or (for `MyISAM` tables) `myisamchk -a`.

`CARDINALITY` is counted based on statistics stored as integers, so the value is not necessarily exact even for small tables. The higher the cardinality, the greater the chance that MySQL uses the index when doing joins.

- `SUB_PART`

The index prefix. That is, the number of indexed characters if the column is only partly indexed, `NULL` if the entire column is indexed.

#### Note

Prefix *limits* are measured in bytes. However, prefix *lengths* for index specifications in `CREATE TABLE`, `ALTER TABLE`, and `CREATE INDEX` statements are interpreted as number of characters for nonbinary string types (`CHAR`, `VARCHAR`, `TEXT`) and number of bytes for binary string types (`BINARY`, `VARBINARY`, `BLOB`). Take this into account when specifying a prefix length for a nonbinary string column that uses a multibyte character set.

For additional information about index prefixes, see [Section 8.3.5, “Column Indexes”](#), and [Section 13.1.15, “CREATE INDEX Statement”](#).

- [PACKED](#)

Indicates how the key is packed. [NULL](#) if it is not.

- [NULLABLE](#)

Contains [YES](#) if the column may contain [NULL](#) values and [''](#) if not.

- [INDEX\\_TYPE](#)

The index method used ([BTREE](#), [FULLTEXT](#), [HASH](#), [RTREE](#)).

- [COMMENT](#)

Information about the index not described in its own column, such as [disabled](#) if the index is disabled.

- [INDEX\\_COMMENT](#)

Any comment provided for the index with a [COMMENT](#) attribute when the index was created.

- [IS\\_VISIBLE](#)

Whether the index is visible to the optimizer. See [Section 8.3.12, “Invisible Indexes”](#).

- [EXPRESSION](#)

MySQL 8.0.13 and higher supports functional key parts (see [Functional Key Parts](#)), which affects both the [COLUMN\\_NAME](#) and [EXPRESSION](#) columns:

- For a nonfunctional key part, [COLUMN\\_NAME](#) indicates the column indexed by the key part and [EXPRESSION](#) is [NULL](#).
- For a functional key part, [COLUMN\\_NAME](#) column is [NULL](#) and [EXPRESSION](#) indicates the expression for the key part.

## Notes

- There is no standard [INFORMATION\\_SCHEMA](#) table for indexes. The MySQL column list is similar to what SQL Server 2000 returns for [sp\\_statistics](#), except that [QUALIFIER](#) and [OWNER](#) are replaced with [CATALOG](#) and [SCHEMA](#), respectively.

Information about table indexes is also available from the [SHOW INDEX](#) statement. See [Section 13.7.7.22, “SHOW INDEX Statement”](#). The following statements are equivalent:

```
SELECT * FROM INFORMATION_SCHEMA.STATISTICS
 WHERE table_name = 'tbl_name'
 AND table_schema = 'db_name'

SHOW INDEX
 FROM tbl_name
 FROM db_name
```

## 26.3.35 The INFORMATION\_SCHEMA ST\_GEOMETRY\_COLUMNS Table

The [ST\\_GEOMETRY\\_COLUMNS](#) table provides information about table columns that store spatial data. This table is based on the SQL/MM (ISO/IEC 13249-3) standard, with extensions as noted. MySQL implements [ST\\_GEOMETRY\\_COLUMNS](#) as a view on the [INFORMATION\\_SCHEMA COLUMNS](#) table.

The [ST\\_GEOMETRY\\_COLUMNS](#) table has these columns:

- [TABLE\\_CATALOG](#)

The name of the catalog to which the table containing the column belongs. This value is always [def](#).

- [TABLE\\_SCHEMA](#)

The name of the schema (database) to which the table containing the column belongs.

- [TABLE\\_NAME](#)

The name of the table containing the column.

- [COLUMN\\_NAME](#)

The name of the column.

- [SRS\\_NAME](#)

The spatial reference system (SRS) name.

- [SRS\\_ID](#)

The spatial reference system ID (SRID).

- [GEOMETRY\\_TYPE\\_NAME](#)

The column data type. Permitted values are: [geometry](#), [point](#), [linestring](#), [polygon](#), [multipoint](#), [multilinestring](#), [multipolygon](#), [geometrycollection](#). This column is a MySQL extension to the standard.

## 26.3.36 The INFORMATION\_SCHEMA ST\_SPATIAL\_REFERENCE\_SYSTEMS Table

The [ST\\_SPATIAL\\_REFERENCE\\_SYSTEMS](#) table provides information about available spatial reference systems (SRSs) for spatial data. This table is based on the SQL/MM (ISO/IEC 13249-3) standard.

Entries in the [ST\\_SPATIAL\\_REFERENCE\\_SYSTEMS](#) table are based on the [European Petroleum Survey Group](#) (EPSG) data set, except for SRID 0, which corresponds to a special SRS used in MySQL that represents an infinite flat Cartesian plane with no units assigned to its axes. For additional information about SRSs, see [Section 11.4.5, “Spatial Reference System Support”](#).

The [ST\\_SPATIAL\\_REFERENCE\\_SYSTEMS](#) table has these columns:

- [SRS\\_NAME](#)

The spatial reference system name. This value is unique.

- [SRS\\_ID](#)

The spatial reference system numeric ID. This value is unique.

[SRS\\_ID](#) values represent the same kind of values as the SRID of geometry values or passed as the SRID argument to spatial functions. SRID 0 (the unitless Cartesian plane) is special. It is always a legal spatial reference system ID and can be used in any computations on spatial data that depend on SRID values.

- [ORGANIZATION](#)

The name of the organization that defined the coordinate system on which the spatial reference system is based.

- [ORGANIZATION\\_COORDSYS\\_ID](#)

The numeric ID given to the spatial reference system by the organization that defined it.

- [DEFINITION](#)

The spatial reference system definition. [DEFINITION](#) values are WKT values, represented as specified in the [Open Geospatial Consortium](#) document [OGC 12-063r5](#).

SRS definition parsing occurs on demand when definitions are needed by GIS functions. Parsed definitions are stored in the data dictionary cache to enable reuse and avoid incurring parsing overhead for every statement that needs SRS information.

- [DESCRIPTION](#)

The spatial reference system description.

## Notes

- The [SRS\\_NAME](#), [ORGANIZATION](#), [ORGANIZATION\\_COORDSYS\\_ID](#), and [DESCRIPTION](#) columns contain information that may be of interest to users, but they are not used by MySQL.

## Example

```
mysql> SELECT * FROM ST_SPATIAL_REFERENCE_SYSTEMS
 WHERE SRS_ID = 4326\G
***** 1. row *****
 SRS_NAME: WGS 84
 SRS_ID: 4326
 ORGANIZATION: EPSG
ORGANIZATION_COORDSYS_ID: 4326
 DEFINITION: GEOGCS["WGS 84",DATUM["World Geodetic System 1984",
 SPHEROID["WGS 84",6378137,298.257223563,
 AUTHORITY["EPSG","7030"]],AUTHORITY["EPSG","6326"]],
 PRIMEM["Greenwich",0,AUTHORITY["EPSG","8901"]],
 UNIT["degree",0.017453292519943278,
 AUTHORITY["EPSG","9122"]],
 AXIS["Lat",NORTH],AXIS["Long",EAST],
 AUTHORITY["EPSG","4326"]]
 DESCRIPTION:
```

This entry describes the SRS used for GPS systems. It has a name ([SRS\\_NAME](#)) of WGS 84 and an ID ([SRS\\_ID](#)) of 4326, which is the ID used by the [European Petroleum Survey Group](#) (EPSG).

The [DEFINITION](#) values for projected and geographic SRSs begin with [PROJCS](#) and [GEOGCS](#), respectively. The definition for SRID 0 is special and has an empty [DEFINITION](#) value. The following query determines how many entries in the [ST\\_SPATIAL\\_REFERENCE\\_SYSTEMS](#) table correspond to projected, geographic, and other SRSs, based on [DEFINITION](#) values:

```
mysql> SELECT
 COUNT(*),
 CASE LEFT(DEFINITION, 6)
 WHEN 'PROJCS' THEN 'Projected'
 WHEN 'GEOGCS' THEN 'Geographic'
 ELSE 'Other'
 END AS SRS_TYPE
FROM INFORMATION_SCHEMA.ST_SPATIAL_REFERENCE_SYSTEMS
GROUP BY SRS_TYPE;
+-----+
| COUNT(*) | SRS_TYPE |
+-----+
1	Other
4668	Projected
483	Geographic
+-----+
```

To enable manipulation of SRS entries stored in the data dictionary, MySQL provides these SQL statements:

- [CREATE SPATIAL REFERENCE SYSTEM](#): See [Section 13.1.19, “CREATE SPATIAL REFERENCE SYSTEM Statement”](#). The description for this statement includes additional information about SRS components.

- `DROP SPATIAL REFERENCE SYSTEM`: See [Section 13.1.31](#), “`DROP SPATIAL REFERENCE SYSTEM` Statement”.

### 26.3.37 The INFORMATION\_SCHEMA ST\_UNITS\_OF\_MEASURE Table

The `ST_UNITS_OF_MEASURE` table (available as of MySQL 8.0.14) provides information about acceptable units for the `ST_Distance()` function.

The `ST_UNITS_OF_MEASURE` table has these columns:

- `UNIT_NAME`

The name of the unit.

- `UNIT_TYPE`

The unit type (for example, `LINEAR`).

- `CONVERSION_FACTOR`

A conversion factor used for internal calculations.

- `DESCRIPTION`

A description of the unit.

### 26.3.38 The INFORMATION\_SCHEMA TABLES Table

The `TABLES` table provides information about tables in databases.

Columns in `TABLES` that represent table statistics hold cached values. The `information_schema_stats_expiry` system variable defines the period of time before cached table statistics expire. The default is 86400 seconds (24 hours). If there are no cached statistics or statistics have expired, statistics are retrieved from storage engines when querying table statistics columns. To update cached values at any time for a given table, use `ANALYZE TABLE`. To always retrieve the latest statistics directly from storage engines, set `information_schema_stats_expiry` to 0. For more information, see [Section 8.2.3](#), “[Optimizing INFORMATION\\_SCHEMA Queries](#)”.

#### Note

If the `innodb_read_only` system variable is enabled, `ANALYZE TABLE` may fail because it cannot update statistics tables in the data dictionary, which use `InnoDB`. For `ANALYZE TABLE` operations that update the key distribution, failure may occur even if the operation updates the table itself (for example, if it is a `MyISAM` table). To obtain the updated distribution statistics, set `information_schema_stats_expiry=0`.

The `TABLES` table has these columns:

- `TABLE_CATALOG`

The name of the catalog to which the table belongs. This value is always `def`.

- `TABLE_SCHEMA`

The name of the schema (database) to which the table belongs.

- `TABLE_NAME`

The name of the table.

- `TABLE_TYPE`

`BASE TABLE` for a table, `VIEW` for a view, or `SYSTEM VIEW` for an `INFORMATION_SCHEMA` table.

The `TABLES` table does not list `TEMPORARY` tables.

- `ENGINE`

The storage engine for the table. See [Chapter 15, The InnoDB Storage Engine](#), and [Chapter 16, Alternative Storage Engines](#).

For partitioned tables, `ENGINE` shows the name of the storage engine used by all partitions.

- `VERSION`

This column is unused. With the removal of `.frm` files in MySQL 8.0, this column now reports a hardcoded value of `10`, which is the last `.frm` file version used in MySQL 5.7.

- `ROW_FORMAT`

The row-storage format (`Fixed`, `Dynamic`, `Compressed`, `Redundant`, `Compact`). For `MyISAM` tables, `Dynamic` corresponds to what `myisamchk -dvv` reports as `Packed`.

- `TABLE_ROWS`

The number of rows. Some storage engines, such as `MyISAM`, store the exact count. For other storage engines, such as `InnoDB`, this value is an approximation, and may vary from the actual value by as much as 40% to 50%. In such cases, use `SELECT COUNT(*)` to obtain an accurate count.

`TABLE_ROWS` is `NULL` for `INFORMATION_SCHEMA` tables.

For `InnoDB` tables, the row count is only a rough estimate used in SQL optimization. (This is also true if the `InnoDB` table is partitioned.)

- `AVG_ROW_LENGTH`

The average row length.

- `DATA_LENGTH`

For `MyISAM`, `DATA_LENGTH` is the length of the data file, in bytes.

For `InnoDB`, `DATA_LENGTH` is the approximate amount of space allocated for the clustered index, in bytes. Specifically, it is the clustered index size, in pages, multiplied by the `InnoDB` page size.

Refer to the notes at the end of this section for information regarding other storage engines.

- `MAX_DATA_LENGTH`

For `MyISAM`, `MAX_DATA_LENGTH` is maximum length of the data file. This is the total number of bytes of data that can be stored in the table, given the data pointer size used.

Unused for `InnoDB`.

Refer to the notes at the end of this section for information regarding other storage engines.

- `INDEX_LENGTH`

For `MyISAM`, `INDEX_LENGTH` is the length of the index file, in bytes.

For `InnoDB`, `INDEX_LENGTH` is the approximate amount of space allocated for non-clustered indexes, in bytes. Specifically, it is the sum of non-clustered index sizes, in pages, multiplied by the `InnoDB` page size.

Refer to the notes at the end of this section for information regarding other storage engines.

- [DATA\\_FREE](#)

The number of allocated but unused bytes.

[InnoDB](#) tables report the free space of the tablespace to which the table belongs. For a table located in the shared tablespace, this is the free space of the shared tablespace. If you are using multiple tablespaces and the table has its own tablespace, the free space is for only that table. Free space means the number of bytes in completely free extents minus a safety margin. Even if free space displays as 0, it may be possible to insert rows as long as new extents need not be allocated.

For NDB Cluster, [DATA\\_FREE](#) shows the space allocated on disk for, but not used by, a Disk Data table or fragment on disk. (In-memory data resource usage is reported by the [DATA\\_LENGTH](#) column.)

For partitioned tables, this value is only an estimate and may not be absolutely correct. A more accurate method of obtaining this information in such cases is to query the [INFORMATION\\_SCHEMA PARTITIONS](#) table, as shown in this example:

```
SELECT SUM(DATA_FREE)
FROM INFORMATION_SCHEMA.PARTITIONS
WHERE TABLE_SCHEMA = 'mydb'
AND TABLE_NAME = 'mytable' ;
```

For more information, see [Section 26.3.21, “The INFORMATION\\_SCHEMA PARTITIONS Table”](#).

- [AUTO\\_INCREMENT](#)

The next [AUTO\\_INCREMENT](#) value.

- [CREATE\\_TIME](#)

When the table was created.

- [UPDATE\\_TIME](#)

When the data file was last updated. For some storage engines, this value is [NULL](#). For example, [InnoDB](#) stores multiple tables in its [system tablespace](#) and the data file timestamp does not apply. Even with [file-per-table](#) mode with each [InnoDB](#) table in a separate [.ibd](#) file, [change buffering](#) can delay the write to the data file, so the file modification time is different from the time of the last insert, update, or delete. For [MyISAM](#), the data file timestamp is used; however, on Windows the timestamp is not updated by updates, so the value is inaccurate.

[UPDATE\\_TIME](#) displays a timestamp value for the last [UPDATE](#), [INSERT](#), or [DELETE](#) performed on [InnoDB](#) tables that are not partitioned. For MVCC, the timestamp value reflects the [COMMIT](#) time, which is considered the last update time. Timestamps are not persisted when the server is restarted or when the table is evicted from the [InnoDB](#) data dictionary cache.

- [CHECK\\_TIME](#)

When the table was last checked. Not all storage engines update this time, in which case, the value is always [NULL](#).

For partitioned [InnoDB](#) tables, [CHECK\\_TIME](#) is always [NULL](#).

- [TABLE\\_COLLATION](#)

The table default collation. The output does not explicitly list the table default character set, but the collation name begins with the character set name.

- [CHECKSUM](#)

The live checksum value, if any.

- [CREATE\\_OPTIONS](#)

Extra options used with [CREATE TABLE](#).

[CREATE\\_OPTIONS](#) shows [partitioned](#) for a partitioned table.

Prior to MySQL 8.0.16, [CREATE\\_OPTIONS](#) shows the [ENCRYPTION](#) clause specified for tables created in file-per-table tablespaces. As of MySQL 8.0.16, it shows the encryption clause for file-per-table tablespaces if the table is encrypted or if the specified encryption differs from the schema encryption. The encryption clause is not shown for tables created in general tablespaces. To identify encrypted file-per-table and general tablespaces, query the [INNODB\\_TABLESPACES\\_ENCRYPTION](#) column.

When creating a table with [strict mode](#) disabled, the storage engine's default row format is used if the specified row format is not supported. The actual row format of the table is reported in the [ROW\\_FORMAT](#) column. [CREATE\\_OPTIONS](#) shows the row format that was specified in the [CREATE TABLE](#) statement.

When altering the storage engine of a table, table options that are not applicable to the new storage engine are retained in the table definition to enable reverting the table with its previously defined options to the original storage engine, if necessary. The [CREATE\\_OPTIONS](#) column may show retained options.

- [TABLE\\_COMMENT](#)

The comment used when creating the table (or information as to why MySQL could not access the table information).

## Notes

- For [NDB](#) tables, the output of this statement shows appropriate values for the [AVG\\_ROW\\_LENGTH](#) and [DATA\\_LENGTH](#) columns, with the exception that [BLOB](#) columns are not taken into account.
- For [NDB](#) tables, [DATA\\_LENGTH](#) includes data stored in main memory only; the [MAX\\_DATA\\_LENGTH](#) and [DATA\\_FREE](#) columns apply to Disk Data.
- For [NDB Cluster Disk Data](#) tables, [MAX\\_DATA\\_LENGTH](#) shows the space allocated for the disk part of a Disk Data table or fragment. (In-memory data resource usage is reported by the [DATA\\_LENGTH](#) column.)
- For [MEMORY](#) tables, the [DATA\\_LENGTH](#), [MAX\\_DATA\\_LENGTH](#), and [INDEX\\_LENGTH](#) values approximate the actual amount of allocated memory. The allocation algorithm reserves memory in large amounts to reduce the number of allocation operations.
- For views, most [TABLES](#) columns are 0 or [NULL](#) except that [TABLE\\_NAME](#) indicates the view name, [CREATE\\_TIME](#) indicates the creation time, and [TABLE\\_COMMENT](#) says [VIEW](#).

Table information is also available from the [SHOW TABLE STATUS](#) and [SHOW TABLES](#) statements. See [Section 13.7.7.38, “SHOW TABLE STATUS Statement”](#), and [Section 13.7.7.39, “SHOW TABLES Statement”](#). The following statements are equivalent:

```
SELECT
 TABLE_NAME, ENGINE, VERSION, ROW_FORMAT, TABLE_ROWS, AVG_ROW_LENGTH,
 DATA_LENGTH, MAX_DATA_LENGTH, INDEX_LENGTH, DATA_FREE, AUTO_INCREMENT,
 CREATE_TIME, UPDATE_TIME, CHECK_TIME, TABLE_COLLATION, CHECKSUM,
 CREATE_OPTIONS, TABLE_COMMENT
FROM INFORMATION_SCHEMA.TABLES
WHERE table_schema = 'db_name'
[AND table_name LIKE 'wild']

SHOW TABLE STATUS
```

```
FROM db_name
[LIKE 'wild']
```

The following statements are equivalent:

```
SELECT
 TABLE_NAME, TABLE_TYPE
FROM INFORMATION_SCHEMA.TABLES
WHERE table_schema = 'db_name'
[AND table_name LIKE 'wild']

SHOW FULL TABLES
FROM db_name
[LIKE 'wild']
```

### 26.3.39 The INFORMATION\_SCHEMA TABLES\_EXTENSIONS Table

The `TABLES_EXTENSIONS` table (available as of MySQL 8.0.21) provides information about table attributes defined for primary and secondary storage engines.

#### Note

The `TABLES_EXTENSIONS` table is reserved for future use.

The `TABLES_EXTENSIONS` table has these columns:

- `TABLE_CATALOG`

The name of the catalog to which the table belongs. This value is always `def`.

- `TABLE_SCHEMA`

The name of the schema (database) to which the table belongs.

- `TABLE_NAME`

The name of the table.

- `ENGINE_ATTRIBUTE`

Table attributes defined for the primary storage engine. Reserved for future use.

- `SECONDARY_ENGINE_ATTRIBUTE`

Table attributes defined for the secondary storage engine. Reserved for future use.

### 26.3.40 The INFORMATION\_SCHEMA TABLESPACES Table

This table is unused. It is deprecated; expect it to be removed in a future MySQL release. Other `INFORMATION_SCHEMA` tables may provide related information:

- For `NDB`, the `INFORMATION_SCHEMA FILES` table provides tablespace-related information.
- For `InnoDB`, the `INFORMATION_SCHEMA INNODB_TABLESPACES` and `INNODB_DATAFILES` tables provide tablespace metadata.

### 26.3.41 The INFORMATION\_SCHEMA TABLESPACES\_EXTENSIONS Table

The `TABLESPACES_EXTENSIONS` table (available as of MySQL 8.0.21) provides information about tablespace attributes defined for primary storage engines.

#### Note

The `TABLESPACES_EXTENSIONS` table is reserved for future use.

The `TABLESPACES_EXTENSIONS` table has these columns:

- `TABLESPACE_NAME`

The name of the tablespace.

- `ENGINE_ATTRIBUTE`

Tablespace attributes defined for the primary storage engine. Reserved for future use.

## 26.3.42 The INFORMATION\_SCHEMA TABLE\_CONSTRAINTS Table

The `TABLE_CONSTRAINTS` table describes which tables have constraints.

The `TABLE_CONSTRAINTS` table has these columns:

- `CONSTRAINT_CATALOG`

The name of the catalog to which the constraint belongs. This value is always `def`.

- `CONSTRAINT_SCHEMA`

The name of the schema (database) to which the constraint belongs.

- `TABLE_SCHEMA`

The name of the schema (database) to which the table belongs.

- `TABLE_NAME`

The name of the table.

- The `CONSTRAINT_TYPE`

The type of constraint. The value can be `UNIQUE`, `PRIMARY KEY`, `FOREIGN KEY`, or (as of MySQL 8.0.16) `CHECK`. This is a `CHAR` (not `ENUM`) column.

The `UNIQUE` and `PRIMARY KEY` information is about the same as what you get from the `Key_name` column in the output from `SHOW INDEX` when the `Non_unique` column is 0.

- `ENFORCED`

For `CHECK` constraints, the value is `YES` or `NO` to indicate whether the constraint is enforced. For other constraints, the value is always `YES`.

This column was added in MySQL 8.0.16.

## 26.3.43 The INFORMATION\_SCHEMA TABLE\_CONSTRAINTS\_EXTENSIONS Table

The `TABLE_CONSTRAINTS_EXTENSIONS` table (available as of MySQL 8.0.21) provides information about table constraint attributes defined for primary and secondary storage engines.

### Note

The `TABLE_CONSTRAINTS_EXTENSIONS` table is reserved for future use.

The `TABLE_CONSTRAINTS_EXTENSIONS` table has these columns:

- `CONSTRAINT_CATALOG`

The name of the catalog to which the table belongs.

- [CONSTRAINT\\_SCHEMA](#)

The name of the schema (database) to which the table belongs.

- [CONSTRAINT\\_NAME](#)

The name of the constraint.

- [TABLE\\_NAME](#)

The name of the table.

- [ENGINE\\_ATTRIBUTE](#)

Constraint attributes defined for the primary storage engine. Reserved for future use.

- [SECONDARY\\_ENGINE\\_ATTRIBUTE](#)

Constraint attributes defined for the secondary storage engine. Reserved for future use.

## 26.3.44 The INFORMATION\_SCHEMA TABLE\_PRIVILEGES Table

The [TABLE\\_PRIVILEGES](#) table provides information about table privileges. It takes its values from the `mysql.tables_priv` system table.

The [TABLE\\_PRIVILEGES](#) table has these columns:

- [GRANTEE](#)

The name of the account to which the privilege is granted, in '`user_name`'@'`host_name`' format.

- [TABLE\\_CATALOG](#)

The name of the catalog to which the table belongs. This value is always `def`.

- [TABLE\\_SCHEMA](#)

The name of the schema (database) to which the table belongs.

- [TABLE\\_NAME](#)

The name of the table.

- [PRIVILEGE\\_TYPE](#)

The privilege granted. The value can be any privilege that can be granted at the table level; see [Section 13.7.1.6, “GRANT Statement”](#). Each row lists a single privilege, so there is one row per table privilege held by the grantee.

- [IS\\_GRANTABLE](#)

`YES` if the user has the `GRANT OPTION` privilege, `NO` otherwise. The output does not list `GRANT OPTION` as a separate row with `PRIVILEGE_TYPE= 'GRANT OPTION'`.

### Notes

- [TABLE\\_PRIVILEGES](#) is a nonstandard [INFORMATION\\_SCHEMA](#) table.

The following statements are *not* equivalent:

```
SELECT ... FROM INFORMATION_SCHEMA.TABLE_PRIVILEGES

SHOW GRANTS ...
```

## 26.3.45 The INFORMATION\_SCHEMA TRIGGERS Table

The [TRIGGERS](#) table provides information about triggers. To see information about a table's triggers, you must have the [TRIGGER](#) privilege for the table.

The [TRIGGERS](#) table has these columns:

- [TRIGGER\\_CATALOG](#)

The name of the catalog to which the trigger belongs. This value is always [def](#).

- [TRIGGER\\_SCHEMA](#)

The name of the schema (database) to which the trigger belongs.

- [TRIGGER\\_NAME](#)

The name of the trigger.

- [EVENT\\_MANIPULATION](#)

The trigger event. This is the type of operation on the associated table for which the trigger activates. The value is [INSERT](#) (a row was inserted), [DELETE](#) (a row was deleted), or [UPDATE](#) (a row was modified).

- [EVENT\\_OBJECT\\_CATALOG](#), [EVENT\\_OBJECT\\_SCHEMA](#), and [EVENT\\_OBJECT\\_TABLE](#)

As noted in [Section 25.3, “Using Triggers”](#), every trigger is associated with exactly one table. These columns indicate the catalog and schema (database) in which this table occurs, and the table name, respectively. The [EVENT\\_OBJECT\\_CATALOG](#) value is always [def](#).

- [ACTION\\_ORDER](#)

The ordinal position of the trigger's action within the list of triggers on the same table with the same [EVENT\\_MANIPULATION](#) and [ACTION\\_TIMING](#) values.

- [ACTION\\_CONDITION](#)

This value is always [NULL](#).

- [ACTION\\_STATEMENT](#)

The trigger body; that is, the statement executed when the trigger activates. This text uses UTF-8 encoding.

- [ACTION\\_ORIENTATION](#)

This value is always [ROW](#).

- [ACTION\\_TIMING](#)

Whether the trigger activates before or after the triggering event. The value is [BEFORE](#) or [AFTER](#).

- [ACTION\\_REFERENCE\\_OLD\\_TABLE](#)

This value is always [NULL](#).

- [ACTION\\_REFERENCE\\_NEW\\_TABLE](#)

This value is always [NULL](#).

- [ACTION\\_REFERENCE\\_OLD\\_ROW](#) and [ACTION\\_REFERENCE\\_NEW\\_ROW](#)

The old and new column identifiers, respectively. The [ACTION\\_REFERENCE\\_OLD\\_ROW](#) value is always [OLD](#) and the [ACTION\\_REFERENCE\\_NEW\\_ROW](#) value is always [NEW](#).

- [CREATED](#)

The date and time when the trigger was created. This is a `TIMESTAMP(2)` value (with a fractional part in hundredths of seconds) for triggers.

- `SQL_MODE`

The SQL mode in effect when the trigger was created, and under which the trigger executes. For the permitted values, see [Section 5.1.11, “Server SQL Modes”](#).

- `DEFINER`

The account named in the `DEFINER` clause (often the user who created the trigger), in `'user_name'@'host_name'` format.

- `CHARACTER_SET_CLIENT`

The session value of the `character_set_client` system variable when the trigger was created.

- `COLLATION_CONNECTION`

The session value of the `collation_connection` system variable when the trigger was created.

- `DATABASE_COLLATION`

The collation of the database with which the trigger is associated.

## Example

The following example uses the `ins_sum` trigger defined in [Section 25.3, “Using Triggers”](#):

```
mysql> SELECT * FROM INFORMATION_SCHEMA.TRIGGERS
 WHERE TRIGGER_SCHEMA='test' AND TRIGGER_NAME='ins_sum'\G
***** 1. row *****
 TRIGGER_CATALOG: def
 TRIGGER_SCHEMA: test
 TRIGGER_NAME: ins_sum
 EVENT_MANIPULATION: INSERT
 EVENT_OBJECT_CATALOG: def
 EVENT_OBJECT_SCHEMA: test
 EVENT_OBJECT_TABLE: account
 ACTION_ORDER: 1
 ACTION_CONDITION: NULL
 ACTION_STATEMENT: SET @sum = @sum + NEW.amount
 ACTION_ORIENTATION: ROW
 ACTION_TIMING: BEFORE

Trigger information is also available from the `SHOW TRIGGERS` statement. See [Section 13.7.7.40, “SHOW TRIGGERS Statement”](#).

## 26.3.46 The INFORMATION\_SCHEMA USER\_ATTRIBUTES Table

The `USER_ATTRIBUTES` table (available as of MySQL 8.0.21) provides information about user comments and user attributes. It takes its values from the `mysql.user` system table.

The `USER_ATTRIBUTES` table has these columns:

- [USER](#)

The user name portion of the account to which the [ATTRIBUTE](#) column value applies.

- [HOST](#)

The host name portion of the account to which the [ATTRIBUTE](#) column value applies.

- [ATTRIBUTE](#)

The user comment, user attribute, or both belonging to the account specified by the [USER](#) and [HOST](#) columns. The value is in JSON object notation. Attributes are shown exactly as set using a [CREATE USER ... ATTRIBUTE ...](#) or [ALTER USER ... ATTRIBUTE ...](#) statement. The user comment is shown as a key-value pair having [comment](#) as the key.

For example, the statement `CREATE USER 'bill'@'localhost' COMMENT 'A comment' ATTRIBUTE '{"foo": "bar", "bazz": "fazz"}'` adds the following row to the `USER_ATTRIBUTES` table:

| USER | HOST      | ATTRIBUTE                                              |
|------|-----------|--------------------------------------------------------|
| bill | localhost | {"foo": "bar", "bazz": "fazz", "comment": "A comment"} |

## Notes

- `USER_ATTRIBUTES` is a nonstandard `INFORMATION_SCHEMA` table.
- To obtain only the user comment for a given user as an unquoted string, you can employ a query such as this one:

```
mysql> SELECT ATTRIBUTE->"$.comment" AS Comment
-> FROM INFORMATION_SCHEMA.USER_ATTRIBUTES
-> WHERE USER='bill' AND HOST='localhost';
```

| Comment   |
|-----------|
| A comment |

Similarly, you can obtain the unquoted value for a given user attribute using its key.

- Prior to MySQL 8.0.22, `USER_ATTRIBUTES` contents are accessible by anyone. As of MySQL 8.0.22, `USER_ATTRIBUTES` contents are accessible as follows:
  - All rows are accessible if:
    - The current thread is a replica thread.
    - The access control system has not been initialized (for example, the server was started with the `--skip-grant-tables` option).
    - The currently authenticated account has the `UPDATE` or `SELECT` privilege for the `mysql.user` system table.
    - The currently authenticated account has the `CREATE USER` and `SYSTEM_USER` privileges.
  - Otherwise, the currently authenticated account can see the row for that account. Additionally, if the account has the `CREATE USER` privilege but not the `SYSTEM_USER` privilege, it can see rows for all other accounts that do not have the `SYSTEM_USER` privilege.

For more information about specifying account comments and attributes, see [Section 13.7.1.3, “CREATE USER Statement”](#).

## 26.3.47 The INFORMATION\_SCHEMA USER\_PRIVILEGES Table

The `USER_PRIVILEGES` table provides information about global privileges. It takes its values from the `mysql.user` system table.

The `USER_PRIVILEGES` table has these columns:

- `GRANTEE`

The name of the account to which the privilege is granted, in '`user_name`'@'`host_name`' format.

- `TABLE_CATALOG`

The name of the catalog. This value is always `def`.

- `PRIVILEGE_TYPE`

The privilege granted. The value can be any privilege that can be granted at the global level; see [Section 13.7.1.6, “GRANT Statement”](#). Each row lists a single privilege, so there is one row per global privilege held by the grantee.

- `IS_GRANTABLE`

`YES` if the user has the `GRANT OPTION` privilege, `NO` otherwise. The output does not list `GRANT OPTION` as a separate row with `PRIVILEGE_TYPE='GRANT OPTION'`.

### Notes

- `USER_PRIVILEGES` is a nonstandard `INFORMATION_SCHEMA` table.

The following statements are *not* equivalent:

```
SELECT ... FROM INFORMATION_SCHEMA.USER_PRIVILEGES
SHOW GRANTS ...
```

## 26.3.48 The INFORMATION\_SCHEMA VIEWS Table

The `VIEWS` table provides information about views in databases. You must have the `SHOW VIEW` privilege to access this table.

The `VIEWS` table has these columns:

- `TABLE_CATALOG`

The name of the catalog to which the view belongs. This value is always `def`.

- `TABLE_SCHEMA`

The name of the schema (database) to which the view belongs.

- `TABLE_NAME`

The name of the view.

- `VIEW_DEFINITION`

The `SELECT` statement that provides the definition of the view. This column has most of what you see in the `Create Table` column that `SHOW CREATE VIEW` produces. Skip the words before `SELECT` and skip the words `WITH CHECK OPTION`. Suppose that the original statement was:

```
CREATE VIEW v AS
```

```
SELECT s2,s1 FROM t
WHERE s1 > 5
ORDER BY s1
WITH CHECK OPTION;
```

Then the view definition looks like this:

```
SELECT s2,s1 FROM t WHERE s1 > 5 ORDER BY s1
```

- **CHECK\_OPTION**

The value of the **CHECK\_OPTION** attribute. The value is one of **NONE**, **CASCADE**, or **LOCAL**.

- **IS\_UPDATABLE**

MySQL sets a flag, called the view updatability flag, at **CREATE VIEW** time. The flag is set to **YES** (true) if **UPDATE** and **DELETE** (and similar operations) are legal for the view. Otherwise, the flag is set to **NO** (false). The **IS\_UPDATABLE** column in the **VIEWS** table displays the status of this flag. It means that the server always knows whether a view is updatable.

If a view is not updatable, statements such **UPDATE**, **DELETE**, and **INSERT** are illegal and are rejected. (Even if a view is updatable, it might not be possible to insert into it; for details, refer to [Section 25.5.3, “Updatable and Insertable Views”](#).)

- **DEFINER**

The account of the user who created the view, in '*user\_name*'@'*host\_name*' format.

- **SECURITY\_TYPE**

The view **SQL SECURITY** characteristic. The value is one of **DEFINER** or **INVOKER**.

- **CHARACTER\_SET\_CLIENT**

The session value of the **character\_set\_client** system variable when the view was created.

- **COLLATION\_CONNECTION**

The session value of the **collation\_connection** system variable when the view was created.

## Notes

MySQL permits different **sql\_mode** settings to tell the server the type of SQL syntax to support. For example, you might use the **ANSI** SQL mode to ensure MySQL correctly interprets the standard SQL concatenation operator, the double bar (**||**), in your queries. If you then create a view that concatenates items, you might worry that changing the **sql\_mode** setting to a value different from **ANSI** could cause the view to become invalid. But this is not the case. No matter how you write out a view definition, MySQL always stores it the same way, in a canonical form. Here is an example that shows how the server changes a double bar concatenation operator to a **CONCAT()** function:

```
mysql> SET sql_mode = 'ANSI';
Query OK, 0 rows affected (0.00 sec)

mysql> CREATE VIEW test.v AS SELECT 'a' || 'b' as coll;
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT VIEW_DEFINITION FROM INFORMATION_SCHEMA.VIEWS
 WHERE TABLE_SCHEMA = 'test' AND TABLE_NAME = 'v';
+-----+
| VIEW_DEFINITION |
+-----+
| select concat('a','b') AS `coll` |
+-----+
1 row in set (0.00 sec)
```

The advantage of storing a view definition in canonical form is that changes made later to the value of `sql_mode` do not affect the results from the view. However, an additional consequence is that comments prior to `SELECT` are stripped from the definition by the server.

## 26.3.49 The INFORMATION\_SCHEMA VIEW\_ROUTINE\_USAGE Table

The `VIEW_ROUTINE_USAGE` table (available as of MySQL 8.0.13) provides access to information about stored functions used in view definitions. The table does not list information about built-in (native) functions or loadable functions used in the definitions.

You can see information only for views for which you have some privilege, and only for functions for which you have some privilege.

The `VIEW_ROUTINE_USAGE` table has these columns:

- `TABLE_CATALOG`

The name of the catalog to which the view belongs. This value is always `def`.

- `TABLE_SCHEMA`

The name of the schema (database) to which the view belongs.

- `TABLE_NAME`

The name of the view.

- `SPECIFIC_CATALOG`

The name of the catalog to which the function used in the view definition belongs. This value is always `def`.

- `SPECIFIC_SCHEMA`

The name of the schema (database) to which the function used in the view definition belongs.

- `SPECIFIC_NAME`

The name of the function used in the view definition.

## 26.3.50 The INFORMATION\_SCHEMA VIEW\_TABLE\_USAGE Table

The `VIEW_TABLE_USAGE` table (available as of MySQL 8.0.13) provides access to information about tables and views used in view definitions.

You can see information only for views for which you have some privilege, and only for tables for which you have some privilege.

The `VIEW_TABLE_USAGE` table has these columns:

- `VIEW_CATALOG`

The name of the catalog to which the view belongs. This value is always `def`.

- `VIEW_SCHEMA`

The name of the schema (database) to which the view belongs.

- `VIEW_NAME`

The name of the view.

- `TABLE_CATALOG`

The name of the catalog to which the table or view used in the view definition belongs. This value is always `def`.

- [TABLE\\_SCHEMA](#)

The name of the schema (database) to which the table or view used in the view definition belongs.

- [TABLE\\_NAME](#)

The name of the table or view used in the view definition.

## 26.4 INFORMATION\_SCHEMA InnoDB Tables

This section provides table definitions for [INFORMATION\\_SCHEMA InnoDB](#) tables. For related information and examples, see [Section 15.15, “InnoDB INFORMATION\\_SCHEMA Tables”](#).

[INFORMATION\\_SCHEMA InnoDB](#) tables can be used to monitor ongoing [InnoDB](#) activity, to detect inefficiencies before they turn into issues, or to troubleshoot performance and capacity issues. As your database becomes bigger and busier, running up against the limits of your hardware capacity, you monitor and tune these aspects to keep the database running smoothly.

### 26.4.1 INFORMATION\_SCHEMA InnoDB Table Reference

The following table summarizes [INFORMATION\\_SCHEMA InnoDB](#) tables. For greater detail, see the individual table descriptions.

**Table 26.3 INFORMATION\_SCHEMA InnoDB Tables**

| Table Name                                 | Description                                                                  | Introduced |
|--------------------------------------------|------------------------------------------------------------------------------|------------|
| <a href="#">INNODB_BUFFER_PAGE</a>         | Pages in InnoDB buffer pool                                                  |            |
| <a href="#">INNODB_BUFFER_PAGE_LRU</a>     | LRU ordering of pages in InnoDB buffer pool                                  |            |
| <a href="#">INNODB_BUFFER_POOL_STATS</a>   | InnoDB buffer pool statistics                                                |            |
| <a href="#">INNODB_CACHED_INDEXES</a>      | Number of index pages cached per index in InnoDB buffer pool                 |            |
| <a href="#">INNODB_CMP</a>                 | Status for operations related to compressed InnoDB tables                    |            |
| <a href="#">INNODB_CMP_PER_INDEX</a>       | Status for operations related to compressed InnoDB tables and indexes        |            |
| <a href="#">INNODB_CMP_PER_INDEX_RESET</a> | Status for operations related to compressed InnoDB tables and indexes        |            |
| <a href="#">INNODB_CMP_RESET</a>           | Status for operations related to compressed InnoDB tables                    |            |
| <a href="#">INNODB_CMPMEM</a>              | Status for compressed pages within InnoDB buffer pool                        |            |
| <a href="#">INNODB_CMPMEM_RESET</a>        | Status for compressed pages within InnoDB buffer pool                        |            |
| <a href="#">INNODB_COLUMNS</a>             | Columns in each InnoDB table                                                 |            |
| <a href="#">INNODB_DATAFILES</a>           | Data file path information for InnoDB file-per-table and general tablespaces |            |
| <a href="#">INNODB_FIELDS</a>              | Key columns of InnoDB indexes                                                |            |

| Table Name                                     | Description                                                                                 | Introduced |
|------------------------------------------------|---------------------------------------------------------------------------------------------|------------|
| <a href="#">INNODB_FOREIGN</a>                 | InnoDB foreign-key metadata                                                                 |            |
| <a href="#">INNODB_FOREIGN_COLS</a>            | InnoDB foreign-key column status information                                                |            |
| <a href="#">INNODB_FT_BEING_DELETED</a>        | Snapshot of <a href="#">INNODB_FT_DELETED</a> table                                         |            |
| <a href="#">INNODB_FT_CONFIG</a>               | Metadata for InnoDB table FULLTEXT index and associated processing                          |            |
| <a href="#">INNODB_FT_DEFAULT_STOPWORDS</a>    | Default list of stopwords for InnoDB FULLTEXT indexes                                       |            |
| <a href="#">INNODB_FT_DELETED</a>              | Rows deleted from InnoDB table FULLTEXT index                                               |            |
| <a href="#">INNODB_FT_INDEX_CACHE</a>          | Token information for newly inserted rows in InnoDB FULLTEXT index                          |            |
| <a href="#">INNODB_FT_INDEX_TABLE</a>          | Inverted index information for processing text searches against InnoDB table FULLTEXT index |            |
| <a href="#">INNODB_INDEXES</a>                 | InnoDB index metadata                                                                       |            |
| <a href="#">INNODB_METRICS</a>                 | InnoDB performance information                                                              |            |
| <a href="#">INNODB_SESSION_TEMP_TABLESPACE</a> | Session temporary-tablespace metadata                                                       | 8.0.13     |
| <a href="#">INNODB_TABLES</a>                  | InnoDB table metadata                                                                       |            |
| <a href="#">INNODB_TABLESPACES</a>             | InnoDB file-per-table, general, and undo tablespace metadata                                |            |
| <a href="#">INNODB_TABLESPACES_BRIEF</a>       | Brief file-per-table, general, undo, and system tablespace metadata                         |            |
| <a href="#">INNODB_TABLESTATS</a>              | InnoDB table low-level status information                                                   |            |
| <a href="#">INNODB_TEMP_TABLE_INFO</a>         | Information about active user-created InnoDB temporary tables                               |            |
| <a href="#">INNODB_TRX</a>                     | Active InnoDB transaction information                                                       |            |
| <a href="#">INNODB_VIRTUAL</a>                 | InnoDB virtual generated column metadata                                                    |            |

## 26.4.2 The INFORMATION\_SCHEMA INNODB\_BUFFER\_PAGE Table

The [INNODB\\_BUFFER\\_PAGE](#) table provides information about each [page](#) in the [InnoDB buffer pool](#).

For related usage information and examples, see [Section 15.15.5, “InnoDB INFORMATION\\_SCHEMA Buffer Pool Tables”](#).

### Warning

Querying the [INNODB\\_BUFFER\\_PAGE](#) table can affect performance. Do not query this table on a production system unless you are aware of the performance impact and have determined it to be acceptable. To avoid impacting performance on a production system, reproduce the issue you want to investigate and query buffer pool statistics on a test instance.

The `INNODB_BUFFER_PAGE` table has these columns:

- `POOL_ID`

The buffer pool ID. This is an identifier to distinguish between multiple buffer pool instances.

- `BLOCK_ID`

The buffer pool block ID.

- `SPACE`

The tablespace ID; the same value as `INNODB_TABLES.SPACE`.

- `PAGE_NUMBER`

The page number.

- `PAGE_TYPE`

The page type. The following table shows the permitted values.

**Table 26.4 INNODB\_BUFFER\_PAGE.PAGE\_TYPE Values**

| Page Type                                 | Description                    |
|-------------------------------------------|--------------------------------|
| <code>ALLOCATED</code>                    | Freshly allocated page         |
| <code>BLOB</code>                         | Uncompressed BLOB page         |
| <code>COMPRESSED_BLOB2</code>             | Subsequent comp BLOB page      |
| <code>COMPRESSED_BLOB</code>              | First compressed BLOB page     |
| <code>ENCRYPTED_RTREE</code>              | Encrypted R-tree               |
| <code>EXTENT_DESCRIPTOR</code>            | Extent descriptor page         |
| <code>FILE_SPACE_HEADER</code>            | File space header              |
| <code>FIL_PAGE_TYPE_UNUSED</code>         | Unused                         |
| <code>IBUF_BITMAP</code>                  | Insert buffer bitmap           |
| <code>IBUF_FREE_LIST</code>               | Insert buffer free list        |
| <code>IBUF_INDEX</code>                   | Insert buffer index            |
| <code>INDEX</code>                        | B-tree node                    |
| <code>INODE</code>                        | Index node                     |
| <code>LOB_DATA</code>                     | Uncompressed LOB data          |
| <code>LOB_FIRST</code>                    | First page of uncompressed LOB |
| <code>LOB_INDEX</code>                    | Uncompressed LOB index         |
| <code>PAGE_IO_COMPRESSED</code>           | Compressed page                |
| <code>PAGE_IO_COMPRESSED_ENCRYPTED</code> | Compressed and encrypted page  |
| <code>PAGE_IO_ENCRYPTED</code>            | Encrypted page                 |
| <code>RSEG_ARRAY</code>                   | Rollback segment array         |
| <code>RTREE_INDEX</code>                  | R-tree index                   |
| <code>SDI_BLOB</code>                     | Uncompressed SDI BLOB          |
| <code>SDI_COMPRESSED_BLOB</code>          | Compressed SDI BLOB            |
| <code>SDI_INDEX</code>                    | SDI index                      |
| <code>SYSTEM</code>                       | System page                    |
| <code>TRX_SYSTEM</code>                   | Transaction system data        |

| Page Type       | Description                   |
|-----------------|-------------------------------|
| UNDO_LOG        | Undo log page                 |
| UNKNOWN         | Unknown                       |
| ZLOB_DATA       | Compressed LOB data           |
| ZLOB_FIRST      | First page of compressed LOB  |
| ZLOB_FRAG       | Compressed LOB fragment       |
| ZLOB_FRAG_ENTRY | Compressed LOB fragment index |
| ZLOB_INDEX      | Compressed LOB index          |

- **FLUSH\_TYPE**

The flush type.

- **FIX\_COUNT**

The number of threads using this block within the buffer pool. When zero, the block is eligible to be evicted.

- **IS\_HASHED**

Whether a hash index has been built on this page.

- **NEWEST\_MODIFICATION**

The Log Sequence Number of the youngest modification.

- **OLDEST\_MODIFICATION**

The Log Sequence Number of the oldest modification.

- **ACCESS\_TIME**

An abstract number used to judge the first access time of the page.

- **TABLE\_NAME**

The name of the table the page belongs to. This column is applicable only to pages with a **PAGE\_TYPE** value of **INDEX**. The column is **NULL** if the server has not yet accessed the table.

- **INDEX\_NAME**

The name of the index the page belongs to. This can be the name of a clustered index or a secondary index. This column is applicable only to pages with a **PAGE\_TYPE** value of **INDEX**.

- **NUMBER\_RECORDS**

The number of records within the page.

- **DATA\_SIZE**

The sum of the sizes of the records. This column is applicable only to pages with a **PAGE\_TYPE** value of **INDEX**.

- **COMPRESSED\_SIZE**

The compressed page size. **NULL** for pages that are not compressed.

- **PAGE\_STATE**

The page state. The following table shows the permitted values.

**Table 26.5 INNODB\_BUFFER\_PAGE.PAGE\_STATE Values**

| Page State    | Description                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------|
| FILE_PAGE     | A buffered file page                                                                                  |
| MEMORY        | Contains a main memory object                                                                         |
| NOT_USED      | In the free list                                                                                      |
| NULL          | Clean compressed pages, compressed pages in the flush list, pages used as buffer pool watch sentinels |
| READY_FOR_USE | A free page                                                                                           |
| REMOVE_HASH   | Hash index should be removed before placing in the free list                                          |

- **IO\_FIX**

Whether any I/O is pending for this page: **IO\_NONE** = no pending I/O, **IO\_READ** = read pending, **IO\_WRITE** = write pending, **IO\_PIN** = relocation and removal from the flush not permitted.

- **IS\_OLD**

Whether the block is in the sublist of old blocks in the LRU list.

- **FREE\_PAGE\_CLOCK**

The value of the **freed\_page\_clock** counter when the block was the last placed at the head of the LRU list. The **freed\_page\_clock** counter tracks the number of blocks removed from the end of the LRU list.

- **IS\_STALE**

Whether the page is stale. Added in MySQL 8.0.24.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_BUFFER_PAGE LIMIT 1\G
***** 1. row *****
 POOL_ID: 0
 BLOCK_ID: 0
 SPACE: 97
 PAGE_NUMBER: 2473
 PAGE_TYPE: INDEX
 FLUSH_TYPE: 1
 FIX_COUNT: 0
 IS_HASHED: YES
NEWEST_MODIFICATION: 733855581
OLDEST_MODIFICATION: 0
 ACCESS_TIME: 3378385672
 TABLE_NAME: `employees`.`salaries`
 INDEX_NAME: PRIMARY
 NUMBER_RECORDS: 468
 DATA_SIZE: 14976
 COMPRESSED_SIZE: 0
 PAGE_STATE: FILE_PAGE
 IO_FIX: IO_NONE
 IS_OLD: YES
 FREE_PAGE_CLOCK: 66
 IS_STALE: NO
```

## Notes

- This table is useful primarily for expert-level performance monitoring, or when developing performance-related extensions for MySQL.

- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.
- When tables, table rows, partitions, or indexes are deleted, associated pages remain in the buffer pool until space is required for other data. The [INNODB\\_BUFFER\\_PAGE](#) table reports information about these pages until they are evicted from the buffer pool. For more information about how the InnoDB manages buffer pool data, see [Section 15.5.1, “Buffer Pool”](#).

### 26.4.3 The INFORMATION\_SCHEMA INNODB\_BUFFER\_PAGE\_LRU Table

The [INNODB\\_BUFFER\\_PAGE\\_LRU](#) table provides information about the pages in the [InnoDB buffer pool](#); in particular, how they are ordered in the LRU list that determines which pages to [evict](#) from the buffer pool when it becomes full.

The [INNODB\\_BUFFER\\_PAGE\\_LRU](#) table has the same columns as the [INNODB\\_BUFFER\\_PAGE](#) table with a few exceptions. It has [LRU\\_POSITION](#) and [COMPRESSED](#) columns instead of [BLOCK\\_ID](#) and [PAGE\\_STATE](#) columns, and it does not include an [IS\\_STALE](#) column.

For related usage information and examples, see [Section 15.15.5, “InnoDB INFORMATION\\_SCHEMA Buffer Pool Tables”](#).

#### Warning

Querying the [INNODB\\_BUFFER\\_PAGE\\_LRU](#) table can affect performance. Do not query this table on a production system unless you are aware of the performance impact and have determined it to be acceptable. To avoid impacting performance on a production system, reproduce the issue you want to investigate and query buffer pool statistics on a test instance.

The [INNODB\\_BUFFER\\_PAGE\\_LRU](#) table has these columns:

- [POOL\\_ID](#)

The buffer pool ID. This is an identifier to distinguish between multiple buffer pool instances.

- [LRU\\_POSITION](#)

The position of the page in the LRU list.

- [SPACE](#)

The tablespace ID; the same value as [INNODB\\_TABLES.SPACE](#).

- [PAGE\\_NUMBER](#)

The page number.

- [PAGE\\_TYPE](#)

The page type. The following table shows the permitted values.

**Table 26.6 INNODB\_BUFFER\_PAGE\_LRU.PAGE\_TYPE Values**

| Page Type                        | Description                |
|----------------------------------|----------------------------|
| <a href="#">ALLOCATED</a>        | Freshly allocated page     |
| <a href="#">BLOB</a>             | Uncompressed BLOB page     |
| <a href="#">COMPRESSED_BLOB2</a> | Subsequent comp BLOB page  |
| <a href="#">COMPRESSED_BLOB</a>  | First compressed BLOB page |

| Page Type                    | Description                    |
|------------------------------|--------------------------------|
| ENCRYPTED_RTREE              | Encrypted R-tree               |
| EXTENT_DESCRIPTOR            | Extent descriptor page         |
| FILE_SPACE_HEADER            | File space header              |
| FIL_PAGE_TYPE_UNUSED         | Unused                         |
| IBUF_BITMAP                  | Insert buffer bitmap           |
| IBUF_FREE_LIST               | Insert buffer free list        |
| IBUF_INDEX                   | Insert buffer index            |
| INDEX                        | B-tree node                    |
| INODE                        | Index node                     |
| LOB_DATA                     | Uncompressed LOB data          |
| LOB_FIRST                    | First page of uncompressed LOB |
| LOB_INDEX                    | Uncompressed LOB index         |
| PAGE_IO_COMPRESSED           | Compressed page                |
| PAGE_IO_COMPRESSED_ENCRYPTED | Compressed and encrypted page  |
| PAGE_IO_ENCRYPTED            | Encrypted page                 |
| RSEG_ARRAY                   | Rollback segment array         |
| RTREE_INDEX                  | R-tree index                   |
| SDI_BLOB                     | Uncompressed SDI BLOB          |
| SDI_COMPRESSED_BLOB          | Compressed SDI BLOB            |
| SDI_INDEX                    | SDI index                      |
| SYSTEM                       | System page                    |
| TRX_SYSTEM                   | Transaction system data        |
| UNDO_LOG                     | Undo log page                  |
| UNKNOWN                      | Unknown                        |
| ZLOB_DATA                    | Compressed LOB data            |
| ZLOB_FIRST                   | First page of compressed LOB   |
| ZLOB_FRAG                    | Compressed LOB fragment        |
| ZLOB_FRAG_ENTRY              | Compressed LOB fragment index  |
| ZLOB_INDEX                   | Compressed LOB index           |

- **FLUSH\_TYPE**

The flush type.

- **FIX\_COUNT**

The number of threads using this block within the buffer pool. When zero, the block is eligible to be evicted.

- **IS\_HASHED**

Whether a hash index has been built on this page.

- **NEWEST\_MODIFICATION**

The Log Sequence Number of the youngest modification.

- **OLDEST\_MODIFICATION**

The Log Sequence Number of the oldest modification.

- `ACCESS_TIME`

An abstract number used to judge the first access time of the page.

- `TABLE_NAME`

The name of the table the page belongs to. This column is applicable only to pages with a `PAGE_TYPE` value of `INDEX`. The column is `NULL` if the server has not yet accessed the table.

- `INDEX_NAME`

The name of the index the page belongs to. This can be the name of a clustered index or a secondary index. This column is applicable only to pages with a `PAGE_TYPE` value of `INDEX`.

- `NUMBER_RECORDS`

The number of records within the page.

- `DATA_SIZE`

The sum of the sizes of the records. This column is applicable only to pages with a `PAGE_TYPE` value of `INDEX`.

- `COMPRESSED_SIZE`

The compressed page size. `NULL` for pages that are not compressed.

- `COMPRESSED`

Whether the page is compressed.

- `IO_FIX`

Whether any I/O is pending for this page: `IO_NONE` = no pending I/O, `IO_READ` = read pending, `IO_WRITE` = write pending.

- `IS_OLD`

Whether the block is in the sublist of old blocks in the LRU list.

- `FREE_PAGE_CLOCK`

The value of the `freed_page_clock` counter when the block was the last placed at the head of the LRU list. The `freed_page_clock` counter tracks the number of blocks removed from the end of the LRU list.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_BUFFER_PAGE_LRU LIMIT 1\G
***** 1. row *****
 POOL_ID: 0
 LRU_POSITION: 0
 SPACE: 97
 PAGE_NUMBER: 1984
 PAGE_TYPE: INDEX
 FLUSH_TYPE: 1
 FIX_COUNT: 0
 IS_HASHED: YES
NEWEST_MODIFICATION: 719490396
OLDEST_MODIFICATION: 0
 ACCESS_TIME: 3378383796
 TABLE_NAME: `employees`.`salaries`
 INDEX_NAME: PRIMARY
```

```
NUMBER_RECORDS: 468
DATA_SIZE: 14976
COMPRESSED_SIZE: 0
COMPRESSED: NO
IO_FIX: IO_NONE
IS_OLD: YES
FREE_PAGE_CLOCK: 0
```

## Notes

- This table is useful primarily for expert-level performance monitoring, or when developing performance-related extensions for MySQL.
- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.
- Querying this table can require MySQL to allocate a large block of contiguous memory, more than 64 bytes times the number of active pages in the buffer pool. This allocation could potentially cause an out-of-memory error, especially for systems with multi-gigabyte buffer pools.
- Querying this table requires MySQL to lock the data structure representing the buffer pool while traversing the LRU list, which can reduce concurrency, especially for systems with multi-gigabyte buffer pools.
- When tables, table rows, partitions, or indexes are deleted, associated pages remain in the buffer pool until space is required for other data. The [INNODB\\_BUFFER\\_PAGE\\_LRU](#) table reports information about these pages until they are evicted from the buffer pool. For more information about how the [InnoDB](#) manages buffer pool data, see [Section 15.5.1, “Buffer Pool”](#).

## 26.4.4 The INFORMATION\_SCHEMA INNODB\_BUFFER\_POOL\_STATS Table

The [INNODB\\_BUFFER\\_POOL\\_STATS](#) table provides much of the same buffer pool information provided in [SHOW ENGINE INNODB STATUS](#) output. Much of the same information may also be obtained using [InnoDB](#) buffer pool [server status variables](#).

The idea of making pages in the buffer pool “young” or “not young” refers to transferring them between the [sublists](#) at the head and tail of the buffer pool data structure. Pages made “young” take longer to age out of the buffer pool, while pages made “not young” are moved much closer to the point of [eviction](#).

For related usage information and examples, see [Section 15.15.5, “InnoDB INFORMATION\\_SCHEMA Buffer Pool Tables”](#).

The [INNODB\\_BUFFER\\_POOL\\_STATS](#) table has these columns:

- [POOL\\_ID](#)

The buffer pool ID. This is an identifier to distinguish between multiple buffer pool instances.

- [POOL\\_SIZE](#)

The [InnoDB](#) buffer pool size in pages.

- [FREE\\_BUFFERS](#)

The number of free pages in the [InnoDB](#) buffer pool.

- [DATABASE\\_PAGES](#)

The number of pages in the [InnoDB](#) buffer pool containing data. This number includes both dirty and clean pages.

- [OLD\\_DATABASE\\_PAGES](#)

The number of pages in the `old` buffer pool sublist.

- [MODIFIED\\_DATABASE\\_PAGES](#)

The number of modified (dirty) database pages.

- [PENDING\\_DECOMPRESS](#)

The number of pages pending decompression.

- [PENDING\\_READS](#)

The number of pending reads.

- [PENDING\\_FLUSH\\_LRU](#)

The number of pages pending flush in the LRU.

- [PENDING\\_FLUSH\\_LIST](#)

The number of pages pending flush in the flush list.

- [PAGES\\_MADE\\_YOUNG](#)

The number of pages made young.

- [PAGES\\_NOT\\_MADE\\_YOUNG](#)

The number of pages not made young.

- [PAGES\\_MADE\\_YOUNG\\_RATE](#)

The number of pages made young per second (pages made young since the last printout / time elapsed).

- [PAGES\\_MADE\\_NOT\\_YOUNG\\_RATE](#)

The number of pages not made per second (pages not made young since the last printout / time elapsed).

- [NUMBER\\_PAGES\\_READ](#)

The number of pages read.

- [NUMBER\\_PAGES\\_CREATED](#)

The number of pages created.

- [NUMBER\\_PAGES\\_WRITTEN](#)

The number of pages written.

- [PAGES\\_READ\\_RATE](#)

The number of pages read per second (pages read since the last printout / time elapsed).

- [PAGES\\_CREATE\\_RATE](#)

The number of pages created per second (pages created since the last printout / time elapsed).

- [PAGES\\_WRITTEN\\_RATE](#)

The number of pages written per second (pages written since the last printout / time elapsed).

- [NUMBER\\_PAGES\\_GET](#)  
The number of logical read requests.
- [HIT\\_RATE](#)  
The buffer pool hit rate.
- [YOUNG\\_MAKE\\_PER\\_THOUSAND\\_GETS](#)  
The number of pages made young per thousand gets.
- [NOT\\_YOUNG\\_MAKE\\_PER\\_THOUSAND\\_GETS](#)  
The number of pages not made young per thousand gets.
- [NUMBER\\_PAGES\\_READ\\_AHEAD](#)  
The number of pages read ahead.
- [NUMBER\\_READ\\_AHEAD\\_EVICTED](#)  
The number of pages read into the [InnoDB](#) buffer pool by the read-ahead background thread that were subsequently evicted without having been accessed by queries.
- [READ\\_AHEAD\\_RATE](#)  
The read-ahead rate per second (pages read ahead since the last printout / time elapsed).
- [READ\\_AHEAD\\_EVICTED\\_RATE](#)  
The number of read-ahead pages evicted without access per second (read-ahead pages not accessed since the last printout / time elapsed).
- [LRU\\_IO\\_TOTAL](#)  
Total LRU I/O.
- [LRU\\_IO\\_CURRENT](#)  
LRU I/O for the current interval.
- [UNCOMPRESS\\_TOTAL](#)  
The total number of pages decompressed.
- [UNCOMPRESS\\_CURRENT](#)  
The number of pages decompressed in the current interval.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_BUFFER_POOL_STATS\G
***** 1. row *****
 POOL_ID: 0
 POOL_SIZE: 8192
 FREE_BUFFERS: 1
 DATABASE_PAGES: 8085
 OLD_DATABASE_PAGES: 2964
MODIFIED_DATABASE_PAGES: 0
 PENDING_DECOMPRESS: 0
 PENDING_READS: 0
 PENDING_FLUSH_LRU: 0
 PENDING_FLUSH_LIST: 0
 PAGES_MADE_YOUNG: 22821
 PAGES_NOT_MADE_YOUNG: 3544303
```

```

PAGES_MADE_YOUNG_RATE: 357.62602199870594
PAGES_MADE_NOT_YOUNG_RATE: 0
NUMBER_PAGES_READ: 2389
NUMBER_PAGES_CREATED: 12385
NUMBER_PAGES_WRITTEN: 13111
PAGES_READ_RATE: 0
PAGES_CREATE_RATE: 0
PAGES_WRITTEN_RATE: 0
NUMBER_PAGES_GET: 33322210
HIT_RATE: 1000
YOUNG_MAKE_PER_THOUSAND_GETS: 18
NOT_YOUNG_MAKE_PER_THOUSAND_GETS: 0
NUMBER_PAGES_READ_AHEAD: 2024
NUMBER_READ_AHEAD_EVICTED: 0
READ_AHEAD_RATE: 0
READ_AHEAD_EVICTED_RATE: 0
LRU_IO_TOTAL: 0
LRU_IO_CURRENT: 0
UNCOMPRESS_TOTAL: 0
UNCOMPRESS_CURRENT: 0

```

## Notes

- This table is useful primarily for expert-level performance monitoring, or when developing performance-related extensions for MySQL.
- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.

## 26.4.5 The INFORMATION\_SCHEMA INNODB\_CACHED\_INDEXES Table

The [INNODB\\_CACHED\\_INDEXES](#) table reports the number of index pages cached in the [InnoDB](#) buffer pool for each index.

For related usage information and examples, see [Section 15.15.5, “InnoDB INFORMATION\\_SCHEMA Buffer Pool Tables”](#).

The [INNODB\\_CACHED\\_INDEXES](#) table has these columns:

- [SPACE\\_ID](#)

The tablespace ID.

- [INDEX\\_ID](#)

An identifier for the index. Index identifiers are unique across all the databases in an instance.

- [N\\_CACHED\\_PAGES](#)

The number of index pages cached in the [InnoDB](#) buffer pool.

## Examples

This query returns the number of index pages cached in the [InnoDB](#) buffer pool for a specific index:

```

mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_CACHED_INDEXES WHERE INDEX_ID=65\G
***** 1. row *****
SPACE_ID: 4294967294
INDEX_ID: 65
N_CACHED_PAGES: 45

```

This query returns the number of index pages cached in the [InnoDB](#) buffer pool for each index, using the [INNODB\\_INDEXES](#) and [INNODB\\_TABLES](#) tables to resolve the table name and index name for each [INDEX\\_ID](#) value.

```
SELECT
 tables.NAME AS table_name,
 indexes.NAME AS index_name,
 cached.N_CACHED_PAGES AS n_cached_pages
FROM
 INFORMATION_SCHEMA.INNODB_CACHED_INDEXES AS cached,
 INFORMATION_SCHEMA.INNODB_INDEXES AS indexes,
 INFORMATION_SCHEMA.INNODB_TABLES AS tables
WHERE
 cached.INDEX_ID = indexes.INDEX_ID
 AND indexes.TABLE_ID = tables.TABLE_ID;
```

## Notes

- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.

## 26.4.6 The INFORMATION\_SCHEMA INNODB\_CMP and INNODB\_CMP\_RESET Tables

The [INNODB\\_CMP](#) and [INNODB\\_CMP\\_RESET](#) tables provide status information on operations related to [compressed](#) InnoDB tables.

The [INNODB\\_CMP](#) and [INNODB\\_CMP\\_RESET](#) tables have these columns:

- [PAGE\\_SIZE](#)

The compressed page size in bytes.

- [COMPRESS\\_OPS](#)

The number of times a B-tree page of size [PAGE\\_SIZE](#) has been compressed. Pages are compressed whenever an empty page is created or the space for the uncompressed modification log runs out.

- [COMPRESS\\_OPS\\_OK](#)

The number of times a B-tree page of size [PAGE\\_SIZE](#) has been successfully compressed. This count should never exceed [COMPRESS\\_OPS](#).

- [COMPRESS\\_TIME](#)

The total time in seconds used for attempts to compress B-tree pages of size [PAGE\\_SIZE](#).

- [UNCOMPRESS\\_OPS](#)

The number of times a B-tree page of size [PAGE\\_SIZE](#) has been uncompressed. B-tree pages are uncompressed whenever compression fails or at first access when the uncompressed page does not exist in the buffer pool.

- [UNCOMPRESS\\_TIME](#)

The total time in seconds used for uncompressing B-tree pages of the size [PAGE\\_SIZE](#).

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_CMP\G
***** 1. row *****
 page_size: 1024
 compress_ops: 0
compress_ops_ok: 0
 compress_time: 0
```

```

uncompress_ops: 0
uncompress_time: 0
***** 2. row *****
 page_size: 2048
 compress_ops: 0
compress_ops_ok: 0
 compress_time: 0
 uncompress_ops: 0
uncompress_time: 0
***** 3. row *****
 page_size: 4096
 compress_ops: 0
compress_ops_ok: 0
 compress_time: 0
 uncompress_ops: 0
uncompress_time: 0
***** 4. row *****
 page_size: 8192
 compress_ops: 86955
compress_ops_ok: 81182
 compress_time: 27
 uncompress_ops: 26828
uncompress_time: 5
***** 5. row *****
 page_size: 16384
 compress_ops: 0
compress_ops_ok: 0
 compress_time: 0
 uncompress_ops: 0
uncompress_time: 0

```

## Notes

- Use these tables to measure the effectiveness of [InnoDB table compression](#) in your database.
- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.
- For usage information, see [Section 15.9.1.4, “Monitoring InnoDB Table Compression at Runtime”](#) and [Section 15.15.1.3, “Using the Compression Information Schema Tables”](#). For general information about [InnoDB table compression](#), see [Section 15.9, “InnoDB Table and Page Compression”](#).

## 26.4.7 The INFORMATION\_SCHEMA INNODB\_CMPMEM and INNODB\_CMPMEM\_RESET Tables

The [INNODB\\_CMPMEM](#) and [INNODB\\_CMPMEM\\_RESET](#) tables provide status information on compressed [pages](#) within the [InnoDB buffer pool](#).

The [INNODB\\_CMPMEM](#) and [INNODB\\_CMPMEM\\_RESET](#) tables have these columns:

- [PAGE\\_SIZE](#)

The block size in bytes. Each record of this table describes blocks of this size.

- [BUFFER\\_POOL\\_INSTANCE](#)

A unique identifier for the buffer pool instance.

- [PAGES\\_USED](#)

The number of blocks of size [PAGE\\_SIZE](#) that are currently in use.

- [PAGES\\_FREE](#)

The number of blocks of size [PAGE\\_SIZE](#) that are currently available for allocation. This column shows the external fragmentation in the memory pool. Ideally, these numbers should be at most 1.

- [RELOCATION\\_OPS](#)

The number of times a block of size [PAGE\\_SIZE](#) has been relocated. The buddy system can relocate the allocated “buddy neighbor” of a freed block when it tries to form a bigger freed block. Reading from the [INNODB\\_CMPMEM\\_RESET](#) table resets this count.

- [RELOCATION\\_TIME](#)

The total time in microseconds used for relocating blocks of size [PAGE\\_SIZE](#). Reading from the table [INNODB\\_CMPMEM\\_RESET](#) resets this count.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_CMPMEM\G
***** 1. row *****
 page_size: 1024
buffer_pool_instance: 0
 pages_used: 0
 pages_free: 0
 relocation_ops: 0
 relocation_time: 0
***** 2. row *****
 page_size: 2048
buffer_pool_instance: 0
 pages_used: 0
 pages_free: 0
 relocation_ops: 0
 relocation_time: 0
***** 3. row *****
 page_size: 4096
buffer_pool_instance: 0
 pages_used: 0
 pages_free: 0
 relocation_ops: 0
 relocation_time: 0
***** 4. row *****
 page_size: 8192
buffer_pool_instance: 0
 pages_used: 7673
 pages_free: 15
 relocation_ops: 4638
 relocation_time: 0
***** 5. row *****
 page_size: 16384
buffer_pool_instance: 0
 pages_used: 0
 pages_free: 0
 relocation_ops: 0
 relocation_time: 0
```

## Notes

- Use these tables to measure the effectiveness of [InnoDB](#) table [compression](#) in your database.
- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.
- For usage information, see [Section 15.9.1.4, “Monitoring InnoDB Table Compression at Runtime”](#) and [Section 15.15.1.3, “Using the Compression Information Schema Tables”](#). For general information about [InnoDB](#) table compression, see [Section 15.9, “InnoDB Table and Page Compression”](#).

## 26.4.8 The INFORMATION\_SCHEMA INNODB\_CMP\_PER\_INDEX and INNODB\_CMP\_PER\_INDEX\_RESET Tables

The `INNODB_CMP_PER_INDEX` and `INNODB_CMP_PER_INDEX_RESET` tables provide status information on operations related to [compressed InnoDB](#) tables and indexes, with separate statistics for each combination of database, table, and index, to help you evaluate the performance and usefulness of compression for specific tables.

For a compressed [InnoDB](#) table, both the table data and all the [secondary indexes](#) are compressed. In this context, the table data is treated as just another index, one that happens to contain all the columns: the [clustered index](#).

The `INNODB_CMP_PER_INDEX` and `INNODB_CMP_PER_INDEX_RESET` tables have these columns:

- `DATABASE_NAME`

The schema (database) containing the applicable table.

- `TABLE_NAME`

The table to monitor for compression statistics.

- `INDEX_NAME`

The index to monitor for compression statistics.

- `COMPRESS_OPS`

The number of compression operations attempted. [Pages](#) are compressed whenever an empty page is created or the space for the uncompressed modification log runs out.

- `COMPRESS_OPS_OK`

The number of successful compression operations. Subtract from the `COMPRESS_OPS` value to get the number of [compression failures](#). Divide by the `COMPRESS_OPS` value to get the percentage of compression failures.

- `COMPRESS_TIME`

The total time in seconds used for compressing data in this index.

- `UNCOMPRESS_OPS`

The number of uncompression operations performed. Compressed [InnoDB](#) pages are uncompressed whenever compression [fails](#), or the first time a compressed page is accessed in the [buffer pool](#) and the uncompressed page does not exist.

- `UNCOMPRESS_TIME`

The total time in seconds used for uncompressing data in this index.

### Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_CMP_PER_INDEX\G
***** 1. row *****
 database_name: employees
 table_name: salaries
 index_name: PRIMARY
 compress_ops: 0
compress_ops_ok: 0
 compress_time: 0
uncompress_ops: 23451
uncompress_time: 4
***** 2. row *****
```

```

database_name: employees
table_name: salaries
index_name: emp_no
compress_ops: 0
compress_ops_ok: 0
compress_time: 0
uncompress_ops: 1597
uncompress_time: 0

```

## Notes

- Use these tables to measure the effectiveness of [InnoDB](#) table [compression](#) for specific tables, indexes, or both.
- You must have the [PROCESS](#) privilege to query these tables.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of these tables, including data types and default values.
- Because collecting separate measurements for every index imposes substantial performance overhead, [INNODB\\_CMP\\_PER\\_INDEX](#) and [INNODB\\_CMP\\_PER\\_INDEX\\_RESET](#) statistics are not gathered by default. You must enable the [innodb\\_cmp\\_per\\_index\\_enabled](#) system variable before performing the operations on compressed tables that you want to monitor.
- For usage information, see [Section 15.9.1.4, “Monitoring InnoDB Table Compression at Runtime”](#) and [Section 15.15.1.3, “Using the Compression Information Schema Tables”](#). For general information about [InnoDB](#) table compression, see [Section 15.9, “InnoDB Table and Page Compression”](#).

## 26.4.9 The INFORMATION\_SCHEMA INNODB\_COLUMNS Table

The [INNODB\\_COLUMNS](#) table provides metadata about [InnoDB](#) table columns.

For related usage information and examples, see [Section 15.15.3, “InnoDB INFORMATION\\_SCHEMA Schema Object Tables”](#).

The [INNODB\\_COLUMNS](#) table has these columns:

- [TABLE\\_ID](#)

An identifier representing the table associated with the column; the same value as [INNODB\\_TABLES.TABLE\\_ID](#).

- [NAME](#)

The name of the column. These names can be uppercase or lowercase depending on the [lower\\_case\\_table\\_names](#) setting. There are no special system-reserved names for columns.

- [POS](#)

The ordinal position of the column within the table, starting from 0 and incrementing sequentially. When a column is dropped, the remaining columns are reordered so that the sequence has no gaps. The [POS](#) value for a virtual generated column encodes the column sequence number and ordinal position of the column. For more information, see the [POS](#) column description in [Section 26.4.29, “The INFORMATION\\_SCHEMA INNODB\\_VIRTUAL Table”](#).

- [MTYPE](#)

Stands for “main type”. A numeric identifier for the column type. 1 = [VARCHAR](#), 2 = [CHAR](#), 3 = [FIXBINARY](#), 4 = [BINARY](#), 5 = [BLOB](#), 6 = [INT](#), 7 = [SYS\\_CHILD](#), 8 = [SYS](#), 9 = [FLOAT](#), 10 = [DOUBLE](#), 11 = [DECIMAL](#), 12 = [VARMYSQL](#), 13 = [MYSQL](#), 14 = [GEOMETRY](#).

- [PRTYPE](#)

The [InnoDB](#) “precise type”, a binary value with bits representing MySQL data type, character set code, and nullability.

- [LEN](#)

The column length, for example 4 for [INT](#) and 8 for [BIGINT](#). For character columns in multibyte character sets, this length value is the maximum length in bytes needed to represent a definition such as [VARCHAR\(N\)](#); that is, it might be  $2*N$ ,  $3*N$ , and so on depending on the character encoding.

- [HAS\\_DEFAULT](#)

A boolean value indicating whether a column that was added instantly using [ALTER TABLE ... ADD COLUMN](#) with [ALGORITHM=INSTANT](#) has a default value. All columns added instantly have a default value, which makes this column an indicator of whether the column was added instantly.

- [DEFAULT\\_VALUE](#)

The initial default value of a column that was added instantly using [ALTER TABLE ... ADD COLUMN](#) with [ALGORITHM=INSTANT](#). If the default value is [NULL](#) or was not specified, this column reports [NULL](#). An explicitly specified non-[NULL](#) default value is shown in an internal binary format. Subsequent modifications of the column default value do not change the value reported by this column.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_COLUMNS where TABLE_ID = 71\G
***** 1. row *****
TABLE_ID: 71
NAME: col1
POS: 0
MTYPE: 6
PRTYPE: 1027
LEN: 4
HAS_DEFAULT: 0
DEFAULT_VALUE: NULL
***** 2. row *****
TABLE_ID: 71
NAME: col2
POS: 1
MTYPE: 2
PRTYPE: 524542
LEN: 10
HAS_DEFAULT: 0
DEFAULT_VALUE: NULL
***** 3. row *****
TABLE_ID: 71
NAME: col3
POS: 2
MTYPE: 1
PRTYPE: 524303
LEN: 10
HAS_DEFAULT: 0
DEFAULT_VALUE: NULL
```

## Notes

- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.

## 26.4.10 The INFORMATION\_SCHEMA INNODB\_DATAFILES Table

The [INNODB\\_DATAFILES](#) table provides data file path information for [InnoDB](#) file-per-table and general tablespaces.

For related usage information and examples, see [Section 15.15.3, “InnoDB INFORMATION\\_SCHEMA Schema Object Tables”](#).

#### Note

The `INFORMATION_SCHEMA.FILES` table reports metadata for InnoDB tablespace types including file-per-table tablespaces, general tablespaces, the system tablespace, the global temporary tablespace, and undo tablespaces.

The `INNODB_DATAFILES` table has these columns:

- `SPACE`

The tablespace ID.

- `PATH`

The tablespace data file path. If a [file-per-table](#) tablespace is created in a location outside the MySQL data directory, the path value is a fully qualified directory path. Otherwise, the path is relative to the data directory.

### Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_DATAFILES WHERE SPACE = 57\G
***** 1. row *****
SPACE: 57
PATH: ./test/t1.ibd
```

### Notes

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA.COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

## 26.4.11 The INFORMATION\_SCHEMA INNODB\_FIELDS Table

The `INNODB_FIELDS` table provides metadata about the key columns (fields) of InnoDB indexes.

For related usage information and examples, see [Section 15.15.3, “InnoDB INFORMATION\\_SCHEMA Schema Object Tables”](#).

The `INNODB_FIELDS` table has these columns:

- `INDEX_ID`

An identifier for the index associated with this key field; the same value as `INNODB_INDEXES.INDEX_ID`.

- `NAME`

The name of the original column from the table; the same value as `INNODB_COLUMNS.NAME`.

- `POS`

The ordinal position of the key field within the index, starting from 0 and incrementing sequentially. When a column is dropped, the remaining columns are reordered so that the sequence has no gaps.

### Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_FIELDS WHERE INDEX_ID = 117\G
***** 1. row *****
INDEX_ID: 117
NAME: coll
POS: 0
```

## Notes

- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.

### 26.4.12 The INFORMATION\_SCHEMA INNODB\_FOREIGN Table

The [INNODB\\_FOREIGN](#) table provides metadata about [InnoDB foreign keys](#).

For related usage information and examples, see [Section 15.15.3, “InnoDB INFORMATION\\_SCHEMA Schema Object Tables”](#).

The [INNODB\\_FOREIGN](#) table has these columns:

- [ID](#)

The name (not a numeric value) of the foreign key index, preceded by the schema (database) name (for example, [test/products\\_fk](#)).

- [FOR\\_NAME](#)

The name of the [child table](#) in this foreign key relationship.

- [REF\\_NAME](#)

The name of the [parent table](#) in this foreign key relationship.

- [N\\_COLS](#)

The number of columns in the foreign key index.

- [TYPE](#)

A collection of bit flags with information about the foreign key column, ORed together. 0 = [ON DELETE/UPDATE RESTRICT](#), 1 = [ON DELETE CASCADE](#), 2 = [ON DELETE SET NULL](#), 4 = [ON UPDATE CASCADE](#), 8 = [ON UPDATE SET NULL](#), 16 = [ON DELETE NO ACTION](#), 32 = [ON UPDATE NO ACTION](#).

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_FOREIGN\G
***** 1. row *****
 ID: test/fk1
FOR_NAME: test/child
REF_NAME: test/parent
 N_COLS: 1
 TYPE: 1
```

## Notes

- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.

### 26.4.13 The INFORMATION\_SCHEMA INNODB\_FOREIGN\_COLS Table

The [INNODB\\_FOREIGN\\_COLS](#) table provides status information about [InnoDB foreign key columns](#).

For related usage information and examples, see [Section 15.15.3, “InnoDB INFORMATION\\_SCHEMA Schema Object Tables”](#).

The `INNODB_FOREIGN_COLS` table has these columns:

- `ID`

The foreign key index associated with this index key field; the same value as `INNODB_FOREIGN.ID`.

- `FOR_COL_NAME`

The name of the associated column in the child table.

- `REF_COL_NAME`

The name of the associated column in the parent table.

- `POS`

The ordinal position of this key field within the foreign key index, starting from 0.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_FOREIGN_COLS WHERE ID = 'test/fk1'\G
***** 1. row *****
 ID: test/fk1
FOR_COL_NAME: parent_id
REF_COL_NAME: id
 POS: 0
```

## Notes

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA.COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

## 26.4.14 The INFORMATION\_SCHEMA INNODB\_FT\_BEING\_DELETED Table

The `INNODB_FT_BEING_DELETED` table provides a snapshot of the `INNODB_FT_DELETED` table; it is used only during an `OPTIMIZE TABLE` maintenance operation. When `OPTIMIZE TABLE` is run, the `INNODB_FT_BEING_DELETED` table is emptied, and `DOC_ID` values are removed from the `INNODB_FT_DELETED` table. Because the contents of `INNODB_FT_BEING_DELETED` typically have a short lifetime, this table has limited utility for monitoring or debugging. For information about running `OPTIMIZE TABLE` on tables with `FULLTEXT` indexes, see [Section 12.10.6, “Fine-Tuning MySQL Full-Text Search”](#).

This table is empty initially. Before querying it, set the value of the `innodb_ft_aux_table` system variable to the name (including the database name) of the table that contains the `FULLTEXT` index (for example, `test/articles`). The output appears similar to the example provided for the `INNODB_FT_DELETED` table.

For related usage information and examples, see [Section 15.15.4, “InnoDB INFORMATION\\_SCHEMA FULLTEXT Index Tables”](#).

The `INNODB_FT_BEING_DELETED` table has these columns:

- `DOC_ID`

The document ID of the row that is in the process of being deleted. This value might reflect the value of an ID column that you defined for the underlying table, or it can be a sequence value generated by InnoDB when the table contains no suitable column. This value is used when you perform text searches, to skip rows in the `INNODB_FT_INDEX_TABLE` table before data for deleted rows is physically removed from the `FULLTEXT` index by an `OPTIMIZE TABLE` statement. For more information, see [Optimizing InnoDB Full-Text Indexes](#).

## Notes

- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.
- You must have the [PROCESS](#) privilege to query this table.
- For more information about [InnoDB FULLTEXT](#) search, see [Section 15.6.2.4, “InnoDB Full-Text Indexes”](#), and [Section 12.10, “Full-Text Search Functions”](#).

## 26.4.15 The INFORMATION\_SCHEMA INNODB\_FT\_CONFIG Table

The [INNODB\\_FT\\_CONFIG](#) table provides metadata about the [FULLTEXT](#) index and associated processing for an [InnoDB](#) table.

This table is empty initially. Before querying it, set the value of the [innodb\\_ft\\_aux\\_table](#) system variable to the name (including the database name) of the table that contains the [FULLTEXT](#) index (for example, [test/articles](#)).

For related usage information and examples, see [Section 15.15.4, “InnoDB INFORMATION\\_SCHEMA FULLTEXT Index Tables”](#).

The [INNODB\\_FT\\_CONFIG](#) table has these columns:

- [KEY](#)

The name designating an item of metadata for an [InnoDB](#) table containing a [FULLTEXT](#) index.

The values for this column might change, depending on the needs for performance tuning and debugging for [InnoDB](#) full-text processing. The key names and their meanings include:

- [optimize\\_checkpoint\\_limit](#): The number of seconds after which an [OPTIMIZE TABLE](#) run stops.
- [synced\\_doc\\_id](#): The next [DOC\\_ID](#) to be issued.
- [stopword\\_table\\_name](#): The *database/table* name for a user-defined stopwords table. The [VALUE](#) column is empty if there is no user-defined stopwords table.
- [use\\_stopword](#): Indicates whether a stopwords table is used, which is defined when the [FULLTEXT](#) index is created.
- [VALUE](#)

The value associated with the corresponding [KEY](#) column, reflecting some limit or current value for an aspect of a [FULLTEXT](#) index for an [InnoDB](#) table.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_FT_CONFIG;
+-----+-----+
| KEY | VALUE |
+-----+-----+
optimize_checkpoint_limit	180
synced_doc_id	0
stopwords_table_name	test/my_stopwords
use_stopword	1
+-----+-----+
```

## Notes

- This table is intended only for internal configuration. It is not intended for statistical information purposes.

- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.
- For more information about [InnoDB FULLTEXT](#) search, see [Section 15.6.2.4, “InnoDB Full-Text Indexes”](#), and [Section 12.10, “Full-Text Search Functions”](#).

## 26.4.16 The INFORMATION\_SCHEMA INNODB\_FT\_DEFAULT\_STOPWORD Table

The [INNODB\\_FT\\_DEFAULT\\_STOPWORD](#) table holds a list of [stopwords](#) that are used by default when creating a [FULLTEXT](#) index on [InnoDB](#) tables. For information about the default [InnoDB](#) stopwords list and how to define your own stopwords lists, see [Section 12.10.4, “Full-Text Stopwords”](#).

For related usage information and examples, see [Section 15.15.4, “InnoDB INFORMATION\\_SCHEMA FULLTEXT Index Tables”](#).

The [INNODB\\_FT\\_DEFAULT\\_STOPWORD](#) table has these columns:

- [value](#)

A word that is used by default as a stopwords for [FULLTEXT](#) indexes on [InnoDB](#) tables. This is not used if you override the default stopwords processing with either the [innodb\\_ft\\_server\\_stopword\\_table](#) or the [innodb\\_ft\\_user\\_stopword\\_table](#) system variable.

### Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_FT_DEFAULT_STOPWORD;
+-----+
| value |
+-----+
| a |
| about |
| an |
| are |
| as |
| at |
| be |
| by |
| com |
| de |
| en |
| for |
| from |
| how |
| i |

| was |
| what |
| when |
| where |
| who |
| will |
| with |
| und |
```

```

| the |
| www |
+-----+
36 rows in set (0.00 sec)

```

## Notes

- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.
- For more information about [InnoDB FULLTEXT](#) search, see [Section 15.6.2.4, “InnoDB Full-Text Indexes”](#), and [Section 12.10, “Full-Text Search Functions”](#).

## 26.4.17 The INFORMATION\_SCHEMA INNODB\_FT\_DELETED Table

The [INNODB\\_FT\\_DELETED](#) table stores rows that are deleted from the [FULLTEXT](#) index for an [InnoDB](#) table. To avoid expensive index reorganization during DML operations for an [InnoDB FULLTEXT](#) index, the information about newly deleted words is stored separately, filtered out of search results when you do a text search, and removed from the main search index only when you issue an [OPTIMIZE TABLE](#) statement for the [InnoDB](#) table. For more information, see [Optimizing InnoDB Full-Text Indexes](#).

This table is empty initially. Before querying it, set the value of the [innodb\\_ft\\_aux\\_table](#) system variable to the name (including the database name) of the table that contains the [FULLTEXT](#) index (for example, [test/articles](#)).

For related usage information and examples, see [Section 15.15.4, “InnoDB INFORMATION\\_SCHEMA FULLTEXT Index Tables”](#).

The [INNODB\\_FT\\_DELETED](#) table has these columns:

- [DOC\\_ID](#)

The document ID of the newly deleted row. This value might reflect the value of an ID column that you defined for the underlying table, or it can be a sequence value generated by [InnoDB](#) when the table contains no suitable column. This value is used when you perform text searches, to skip rows in the [INNODB\\_FT\\_INDEX\\_TABLE](#) table before data for deleted rows is physically removed from the [FULLTEXT](#) index by an [OPTIMIZE TABLE](#) statement. For more information, see [Optimizing InnoDB Full-Text Indexes](#).

## Example

```

mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_FT_DELETED;
+-----+
| DOC_ID |
+-----+
| 6 |
| 7 |
| 8 |
+-----+

```

## Notes

- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.
- For more information about [InnoDB FULLTEXT](#) search, see [Section 15.6.2.4, “InnoDB Full-Text Indexes”](#), and [Section 12.10, “Full-Text Search Functions”](#).

## 26.4.18 The INFORMATION\_SCHEMA INNODB\_FT\_INDEX\_CACHE Table

The `INNODB_FT_INDEX_CACHE` table provides token information about newly inserted rows in a `FULLTEXT` index. To avoid expensive index reorganization during DML operations, the information about newly indexed words is stored separately, and combined with the main search index only when `OPTIMIZE TABLE` is run, when the server is shut down, or when the cache size exceeds a limit defined by the `innodb_ft_cache_size` or `innodb_ft_total_cache_size` system variable.

This table is empty initially. Before querying it, set the value of the `innodb_ft_aux_table` system variable to the name (including the database name) of the table that contains the `FULLTEXT` index (for example, `test/articles`).

For related usage information and examples, see [Section 15.15.4, “InnoDB INFORMATION\\_SCHEMA FULLTEXT Index Tables”](#).

The `INNODB_FT_INDEX_CACHE` table has these columns:

- `WORD`

A word extracted from the text of a newly inserted row.

- `FIRST_DOC_ID`

The first document ID in which this word appears in the `FULLTEXT` index.

- `LAST_DOC_ID`

The last document ID in which this word appears in the `FULLTEXT` index.

- `DOC_COUNT`

The number of rows in which this word appears in the `FULLTEXT` index. The same word can occur several times within the cache table, once for each combination of `DOC_ID` and `POSITION` values.

- `DOC_ID`

The document ID of the newly inserted row. This value might reflect the value of an ID column that you defined for the underlying table, or it can be a sequence value generated by `InnoDB` when the table contains no suitable column.

- `POSITION`

The position of this particular instance of the word within the relevant document identified by the `DOC_ID` value. The value does not represent an absolute position; it is an offset added to the `POSITION` of the previous instance of that word.

## Notes

- This table is empty initially. Before querying it, set the value of the `innodb_ft_aux_table` system variable to the name (including the database name) of the table that contains the `FULLTEXT` index (for example `test/articles`). The following example demonstrates how to use the `innodb_ft_aux_table` system variable to show information about a `FULLTEXT` index for a specified table.

```
mysql> USE test;

mysql> CREATE TABLE articles (
 id INT UNSIGNED AUTO_INCREMENT NOT NULL PRIMARY KEY,
 title VARCHAR(200),
 body TEXT,
 FULLTEXT (title,body)
) ENGINE=InnoDB;

mysql> INSERT INTO articles (title,body) VALUES
('MySQL Tutorial','DBMS stands for DataBase ...'),
('How To Use MySQL Well','After you went through a ...'),
```

```

('Optimizing MySQL','In this tutorial we show ...'),
('1001 MySQL Tricks','1. Never run mysqld as root. 2. ...'),
('MySQL vs. YourSQL','In the following database comparison ...'),
('MySQL Security','When configured properly, MySQL ...');

mysql> SET GLOBAL innodb_ft_aux_table = 'test/articles';

mysql> SELECT WORD, DOC_COUNT, DOC_ID, POSITION
FROM INFORMATION_SCHEMA.INNODB_FT_INDEX_CACHE LIMIT 5;
+-----+-----+-----+-----+
| WORD | DOC_COUNT | DOC_ID | POSITION |
+-----+-----+-----+-----+
1001	1	4	0
after	1	2	22
comparison	1	5	44
configured	1	6	20
database	2	1	31
+-----+-----+-----+-----+

```

- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.
- For more information about [InnoDB FULLTEXT](#) search, see [Section 15.6.2.4, “InnoDB Full-Text Indexes”](#), and [Section 12.10, “Full-Text Search Functions”](#).

## 26.4.19 The INFORMATION\_SCHEMA INNODB\_FT\_INDEX\_TABLE Table

The [INNODB\\_FT\\_INDEX\\_TABLE](#) table provides information about the inverted index used to process text searches against the [FULLTEXT](#) index of an [InnoDB](#) table.

This table is empty initially. Before querying it, set the value of the [innodb\\_ft\\_aux\\_table](#) system variable to the name (including the database name) of the table that contains the [FULLTEXT](#) index (for example, `test/articles`).

For related usage information and examples, see [Section 15.15.4, “InnoDB INFORMATION\\_SCHEMA FULLTEXT Index Tables”](#).

The [INNODB\\_FT\\_INDEX\\_TABLE](#) table has these columns:

- [WORD](#)

A word extracted from the text of the columns that are part of a [FULLTEXT](#).

- [FIRST\\_DOC\\_ID](#)

The first document ID in which this word appears in the [FULLTEXT](#) index.

- [LAST\\_DOC\\_ID](#)

The last document ID in which this word appears in the [FULLTEXT](#) index.

- [DOC\\_COUNT](#)

The number of rows in which this word appears in the [FULLTEXT](#) index. The same word can occur several times within the cache table, once for each combination of [DOC\\_ID](#) and [POSITION](#) values.

- [DOC\\_ID](#)

The document ID of the row containing the word. This value might reflect the value of an ID column that you defined for the underlying table, or it can be a sequence value generated by [InnoDB](#) when the table contains no suitable column.

- [POSITION](#)

The position of this particular instance of the word within the relevant document identified by the `DOC_ID` value.

## Notes

- This table is empty initially. Before querying it, set the value of the `innodb_ft_aux_table` system variable to the name (including the database name) of the table that contains the `FULLTEXT` index (for example, `test/articles`). The following example demonstrates how to use the `innodb_ft_aux_table` system variable to show information about a `FULLTEXT` index for a specified table. Before information for newly inserted rows appears in `INNODB_FT_INDEX_TABLE`, the `FULLTEXT` index cache must be flushed to disk. This is accomplished by running an `OPTIMIZE TABLE` operation on the indexed table with the `innodb_optimize_fulltext_only` system variable enabled. (The example disables that variable again at the end because it is intended to be enabled only temporarily.)

```
mysql> USE test;

mysql> CREATE TABLE articles (
 id INT UNSIGNED AUTO_INCREMENT NOT NULL PRIMARY KEY,
 title VARCHAR(200),
 body TEXT,
 FULLTEXT (title,body)
) ENGINE=InnoDB;

mysql> INSERT INTO articles (title,body) VALUES
('MySQL Tutorial','DBMS stands for DataBase ...'),
('How To Use MySQL Well','After you went through a ...'),
('Optimizing MySQL','In this tutorial we show ...'),
('1001 MySQL Tricks','1. Never run mysqld as root. 2. ...'),
('MySQL vs. YourSQL','In the following database comparison ...'),
('MySQL Security','When configured properly, MySQL ...');

mysql> SET GLOBAL innodb_optimize_fulltext_only=ON;

mysql> OPTIMIZE TABLE articles;
+-----+-----+-----+-----+
| Table | Op | Msg_type | Msg_text |
+-----+-----+-----+-----+
| test.articles | optimize | status | OK |
+-----+-----+-----+-----+

mysql> SET GLOBAL innodb_ft_aux_table = 'test/articles';

mysql> SELECT WORD, DOC_COUNT, DOC_ID, POSITION
FROM INFORMATION_SCHEMA.INNODB_FT_INDEX_TABLE LIMIT 5;
+-----+-----+-----+-----+
| WORD | DOC_COUNT | DOC_ID | POSITION |
+-----+-----+-----+-----+
1001	1	4	0
after	1	2	22
comparison	1	5	44
configured	1	6	20
database	2	1	31
+-----+-----+-----+-----+

mysql> SET GLOBAL innodb_optimize_fulltext_only=OFF;
```

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.
- For more information about `InnoDB FULLTEXT` search, see [Section 15.6.2.4, “InnoDB Full-Text Indexes”](#), and [Section 12.10, “Full-Text Search Functions”](#).

## 26.4.20 The INFORMATION\_SCHEMA INNODB\_INDEXES Table

The `INNODB_INDEXES` table provides metadata about `InnoDB` indexes.

For related usage information and examples, see [Section 15.15.3, “InnoDB INFORMATION\\_SCHEMA Schema Object Tables”](#).

The `INNODB_INDEXES` table has these columns:

- `INDEX_ID`

An identifier for the index. Index identifiers are unique across all the databases in an instance.

- `NAME`

The name of the index. Most indexes created implicitly by `InnoDB` have consistent names but the index names are not necessarily unique. Examples: `PRIMARY` for a primary key index, `GEN_CLUST_INDEX` for the index representing a primary key when one is not specified, and `ID_IND`, `FOR_IND`, and `REF_IND` for foreign key constraints.

- `TABLE_ID`

An identifier representing the table associated with the index; the same value as `INNODB_TABLES.TABLE_ID`.

- `TYPE`

A numeric value derived from bit-level information that identifies the index type. 0 = nonunique secondary index; 1 = automatically generated clustered index (`GEN_CLUST_INDEX`); 2 = unique nonclustered index; 3 = clustered index; 32 = full-text index; 64 = spatial index; 128 = secondary index on a [virtual generated column](#).

- `N_FIELDS`

The number of columns in the index key. For `GEN_CLUST_INDEX` indexes, this value is 0 because the index is created using an artificial value rather than a real table column.

- `PAGE_NO`

The root page number of the index B-tree. For full-text indexes, the `PAGE_NO` column is unused and set to -1 (`FIL_NULL`) because the full-text index is laid out in several B-trees (auxiliary tables).

- `SPACE`

An identifier for the tablespace where the index resides. 0 means the `InnoDB system tablespace`. Any other number represents a table created with a separate `.ibd` file in [file-per-table](#) mode. This identifier stays the same after a `TRUNCATE TABLE` statement. Because all indexes for a table reside in the same tablespace as the table, this value is not necessarily unique.

- `MERGE_THRESHOLD`

The merge threshold value for index pages. If the amount of data in an index page falls below the `MERGE_THRESHOLD` value when a row is deleted or when a row is shortened by an update operation, `InnoDB` attempts to merge the index page with the neighboring index page. The default threshold value is 50%. For more information, see [Section 15.8.11, “Configuring the Merge Threshold for Index Pages”](#).

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_INDEXES WHERE TABLE_ID = 34\G
***** 1. row *****
INDEX_ID: 39
NAME: GEN_CLUST_INDEX
TABLE_ID: 34
TYPE: 1
```

```

 N_FIELDS: 0
 PAGE_NO: 3
 SPACE: 23
MERGE_THRESHOLD: 50
***** 2. row *****
 INDEX_ID: 40
 NAME: i1
 TABLE_ID: 34
 TYPE: 0
 N_FIELDS: 1
 PAGE_NO: 4
 SPACE: 23
MERGE_THRESHOLD: 50

```

## Notes

- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.

### 26.4.21 The INFORMATION\_SCHEMA INNODB\_METRICS Table

The [INNODB\\_METRICS](#) table provides a wide variety of [InnoDB](#) performance information, complementing the specific focus areas of the Performance Schema tables for [InnoDB](#). With simple queries, you can check the overall health of the system. With more detailed queries, you can diagnose issues such as performance bottlenecks, resource shortages, and application issues.

Each monitor represents a point within the [InnoDB](#) source code that is instrumented to gather counter information. Each counter can be started, stopped, and reset. You can also perform these actions for a group of counters using their common module name.

By default, relatively little data is collected. To start, stop, and reset counters, set one of the system variables [innodb\\_monitor\\_enable](#), [innodb\\_monitor\\_disable](#), [innodb\\_monitor\\_reset](#), or [innodb\\_monitor\\_reset\\_all](#), using the name of the counter, the name of the module, a wildcard match for such a name using the “%” character, or the special keyword [all](#).

For usage information, see [Section 15.15.6, “InnoDB INFORMATION\\_SCHEMA Metrics Table”](#).

The [INNODB\\_METRICS](#) table has these columns:

- [NAME](#)  
A unique name for the counter.
- [SUBSYSTEM](#)  
The aspect of [InnoDB](#) that the metric applies to.
- [COUNT](#)  
The value since the counter was enabled.
- [MAX\\_COUNT](#)  
The maximum value since the counter was enabled.
- [MIN\\_COUNT](#)  
The minimum value since the counter was enabled.
- [AVG\\_COUNT](#)  
The average value since the counter was enabled.

- [COUNT\\_RESET](#)

The counter value since it was last reset. (The [\\_RESET](#) columns act like the lap counter on a stopwatch: you can measure the activity during some time interval, while the cumulative figures are still available in [COUNT](#), [MAX\\_COUNT](#), and so on.)

- [MAX\\_COUNT\\_RESET](#)

The maximum counter value since it was last reset.

- [MIN\\_COUNT\\_RESET](#)

The minimum counter value since it was last reset.

- [AVG\\_COUNT\\_RESET](#)

The average counter value since it was last reset.

- [TIME\\_ENABLED](#)

The timestamp of the last start.

- [TIME\\_DISABLED](#)

The timestamp of the last stop.

- [TIME\\_ELAPSED](#)

The elapsed time in seconds since the counter started.

- [TIME\\_RESET](#)

The timestamp of the last reset.

- [STATUS](#)

Whether the counter is still running ([enabled](#)) or stopped ([disabled](#)).

- [TYPE](#)

Whether the item is a cumulative counter, or measures the current value of some resource.

- [COMMENT](#)

The counter description.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_METRICS WHERE NAME='dml_inserts'\G
***** 1. row *****
 NAME: dml_inserts
 SUBSYSTEM: dml
 COUNT: 3
 MAX_COUNT: 3
 MIN_COUNT: NULL
 AVG_COUNT: 0.046153846153846156
 COUNT_RESET: 3
MAX_COUNT_RESET: 3
MIN_COUNT_RESET: NULL
AVG_COUNT_RESET: NULL
 TIME_ENABLED: 2014-12-04 14:18:28
 TIME_DISABLED: NULL
 TIME_ELAPSED: 65
 TIME_RESET: NULL
 STATUS: enabled
 TYPE: status_counter
```

COMMENT: Number of rows inserted

## Notes

- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.
- Transaction counter [COUNT](#) values may differ from the number of transaction events reported in Performance Schema [EVENTS\\_TRANSACTIONS\\_SUMMARY](#) tables. [InnoDB](#) counts only those transactions that it executes, whereas Performance Schema collects events for all non-aborted transactions initiated by the server, including empty transactions.

## 26.4.22 The INFORMATION\_SCHEMA INNODB\_SESSION\_TEMP\_TABLESPACES Table

The [INNODB\\_SESSION\\_TEMP\\_TABLESPACES](#) table provides metadata about session temporary tablespaces used for internal and user-created temporary tables. This table was added in MySQL 8.0.13.

The [INNODB\\_SESSION\\_TEMP\\_TABLESPACES](#) table has these columns:

- [ID](#)

The process or session ID.

- [SPACE](#)

The tablespace ID. A range of 400 thousand space IDs is reserved for session temporary tablespaces. Session temporary tablespaces are recreated each time the server is started. Space IDs are not persisted when the server is shut down and may be reused.

- [PATH](#)

The tablespace data file path. A session temporary tablespace has an [ibt](#) file extension.

- [SIZE](#)

The size of the tablespace, in bytes.

- [STATE](#)

The state of the tablespace. [ACTIVE](#) indicates that the tablespace is currently used by a session. [INACTIVE](#) indicates that the tablespace is in the pool of available session temporary tablespaces.

- [PURPOSE](#)

The purpose of the tablespace. [INTRINSIC](#) indicates that the tablespace is used for optimized internal temporary tables use by the optimizer. [SLAVE](#) indicates that the tablespace is allocated for storing user-created temporary tables on a replication slave. [USER](#) indicates that the tablespace is used for user-created temporary tables. [NONE](#) indicates that the tablespace is not in use.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_SESSION_TEMP_TABLESPACES;
```

| ID | SPACE      | PATH                       | SIZE  | STATE    | PURPOSE   |
|----|------------|----------------------------|-------|----------|-----------|
| 8  | 4294566162 | ./#innodb_temp/temp_10.ibt | 81920 | ACTIVE   | INTRINSIC |
| 8  | 4294566161 | ./#innodb_temp/temp_9.ibt  | 98304 | ACTIVE   | USER      |
| 0  | 4294566153 | ./#innodb_temp/temp_1.ibt  | 81920 | INACTIVE | NONE      |
| 0  | 4294566154 | ./#innodb_temp/temp_2.ibt  | 81920 | INACTIVE | NONE      |

|   |            |                           |       |          |      |  |
|---|------------|---------------------------|-------|----------|------|--|
| 0 | 4294566155 | ./#innodb_temp/temp_3.ibt | 81920 | INACTIVE | NONE |  |
| 0 | 4294566156 | ./#innodb_temp/temp_4.ibt | 81920 | INACTIVE | NONE |  |
| 0 | 4294566157 | ./#innodb_temp/temp_5.ibt | 81920 | INACTIVE | NONE |  |
| 0 | 4294566158 | ./#innodb_temp/temp_6.ibt | 81920 | INACTIVE | NONE |  |
| 0 | 4294566159 | ./#innodb_temp/temp_7.ibt | 81920 | INACTIVE | NONE |  |
| 0 | 4294566160 | ./#innodb_temp/temp_8.ibt | 81920 | INACTIVE | NONE |  |

## Notes

- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.

## 26.4.23 The INFORMATION\_SCHEMA INNODB\_TABLES Table

The [INNODB\\_TABLES](#) table provides metadata about [InnoDB](#) tables.

For related usage information and examples, see [Section 15.15.3, “InnoDB INFORMATION\\_SCHEMA Schema Object Tables”](#).

The [INNODB\\_TABLES](#) table has these columns:

- [TABLE\\_ID](#)

An identifier for the [InnoDB](#) table. This value is unique across all databases in the instance.

- [NAME](#)

The name of the table, preceded by the schema (database) name where appropriate (for example, [test/t1](#)). Names of databases and user tables are in the same case as they were originally defined, possibly influenced by the [lower\\_case\\_table\\_names](#) setting.

- [FLAG](#)

A numeric value that represents bit-level information about table format and storage characteristics.

- [N\\_COLS](#)

The number of columns in the table. The number reported includes three hidden columns that are created by [InnoDB](#) ([DB\\_ROW\\_ID](#), [DB\\_TRX\\_ID](#), and [DB\\_ROLL\\_PTR](#)). The number reported also includes [virtual generated columns](#), if present.

- [SPACE](#)

An identifier for the tablespace where the table resides. 0 means the [InnoDB system tablespace](#). Any other number represents either a [file-per-table](#) tablespace or a general tablespace. This identifier stays the same after a [TRUNCATE TABLE](#) statement. For file-per-table tablespaces, this identifier is unique for tables across all databases in the instance.

- [ROW\\_FORMAT](#)

The table's row format ([Compact](#), [Redundant](#), [Dynamic](#), or [Compressed](#)).

- [ZIP\\_PAGE\\_SIZE](#)

The zip page size. Applies only to tables with a row format of [Compressed](#).

- [SPACE\\_TYPE](#)

The type of tablespace to which the table belongs. Possible values include [System](#) for the system tablespace, [General](#) for general tablespaces, and [Single](#) for file-per-table

tablespaces. Tables assigned to the system tablespace using `CREATE TABLE` or `ALTER TABLE TABLESPACE=innodb_system` have a `SPACE_TYPE` of `General`. For more information, see `CREATE TABLESPACE`.

- `INSTANT_COLS`

The number of columns in the table prior to adding the first instant column using `ALTER TABLE ... ADD COLUMN` with `ALGORITHM=INSTANT`.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_TABLES WHERE TABLE_ID = 214\G
***** 1. row *****
TABLE_ID: 214
NAME: test/t1
FLAG: 129
N_COLS: 4
SPACE: 233
ROW_FORMAT: Compact
ZIP_PAGE_SIZE: 0
SPACE_TYPE: General
INSTANT_COLS: 0
```

## Notes

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

## 26.4.24 The INFORMATION\_SCHEMA INNODB\_TABLESPACES Table

The `INNODB_TABLESPACES` table provides metadata about `InnoDB` file-per-table, general, and undo tablespaces.

For related usage information and examples, see [Section 15.15.3, “InnoDB INFORMATION\\_SCHEMA Schema Object Tables”](#).

### Note

The `INFORMATION_SCHEMA FILES` table reports metadata for `InnoDB` tablespace types including file-per-table tablespaces, general tablespaces, the system tablespace, the global temporary tablespace, and undo tablespaces.

The `INNODB_TABLESPACES` table has these columns:

- `SPACE`

The tablespace ID.

- `NAME`

The schema (database) and table name.

- `FLAG`

A numeric value that represents bit-level information about tablespace format and storage characteristics.

- `ROW_FORMAT`

The tablespace row format (`Compact` or `Redundant`, `Dynamic` or `Compressed`, or `Undo`). The data in this column is interpreted from the tablespace flag information that resides in the data file.

There is no way to determine from this flag information if the tablespace row format is [Redundant](#) or [Compact](#), which is why one of the possible `ROW_FORMAT` values is [Compact](#) or [Redundant](#).

- [PAGE\\_SIZE](#)

The tablespace page size. The data in this column is interpreted from the tablespace flags information that resides in the [.ibd file](#).

- [ZIP\\_PAGE\\_SIZE](#)

The tablespace zip page size. The data in this column is interpreted from the tablespace flags information that resides in the [.ibd file](#).

- [SPACE\\_TYPE](#)

The type of tablespace. Possible values include [General](#) for general tablespaces, [Single](#) for file-per-table tablespaces, [System](#) for the system tablespace, and [Undo](#) for undo tablespaces.

- [FS\\_BLOCK\\_SIZE](#)

The file system block size, which is the unit size used for hole punching. This column pertains to the [InnoDB transparent page compression](#) feature.

- [FILE\\_SIZE](#)

The apparent size of the file, which represents the maximum size of the file, uncompressed. This column pertains to the [InnoDB transparent page compression](#) feature.

- [ALLOCATED\\_SIZE](#)

The actual size of the file, which is the amount of space allocated on disk. This column pertains to the [InnoDB transparent page compression](#) feature.

- [AUTOEXTEND\\_SIZE](#)

The auto-extend size of the tablespace. This column was added in MySQL 8.0.23.

- [SERVER\\_VERSION](#)

The MySQL version that created the tablespace, or the MySQL version into which the tablespace was imported, or the version of the last major MySQL version upgrade. The value is unchanged by a release series upgrade, such as an upgrade from MySQL 8.0.x to 8.0.y. The value can be considered a “creation” marker or “certified” marker for the tablespace.

- [SPACE\\_VERSION](#)

The tablespace version, used to track changes to the tablespace format.

- [ENCRYPTION](#)

Whether the tablespace is encrypted. This column was added in MySQL 8.0.13.

- [STATE](#)

The tablespace state. This column was added in MySQL 8.0.14.

For file-per-table and general tablespaces, states include:

- [normal](#): The tablespace is normal and active.
- [discarded](#): The tablespace was discarded by an `ALTER TABLE ... DISCARD TABLESPACE` statement.

- **corrupted**: The tablespace is identified by InnoDB as corrupted.

For undo tablespaces, states include:

- **active**: Rollback segments in the undo tablespace can be allocated to new transactions.
- **inactive**: Rollback segments in the undo tablespace are no longer used by new transactions. The truncate process is in progress. The undo tablespace was either selected by the purge thread implicitly or was made inactive by an `ALTER UNDO TABLESPACE ... SET INACTIVE` statement.
- **empty**: The undo tablespace was truncated and is no longer active. It is ready to be dropped or made active again by an `ALTER UNDO TABLESPACE ... SET INACTIVE` statement.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_TABLESPACES WHERE SPACE = 26\G
***** 1. row *****
 SPACE: 26
 NAME: test/t1
 FLAG: 0
 ROW_FORMAT: Compact or Redundant
 PAGE_SIZE: 16384
 ZIP_PAGE_SIZE: 0
 SPACE_TYPE: Single
 FS_BLOCK_SIZE: 4096
 FILE_SIZE: 98304
 ALLOCATED_SIZE: 65536
 AUTOEXTEND_SIZE: 0
 SERVER_VERSION: 8.0.23
 SPACE_VERSION: 1
 ENCRYPTION: N
 STATE: normal
```

## Notes

- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA.COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

### 26.4.25 The INFORMATION\_SCHEMA INNODB\_TABLESPACES\_BRIEF Table

The `INNODB_TABLESPACES_BRIEF` table provides space ID, name, path, flag, and space type metadata for file-per-table, general, undo, and system tablespaces.

`INNODB_TABLESPACES` provides the same metadata but loads more slowly because other metadata provided by the table, such as `FS_BLOCK_SIZE`, `FILE_SIZE`, and `ALLOCATED_SIZE`, must be loaded dynamically.

Space and path metadata is also provided by the `INNODB_DATAFILES` table.

The `INNODB_TABLESPACES_BRIEF` table has these columns:

- **SPACE**

The tablespace ID.

- **NAME**

The tablespace name. For file-per-table tablespaces, the name is in the form of `schema/table_name`.

- [PATH](#)

The tablespace data file path. If a [file-per-table](#) tablespace is created in a location outside the MySQL data directory, the path value is a fully qualified directory path. Otherwise, the path is relative to the data directory.

- [FLAG](#)

A numeric value that represents bit-level information about tablespace format and storage characteristics.

- [SPACE\\_TYPE](#)

The type of tablespace. Possible values include [General](#) for [InnoDB](#) general tablespaces, [Single](#) for [InnoDB](#) file-per-table tablespaces, and [System](#) for the [InnoDB](#) system tablespace.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_TABLESPACES_BRIEF WHERE SPACE = 7;
```

| SPACE | NAME    | PATH          | FLAG  | SPACE_TYPE |
|-------|---------|---------------|-------|------------|
| 7     | test/t1 | ./test/t1.ibd | 16417 | Single     |

## Notes

- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.

## 26.4.26 The INFORMATION\_SCHEMA INNODB\_TABLESTATS View

The [INNODB\\_TABLESTATS](#) table provides a view of low-level status information about [InnoDB](#) tables. This data is used by the MySQL optimizer to calculate which index to use when querying an [InnoDB](#) table. This information is derived from in-memory data structures rather than data stored on disk. There is no corresponding internal [InnoDB](#) system table.

[InnoDB](#) tables are represented in this view if they have been opened since the last server restart and have not aged out of the table cache. Tables for which persistent stats are available are always represented in this view.

Table statistics are updated only for [DELETE](#) or [UPDATE](#) operations that modify indexed columns. Statistics are not updated by operations that modify only nonindexed columns.

[ANALYZE TABLE](#) clears table statistics and sets the [STATS\\_INITIALIZED](#) column to [Uninitialized](#). Statistics are collected again the next time the table is accessed.

For related usage information and examples, see [Section 15.15.3, “InnoDB INFORMATION\\_SCHEMA Schema Object Tables”](#).

The [INNODB\\_TABLESTATS](#) table has these columns:

- [TABLE\\_ID](#)

An identifier representing the table for which statistics are available; the same value as [INNODB\\_TABLES.TABLE\\_ID](#).

- [NAME](#)

The name of the table; the same value as [INNODB\\_TABLES.NAME](#).

- `STATS_INITIALIZED`

The value is `Initialized` if the statistics are already collected, `Uninitialized` if not.

- `NUM_ROWS`

The current estimated number of rows in the table. Updated after each DML operation. The value could be imprecise if uncommitted transactions are inserting into or deleting from the table.

- `CLUST_INDEX_SIZE`

The number of pages on disk that store the clustered index, which holds the `InnoDB` table data in primary key order. This value might be null if no statistics are collected yet for the table.

- `OTHER_INDEX_SIZE`

The number of pages on disk that store all secondary indexes for the table. This value might be null if no statistics are collected yet for the table.

- `MODIFIED_COUNTER`

The number of rows modified by DML operations, such as `INSERT`, `UPDATE`, `DELETE`, and also cascade operations from foreign keys. This column is reset each time table statistics are recalculated.

- `AUTOINC`

The next number to be issued for any auto-increment-based operation. The rate at which the `AUTOINC` value changes depends on how many times auto-increment numbers have been requested and how many numbers are granted per request.

- `REF_COUNT`

When this counter reaches zero, the table metadata can be evicted from the table cache.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_TABLESTATS where TABLE_ID = 71\G
***** 1. row *****
 TABLE_ID: 71
 NAME: test/t1
STATS_INITIALIZED: Initialized
 NUM_ROWS: 1
 CLUST_INDEX_SIZE: 1
 OTHER_INDEX_SIZE: 0
 MODIFIED_COUNTER: 1
 AUTOINC: 0
 REF_COUNT: 1
```

## Notes

- This table is useful primarily for expert-level performance monitoring, or when developing performance-related extensions for MySQL.
- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

## 26.4.27 The INFORMATION\_SCHEMA INNODB\_TEMP\_TABLE\_INFO Table

The `INNODB_TEMP_TABLE_INFO` table provides information about user-created `InnoDB` temporary tables that are active in an `InnoDB` instance. It does not provide information about internal `InnoDB` temporary tables used by the optimizer. The `INNODB_TEMP_TABLE_INFO` table is created when first queried, exists only in memory, and is not persisted to disk.

For usage information and examples, see [Section 15.15.7, “InnoDB INFORMATION\\_SCHEMA Temporary Table Info Table”](#).

The `INNODB_TEMP_TABLE_INFO` table has these columns:

- `TABLE_ID`

The table ID of the temporary table.

- `NAME`

The name of the temporary table.

- `N_COLS`

The number of columns in the temporary table. The number includes three hidden columns created by InnoDB (`DB_ROW_ID`, `DB_TRX_ID`, and `DB_ROLL_PTR`).

- `SPACE`

The ID of the temporary tablespace where the temporary table resides.

## Example

```
mysql> CREATE TEMPORARY TABLE t1 (c1 INT PRIMARY KEY) ENGINE=INNODB;

mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_TEMP_TABLE_INFO\G
***** 1. row *****
TABLE_ID: 97
 NAME: #sql8c88_43_0
 N_COLS: 4
 SPACE: 76
```

## Notes

- This table is useful primarily for expert-level monitoring.
- You must have the `PROCESS` privilege to query this table.
- Use the `INFORMATION_SCHEMA COLUMNS` table or the `SHOW COLUMNS` statement to view additional information about the columns of this table, including data types and default values.

## 26.4.28 The INFORMATION\_SCHEMA INNODB\_TRX Table

The `INNODB_TRX` table provides information about every transaction currently executing inside InnoDB, including whether the transaction is waiting for a lock, when the transaction started, and the SQL statement the transaction is executing, if any.

For usage information, see [Section 15.15.2.1, “Using InnoDB Transaction and Locking Information”](#).

The `INNODB_TRX` table has these columns:

- `TRX_ID`

A unique transaction ID number, internal to InnoDB. These IDs are not created for transactions that are read only and nonlocking. For details, see [Section 8.5.3, “Optimizing InnoDB Read-Only Transactions”](#).

- `TRX_WEIGHT`

The weight of a transaction, reflecting (but not necessarily the exact count of) the number of rows altered and the number of rows locked by the transaction. To resolve a deadlock, InnoDB selects the transaction with the smallest weight as the “victim” to roll back. Transactions that have changed

nontransactional tables are considered heavier than others, regardless of the number of altered and locked rows.

- [TRX\\_STATE](#)

The transaction execution state. Permitted values are [RUNNING](#), [LOCK WAIT](#), [ROLLING BACK](#), and [COMMITTING](#).

- [TRX\\_STARTED](#)

The transaction start time.

- [TRX\\_REQUESTED\\_LOCK\\_ID](#)

The ID of the lock the transaction is currently waiting for, if [TRX\\_STATE](#) is [LOCK WAIT](#); otherwise [NULL](#). To obtain details about the lock, join this column with the [ENGINE\\_LOCK\\_ID](#) column of the Performance Schema [data\\_locks](#) table.

- [TRX\\_WAIT\\_STARTED](#)

The time when the transaction started waiting on the lock, if [TRX\\_STATE](#) is [LOCK WAIT](#); otherwise [NULL](#).

- [TRX\\_MYSQL\\_THREAD\\_ID](#)

The MySQL thread ID. To obtain details about the thread, join this column with the [ID](#) column of the [INFORMATION\\_SCHEMA PROCESSLIST](#) table, but see [Section 15.15.2.3, “Persistence and Consistency of InnoDB Transaction and Locking Information”](#).

- [TRX\\_QUERY](#)

The SQL statement that is being executed by the transaction.

- [TRX\\_OPERATION\\_STATE](#)

The transaction's current operation, if any; otherwise [NULL](#).

- [TRX\\_TABLES\\_IN\\_USE](#)

The number of [InnoDB](#) tables used while processing the current SQL statement of this transaction.

- [TRX\\_TABLES\\_LOCKED](#)

The number of [InnoDB](#) tables that the current SQL statement has row locks on. (Because these are row locks, not table locks, the tables can usually still be read from and written to by multiple transactions, despite some rows being locked.)

- [TRX\\_LOCK\\_STRUCTS](#)

The number of locks reserved by the transaction.

- [TRX\\_LOCK\\_MEMORY\\_BYTES](#)

The total size taken up by the lock structures of this transaction in memory.

- [TRX\\_ROWS\\_LOCKED](#)

The approximate number of rows locked by this transaction. The value might include delete-marked rows that are physically present but not visible to the transaction.

- [TRX\\_ROWS\\_MODIFIED](#)

The number of modified and inserted rows in this transaction.

- [TRX\\_CONCURRENCY\\_TICKETS](#)

A value indicating how much work the current transaction can do before being swapped out, as specified by the [innodb\\_concurrency\\_tickets](#) system variable.

- [TRX\\_ISOLATION\\_LEVEL](#)

The isolation level of the current transaction.

- [TRX\\_UNIQUE\\_CHECKS](#)

Whether unique checks are turned on or off for the current transaction. For example, they might be turned off during a bulk data load.

- [TRX\\_FOREIGN\\_KEY\\_CHECKS](#)

Whether foreign key checks are turned on or off for the current transaction. For example, they might be turned off during a bulk data load.

- [TRX\\_LAST\\_FOREIGN\\_KEY\\_ERROR](#)

The detailed error message for the last foreign key error, if any; otherwise [NULL](#).

- [TRX\\_ADAPTIVE\\_HASH\\_LATCHED](#)

Whether the adaptive hash index is locked by the current transaction. When the adaptive hash index search system is partitioned, a single transaction does not lock the entire adaptive hash index. Adaptive hash index partitioning is controlled by [innodb\\_adaptive\\_hash\\_index\\_parts](#), which is set to 8 by default.

- [TRX\\_ADAPTIVE\\_HASH\\_TIMEOUT](#)

Whether to relinquish the search latch immediately for the adaptive hash index, or reserve it across calls from MySQL. When there is no adaptive hash index contention, this value remains zero and statements reserve the latch until they finish. During times of contention, it counts down to zero, and statements release the latch immediately after each row lookup. When the adaptive hash index search system is partitioned (controlled by [innodb\\_adaptive\\_hash\\_index\\_parts](#)), the value remains 0.

- [TRX\\_IS\\_READ\\_ONLY](#)

A value of 1 indicates the transaction is read only.

- [TRX\\_AUTOCOMMIT\\_NON\\_LOCKING](#)

A value of 1 indicates the transaction is a [SELECT](#) statement that does not use the [FOR UPDATE](#) or [LOCK IN SHARED MODE](#) clauses, and is executing with [autocommit](#) enabled so that the transaction contains only this one statement. When this column and [TRX\\_IS\\_READ\\_ONLY](#) are both 1, [InnoDB](#) optimizes the transaction to reduce the overhead associated with transactions that change table data.

- [TRX\\_SCHEDULE\\_WEIGHT](#)

The transaction schedule weight assigned by the Contention-Aware Transaction Scheduling (CATS) algorithm to transactions waiting for a lock. The value is relative to the values of other transactions. A higher value has a greater weight. A value is computed only for transactions in a [LOCK WAIT](#) state, as reported by the [TRX\\_STATE](#) column. A [NULL](#) value is reported for transactions that are not waiting for a lock. The [TRX\\_SCHEDULE\\_WEIGHT](#) value is different from the [TRX\\_WEIGHT](#) value, which is computed by a different algorithm for a different purpose.

## Example

```
mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_TRX\G
```

```

***** 1. row *****
 trx_id: 1510
 trx_state: RUNNING
 trx_started: 2014-11-19 13:24:40
 trx_requested_lock_id: NULL
 trx_wait_started: NULL
 trx_weight: 586739
 trx_mysql_thread_id: 2
 trx_query: DELETE FROM employees.salaries WHERE salary > 65000
 trx_operation_state: updating or deleting
 trx_tables_in_use: 1
 trx_tables_locked: 1
 trx_lock_structs: 3003
 trx_lock_memory_bytes: 450768
 trx_rows_locked: 1407513
 trx_rows_modified: 583736
 trx_concurrency_tickets: 0
 trx_isolation_level: REPEATABLE READ
 trx_unique_checks: 1
 trx_foreign_key_checks: 1
 trx_last_foreign_key_error: NULL
 trx_adaptive_hash_latched: 0
 trx_adaptive_hash_timeout: 10000
 trx_is_read_only: 0
 trx_autocommit_non_locking: 0
 trx_schedule_weight: NULL

```

## Notes

- Use this table to help diagnose performance problems that occur during times of heavy concurrent load. Its contents are updated as described in [Section 15.15.2.3, “Persistence and Consistency of InnoDB Transaction and Locking Information”](#).
- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.

## 26.4.29 The INFORMATION\_SCHEMA INNODB\_VIRTUAL Table

The [INNODB\\_VIRTUAL](#) table provides metadata about [InnoDB virtual generated columns](#) and columns upon which virtual generated columns are based.

A row appears in the [INNODB\\_VIRTUAL](#) table for each column upon which a virtual generated column is based.

The [INNODB\\_VIRTUAL](#) table has these columns:

- [TABLE\\_ID](#)

An identifier representing the table associated with the virtual column; the same value as [INNODB\\_TABLES.TABLE\\_ID](#).

- [POS](#)

The position value of the [virtual generated column](#). The value is large because it encodes the column sequence number and ordinal position. The formula used to calculate the value uses a bitwise operation:

```
((nth virtual generated column for the InnoDB instance + 1) << 16)
+ the ordinal position of the virtual generated column
```

For example, if the first virtual generated column in the [InnoDB](#) instance is the third column of the table, the formula is  $(0 + 1) \ll 16 + 2$ . The first virtual generated column in the [InnoDB](#) instance is always number 0. As the third column in the table, the ordinal position of the virtual generated column is 2. Ordinal positions are counted from 0.

- [BASE\\_POS](#)

The ordinal position of the columns upon which a virtual generated column is based.

## Example

```
mysql> CREATE TABLE `t1` (
 `a` int(11) DEFAULT NULL,
 `b` int(11) DEFAULT NULL,
 `c` int(11) GENERATED ALWAYS AS (a+b) VIRTUAL,
 `h` varchar(10) DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4;

mysql> SELECT * FROM INFORMATION_SCHEMA.INNODB_VIRTUAL
WHERE TABLE_ID IN
 (SELECT TABLE_ID FROM INFORMATION_SCHEMA.INNODB_TABLES
 WHERE NAME LIKE "test/t1");
```

| TABLE_ID | POS   | BASE_POS |
|----------|-------|----------|
| 98       | 65538 | 0        |
| 98       | 65538 | 1        |

## Notes

- If a constant value is assigned to a [virtual generated column](#), as in the following table, an entry for the column does not appear in the [INNODB\\_VIRTUAL](#) table. For an entry to appear, a virtual generated column must have a base column.

```
CREATE TABLE `t1` (
 `a` int(11) DEFAULT NULL,
 `b` int(11) DEFAULT NULL,
 `c` int(11) GENERATED ALWAYS AS (5) VIRTUAL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4;
```

However, metadata for such a column does appear in the [INNODB\\_COLUMNS](#) table.

- You must have the [PROCESS](#) privilege to query this table.
- Use the [INFORMATION\\_SCHEMA COLUMNS](#) table or the [SHOW COLUMNS](#) statement to view additional information about the columns of this table, including data types and default values.

## 26.5 INFORMATION\_SCHEMA Thread Pool Tables

### Note

As of MySQL 8.0.14, the [INFORMATION\\_SCHEMA](#) thread pool tables are also available as Performance Schema tables. (See [Section 27.12.16, “Performance Schema Thread Pool Tables”](#).) The [INFORMATION\\_SCHEMA](#) tables are deprecated; expect them to be removed in a future version of MySQL. Applications should transition away from the old tables to the new tables. For example, if an application uses this query:

```
SELECT * FROM INFORMATION_SCHEMA.TP_THREAD_STATE;
```

The application should use this query instead:

```
SELECT * FROM performance_schema.tp_thread_state;
```

The following sections describe the [INFORMATION\\_SCHEMA](#) tables associated with the thread pool plugin (see [Section 5.6.3, “MySQL Enterprise Thread Pool”](#)). They provide information about thread pool operation:

- [TP\\_THREAD\\_GROUP\\_STATE](#): Information about thread pool thread group states

- [TP\\_THREAD\\_GROUP\\_STATS](#): Thread group statistics
- [TP\\_THREAD\\_STATE](#): Information about thread pool thread states

Rows in these tables represent snapshots in time. In the case of [TP\\_THREAD\\_STATE](#), all rows for a thread group comprise a snapshot in time. Thus, the MySQL server holds the mutex of the thread group while producing the snapshot. But it does not hold mutexes on all thread groups at the same time, to prevent a statement against [TP\\_THREAD\\_STATE](#) from blocking the entire MySQL server.

The [INFORMATION\\_SCHEMA](#) thread pool tables are implemented by individual plugins and the decision whether to load one can be made independently of the others (see [Section 5.6.3.2, “Thread Pool Installation”](#)). However, the content of all the tables depends on the thread pool plugin being enabled. If a table plugin is enabled but the thread pool plugin is not, the table becomes visible and can be accessed but is empty.

## 26.5.1 INFORMATION\_SCHEMA Thread Pool Table Reference

The following table summarizes [INFORMATION\\_SCHEMA](#) thread pool tables. For greater detail, see the individual table descriptions.

**Table 26.7 INFORMATION\_SCHEMA Thread Pool Tables**

| Table Name                            | Description                         |
|---------------------------------------|-------------------------------------|
| <a href="#">TP_THREAD_GROUP_STATE</a> | Thread pool thread group states     |
| <a href="#">TP_THREAD_GROUP_STATS</a> | Thread pool thread group statistics |
| <a href="#">TP_THREAD_STATE</a>       | Thread pool thread information      |

## 26.5.2 The INFORMATION\_SCHEMA TP\_THREAD\_GROUP\_STATE Table

### Note

As of MySQL 8.0.14, the thread pool [INFORMATION\\_SCHEMA](#) tables are also available as Performance Schema tables. (See [Section 27.12.16, “Performance Schema Thread Pool Tables”](#).) The [INFORMATION\\_SCHEMA](#) tables are deprecated; expect them to be removed in a future version of MySQL. Applications should transition away from the old tables to the new tables. For example, if an application uses this query:

```
SELECT * FROM INFORMATION_SCHEMA.TP_THREAD_GROUP_STATE;
```

The application should use this query instead:

```
SELECT * FROM performance_schema.tp_thread_group_state;
```

The [TP\\_THREAD\\_GROUP\\_STATE](#) table has one row per thread group in the thread pool. Each row provides information about the current state of a group.

For descriptions of the columns in the [INFORMATION\\_SCHEMA TP\\_THREAD\\_GROUP\\_STATE](#) table, see [Section 27.12.16.1, “The tp\\_thread\\_group\\_state Table”](#). The Performance Schema [tp\\_thread\\_group\\_state](#) table has equivalent columns.

## 26.5.3 The INFORMATION\_SCHEMA TP\_THREAD\_GROUP\_STATS Table

### Note

As of MySQL 8.0.14, the thread pool [INFORMATION\\_SCHEMA](#) tables are also available as Performance Schema tables. (See [Section 27.12.16, “Performance Schema Thread Pool Tables”](#).) The [INFORMATION\\_SCHEMA](#) tables are deprecated; expect them to be removed in a future version of

MySQL. Applications should transition away from the old tables to the new tables. For example, if an application uses this query:

```
SELECT * FROM INFORMATION_SCHEMA.TP_THREAD_GROUP_STATS;
```

The application should use this query instead:

```
SELECT * FROM performance_schema.tp_thread_group_stats;
```

The `TP_THREAD_GROUP_STATS` table reports statistics per thread group. There is one row per group.

For descriptions of the columns in the `INFORMATION_SCHEMA TP_THREAD_GROUP_STATS` table, see [Section 27.12.16.2, “The `tp\_thread\_group\_stats` Table”](#). The Performance Schema `tp_thread_group_stats` table has equivalent columns.

## 26.5.4 The INFORMATION\_SCHEMA TP\_THREAD\_STATE Table

### Note

As of MySQL 8.0.14, the thread pool `INFORMATION_SCHEMA` tables are also available as Performance Schema tables. (See [Section 27.12.16, “Performance Schema Thread Pool Tables”](#).) The `INFORMATION_SCHEMA` tables are deprecated; expect them to be removed in a future version of MySQL. Applications should transition away from the old tables to the new tables. For example, if an application uses this query:

```
SELECT * FROM INFORMATION_SCHEMA.TP_THREAD_STATE;
```

The application should use this query instead:

```
SELECT * FROM performance_schema.tp_thread_state;
```

The `TP_THREAD_STATE` table has one row per thread created by the thread pool to handle connections.

For descriptions of the columns in the `INFORMATION_SCHEMA TP_THREAD_STATE` table, see [Section 27.12.16.3, “The `tp\_thread\_state` Table”](#). The Performance Schema `tp_thread_state` table has equivalent columns.

## 26.6 INFORMATION\_SCHEMA Connection-Control Tables

The following sections describe the `INFORMATION_SCHEMA` tables associated with the `CONNECTION_CONTROL` plugin.

### 26.6.1 INFORMATION\_SCHEMA Connection-Control Table Reference

The following table summarizes `INFORMATION_SCHEMA` connection-control tables. For greater detail, see the individual table descriptions.

**Table 26.8 INFORMATION\_SCHEMA Connection-Control Tables**

| Table Name                                            | Description                                                          |
|-------------------------------------------------------|----------------------------------------------------------------------|
| <code>CONNECTION_CONTROL_FAILED_LOGIN_ATTEMPTS</code> | Current number of consecutive failed connection attempts per account |

### 26.6.2 The INFORMATION\_SCHEMA CONNECTION\_CONTROL\_FAILED\_LOGIN\_ATTEMPTS Table

This table provides information about the current number of consecutive failed connection attempts per account (user/host combination).

`CONNECTION_CONTROL_FAILED_LOGIN_ATTEMPTS` has these columns:

- `USERHOST`

The user/host combination indicating an account that has failed connection attempts, in `'user_name'@'host_name'` format.

- `FAILED_ATTEMPTS`

The current number of consecutive failed connection attempts for the `USERHOST` value. This counts all failed attempts, regardless of whether they were delayed. The number of attempts for which the server added a delay to its response is the difference between the `FAILED_ATTEMPTS` value and the `connection_control_failed_connections_threshold` system variable value.

## Notes

- The `CONNECTION_CONTROL_FAILED_LOGIN_ATTEMPTS` plugin must be activated for this table to be available, and the `CONNECTION_CONTROL` plugin must be activated or the table contents are always empty. See [Section 6.4.2, “The Connection-Control Plugins”](#).
- The table contains rows only for accounts that have had one or more consecutive failed connection attempts without a subsequent successful attempt. When an account connects successfully, its failed-connection count is reset to zero and the server removes any row corresponding to the account.
- Assigning a value to the `connection_control_failed_connections_threshold` system variable at runtime resets all accumulated failed-connection counters to zero, which causes the table to become empty.

## 26.7 INFORMATION\_SCHEMA MySQL Enterprise Firewall Tables

The following sections describe the `INFORMATION_SCHEMA` tables associated with MySQL Enterprise Firewall (see [Section 6.4.7, “MySQL Enterprise Firewall”](#)). They provide views into the firewall in-memory data cache. These tables are available only if the appropriate firewall plugins are enabled.

### 26.7.1 INFORMATION\_SCHEMA Firewall Table Reference

The following table summarizes `INFORMATION_SCHEMA` firewall tables. For greater detail, see the individual table descriptions.

**Table 26.9 INFORMATION\_SCHEMA Firewall Tables**

| Table Name                            | Description                                            | Deprecated |
|---------------------------------------|--------------------------------------------------------|------------|
| <code>MYSQL_FIREWALL_USERS</code>     | Firewall in-memory data for account profiles           | 8.0.26     |
| <code>MYSQL_FIREWALL_WHITELIST</code> | Firewall in-memory data for account profile allowlists | 8.0.26     |

### 26.7.2 The INFORMATION\_SCHEMA MYSQL\_FIREWALL\_USERS Table

The `MYSQL_FIREWALL_USERS` table provides a view into the in-memory data cache for MySQL Enterprise Firewall. It lists names and operational modes of registered firewall account profiles. It is used in conjunction with the `mysql.firewall_users` system table that provides persistent storage of firewall data; see [MySQL Enterprise Firewall Tables](#).

The `MYSQL_FIREWALL_USERS` table has these columns:

- `USERHOST`

The account profile name. Each account name has the format `user_name@host_name`.

- **MODE**

The current operational mode for the profile. Permitted mode values are `OFF`, `DETECTING`, `PROTECTING`, `RECORDING`, and `RESET`. For details about their meanings, see [Firewall Concepts](#).

As of MySQL 8.0.26, this table is deprecated and subject to removal in a future MySQL version. See [Migrating Account Profiles to Group Profiles](#).

### 26.7.3 The INFORMATION\_SCHEMA MYSQL\_FIREWALL\_WHITELIST Table

The `MYSQL_FIREWALL_WHITELIST` table provides a view into the in-memory data cache for MySQL Enterprise Firewall. It lists allowlist rules of registered firewall account profiles. It is used in conjunction with the `mysql.firewall_whitelist` system table that provides persistent storage of firewall data; see [MySQL Enterprise Firewall Tables](#).

The `MYSQL_FIREWALL_WHITELIST` table has these columns:

- **USERHOST**

The account profile name. Each account name has the format `user_name@host_name`.

- **RULE**

A normalized statement indicating an acceptable statement pattern for the profile. A profile allowlist is the union of its rules.

As of MySQL 8.0.26, this table is deprecated and subject to removal in a future MySQL version. See [Migrating Account Profiles to Group Profiles](#).

## 26.8 Extensions to SHOW Statements

Some extensions to `SHOW` statements accompany the implementation of `INFORMATION_SCHEMA`:

- `SHOW` can be used to get information about the structure of `INFORMATION_SCHEMA` itself.
- Several `SHOW` statements accept a `WHERE` clause that provides more flexibility in specifying which rows to display.

`INFORMATION_SCHEMA` is an information database, so its name is included in the output from `SHOW DATABASES`. Similarly, `SHOW TABLES` can be used with `INFORMATION_SCHEMA` to obtain a list of its tables:

```
mysql> SHOW TABLES FROM INFORMATION_SCHEMA;
```

| Tables_in_INFORMATION_SCHEMA          |
|---------------------------------------|
| CHARACTER_SETS                        |
| COLLATIONS                            |
| COLLATION_CHARACTER_SET_APPLICABILITY |
| COLUMNS                               |
| COLUMN_PRIVILEGES                     |
| ENGINES                               |
| EVENTS                                |
| FILES                                 |
| KEY_COLUMN_USAGE                      |
| PARTITIONS                            |
| PLUGINS                               |
| PROCESSLIST                           |
| REFERENTIAL_CONSTRAINTS               |
| ROUTINES                              |
| SCHEMATA                              |

```

| SCHEMA_PRIVILEGES
| STATISTICS
| TABLES
| TABLE_CONSTRAINTS
| TABLE_PRIVILEGES
| TRIGGERS
| USER_PRIVILEGES
| VIEWS
+-----+

```

`SHOW COLUMNS` and `DESCRIBE` can display information about the columns in individual `INFORMATION_SCHEMA` tables.

`SHOW` statements that accept a `LIKE` clause to limit the rows displayed also permit a `WHERE` clause that specifies more general conditions that selected rows must satisfy:

```

SHOW CHARACTER SET
SHOW COLLATION
SHOW COLUMNS
SHOW DATABASES
SHOW FUNCTION STATUS
SHOW INDEX
SHOW OPEN TABLES
SHOW PROCEDURE STATUS
SHOW STATUS
SHOW TABLE STATUS
SHOW TABLES
SHOW TRIGGERS
SHOW VARIABLES

```

The `WHERE` clause, if present, is evaluated against the column names displayed by the `SHOW` statement. For example, the `SHOW CHARACTER SET` statement produces these output columns:

```

mysql> SHOW CHARACTER SET;
+-----+-----+-----+-----+
| Charset | Description | Default collation | Maxlen |
+-----+-----+-----+-----+
big5	Big5 Traditional Chinese	big5_chinese_ci	2
dec8	DEC West European	dec8_swedish_ci	1
cp850	DOS West European	cp850_general_ci	1
hp8	HP West European	hp8_english_ci	1
koi8r	KOI8-R Relcom Russian	koi8r_general_ci	1
latin1	cp1252 West European	latin1_swedish_ci	1
latin2	ISO 8859-2 Central European	latin2_general_ci	1
...

```

To use a `WHERE` clause with `SHOW CHARACTER SET`, you would refer to those column names. As an example, the following statement displays information about character sets for which the default collation contains the string `'japanese'`:

```

mysql> SHOW CHARACTER SET WHERE `Default collation` LIKE '%japanese%';
+-----+-----+-----+-----+
| Charset | Description | Default collation | Maxlen |
+-----+-----+-----+-----+
ujis	EUC-JP Japanese	ujis_japanese_ci	3
sjis	Shift-JIS Japanese	sjis_japanese_ci	2
cp932	SJIS for Windows Japanese	cp932_japanese_ci	2
eucjpms	UJIS for Windows Japanese	eucjpms_japanese_ci	3
+-----+-----+-----+-----+

```

This statement displays the multibyte character sets:

```

mysql> SHOW CHARACTER SET WHERE Maxlen > 1;
+-----+-----+-----+-----+
| Charset | Description | Default collation | Maxlen |
+-----+-----+-----+-----+
big5	Big5 Traditional Chinese	big5_chinese_ci	2
ujis	EUC-JP Japanese	ujis_japanese_ci	3
sjis	Shift-JIS Japanese	sjis_japanese_ci	2
euckr	EUC-KR Korean	euckr_korean_ci	2

```

## Extensions to SHOW Statements

---

|                           |                           |                     |   |  |
|---------------------------|---------------------------|---------------------|---|--|
| gb2312                    | GB2312 Simplified Chinese | gb2312_chinese_ci   | 2 |  |

The MySQL Performance Schema is a feature for monitoring MySQL Server execution at a low level. The Performance Schema has these characteristics:

- The Performance Schema provides a way to inspect internal execution of the server at runtime. It is implemented using the `PERFORMANCE_SCHEMA` storage engine and the `performance_schema` database. The Performance Schema focuses primarily on performance data. This differs from `INFORMATION_SCHEMA`, which serves for inspection of metadata.
- The Performance Schema monitors server events. An “event” is anything the server does that takes time and has been instrumented so that timing information can be collected. In general, an event could be a function call, a wait for the operating system, a stage of an SQL statement execution such as parsing or sorting, or an entire statement or group of statements. Event collection provides access to information about synchronization calls (such as for mutexes) file and table I/O, table locks, and so forth for the server and for several storage engines.
- Performance Schema events are distinct from events written to the server's binary log (which describe data modifications) and Event Scheduler events (which are a type of stored program).
- Performance Schema events are specific to a given instance of the MySQL Server. Performance Schema tables are considered local to the server, and changes to them are not replicated or written to the binary log.
- Current events are available, as well as event histories and summaries. This enables you to determine how many times instrumented activities were performed and how much time they took. Event information is available to show the activities of specific threads, or activity associated with particular objects such as a mutex or file.
- The `PERFORMANCE_SCHEMA` storage engine collects event data using “instrumentation points” in server source code.
- Collected events are stored in tables in the `performance_schema` database. These tables can be queried using `SELECT` statements like other tables.
- Performance Schema configuration can be modified dynamically by updating tables in the `performance_schema` database through SQL statements. Configuration changes affect data collection immediately.
- Tables in the Performance Schema are in-memory tables that use no persistent on-disk storage. The contents are repopulated beginning at server startup and discarded at server shutdown.
- Monitoring is available on all platforms supported by MySQL.

Some limitations might apply: The types of timers might vary per platform. Instruments that apply to storage engines might not be implemented for all storage engines. Instrumentation of each third-party engine is the responsibility of the engine maintainer. See also [Section 27.20, “Restrictions on Performance Schema”](#).

- Data collection is implemented by modifying the server source code to add instrumentation. There are no separate threads associated with the Performance Schema, unlike other features such as replication or the Event Scheduler.

The Performance Schema is intended to provide access to useful information about server execution while having minimal impact on server performance. The implementation follows these design goals:

- Activating the Performance Schema causes no changes in server behavior. For example, it does not cause thread scheduling to change, and it does not cause query execution plans (as shown by `EXPLAIN`) to change.

- Server monitoring occurs continuously and unobtrusively with very little overhead. Activating the Performance Schema does not make the server unusable.
- The parser is unchanged. There are no new keywords or statements.
- Execution of server code proceeds normally even if the Performance Schema fails internally.
- When there is a choice between performing processing during event collection initially or during event retrieval later, priority is given to making collection faster. This is because collection is ongoing whereas retrieval is on demand and might never happen at all.
- Most Performance Schema tables have indexes, which gives the optimizer access to execution plans other than full table scans. For more information, see [Section 8.2.4, “Optimizing Performance Schema Queries”](#).
- It is easy to add new instrumentation points.
- Instrumentation is versioned. If the instrumentation implementation changes, previously instrumented code continues to work. This benefits developers of third-party plugins because it is not necessary to upgrade each plugin to stay synchronized with the latest Performance Schema changes.

#### Note

The MySQL `sys` schema is a set of objects that provides convenient access to data collected by the Performance Schema. The `sys` schema is installed by default. For usage instructions, see [Chapter 28, MySQL `sys` Schema](#).

## 27.1 Performance Schema Quick Start

This section briefly introduces the Performance Schema with examples that show how to use it. For additional examples, see [Section 27.19, “Using the Performance Schema to Diagnose Problems”](#).

The Performance Schema is enabled by default. To enable or disable it explicitly, start the server with the `performance_schema` variable set to an appropriate value. For example, use these lines in the server `my.cnf` file:

```
[mysqld]
performance_schema=ON
```

When the server starts, it sees `performance_schema` and attempts to initialize the Performance Schema. To verify successful initialization, use this statement:

```
mysql> SHOW VARIABLES LIKE 'performance_schema';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| performance_schema | ON |
+-----+-----+
```

A value of `ON` means that the Performance Schema initialized successfully and is ready for use. A value of `OFF` means that some error occurred. Check the server error log for information about what went wrong.

The Performance Schema is implemented as a storage engine, so you can see it listed in the output from the `INFORMATION_SCHEMA.ENGINES` table or the `SHOW ENGINES` statement:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.ENGINES
 WHERE ENGINE='PERFORMANCE_SCHEMA'\G
***** 1. row *****
ENGINE: PERFORMANCE_SCHEMA
SUPPORT: YES
COMMENT: Performance Schema
TRANSACTIONS: NO
```

```

XA: NO
SAVEPOINTS: NO

mysql> SHOW ENGINES\G
...
Engine: PERFORMANCE_SCHEMA
Support: YES
Comment: Performance Schema
Transactions: NO
XA: NO
Savepoints: NO
...

```

The `PERFORMANCE_SCHEMA` storage engine operates on tables in the `performance_schema` database. You can make `performance_schema` the default database so that references to its tables need not be qualified with the database name:

```
mysql> USE performance_schema;
```

Performance Schema tables are stored in the `performance_schema` database. Information about the structure of this database and its tables can be obtained, as for any other database, by selecting from the `INFORMATION_SCHEMA` database or by using `SHOW` statements. For example, use either of these statements to see what Performance Schema tables exist:

```

mysql> SELECT TABLE_NAME FROM INFORMATION_SCHEMA.TABLES
 WHERE TABLE_SCHEMA = 'performance_schema';
+-----+
| TABLE_NAME |
+-----+
| accounts |
| cond_instances |
| ... |
| events_stages_current |
| events_stages_history |
| events_stages_history_long |
| events_stages_summary_by_account_by_event_name |
| events_stages_summary_by_host_by_event_name |
| events_stages_summary_by_thread_by_event_name |
| events_stages_summary_by_user_by_event_name |
| events_stages_summary_global_by_event_name |
| events_statements_current |
| events_statements_history |
| events_statements_history_long |
| ... |

| socket_summary_by_instance
| table_handles
| table_io_waits_summary_by_index_usage
| table_io_waits_summary_by_table
| table_lock_waits_summary_by_table
| threads
| users
+-----+

mysql> SHOW TABLES FROM performance_schema;
+-----+
| Tables_in_performance_schema
+-----+
| accounts
| cond_instances
| events_stages_current
| events_stages_history
| events_stages_history_long
| ...

```

The number of Performance Schema tables increases over time as implementation of additional instrumentation proceeds.

The name of the `performance_schema` database is lowercase, as are the names of tables within it. Queries should specify the names in lowercase.

To see the structure of individual tables, use `SHOW CREATE TABLE`:

```

mysql> SHOW CREATE TABLE performance_schema.setup_consumers\G
***** 1. row *****
 Table: setup_consumers
Create Table: CREATE TABLE `setup_consumers` (
 `NAME` varchar(64) NOT NULL,
 `ENABLED` enum('YES','NO') NOT NULL,
 PRIMARY KEY (`NAME`)
) ENGINE=PERFORMANCE_SCHEMA DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci

```

Table structure is also available by selecting from tables such as `INFORMATION_SCHEMA.COLUMNS` or by using statements such as `SHOW COLUMNS`.

Tables in the `performance_schema` database can be grouped according to the type of information in them: Current events, event histories and summaries, object instances, and setup (configuration) information. The following examples illustrate a few uses for these tables. For detailed information about the tables in each group, see [Section 27.12, “Performance Schema Table Descriptions”](#).

Initially, not all instruments and consumers are enabled, so the performance schema does not collect all events. To turn all of these on and enable event timing, execute two statements (the row counts may differ depending on MySQL version):

```

mysql> UPDATE performance_schema.setup_instruments
 SET ENABLED = 'YES', TIMED = 'YES';
Query OK, 560 rows affected (0.04 sec)
mysql> UPDATE performance_schema.setup_consumers
 SET ENABLED = 'YES';
Query OK, 10 rows affected (0.00 sec)

```

To see what the server is doing at the moment, examine the `events_waits_current` table. It contains one row per thread showing each thread's most recent monitored event:

```

mysql> SELECT *
 FROM performance_schema.events_waits_current\G
***** 1. row *****
 THREAD_ID: 0
 EVENT_ID: 5523
 END_EVENT_ID: 5523
 EVENT_NAME: wait/synch/mutex/mysys/THR_LOCK::mutex

```

```

SOURCE: thr_lock.c:525
TIMER_START: 201660494489586
TIMER_END: 201660494576112
TIMER_WAIT: 86526
SPINS: NULL
OBJECT_SCHEMA: NULL
OBJECT_NAME: NULL
INDEX_NAME: NULL
OBJECT_TYPE: NULL
OBJECT_INSTANCE_BEGIN: 142270668
NESTING_EVENT_ID: NULL
NESTING_EVENT_TYPE: NULL
OPERATION: lock
NUMBER_OF_BYTES: NULL
FLAGS: 0
...

```

This event indicates that thread 0 was waiting for 86,526 picoseconds to acquire a lock on `THR_LOCK::mutex`, a mutex in the `mysys` subsystem. The first few columns provide the following information:

- The ID columns indicate which thread the event comes from and the event number.
- `EVENT_NAME` indicates what was instrumented and `SOURCE` indicates which source file contains the instrumented code.
- The timer columns show when the event started and stopped and how long it took. If an event is still in progress, the `TIMER_END` and `TIMER_WAIT` values are `NULL`. Timer values are approximate and expressed in picoseconds. For information about timers and event time collection, see [Section 27.4.1, “Performance Schema Event Timing”](#).

The history tables contain the same kind of rows as the current-events table but have more rows and show what the server has been doing “recently” rather than “currently.” The `events_waits_history` and `events_waits_history_long` tables contain the most recent 10 events per thread and most recent 10,000 events, respectively. For example, to see information for recent events produced by thread 13, do this:

```

mysql> SELECT EVENT_ID, EVENT_NAME, TIMER_WAIT
 FROM performance_schema.events_waits_history
 WHERE THREAD_ID = 13
 ORDER BY EVENT_ID;

```

| EVENT_ID | EVENT_NAME                              | TIMER_WAIT |
|----------|-----------------------------------------|------------|
| 86       | wait/synch/mutex/mysys/THR_LOCK::mutex  | 686322     |
| 87       | wait/synch/mutex/mysys/THR_LOCK_malloc  | 320535     |
| 88       | wait/synch/mutex/mysys/THR_LOCK_malloc  | 339390     |
| 89       | wait/synch/mutex/mysys/THR_LOCK_malloc  | 377100     |
| 90       | wait/synch/mutex/sql/LOCK_plugin        | 614673     |
| 91       | wait/synch/mutex/sql/LOCK_open          | 659925     |
| 92       | wait/synch/mutex/sql/THD::LOCK_thd_data | 494001     |
| 93       | wait/synch/mutex/mysys/THR_LOCK_malloc  | 222489     |
| 94       | wait/synch/mutex/mysys/THR_LOCK_malloc  | 214947     |
| 95       | wait/synch/mutex/mysys/LOCK_alarm       | 312993     |

As new events are added to a history table, older events are discarded if the table is full.

Summary tables provide aggregated information for all events over time. The tables in this group summarize event data in different ways. To see which instruments have been executed the most times or have taken the most wait time, sort the `events_waits_summary_global_by_event_name` table on the `COUNT_STAR` or `SUM_TIMER_WAIT` column, which correspond to a `COUNT(*)` or `SUM(TIMER_WAIT)` value, respectively, calculated over all events:

```

mysql> SELECT EVENT_NAME, COUNT_STAR
 FROM performance_schema.events_waits_summary_global_by_event_name
 ORDER BY COUNT_STAR DESC LIMIT 10;

```

```

+-----+-----+
| EVENT_NAME | COUNT_STAR |
+-----+-----+
wait/synch/mutex/mysys/THR_LOCK_malloc	6419
wait/io/file/sql/FRM	452
wait/synch/mutex/sql/LOCK_plugin	337
wait/synch/mutex/mysys/THR_LOCK_open	187
wait/synch/mutex/mysys/LOCK_alarm	147
wait/synch/mutex/sql/THD::LOCK_thd_data	115
wait/io/file/myisam/kfile	102
wait/synch/mutex/sql/LOCK_global_system_variables	89
wait/synch/mutex/mysys/THR_LOCK::mutex	89
wait/synch/mutex/sql/LOCK_open	88
+-----+-----+

mysql> SELECT EVENT_NAME, SUM_TIMER_WAIT
FROM performance_schema.events_waits_summary_global_by_event_name
ORDER BY SUM_TIMER_WAIT DESC LIMIT 10;

+-----+-----+
| EVENT_NAME | SUM_TIMER_WAIT |
+-----+-----+
wait/io/file/sql/MYSQL_LOG	1599816582
wait/synch/mutex/mysys/THR_LOCK_malloc	1530083250
wait/io/file/sql/binlog_index	1385291934
wait/io/file/sql/FRM	1292823243
wait/io/file/myisam/kfile	411193611
wait/io/file/myisam/dfile	322401645
wait/synch/mutex/mysys/LOCK_alarm	145126935
wait/io/file/sql/casetest	104324715
wait/synch/mutex/sql/LOCK_plugin	86027823
wait/io/file/sql/pid	72591750
+-----+-----+

```

These results show that the `THR_LOCK_malloc` mutex is “hot,” both in terms of how often it is used and amount of time that threads wait attempting to acquire it.

#### Note

The `THR_LOCK_malloc` mutex is used only in debug builds. In production builds it is not hot because it is nonexistent.

Instance tables document what types of objects are instrumented. An instrumented object, when used by the server, produces an event. These tables provide event names and explanatory notes or status information. For example, the `file_instances` table lists instances of instruments for file I/O operations and their associated files:

```

mysql> SELECT *
FROM performance_schema.file_instances\G
***** 1. row *****
FILE_NAME: /opt/mysql-log/60500/binlog.000007
EVENT_NAME: wait/io/file/sql/binlog
OPEN_COUNT: 0
***** 2. row *****
FILE_NAME: /opt/mysql/60500/data/mysql/tables_priv.MYI
EVENT_NAME: wait/io/file/myisam/kfile
OPEN_COUNT: 1
***** 3. row *****
FILE_NAME: /opt/mysql/60500/data/mysql/columns_priv.MYI
EVENT_NAME: wait/io/file/myisam/kfile
OPEN_COUNT: 1
...

```

Setup tables are used to configure and display monitoring characteristics. For example, `setup_instruments` lists the set of instruments for which events can be collected and shows which of them are enabled:

```

mysql> SELECT NAME, ENABLED, TIMED
FROM performance_schema.setup_instruments;
+-----+-----+-----+

```

| NAME                                              | ENABLED | TIMED |
|---------------------------------------------------|---------|-------|
| ...                                               |         |       |
| stage/sql/end                                     | NO      | NO    |
| stage/sql/executing                               | NO      | NO    |
| stage/sql/init                                    | NO      | NO    |
| stage/sql/insert                                  | NO      | NO    |
| ...                                               |         |       |
| statement/sql/load                                | YES     | YES   |
| statement/sql/grant                               | YES     | YES   |
| statement/sql/check                               | YES     | YES   |
| statement/sql/flush                               | YES     | YES   |
| ...                                               |         |       |
| wait/synch/mutex/sql/LOCK_global_read_lock        | YES     | YES   |
| wait/synch/mutex/sql/LOCK_global_system_variables | YES     | YES   |
| wait/synch/mutex/sql/LOCK_lock_db                 | YES     | YES   |
| wait/synch/mutex/sql/LOCK_manager                 | YES     | YES   |
| ...                                               |         |       |
| wait/synch/rwlock/sql/LOCK_grant                  | YES     | YES   |
| wait/synch/rwlock/sql/LOGGER::LOCK_logger         | YES     | YES   |
| wait/synch/rwlock/sql/LOCK_sys_init_connect       | YES     | YES   |
| wait/synch/rwlock/sql/LOCK_sys_init_slave         | YES     | YES   |
| ...                                               |         |       |
| wait/io/file/sql/binlog                           | YES     | YES   |
| wait/io/file/sql/binlog_index                     | YES     | YES   |
| wait/io/file/sql/casetest                         | YES     | YES   |
| wait/io/file/sql/dbopt                            | YES     | YES   |
| ...                                               |         |       |

To understand how to interpret instrument names, see [Section 27.6, “Performance Schema Instrument Naming Conventions”](#).

To control whether events are collected for an instrument, set its `ENABLED` value to `YES` or `NO`. For example:

```
mysql> UPDATE performance_schema.setup_instruments
 SET ENABLED = 'NO'
 WHERE NAME = 'wait/synch/mutex/sql/LOCK_mysql_create_db';
```

The Performance Schema uses collected events to update tables in the `performance_schema` database, which act as “consumers” of event information. The `setup_consumers` table lists the available consumers and which are enabled:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
```

| NAME                             | ENABLED |
|----------------------------------|---------|
| events_stages_current            | NO      |
| events_stages_history            | NO      |
| events_stages_history_long       | NO      |
| events_statements_current        | YES     |
| events_statements_history        | YES     |
| events_statements_history_long   | NO      |
| events_transactions_current      | YES     |
| events_transactions_history      | YES     |
| events_transactions_history_long | NO      |
| events_waits_current             | NO      |
| events_waits_history             | NO      |
| events_waits_history_long        | NO      |
| global_instrumentation           | YES     |
| thread_instrumentation           | YES     |
| statements_digest                | YES     |

To control whether the Performance Schema maintains a consumer as a destination for event information, set its `ENABLED` value.

For more information about the setup tables and how to use them to control event collection, see [Section 27.4.2, “Performance Schema Event Filtering”](#).

There are some miscellaneous tables that do not fall into any of the previous groups. For example, `performance_timers` lists the available event timers and their characteristics. For information about timers, see [Section 27.4.1, “Performance Schema Event Timing”](#).

## 27.2 Performance Schema Build Configuration

The Performance Schema is mandatory and always compiled in. It is possible to exclude certain parts of the Performance Schema instrumentation. For example, to exclude stage and statement instrumentation, do this:

```
shell> cmake . \
 -DDISABLE_PSI_STAGE=1 \
 -DDISABLE_PSI_STATEMENT=1
```

For more information, see the descriptions of the `DISABLE_PSI_XXX` CMake options in [Section 2.9.7, “MySQL Source-Configuration Options”](#).

If you install MySQL over a previous installation that was configured without the Performance Schema (or with an older version of the Performance Schema that has missing or out-of-date tables). One indication of this issue is the presence of messages such as the following in the error log:

```
[ERROR] Native table 'performance_schema'.'events_waits_history'
has the wrong structure
[ERROR] Native table 'performance_schema'.'events_waits_history_long'
has the wrong structure
...
```

To correct that problem, perform the MySQL upgrade procedure. See [Section 2.11, “Upgrading MySQL”](#).

Because the Performance Schema is configured into the server at build time, a row for `PERFORMANCE_SCHEMA` appears in the output from `SHOW ENGINES`. This means that the Performance Schema is available, not that it is enabled. To enable it, you must do so at server startup, as described in the next section.

## 27.3 Performance Schema Startup Configuration

To use the MySQL Performance Schema, it must be enabled at server startup to enable event collection to occur.

The Performance Schema is enabled by default. To enable or disable it explicitly, start the server with the `performance_schema` variable set to an appropriate value. For example, use these lines in the server `my.cnf` file:

```
[mysqld]
performance_schema=ON
```

If the server is unable to allocate any internal buffer during Performance Schema initialization, the Performance Schema disables itself and sets `performance_schema` to `OFF`, and the server runs without instrumentation.

The Performance Schema also permits instrument and consumer configuration at server startup.

To control an instrument at server startup, use an option of this form:

```
--performance-schema-instrument='instrument_name=value'
```

Here, `instrument_name` is an instrument name such as `wait/synch/mutex/sql/LOCK_open`, and `value` is one of these values:

- `OFF`, `FALSE`, or `0`: Disable the instrument
- `ON`, `TRUE`, or `1`: Enable and time the instrument

- **COUNTED**: Enable and count (rather than time) the instrument

Each `--performance-schema-instrument` option can specify only one instrument name, but multiple instances of the option can be given to configure multiple instruments. In addition, patterns are permitted in instrument names to configure instruments that match the pattern. To configure all condition synchronization instruments as enabled and counted, use this option:

```
--performance-schema-instrument='wait/synch/cond/%=COUNTED'
```

To disable all instruments, use this option:

```
--performance-schema-instrument='%=OFF'
```

Exception: The `memory/performance_schema/%` instruments are built in and cannot be disabled at startup.

Longer instrument name strings take precedence over shorter pattern names, regardless of order. For information about specifying patterns to select instruments, see [Section 27.4.9, “Naming Instruments or Consumers for Filtering Operations”](#).

An unrecognized instrument name is ignored. It is possible that a plugin installed later may create the instrument, at which time the name is recognized and configured.

To control a consumer at server startup, use an option of this form:

```
--performance-schema-consumer-consumer_name=value
```

Here, *consumer\_name* is a consumer name such as `events_waits_history`, and *value* is one of these values:

- **OFF**, **FALSE**, or **0**: Do not collect events for the consumer
- **ON**, **TRUE**, or **1**: Collect events for the consumer

For example, to enable the `events_waits_history` consumer, use this option:

```
--performance-schema-consumer-events-waits-history=ON
```

The permitted consumer names can be found by examining the `setup_consumers` table. Patterns are not permitted. Consumer names in the `setup_consumers` table use underscores, but for consumers set at startup, dashes and underscores within the name are equivalent.

The Performance Schema includes several system variables that provide configuration information:

```
mysql> SHOW VARIABLES LIKE 'perf%';
```

| Variable_name                                          | Value |
|--------------------------------------------------------|-------|
| performance_schema                                     | ON    |
| performance_schema_accounts_size                       | 100   |
| performance_schema_digests_size                        | 200   |
| performance_schema_events_stages_history_long_size     | 10000 |
| performance_schema_events_stages_history_size          | 10    |
| performance_schema_events_statements_history_long_size | 10000 |
| performance_schema_events_statements_history_size      | 10    |
| performance_schema_events_waits_history_long_size      | 10000 |
| performance_schema_events_waits_history_size           | 10    |
| performance_schema_hosts_size                          | 100   |
| performance_schema_max_cond_classes                    | 80    |
| performance_schema_max_cond_instances                  | 1000  |
| ...                                                    |       |

The `performance_schema` variable is **ON** or **OFF** to indicate whether the Performance Schema is enabled or disabled. The other variables indicate table sizes (number of rows) or memory allocation values.

**Note**

With the Performance Schema enabled, the number of Performance Schema instances affects the server memory footprint, perhaps to a large extent. The Performance Schema autoscales many parameters to use memory only as required; see [Section 27.17, “The Performance Schema Memory-Allocation Model”](#).

To change the value of Performance Schema system variables, set them at server startup. For example, put the following lines in a `my.cnf` file to change the sizes of the history tables for wait events:

```
[mysqld]
performance_schema
performance_schema_events_waits_history_size=20
performance_schema_events_waits_history_long_size=15000
```

The Performance Schema automatically sizes the values of several of its parameters at server startup if they are not set explicitly. For example, it sizes the parameters that control the sizes of the events waits tables this way. The Performance Schema allocates memory incrementally, scaling its memory use to actual server load, instead of allocating all the memory it needs during server startup. Consequently, many sizing parameters need not be set at all. To see which parameters are autosized or autoscaled, use `mysqld --verbose --help` and examine the option descriptions, or see [Section 27.15, “Performance Schema System Variables”](#).

For each autosized parameter that is not set at server startup, the Performance Schema determines how to set its value based on the value of the following system values, which are considered as “hints” about how you have configured your MySQL server:

```
max_connections
open_files_limit
table_definition_cache
table_open_cache
```

To override autosizing or autoscaling for a given parameter, set it to a value other than `-1` at startup. In this case, the Performance Schema assigns it the specified value.

At runtime, `SHOW VARIABLES` displays the actual values that autosized parameters were set to. Autoscaled parameters display with a value of `-1`.

If the Performance Schema is disabled, its autosized and autoscaled parameters remain set to `-1` and `SHOW VARIABLES` displays `-1`.

## 27.4 Performance Schema Runtime Configuration

Specific Performance Schema features can be enabled at runtime to control which types of event collection occur.

Performance Schema setup tables contain information about monitoring configuration:

```
mysql> SELECT TABLE_NAME FROM INFORMATION_SCHEMA.TABLES
WHERE TABLE_SCHEMA = 'performance_schema'
AND TABLE_NAME LIKE 'setup%';
+-----+
| TABLE_NAME |
+-----+
| setup_actors |
| setup_consumers |
| setup_instruments |
| setup_objects |
| setup_threads |
+-----+
```

You can examine the contents of these tables to obtain information about Performance Schema monitoring characteristics. If you have the `UPDATE` privilege, you can change Performance Schema operation by modifying setup tables to affect how monitoring occurs. For additional details about these tables, see [Section 27.12.2, “Performance Schema Setup Tables”](#).

The `setup_instruments` and `setup_consumers` tables list the instruments for which events can be collected and the types of consumers for which event information actually is collected, respectively. Other setup tables enable further modification of the monitoring configuration. [Section 27.4.2, “Performance Schema Event Filtering”](#), discusses how you can modify these tables to affect event collection.

If there are Performance Schema configuration changes that must be made at runtime using SQL statements and you would like these changes to take effect each time the server starts, put the statements in a file and start the server with the `init_file` system variable set to name the file. This strategy can also be useful if you have multiple monitoring configurations, each tailored to produce a different kind of monitoring, such as casual server health monitoring, incident investigation, application behavior troubleshooting, and so forth. Put the statements for each monitoring configuration into their own file and specify the appropriate file as the `init_file` value when you start the server.

## 27.4.1 Performance Schema Event Timing

Events are collected by means of instrumentation added to the server source code. Instruments time events, which is how the Performance Schema provides an idea of how long events take. It is also possible to configure instruments not to collect timing information. This section discusses the available timers and their characteristics, and how timing values are represented in events.

### Performance Schema Timers

Performance Schema timers vary in precision and amount of overhead. To see what timers are available and their characteristics, check the `performance_timers` table:

```
mysql> SELECT * FROM performance_schema.performance_timers;
```

| TIMER_NAME  | TIMER_FREQUENCY | TIMER_RESOLUTION | TIMER_OVERHEAD |
|-------------|-----------------|------------------|----------------|
| CYCLE       | 2389029850      | 1                | 72             |
| NANOSECOND  | 1000000000      | 1                | 112            |
| MICROSECOND | 1000000         | 1                | 136            |
| MILLISECOND | 1036            | 1                | 168            |

If the values associated with a given timer name are `NULL`, that timer is not supported on your platform.

The columns have these meanings:

- The `TIMER_NAME` column shows the names of the available timers. `CYCLE` refers to the timer that is based on the CPU (processor) cycle counter.
- `TIMER_FREQUENCY` indicates the number of timer units per second. For a cycle timer, the frequency is generally related to the CPU speed. The value shown was obtained on a system with a 2.4GHz processor. The other timers are based on fixed fractions of seconds.
- `TIMER_RESOLUTION` indicates the number of timer units by which timer values increase at a time. If a timer has a resolution of 10, its value increases by 10 each time.
- `TIMER_OVERHEAD` is the minimal number of cycles of overhead to obtain one timing with the given timer. The overhead per event is twice the value displayed because the timer is invoked at the beginning and end of the event.

The Performance Schema assigns timers as follows:

- The wait timer uses `CYCLE`.

- The idle, stage, statement, and transaction timers use `NANOSECOND` on platforms where the `NANOSECOND` timer is available, `MICROSECOND` otherwise.

At server startup, the Performance Schema verifies that assumptions made at build time about timer assignments are correct, and displays a warning if a timer is not available.

To time wait events, the most important criterion is to reduce overhead, at the possible expense of the timer accuracy, so using the `CYCLE` timer is the best.

The time a statement (or stage) takes to execute is in general orders of magnitude larger than the time it takes to execute a single wait. To time statements, the most important criterion is to have an accurate measure, which is not affected by changes in processor frequency, so using a timer which is not based on cycles is the best. The default timer for statements is `NANOSECOND`. The extra “overhead” compared to the `CYCLE` timer is not significant, because the overhead caused by calling a timer twice (once when the statement starts, once when it ends) is orders of magnitude less compared to the CPU time used to execute the statement itself. Using the `CYCLE` timer has no benefit here, only drawbacks.

The precision offered by the cycle counter depends on processor speed. If the processor runs at 1 GHz (one billion cycles/second) or higher, the cycle counter delivers sub-nanosecond precision. Using the cycle counter is much cheaper than getting the actual time of day. For example, the standard `gettimeofday()` function can take hundreds of cycles, which is an unacceptable overhead for data gathering that may occur thousands or millions of times per second.

Cycle counters also have disadvantages:

- End users expect to see timings in wall-clock units, such as fractions of a second. Converting from cycles to fractions of seconds can be expensive. For this reason, the conversion is a quick and fairly rough multiplication operation.
- Processor cycle rate might change, such as when a laptop goes into power-saving mode or when a CPU slows down to reduce heat generation. If a processor's cycle rate fluctuates, conversion from cycles to real-time units is subject to error.
- Cycle counters might be unreliable or unavailable depending on the processor or the operating system. For example, on Pentiums, the instruction is `RDTSC` (an assembly-language rather than a C instruction) and it is theoretically possible for the operating system to prevent user-mode programs from using it.
- Some processor details related to out-of-order execution or multiprocessor synchronization might cause the counter to seem fast or slow by up to 1000 cycles.

MySQL works with cycle counters on x386 (Windows, macOS, Linux, Solaris, and other Unix flavors), PowerPC, and IA-64.

## Performance Schema Timer Representation in Events

Rows in Performance Schema tables that store current events and historical events have three columns to represent timing information: `TIMER_START` and `TIMER_END` indicate when an event started and finished, and `TIMER_WAIT` indicates event duration.

The `setup_instruments` table has an `ENABLED` column to indicate the instruments for which to collect events. The table also has a `TIMED` column to indicate which instruments are timed. If an instrument is not enabled, it produces no events. If an enabled instrument is not timed, events produced by the instrument have `NULL` for the `TIMER_START`, `TIMER_END`, and `TIMER_WAIT` timer values. This in turn causes those values to be ignored when calculating aggregate time values in summary tables (sum, minimum, maximum, and average).

Internally, times within events are stored in units given by the timer in effect when event timing begins. For display when events are retrieved from Performance Schema tables, times are shown in picoseconds (trillionths of a second) to normalize them to a standard unit, regardless of which timer is selected.

The timer baseline (“time zero”) occurs at Performance Schema initialization during server startup. `TIMER_START` and `TIMER_END` values in events represent picoseconds since the baseline. `TIMER_WAIT` values are durations in picoseconds.

Picosecond values in events are approximate. Their accuracy is subject to the usual forms of error associated with conversion from one unit to another. If the `CYCLE` timer is used and the processor rate varies, there might be drift. For these reasons, it is not reasonable to look at the `TIMER_START` value for an event as an accurate measure of time elapsed since server startup. On the other hand, it is reasonable to use `TIMER_START` or `TIMER_WAIT` values in `ORDER BY` clauses to order events by start time or duration.

The choice of picoseconds in events rather than a value such as microseconds has a performance basis. One implementation goal was to show results in a uniform time unit, regardless of the timer. In an ideal world this time unit would look like a wall-clock unit and be reasonably precise; in other words, microseconds. But to convert cycles or nanoseconds to microseconds, it would be necessary to perform a division for every instrumentation. Division is expensive on many platforms. Multiplication is not expensive, so that is what is used. Therefore, the time unit is an integer multiple of the highest possible `TIMER_FREQUENCY` value, using a multiplier large enough to ensure that there is no major precision loss. The result is that the time unit is “picoseconds.” This precision is spurious, but the decision enables overhead to be minimized.

While a wait, stage, statement, or transaction event is executing, the respective current-event tables display current-event timing information:

```
events_waits_current
events_stages_current
events_statements_current
events_transactions_current
```

To make it possible to determine how long a not-yet-completed event has been running, the timer columns are set as follows:

- `TIMER_START` is populated.
- `TIMER_END` is populated with the current timer value.
- `TIMER_WAIT` is populated with the time elapsed so far (`TIMER_END - TIMER_START`).

Events that have not yet completed have an `END_EVENT_ID` value of `NULL`. To assess time elapsed so far for an event, use the `TIMER_WAIT` column. Therefore, to identify events that have not yet completed and have taken longer than *N* picoseconds thus far, monitoring applications can use this expression in queries:

```
WHERE END_EVENT_ID IS NULL AND TIMER_WAIT > N
```

Event identification as just described assumes that the corresponding instruments have `ENABLED` and `TIMED` set to `YES` and that the relevant consumers are enabled.

## 27.4.2 Performance Schema Event Filtering

Events are processed in a producer/consumer fashion:

- Instrumented code is the source for events and produces events to be collected. The `setup_instruments` table lists the instruments for which events can be collected, whether they are enabled, and (for enabled instruments) whether to collect timing information:

```
mysql> SELECT NAME, ENABLED, TIMED
FROM performance_schema.setup_instruments;
```

| NAME                                              | ENABLED | TIMED |
|---------------------------------------------------|---------|-------|
| ...                                               |         |       |
| wait/synch/mutex/sql/LOCK_global_read_lock        | YES     | YES   |
| wait/synch/mutex/sql/LOCK_global_system_variables | YES     | YES   |
| wait/synch/mutex/sql/LOCK_lock_db                 | YES     | YES   |

```
| wait/synch/mutex/sql/LOCK_manager | YES | YES |
...
```

The `setup_instruments` table provides the most basic form of control over event production. To further refine event production based on the type of object or thread being monitored, other tables may be used as described in [Section 27.4.3, “Event Pre-Filtering”](#).

- Performance Schema tables are the destinations for events and consume events. The `setup_consumers` table lists the types of consumers to which event information can be sent and whether they are enabled:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
```

| NAME                             | ENABLED |
|----------------------------------|---------|
| events_stages_current            | NO      |
| events_stages_history            | NO      |
| events_stages_history_long       | NO      |
| events_statements_current        | YES     |
| events_statements_history        | YES     |
| events_statements_history_long   | NO      |
| events_transactions_current      | YES     |
| events_transactions_history      | YES     |
| events_transactions_history_long | NO      |
| events_waits_current             | NO      |
| events_waits_history             | NO      |
| events_waits_history_long        | NO      |
| global_instrumentation           | YES     |
| thread_instrumentation           | YES     |
| statements_digest                | YES     |

Filtering can be done at different stages of performance monitoring:

- **Pre-filtering.** This is done by modifying Performance Schema configuration so that only certain types of events are collected from producers, and collected events update only certain consumers. To do this, enable or disable instruments or consumers. Pre-filtering is done by the Performance Schema and has a global effect that applies to all users.

Reasons to use pre-filtering:

- To reduce overhead. Performance Schema overhead should be minimal even with all instruments enabled, but perhaps you want to reduce it further. Or you do not care about timing events and want to disable the timing code to eliminate timing overhead.
- To avoid filling the current-events or history tables with events in which you have no interest. Pre-filtering leaves more “room” in these tables for instances of rows for enabled instrument types. If you enable only file instruments with pre-filtering, no rows are collected for nonfile instruments. With post-filtering, nonfile events are collected, leaving fewer rows for file events.
- To avoid maintaining some kinds of event tables. If you disable a consumer, the server does not spend time maintaining destinations for that consumer. For example, if you do not care about event histories, you can disable the history table consumers to improve performance.
- **Post-filtering.** This involves the use of `WHERE` clauses in queries that select information from Performance Schema tables, to specify which of the available events you want to see. Post-filtering is performed on a per-user basis because individual users select which of the available events are of interest.

Reasons to use post-filtering:

- To avoid making decisions for individual users about which event information is of interest.
- To use the Performance Schema to investigate a performance issue when the restrictions to impose using pre-filtering are not known in advance.

The following sections provide more detail about pre-filtering and provide guidelines for naming instruments or consumers in filtering operations. For information about writing queries to retrieve information (post-filtering), see [Section 27.5, “Performance Schema Queries”](#).

### 27.4.3 Event Pre-Filtering

Pre-filtering is done by the Performance Schema and has a global effect that applies to all users. Pre-filtering can be applied to either the producer or consumer stage of event processing:

- To configure pre-filtering at the producer stage, several tables can be used:
  - `setup_instruments` indicates which instruments are available. An instrument disabled in this table produces no events regardless of the contents of the other production-related setup tables. An instrument enabled in this table is permitted to produce events, subject to the contents of the other tables.
  - `setup_objects` controls whether the Performance Schema monitors particular table and stored program objects.
  - `threads` indicates whether monitoring is enabled for each server thread.
  - `setup_actors` determines the initial monitoring state for new foreground threads.
- To configure pre-filtering at the consumer stage, modify the `setup_consumers` table. This determines the destinations to which events are sent. `setup_consumers` also implicitly affects event production. If a given event is not sent to any destination (that is, it is never consumed), the Performance Schema does not produce it.

Modifications to any of these tables affect monitoring immediately, with the exception that modifications to the `setup_actors` table affect only foreground threads created subsequent to the modification, not existing threads.

When you change the monitoring configuration, the Performance Schema does not flush the history tables. Events already collected remain in the current-events and history tables until displaced by newer events. If you disable instruments, you might need to wait a while before events for them are displaced by newer events of interest. Alternatively, use `TRUNCATE TABLE` to empty the history tables.

After making instrumentation changes, you might want to truncate the summary tables. Generally, the effect is to reset the summary columns to 0 or `NULL`, not to remove rows. This enables you to clear collected values and restart aggregation. That might be useful, for example, after you have made a runtime configuration change. Exceptions to this truncation behavior are noted in individual summary table sections.

The following sections describe how to use specific tables to control Performance Schema pre-filtering.

### 27.4.4 Pre-Filtering by Instrument

The `setup_instruments` table lists the available instruments:

```
mysql> SELECT NAME, ENABLED, TIMED
 FROM performance_schema.setup_instruments;
```

| NAME                | ENABLED | TIMED |
|---------------------|---------|-------|
| ...                 |         |       |
| stage/sql/end       | NO      | NO    |
| stage/sql/executing | NO      | NO    |
| stage/sql/init      | NO      | NO    |
| stage/sql/insert    | NO      | NO    |
| ...                 |         |       |
| statement/sql/load  | YES     | YES   |
| statement/sql/grant | YES     | YES   |
| statement/sql/check | YES     | YES   |

|                                                   |     |     |  |
|---------------------------------------------------|-----|-----|--|
| statement/sql/flush                               | YES | YES |  |
| ...                                               |     |     |  |
| wait/synch/mutex/sql/LOCK_global_read_lock        | YES | YES |  |
| wait/synch/mutex/sql/LOCK_global_system_variables | YES | YES |  |
| wait/synch/mutex/sql/LOCK_lock_db                 | YES | YES |  |
| wait/synch/mutex/sql/LOCK_manager                 | YES | YES |  |
| ...                                               |     |     |  |
| wait/synch/rwlock/sql/LOCK_grant                  | YES | YES |  |
| wait/synch/rwlock/sql/LOGGER::LOCK_logger         | YES | YES |  |
| wait/synch/rwlock/sql/LOCK_sys_init_connect       | YES | YES |  |
| wait/synch/rwlock/sql/LOCK_sys_init_slave         | YES | YES |  |
| ...                                               |     |     |  |
| wait/io/file/sql/binlog                           | YES | YES |  |
| wait/io/file/sql/binlog_index                     | YES | YES |  |
| wait/io/file/sql/casetest                         | YES | YES |  |
| wait/io/file/sql/dbopt                            | YES | YES |  |
| ...                                               |     |     |  |

To control whether an instrument is enabled, set its `ENABLED` column to `YES` or `NO`. To configure whether to collect timing information for an enabled instrument, set its `TIMED` value to `YES` or `NO`. Setting the `TIMED` column affects Performance Schema table contents as described in [Section 27.4.1, “Performance Schema Event Timing”](#).

Modifications to most `setup_instruments` rows affect monitoring immediately. For some instruments, modifications are effective only at server startup; changing them at runtime has no effect. This affects primarily mutexes, conditions, and rwlocks in the server, although there may be other instruments for which this is true.

The `setup_instruments` table provides the most basic form of control over event production. To further refine event production based on the type of object or thread being monitored, other tables may be used as described in [Section 27.4.3, “Event Pre-Filtering”](#).

The following examples demonstrate possible operations on the `setup_instruments` table. These changes, like other pre-filtering operations, affect all users. Some of these queries use the `LIKE` operator and a pattern match instrument names. For additional information about specifying patterns to select instruments, see [Section 27.4.9, “Naming Instruments or Consumers for Filtering Operations”](#).

- Disable all instruments:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO';
```

Now no events are collected.

- Disable all file instruments, adding them to the current set of disabled instruments:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO'
WHERE NAME LIKE 'wait/io/file/%';
```

- Disable only file instruments, enable all other instruments:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = IF(NAME LIKE 'wait/io/file/%', 'NO', 'YES');
```

- Enable all but those instruments in the `mysys` library:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = CASE WHEN NAME LIKE '%/mysys/%' THEN 'YES' ELSE 'NO' END;
```

- Disable a specific instrument:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO'
WHERE NAME = 'wait/synch/mutex/mysys/TMPDIR_mutex';
```

- To toggle the state of an instrument, “flip” its `ENABLED` value:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = IF(ENABLED = 'YES', 'NO', 'YES')
WHERE NAME = 'wait/synch/mutex/mysys/TMPDIR_mutex';
```

- Disable timing for all events:

```
UPDATE performance_schema.setup_instruments
SET TIMED = 'NO';
```

## 27.4.5 Pre-Filtering by Object

The `setup_objects` table controls whether the Performance Schema monitors particular table and stored program objects. The initial `setup_objects` contents look like this:

```
mysql> SELECT * FROM performance_schema.setup_objects;
```

| OBJECT_TYPE | OBJECT_SCHEMA      | OBJECT_NAME | ENABLED | TIMED |
|-------------|--------------------|-------------|---------|-------|
| EVENT       | mysql              | %           | NO      | NO    |
| EVENT       | performance_schema | %           | NO      | NO    |
| EVENT       | information_schema | %           | NO      | NO    |
| EVENT       | %                  | %           | YES     | YES   |
| FUNCTION    | mysql              | %           | NO      | NO    |
| FUNCTION    | performance_schema | %           | NO      | NO    |
| FUNCTION    | information_schema | %           | NO      | NO    |
| FUNCTION    | %                  | %           | YES     | YES   |
| PROCEDURE   | mysql              | %           | NO      | NO    |
| PROCEDURE   | performance_schema | %           | NO      | NO    |
| PROCEDURE   | information_schema | %           | NO      | NO    |
| PROCEDURE   | %                  | %           | YES     | YES   |
| TABLE       | mysql              | %           | NO      | NO    |
| TABLE       | performance_schema | %           | NO      | NO    |
| TABLE       | information_schema | %           | NO      | NO    |
| TABLE       | %                  | %           | YES     | YES   |
| TRIGGER     | mysql              | %           | NO      | NO    |
| TRIGGER     | performance_schema | %           | NO      | NO    |
| TRIGGER     | information_schema | %           | NO      | NO    |
| TRIGGER     | %                  | %           | YES     | YES   |

Modifications to the `setup_objects` table affect object monitoring immediately.

The `OBJECT_TYPE` column indicates the type of object to which a row applies. `TABLE` filtering affects table I/O events (`wait/io/table/sql/handler` instrument) and table lock events (`wait/lock/table/sql/handler` instrument).

The `OBJECT_SCHEMA` and `OBJECT_NAME` columns should contain a literal schema or object name, or '%' to match any name.

The `ENABLED` column indicates whether matching objects are monitored, and `TIMED` indicates whether to collect timing information. Setting the `TIMED` column affects Performance Schema table contents as described in [Section 27.4.1, “Performance Schema Event Timing”](#).

The effect of the default object configuration is to instrument all objects except those in the `mysql`, `INFORMATION_SCHEMA`, and `performance_schema` databases. (Tables in the `INFORMATION_SCHEMA` database are not instrumented regardless of the contents of `setup_objects`; the row for `information_schema.%` simply makes this default explicit.)

When the Performance Schema checks for a match in `setup_objects`, it tries to find more specific matches first. For rows that match a given `OBJECT_TYPE`, the Performance Schema checks rows in this order:

- Rows with `OBJECT_SCHEMA='literal'` and `OBJECT_NAME='literal'`.
- Rows with `OBJECT_SCHEMA='literal'` and `OBJECT_NAME='%'`.

- Rows with `OBJECT_SCHEMA = '%'` and `OBJECT_NAME = '%'`.

For example, with a table `db1.t1`, the Performance Schema looks in `TABLE` rows for a match for `'db1'` and `'t1'`, then for `'db1'` and `'%'`, then for `'%'` and `'%'`. The order in which matching occurs matters because different matching `setup_objects` rows can have different `ENABLED` and `TIMED` values.

For table-related events, the Performance Schema combines the contents of `setup_objects` with `setup_instruments` to determine whether to enable instruments and whether to time enabled instruments:

- For tables that match a row in `setup_objects`, table instruments produce events only if `ENABLED` is `YES` in both `setup_instruments` and `setup_objects`.
- The `TIMED` values in the two tables are combined, so that timing information is collected only when both values are `YES`.

For stored program objects, the Performance Schema takes the `ENABLED` and `TIMED` columns directly from the `setup_objects` row. There is no combining of values with `setup_instruments`.

Suppose that `setup_objects` contains the following `TABLE` rows that apply to `db1`, `db2`, and `db3`:

| OBJECT_TYPE | OBJECT_SCHEMA | OBJECT_NAME | ENABLED | TIMED |
|-------------|---------------|-------------|---------|-------|
| TABLE       | db1           | t1          | YES     | YES   |
| TABLE       | db1           | t2          | NO      | NO    |
| TABLE       | db2           | %           | YES     | YES   |
| TABLE       | db3           | %           | NO      | NO    |
| TABLE       | %             | %           | YES     | YES   |

If an object-related instrument in `setup_instruments` has an `ENABLED` value of `NO`, events for the object are not monitored. If the `ENABLED` value is `YES`, event monitoring occurs according to the `ENABLED` value in the relevant `setup_objects` row:

- `db1.t1` events are monitored
- `db1.t2` events are not monitored
- `db2.t3` events are monitored
- `db3.t4` events are not monitored
- `db4.t5` events are monitored

Similar logic applies for combining the `TIMED` columns from the `setup_instruments` and `setup_objects` tables to determine whether to collect event timing information.

If a persistent table and a temporary table have the same name, matching against `setup_objects` rows occurs the same way for both. It is not possible to enable monitoring for one table but not the other. However, each table is instrumented separately.

## 27.4.6 Pre-Filtering by Thread

The `threads` table contains a row for each server thread. Each row contains information about a thread and indicates whether monitoring is enabled for it. For the Performance Schema to monitor a thread, these things must be true:

- The `thread_instrumentation` consumer in the `setup_consumers` table must be `YES`.
- The `threads.INSTRUMENTED` column must be `YES`.
- Monitoring occurs only for those thread events produced from instruments that are enabled in the `setup_instruments` table.

The `threads` table also indicates for each server thread whether to perform historical event logging. This includes wait, stage, statement, and transaction events and affects logging to these tables:

```
events_waits_history
events_waits_history_long
events_stages_history
events_stages_history_long
events_statements_history
events_statements_history_long
events_transactions_history
events_transactions_history_long
```

For historical event logging to occur, these things must be true:

- The appropriate history-related consumers in the `setup_consumers` table must be enabled. For example, wait event logging in the `events_waits_history` and `events_waits_history_long` tables requires the corresponding `events_waits_history` and `events_waits_history_long` consumers to be `YES`.
- The `threads.HISTORY` column must be `YES`.
- Logging occurs only for those thread events produced from instruments that are enabled in the `setup_instruments` table.

For foreground threads (resulting from client connections), the initial values of the `INSTRUMENTED` and `HISTORY` columns in `threads` table rows are determined by whether the user account associated with a thread matches any row in the `setup_actors` table. The values come from the `ENABLED` and `HISTORY` columns of the matching `setup_actors` table row.

For background threads, there is no associated user. `INSTRUMENTED` and `HISTORY` are `YES` by default and `setup_actors` is not consulted.

The initial `setup_actors` contents look like this:

```
mysql> SELECT * FROM performance_schema.setup_actors;
+-----+-----+-----+-----+-----+
| HOST | USER | ROLE | ENABLED | HISTORY |
+-----+-----+-----+-----+-----+
| % | % | % | YES | YES |
+-----+-----+-----+-----+-----+
```

The `HOST` and `USER` columns should contain a literal host or user name, or `'%'` to match any name.

The `ENABLED` and `HISTORY` columns indicate whether to enable instrumentation and historical event logging for matching threads, subject to the other conditions described previously.

When the Performance Schema checks for a match for each new foreground thread in `setup_actors`, it tries to find more specific matches first, using the `USER` and `HOST` columns (`ROLE` is unused):

- Rows with `USER='literal'` and `HOST='literal'`.
- Rows with `USER='literal'` and `HOST='%'`.
- Rows with `USER='%'` and `HOST='literal'`.
- Rows with `USER='%'` and `HOST='%'`.

The order in which matching occurs matters because different matching `setup_actors` rows can have different `USER` and `HOST` values. This enables instrumenting and historical event logging to be applied selectively per host, user, or account (user and host combination), based on the `ENABLED` and `HISTORY` column values:

- When the best match is a row with `ENABLED=YES`, the `INSTRUMENTED` value for the thread becomes `YES`. When the best match is a row with `HISTORY=YES`, the `HISTORY` value for the thread becomes `YES`.

- When the best match is a row with `ENABLED=NO`, the `INSTRUMENTED` value for the thread becomes `NO`. When the best match is a row with `HISTORY=NO`, the `HISTORY` value for the thread becomes `NO`.
- When no match is found, the `INSTRUMENTED` and `HISTORY` values for the thread become `NO`.

The `ENABLED` and `HISTORY` columns in `setup_actors` rows can be set to `YES` or `NO` independent of one another. This means you can enable instrumentation separately from whether you collect historical events.

By default, monitoring and historical event collection are enabled for all new foreground threads because the `setup_actors` table initially contains a row with `'%'` for both `HOST` and `USER`. To perform more limited matching such as to enable monitoring only for some foreground threads, you must change this row because it matches any connection, and add rows for more specific `HOST/USER` combinations.

Suppose that you modify `setup_actors` as follows:

```
UPDATE performance_schema.setup_actors
SET ENABLED = 'NO', HISTORY = 'NO'
WHERE HOST = '%' AND USER = '%';
INSERT INTO performance_schema.setup_actors
(HOST,USER,ROLE,ENABLED,HISTORY)
VALUES('localhost','joe','%','YES','YES');
INSERT INTO performance_schema.setup_actors
(HOST,USER,ROLE,ENABLED,HISTORY)
VALUES('hosta.example.com','joe','%','YES','NO');
INSERT INTO performance_schema.setup_actors
(HOST,USER,ROLE,ENABLED,HISTORY)
VALUES('%','sam','%','NO','YES');
```

The `UPDATE` statement changes the default match to disable instrumentation and historical event collection. The `INSERT` statements add rows for more specific matches.

Now the Performance Schema determines how to set the `INSTRUMENTED` and `HISTORY` values for new connection threads as follows:

- If `joe` connects from the local host, the connection matches the first inserted row. The `INSTRUMENTED` and `HISTORY` values for the thread become `YES`.
- If `joe` connects from `hosta.example.com`, the connection matches the second inserted row. The `INSTRUMENTED` value for the thread becomes `YES` and the `HISTORY` value becomes `NO`.
- If `joe` connects from any other host, there is no match. The `INSTRUMENTED` and `HISTORY` values for the thread become `NO`.
- If `sam` connects from any host, the connection matches the third inserted row. The `INSTRUMENTED` value for the thread becomes `NO` and the `HISTORY` value becomes `YES`.
- For any other connection, the row with `HOST` and `USER` set to `'%'` matches. This row now has `ENABLED` and `HISTORY` set to `NO`, so the `INSTRUMENTED` and `HISTORY` values for the thread become `NO`.

Modifications to the `setup_actors` table affect only foreground threads created subsequent to the modification, not existing threads. To affect existing threads, modify the `INSTRUMENTED` and `HISTORY` columns of `threads` table rows.

## 27.4.7 Pre-Filtering by Consumer

The `setup_consumers` table lists the available consumer types and which are enabled:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
+-----+-----+
| NAME | ENABLED |
+-----+-----+
| events_stages_current | NO |
```

|                                  |     |
|----------------------------------|-----|
| events_stages_history            | NO  |
| events_stages_history_long       | NO  |
| events_statements_current        | YES |
| events_statements_history        | YES |
| events_statements_history_long   | NO  |
| events_transactions_current      | YES |
| events_transactions_history      | YES |
| events_transactions_history_long | NO  |
| events_waits_current             | NO  |
| events_waits_history             | NO  |
| events_waits_history_long        | NO  |
| global_instrumentation           | YES |
| thread_instrumentation           | YES |
| statements_digest                | YES |

Modify the `setup_consumers` table to affect pre-filtering at the consumer stage and determine the destinations to which events are sent. To enable or disable a consumer, set its `ENABLED` value to `YES` or `NO`.

Modifications to the `setup_consumers` table affect monitoring immediately.

If you disable a consumer, the server does not spend time maintaining destinations for that consumer. For example, if you do not care about historical event information, disable the history consumers:

```
UPDATE performance_schema.setup_consumers
SET ENABLED = 'NO'
WHERE NAME LIKE '%history%';
```

The consumer settings in the `setup_consumers` table form a hierarchy from higher levels to lower. The following principles apply:

- Destinations associated with a consumer receive no events unless the Performance Schema checks the consumer and the consumer is enabled.
- A consumer is checked only if all consumers it depends on (if any) are enabled.
- If a consumer is not checked, or is checked but is disabled, other consumers that depend on it are not checked.
- Dependent consumers may have their own dependent consumers.
- If an event would not be sent to any destination, the Performance Schema does not produce it.

The following lists describe the available consumer values. For discussion of several representative consumer configurations and their effect on instrumentation, see [Section 27.4.8, “Example Consumer Configurations”](#).

- [Global and Thread Consumers](#)
- [Wait Event Consumers](#)
- [Stage Event Consumers](#)
- [Statement Event Consumers](#)
- [Transaction Event Consumers](#)
- [Statement Digest Consumer](#)

## Global and Thread Consumers

- `global_instrumentation` is the highest level consumer. If `global_instrumentation` is `NO`, it disables global instrumentation. All other settings are lower level and are not checked; it does not matter what they are set to. No global or per thread information is maintained and no individual events are collected in the current-events or event-history tables. If `global_instrumentation`

is **YES**, the Performance Schema maintains information for global states and also checks the `thread_instrumentation` consumer.

- `thread_instrumentation` is checked only if `global_instrumentation` is **YES**. Otherwise, if `thread_instrumentation` is **NO**, it disables thread-specific instrumentation and all lower-level settings are ignored. No information is maintained per thread and no individual events are collected in the current-events or event-history tables. If `thread_instrumentation` is **YES**, the Performance Schema maintains thread-specific information and also checks `events_xxx_current` consumers.

## Wait Event Consumers

These consumers require both `global_instrumentation` and `thread_instrumentation` to be **YES** or they are not checked. If checked, they act as follows:

- `events_waits_current`, if **NO**, disables collection of individual wait events in the `events_waits_current` table. If **YES**, it enables wait event collection and the Performance Schema checks the `events_waits_history` and `events_waits_history_long` consumers.
- `events_waits_history` is not checked if `event_waits_current` is **NO**. Otherwise, an `events_waits_history` value of **NO** or **YES** disables or enables collection of wait events in the `events_waits_history` table.
- `events_waits_history_long` is not checked if `event_waits_current` is **NO**. Otherwise, an `events_waits_history_long` value of **NO** or **YES** disables or enables collection of wait events in the `events_waits_history_long` table.

## Stage Event Consumers

These consumers require both `global_instrumentation` and `thread_instrumentation` to be **YES** or they are not checked. If checked, they act as follows:

- `events_stages_current`, if **NO**, disables collection of individual stage events in the `events_stages_current` table. If **YES**, it enables stage event collection and the Performance Schema checks the `events_stages_history` and `events_stages_history_long` consumers.
- `events_stages_history` is not checked if `event_stages_current` is **NO**. Otherwise, an `events_stages_history` value of **NO** or **YES** disables or enables collection of stage events in the `events_stages_history` table.
- `events_stages_history_long` is not checked if `event_stages_current` is **NO**. Otherwise, an `events_stages_history_long` value of **NO** or **YES** disables or enables collection of stage events in the `events_stages_history_long` table.

## Statement Event Consumers

These consumers require both `global_instrumentation` and `thread_instrumentation` to be **YES** or they are not checked. If checked, they act as follows:

- `events_statements_current`, if **NO**, disables collection of individual statement events in the `events_statements_current` table. If **YES**, it enables statement event collection and the Performance Schema checks the `events_statements_history` and `events_statements_history_long` consumers.
- `events_statements_history` is not checked if `events_statements_current` is **NO**. Otherwise, an `events_statements_history` value of **NO** or **YES** disables or enables collection of statement events in the `events_statements_history` table.
- `events_statements_history_long` is not checked if `events_statements_current` is **NO**. Otherwise, an `events_statements_history_long` value of **NO** or **YES** disables or enables collection of statement events in the `events_statements_history_long` table.

## Transaction Event Consumers

These consumers require both `global_instrumentation` and `thread_instrumentation` to be `YES` or they are not checked. If checked, they act as follows:

- `events_transactions_current`, if `NO`, disables collection of individual transaction events in the `events_transactions_current` table. If `YES`, it enables transaction event collection and the Performance Schema checks the `events_transactions_history` and `events_transactions_history_long` consumers.
- `events_transactions_history` is not checked if `events_transactions_current` is `NO`. Otherwise, an `events_transactions_history` value of `NO` or `YES` disables or enables collection of transaction events in the `events_transactions_history` table.
- `events_transactions_history_long` is not checked if `events_transactions_current` is `NO`. Otherwise, an `events_transactions_history_long` value of `NO` or `YES` disables or enables collection of transaction events in the `events_transactions_history_long` table.

## Statement Digest Consumer

The `statements_digest` consumer requires `global_instrumentation` to be `YES` or it is not checked. There is no dependency on the statement event consumers, so you can obtain statistics per digest without having to collect statistics in `events_statements_current`, which is advantageous in terms of overhead. Conversely, you can get detailed statements in `events_statements_current` without digests (the `DIGEST` and `DIGEST_TEXT` columns are `NULL` in this case).

For more information about statement digesting, see [Section 27.10, “Performance Schema Statement Digests and Sampling”](#).

## 27.4.8 Example Consumer Configurations

The consumer settings in the `setup_consumers` table form a hierarchy from higher levels to lower. The following discussion describes how consumers work, showing specific configurations and their effects as consumer settings are enabled progressively from high to low. The consumer values shown are representative. The general principles described here apply to other consumer values that may be available.

The configuration descriptions occur in order of increasing functionality and overhead. If you do not need the information provided by enabling lower-level settings, disable them so that the Performance Schema executes less code on your behalf and there is less information to sift through.

The `setup_consumers` table contains the following hierarchy of values:

```
global_instrumentation
thread_instrumentation
 events_waits_current
 events_waits_history
 events_waits_history_long
 events_stages_current
 events_stages_history
 events_stages_history_long
 events_statements_current
 events_statements_history
 events_statements_history_long
 events_transactions_current
 events_transactions_history
 events_transactions_history_long
statements_digest
```

### Note

In the consumer hierarchy, the consumers for waits, stages, statements, and transactions are all at the same level. This differs from the event nesting

hierarchy, for which wait events nest within stage events, which nest within statement events, which nest within transaction events.

If a given consumer setting is **NO**, the Performance Schema disables the instrumentation associated with the consumer and ignores all lower-level settings. If a given setting is **YES**, the Performance Schema enables the instrumentation associated with it and checks the settings at the next lowest level. For a description of the rules for each consumer, see [Section 27.4.7, “Pre-Filtering by Consumer”](#).

For example, if `global_instrumentation` is enabled, `thread_instrumentation` is checked. If `thread_instrumentation` is enabled, the `events_xxx_current` consumers are checked. If of these `events_waits_current` is enabled, `events_waits_history` and `events_waits_history_long` are checked.

Each of the following configuration descriptions indicates which setup elements the Performance Schema checks and which output tables it maintains (that is, for which tables it collects information).

- [No Instrumentation](#)
- [Global Instrumentation Only](#)
- [Global and Thread Instrumentation Only](#)
- [Global, Thread, and Current-Event Instrumentation](#)
- [Global, Thread, Current-Event, and Event-History instrumentation](#)

## No Instrumentation

Server configuration state:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
+-----+-----+
| NAME | ENABLED |
+-----+-----+
| global_instrumentation | NO |
| ... | |
+-----+-----+
```

In this configuration, nothing is instrumented.

Setup elements checked:

- Table `setup_consumers`, consumer `global_instrumentation`

Output tables maintained:

- None

## Global Instrumentation Only

Server configuration state:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
+-----+-----+
| NAME | ENABLED |
+-----+-----+
global_instrumentation	YES
thread_instrumentation	NO
...	
+-----+-----+
```

In this configuration, instrumentation is maintained only for global states. Per-thread instrumentation is disabled.

Additional setup elements checked, relative to the preceding configuration:

- Table `setup_consumers`, consumer `thread_instrumentation`

- Table `setup_instruments`
- Table `setup_objects`

Additional output tables maintained, relative to the preceding configuration:

- `mutex_instances`
- `rwlock_instances`
- `cond_instances`
- `file_instances`
- `users`
- `hosts`
- `accounts`
- `socket_summary_by_event_name`
- `file_summary_by_instance`
- `file_summary_by_event_name`
- `objects_summary_global_by_type`
- `memory_summary_global_by_event_name`
- `table_lock_waits_summary_by_table`
- `table_io_waits_summary_by_index_usage`
- `table_io_waits_summary_by_table`
- `events_waits_summary_by_instance`
- `events_waits_summary_global_by_event_name`
- `events_stages_summary_global_by_event_name`
- `events_statements_summary_global_by_event_name`
- `events_transactions_summary_global_by_event_name`

## Global and Thread Instrumentation Only

Server configuration state:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
+-----+-----+
| NAME | ENABLED |
+-----+-----+
global_instrumentation	YES
thread_instrumentation	YES
events_waits_current	NO
...	
events_stages_current	NO
...	
events_statements_current	NO
...	
events_transactions_current	NO
...	
+-----+-----+
```

In this configuration, instrumentation is maintained globally and per thread. No individual events are collected in the current-events or event-history tables.

Additional setup elements checked, relative to the preceding configuration:

- Table `setup_consumers`, consumers `events_xxx_current`, where `xxx` is `waits`, `stages`, `statements`, `transactions`
- Table `setup_actors`
- Column `threads.instrumented`

Additional output tables maintained, relative to the preceding configuration:

- `events_xxx_summary_by_yyy_by_event_name`, where `xxx` is `waits`, `stages`, `statements`, `transactions`; and `yyy` is `thread`, `user`, `host`, `account`

## Global, Thread, and Current-Event Instrumentation

Server configuration state:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
+-----+-----+
| NAME | ENABLED |
+-----+-----+
global_instrumentation	YES
thread_instrumentation	YES
events_waits_current	YES
events_waits_history	NO
events_waits_history_long	NO
events_stages_current	YES
events_stages_history	NO
events_stages_history_long	NO
events_statements_current	YES
events_statements_history	NO
events_statements_history_long	NO
events_transactions_current	YES
events_transactions_history	NO
events_transactions_history_long	NO
...	
+-----+-----+
```

In this configuration, instrumentation is maintained globally and per thread. Individual events are collected in the current-events table, but not in the event-history tables.

Additional setup elements checked, relative to the preceding configuration:

- Consumers `events_xxx_history`, where `xxx` is `waits`, `stages`, `statements`, `transactions`
- Consumers `events_xxx_history_long`, where `xxx` is `waits`, `stages`, `statements`, `transactions`

Additional output tables maintained, relative to the preceding configuration:

- `events_xxx_current`, where `xxx` is `waits`, `stages`, `statements`, `transactions`

## Global, Thread, Current-Event, and Event-History instrumentation

The preceding configuration collects no event history because the `events_xxx_history` and `events_xxx_history_long` consumers are disabled. Those consumers can be enabled separately or together to collect event history per thread, globally, or both.

This configuration collects event history per thread, but not globally:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
+-----+-----+
| NAME | ENABLED |
+-----+-----+
global_instrumentation	YES
thread_instrumentation	YES
events_waits_current	YES
+-----+-----+
```

|                                  |     |
|----------------------------------|-----|
| events_waits_history             | YES |
| events_waits_history_long        | NO  |
| events_stages_current            | YES |
| events_stages_history            | YES |
| events_stages_history_long       | NO  |
| events_statements_current        | YES |
| events_statements_history        | YES |
| events_statements_history_long   | NO  |
| events_transactions_current      | YES |
| events_transactions_history      | YES |
| events_transactions_history_long | NO  |
| ...                              |     |

Event-history tables maintained for this configuration:

- `events_xxx_history`, where `xxx` is `waits`, `stages`, `statements`, `transactions`

This configuration collects event history globally, but not per thread:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
+-----+-----+
| NAME | ENABLED |
+-----+-----+
global_instrumentation	YES
thread_instrumentation	YES
events_waits_current	YES
events_waits_history	NO
events_waits_history_long	YES
events_stages_current	YES
events_stages_history	NO
events_stages_history_long	YES
events_statements_current	YES
events_statements_history	NO
events_statements_history_long	YES
events_transactions_current	YES
events_transactions_history	NO
events_transactions_history_long	YES
...	
+-----+-----+
```

Event-history tables maintained for this configuration:

- `events_xxx_history_long`, where `xxx` is `waits`, `stages`, `statements`, `transactions`

This configuration collects event history per thread and globally:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
+-----+-----+
| NAME | ENABLED |
+-----+-----+
global_instrumentation	YES
thread_instrumentation	YES
events_waits_current	YES
events_waits_history	YES
events_waits_history_long	YES
events_stages_current	YES
events_stages_history	YES
events_stages_history_long	YES
events_statements_current	YES
events_statements_history	YES
events_statements_history_long	YES
events_transactions_current	YES
events_transactions_history	YES
events_transactions_history_long	YES
...	
+-----+-----+
```

Event-history tables maintained for this configuration:

- `events_xxx_history`, where `xxx` is `waits`, `stages`, `statements`, `transactions`

- `events_xxx_history_long`, where `xxx` is `waits`, `stages`, `statements`, `transactions`

## 27.4.9 Naming Instruments or Consumers for Filtering Operations

Names given for filtering operations can be as specific or general as required. To indicate a single instrument or consumer, specify its name in full:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO'
WHERE NAME = 'wait/synch/mutex/myisammrg/MYRG_INFO::mutex';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'NO'
WHERE NAME = 'events_waits_current';
```

To specify a group of instruments or consumers, use a pattern that matches the group members:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO'
WHERE NAME LIKE 'wait/synch/mutex/%';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'NO'
WHERE NAME LIKE '%history%';
```

If you use a pattern, it should be chosen so that it matches all the items of interest and no others. For example, to select all file I/O instruments, it is better to use a pattern that includes the entire instrument name prefix:

```
... WHERE NAME LIKE 'wait/io/file/%';
```

A pattern of `%/file/%` matches other instruments that have an element of `/file/` anywhere in the name. Even less suitable is the pattern `%file%` because it matches instruments with `file` anywhere in the name, such as `wait/synch/mutex/innodb/file_open_mutex`.

To check which instrument or consumer names a pattern matches, perform a simple test:

```
SELECT NAME FROM performance_schema.setup_instruments
WHERE NAME LIKE 'pattern';

SELECT NAME FROM performance_schema.setup_consumers
WHERE NAME LIKE 'pattern';
```

For information about the types of names that are supported, see [Section 27.6, “Performance Schema Instrument Naming Conventions”](#).

## 27.4.10 Determining What Is Instrumented

It is always possible to determine what instruments the Performance Schema includes by checking the `setup_instruments` table. For example, to see what file-related events are instrumented for the `InnoDB` storage engine, use this query:

```
mysql> SELECT NAME, ENABLED, TIMED
FROM performance_schema.setup_instruments
WHERE NAME LIKE 'wait/io/file/innodb/%';
```

| NAME                                            | ENABLED | TIMED |
|-------------------------------------------------|---------|-------|
| wait/io/file/innodb/innodb_tablespace_open_file | YES     | YES   |
| wait/io/file/innodb/innodb_data_file            | YES     | YES   |
| wait/io/file/innodb/innodb_log_file             | YES     | YES   |
| wait/io/file/innodb/innodb_temp_file            | YES     | YES   |
| wait/io/file/innodb/innodb_arch_file            | YES     | YES   |
| wait/io/file/innodb/innodb_clone_file           | YES     | YES   |

An exhaustive description of precisely what is instrumented is not given in this documentation, for several reasons:

- What is instrumented is the server code. Changes to this code occur often, which also affects the set of instruments.
- It is not practical to list all the instruments because there are hundreds of them.
- As described earlier, it is possible to find out by querying the `setup_instruments` table. This information is always up to date for your version of MySQL, also includes instrumentation for instrumented plugins you might have installed that are not part of the core server, and can be used by automated tools.

## 27.5 Performance Schema Queries

Pre-filtering limits which event information is collected and is independent of any particular user. By contrast, post-filtering is performed by individual users through the use of queries with appropriate `WHERE` clauses that restrict what event information to select from the events available after pre-filtering has been applied.

In [Section 27.4.3, “Event Pre-Filtering”](#), an example showed how to pre-filter for file instruments. If the event tables contain both file and nonfile information, post-filtering is another way to see information only for file events. Add a `WHERE` clause to queries to restrict event selection appropriately:

```
mysql> SELECT THREAD_ID, NUMBER_OF_BYTES
 FROM performance_schema.events_waits_history
 WHERE EVENT_NAME LIKE 'wait/io/file/%'
 AND NUMBER_OF_BYTES IS NOT NULL;
```

| THREAD_ID | NUMBER_OF_BYTES |
|-----------|-----------------|
| 11        | 66              |
| 11        | 47              |
| 11        | 139             |
| 5         | 24              |
| 5         | 834             |

Most Performance Schema tables have indexes, which gives the optimizer access to execution plans other than full table scans. These indexes also improve performance for related objects, such as `sys` schema views that use those tables. For more information, see [Section 8.2.4, “Optimizing Performance Schema Queries”](#).

## 27.6 Performance Schema Instrument Naming Conventions

An instrument name consists of a sequence of elements separated by `' / '` characters. Example names:

```
wait/io/file/myisam/log
wait/io/file/mysys/charset
wait/lock/table/sql/handler
wait/synch/cond/mysys/COND_alarm
wait/synch/cond/sql/BINLOG::update_cond
wait/synch/mutex/mysys/BITMAP_mutex
wait/synch/mutex/sql/LOCK_delete
wait/synch/rwlock/sql/Query_cache_query::lock
stage/sql/closing_tables
stage/sql/Sorting_result
statement/com/Execute
statement/com/Query
statement/sql/create_table
statement/sql/lock_tables
errors
```

The instrument name space has a tree-like structure. The elements of an instrument name from left to right provide a progression from more general to more specific. The number of elements a name has depends on the type of instrument.

The interpretation of a given element in a name depends on the elements to the left of it. For example, `myisam` appears in both of the following names, but `myisam` in the first name is related to file I/O, whereas in the second it is related to a synchronization instrument:

```
wait/io/file/myisam/log
wait/synch/cond/myisam/MI_SORT_INFO::cond
```

Instrument names consist of a prefix with a structure defined by the Performance Schema implementation and a suffix defined by the developer implementing the instrument code. The top-level element of an instrument prefix indicates the type of instrument. This element also determines which event timer in the `performance_timers` table applies to the instrument. For the prefix part of instrument names, the top level indicates the type of instrument.

The suffix part of instrument names comes from the code for the instruments themselves. Suffixes may include levels such as these:

- A name for the major element (a server module such as `myisam`, `innodb`, `mysys`, or `sql`) or a plugin name.
- The name of a variable in the code, in the form `XXX` (a global variable) or `CCC::MMM` (a member `MMM` in class `CCC`). Examples: `COND_thread_cache`, `THR_LOCK_myisam`, `BINLOG::LOCK_index`.
- [Top-Level Instrument Elements](#)
- [Idle Instrument Elements](#)
- [Error Instrument Elements](#)
- [Memory Instrument Elements](#)
- [Stage Instrument Elements](#)
- [Statement Instrument Elements](#)
- [Thread Instrument Elements](#)
- [Wait Instrument Elements](#)

## Top-Level Instrument Elements

- `idle`: An instrumented idle event. This instrument has no further elements.
- `error`: An instrumented error event. This instrument has no further elements.
- `memory`: An instrumented memory event.
- `stage`: An instrumented stage event.
- `statement`: An instrumented statement event.
- `transaction`: An instrumented transaction event. This instrument has no further elements.
- `wait`: An instrumented wait event.

## Idle Instrument Elements

The `idle` instrument is used for idle events, which The Performance Schema generates as discussed in the description of the `socket_instances.STATE` column in [Section 27.12.3.5, “The socket\\_instances Table”](#).

## Error Instrument Elements

The `error` instrument indicates whether to collect information for server errors and warnings. This instrument is enabled by default. The `TIMED` column for the `error` row in the `setup_instruments` table is inapplicable because timing information is not collected.

## Memory Instrument Elements

Memory instrumentation is enabled by default. Memory instrumentation can be enabled or disabled at startup, or dynamically at runtime by updating the `ENABLED` column of the relevant instruments in the `setup_instruments` table. Memory instruments have names of the form `memory/code_area/instrument_name` where `code_area` is a value such as `sql` or `myisam`, and `instrument_name` is the instrument detail.

Instruments named with the prefix `memory/performance_schema/` expose how much memory is allocated for internal buffers in the Performance Schema. The `memory/performance_schema/` instruments are built in, always enabled, and cannot be disabled at startup or runtime. Built-in memory instruments are displayed only in the `memory_summary_global_by_event_name` table. For more information, see [Section 27.17, “The Performance Schema Memory-Allocation Model”](#).

## Stage Instrument Elements

Stage instruments have names of the form `stage/code_area/stage_name`, where `code_area` is a value such as `sql` or `myisam`, and `stage_name` indicates the stage of statement processing, such as `Sorting result` or `Sending data`. Stages correspond to the thread states displayed by `SHOW PROCESSLIST` or that are visible in the `INFORMATION_SCHEMA.PROCESSLIST` table.

## Statement Instrument Elements

- `statement/abstract/*`: An abstract instrument for statement operations. Abstract instruments are used during the early stages of statement classification before the exact statement type is known, then changed to a more specific statement instrument when the type is known. For a description of this process, see [Section 27.12.6, “Performance Schema Statement Event Tables”](#).
- `statement/com`: An instrumented command operation. These have names corresponding to `COM_xxx` operations (see the `mysql_com.h` header file and `sql/sql_parse.cc`). For example, the `statement/com/Connect` and `statement/com/Init DB` instruments correspond to the `COM_CONNECT` and `COM_INIT_DB` commands.
- `statement/scheduler/event`: A single instrument to track all events executed by the Event Scheduler. This instrument comes into play when a scheduled event begins executing.
- `statement/sp`: An instrumented internal instruction executed by a stored program. For example, the `statement/sp/cfetch` and `statement/sp/freturn` instruments are used cursor fetch and function return instructions.
- `statement/sql`: An instrumented SQL statement operation. For example, the `statement/sql/create_db` and `statement/sql/select` instruments are used for `CREATE DATABASE` and `SELECT` statements.

## Thread Instrument Elements

Instrumented threads are displayed in the `setup_threads` table, which exposes thread class names and attributes.

Thread instruments begin with `thread` (for example, `thread/sql/parser_service` or `thread/performance_schema/setup`).

## Wait Instrument Elements

- `wait/io`

An instrumented I/O operation.

- `wait/io/file`

An instrumented file I/O operation. For files, the wait is the time waiting for the file operation to complete (for example, a call to `fwrite()`). Due to caching, the physical file I/O on the disk might not happen within this call.

- `wait/io/socket`

An instrumented socket operation. Socket instruments have names of the form `wait/io/socket/sql/socket_type`. The server has a listening socket for each network protocol that it supports. The instruments associated with listening sockets for TCP/IP or Unix socket file connections have a `socket_type` value of `server_tcpip_socket` or `server_unix_socket`, respectively. When a listening socket detects a connection, the server transfers the connection to a new socket managed by a separate thread. The instrument for the new connection thread has a `socket_type` value of `client_connection`.

- `wait/io/table`

An instrumented table I/O operation. These include row-level accesses to persistent base tables or temporary tables. Operations that affect rows are fetch, insert, update, and delete. For a view, waits are associated with base tables referenced by the view.

Unlike most waits, a table I/O wait can include other waits. For example, table I/O might include file I/O or memory operations. Thus, `events_waits_current` for a table I/O wait usually has two rows. For more information, see [Section 27.8, “Performance Schema Atom and Molecule Events”](#).

Some row operations might cause multiple table I/O waits. For example, an insert might activate a trigger that causes an update.

- `wait/lock`

An instrumented lock operation.

- `wait/lock/table`

An instrumented table lock operation.

- `wait/lock/metadata/sql/mdl`

An instrumented metadata lock operation.

- `wait/synch`

An instrumented synchronization object. For synchronization objects, the `TIMER_WAIT` time includes the amount of time blocked while attempting to acquire a lock on the object, if any.

- `wait/synch/cond`

A condition is used by one thread to signal to other threads that something they were waiting for has happened. If a single thread was waiting for a condition, it can wake up and proceed with its execution. If several threads were waiting, they can all wake up and compete for the resource for which they were waiting.

- `wait/synch/mutex`

A mutual exclusion object used to permit access to a resource (such as a section of executable code) while preventing other threads from accessing the resource.

- `wait/synch/prlock`

A priority `rwlock` lock object.

- `wait/synch/rwlock`

A plain [read/write lock](#) object used to lock a specific variable for access while preventing its use by other threads. A shared read lock can be acquired simultaneously by multiple threads. An exclusive write lock can be acquired by only one thread at a time.

- [wait/synch/sxlock](#)

A shared-exclusive (SX) lock is a type of [rwlock](#) lock object that provides write access to a common resource while permitting inconsistent reads by other threads. [sxlocks](#) optimize concurrency and improve scalability for read-write workloads.

## 27.7 Performance Schema Status Monitoring

There are several status variables associated with the Performance Schema:

```
mysql> SHOW STATUS LIKE 'perf%';
```

| Variable_name                                 | Value |
|-----------------------------------------------|-------|
| Performance_schema_accounts_lost              | 0     |
| Performance_schema_cond_classes_lost          | 0     |
| Performance_schema_cond_instances_lost        | 0     |
| Performance_schema_digest_lost                | 0     |
| Performance_schema_file_classes_lost          | 0     |
| Performance_schema_file_handles_lost          | 0     |
| Performance_schema_file_instances_lost        | 0     |
| Performance_schema_hosts_lost                 | 0     |
| Performance_schema_locker_lost                | 0     |
| Performance_schema_memory_classes_lost        | 0     |
| Performance_schema_metadata_lock_lost         | 0     |
| Performance_schema_mutex_classes_lost         | 0     |
| Performance_schema_mutex_instances_lost       | 0     |
| Performance_schema_nested_statement_lost      | 0     |
| Performance_schema_program_lost               | 0     |
| Performance_schema_rwlock_classes_lost        | 0     |
| Performance_schema_rwlock_instances_lost      | 0     |
| Performance_schema_session_connect_attrs_lost | 0     |
| Performance_schema_socket_classes_lost        | 0     |
| Performance_schema_socket_instances_lost      | 0     |
| Performance_schema_stage_classes_lost         | 0     |
| Performance_schema_statement_classes_lost     | 0     |
| Performance_schema_table_handles_lost         | 0     |
| Performance_schema_table_instances_lost       | 0     |
| Performance_schema_thread_classes_lost        | 0     |
| Performance_schema_thread_instances_lost      | 0     |
| Performance_schema_users_lost                 | 0     |

The Performance Schema status variables provide information about instrumentation that could not be loaded or created due to memory constraints. Names for these variables have several forms:

- [Performance\\_schema\\_xxx\\_classes\\_lost](#) indicates how many instruments of type [xxx](#) could not be loaded.
- [Performance\\_schema\\_xxx\\_instances\\_lost](#) indicates how many instances of object type [xxx](#) could not be created.
- [Performance\\_schema\\_xxx\\_handles\\_lost](#) indicates how many instances of object type [xxx](#) could not be opened.
- [Performance\\_schema\\_locker\\_lost](#) indicates how many events are “lost” or not recorded.

For example, if a mutex is instrumented in the server source but the server cannot allocate memory for the instrumentation at runtime, it increments [Performance\\_schema\\_mutex\\_classes\\_lost](#). The mutex still functions as a synchronization object (that is, the server continues to function normally), but performance data for it is not collected. If the instrument can be allocated, it can be used for initializing instrumented mutex instances. For a singleton mutex such as a global mutex, there is only

one instance. Other mutexes have an instance per connection, or per page in various caches and data buffers, so the number of instances varies over time. Increasing the maximum number of connections or the maximum size of some buffers increases the maximum number of instances that might be allocated at once. If the server cannot create a given instrumented mutex instance, it increments `Performance_schema_mutex_instances_lost`.

Suppose that the following conditions hold:

- The server was started with the `--performance_schema_max_mutex_classes=200` option and thus has room for 200 mutex instruments.
- 150 mutex instruments have been loaded already.
- The plugin named `plugin_a` contains 40 mutex instruments.
- The plugin named `plugin_b` contains 20 mutex instruments.

The server allocates mutex instruments for the plugins depending on how many they need and how many are available, as illustrated by the following sequence of statements:

```
INSTALL PLUGIN plugin_a
```

The server now has  $150+40 = 190$  mutex instruments.

```
UNINSTALL PLUGIN plugin_a;
```

The server still has 190 instruments. All the historical data generated by the plugin code is still available, but new events for the instruments are not collected.

```
INSTALL PLUGIN plugin_a;
```

The server detects that the 40 instruments are already defined, so no new instruments are created, and previously assigned internal memory buffers are reused. The server still has 190 instruments.

```
INSTALL PLUGIN plugin_b;
```

The server has room for  $200-190 = 10$  instruments (in this case, mutex classes), and sees that the plugin contains 20 new instruments. 10 instruments are loaded, and 10 are discarded or “lost.” The `Performance_schema_mutex_classes_lost` indicates the number of instruments (mutex classes) lost:

```
mysql> SHOW STATUS LIKE "perf%mutex_classes_lost";
+-----+-----+
| Variable_name | Value |
+-----+-----+
| Performance_schema_mutex_classes_lost | 10 |
+-----+-----+
1 row in set (0.10 sec)
```

The instrumentation still works and collects (partial) data for `plugin_b`.

When the server cannot create a mutex instrument, these results occur:

- No row for the instrument is inserted into the `setup_instruments` table.
- `Performance_schema_mutex_classes_lost` increases by 1.
- `Performance_schema_mutex_instances_lost` does not change. (When the mutex instrument is not created, it cannot be used to create instrumented mutex instances later.)

The pattern just described applies to all types of instruments, not just mutexes.

A value of `Performance_schema_mutex_classes_lost` greater than 0 can happen in two cases:

- To save a few bytes of memory, you start the server with `--performance_schema_max_mutex_classes=N`, where *N* is less than the default value. The

default value is chosen to be sufficient to load all the plugins provided in the MySQL distribution, but this can be reduced if some plugins are never loaded. For example, you might choose not to load some of the storage engines in the distribution.

- You load a third-party plugin that is instrumented for the Performance Schema but do not allow for the plugin's instrumentation memory requirements when you start the server. Because it comes from a third party, the instrument memory consumption of this engine is not accounted for in the default value chosen for `performance_schema_max_mutex_classes`.

If the server has insufficient resources for the plugin's instruments and you do not explicitly allocate more using `--performance_schema_max_mutex_classes=N`, loading the plugin leads to starvation of instruments.

If the value chosen for `performance_schema_max_mutex_classes` is too small, no error is reported in the error log and there is no failure at runtime. However, the content of the tables in the `performance_schema` database misses events. The `Performance_schema_mutex_classes_lost` status variable is the only visible sign to indicate that some events were dropped internally due to failure to create instruments.

If an instrument is not lost, it is known to the Performance Schema, and is used when instrumenting instances. For example, `wait/synch/mutex/sql/LOCK_delete` is the name of a mutex instrument in the `setup_instruments` table. This single instrument is used when creating a mutex in the code (in `THD::LOCK_delete`) however many instances of the mutex are needed as the server runs. In this case, `LOCK_delete` is a mutex that is per connection (`THD`), so if a server has 1000 connections, there are 1000 threads, and 1000 instrumented `LOCK_delete` mutex instances (`THD::LOCK_delete`).

If the server does not have room for all these 1000 instrumented mutexes (instances), some mutexes are created with instrumentation, and some are created without instrumentation. If the server can create only 800 instances, 200 instances are lost. The server continues to run, but increments `Performance_schema_mutex_instances_lost` by 200 to indicate that instances could not be created.

A value of `Performance_schema_mutex_instances_lost` greater than 0 can happen when the code initializes more mutexes at runtime than were allocated for `--performance_schema_max_mutex_instances=N`.

The bottom line is that if `SHOW STATUS LIKE 'perf%'` says that nothing was lost (all values are zero), the Performance Schema data is accurate and can be relied upon. If something was lost, the data is incomplete, and the Performance Schema could not record everything given the insufficient amount of memory it was given to use. In this case, the specific `Performance_schema_xxx_lost` variable indicates the problem area.

It might be appropriate in some cases to cause deliberate instrument starvation. For example, if you do not care about performance data for file I/O, you can start the server with all Performance Schema parameters related to file I/O set to 0. No memory is allocated for file-related classes, instances, or handles, and all file events are lost.

Use `SHOW ENGINE PERFORMANCE_SCHEMA STATUS` to inspect the internal operation of the Performance Schema code:

```
mysql> SHOW ENGINE PERFORMANCE_SCHEMA STATUS\G
...
***** 3. row *****
 Type: performance_schema
 Name: events_waits_history.size
 Status: 76
***** 4. row *****
 Type: performance_schema
 Name: events_waits_history.count
 Status: 10000
***** 5. row *****
 Type: performance_schema
```

```

Name: events_waits_history.memory
Status: 760000
...
***** 57. row *****
Type: performance_schema
Name: performance_schema.memory
Status: 26459600
...

```

This statement is intended to help the DBA understand the effects that different Performance Schema options have on memory requirements. For a description of the field meanings, see [Section 13.7.7.15, “SHOW ENGINE Statement”](#).

## 27.8 Performance Schema Atom and Molecule Events

For a table I/O event, there are usually two rows in `events_waits_current`, not one. For example, a row fetch might result in rows like this:

| Row# | EVENT_NAME                | TIMER_START | TIMER_END |
|------|---------------------------|-------------|-----------|
| 1    | wait/io/file/myisam/dfile | 10001       | 10002     |
| 2    | wait/io/table/sql/handler | 10000       | NULL      |

The row fetch causes a file read. In the example, the table I/O fetch event started before the file I/O event but has not finished (its `TIMER_END` value is `NULL`). The file I/O event is “nested” within the table I/O event.

This occurs because, unlike other “atomic” wait events such as for mutexes or file I/O, table I/O events are “molecular” and include (overlap with) other events. In `events_waits_current`, the table I/O event usually has two rows:

- One row for the most recent table I/O wait event
- One row for the most recent wait event of any kind

Usually, but not always, the “of any kind” wait event differs from the table I/O event. As each subsidiary event completes, it disappears from `events_waits_current`. At this point, and until the next subsidiary event begins, the table I/O wait is also the most recent wait of any kind.

## 27.9 Performance Schema Tables for Current and Historical Events

For wait, stage, statement, and transaction events, the Performance Schema can monitor and store current events. In addition, when events end, the Performance Schema can store them in history tables. For each event type, the Performance Schema uses three tables for storing current and historical events. The tables have names of the following forms, where `xxx` indicates the event type (`waits`, `stages`, `statements`, `transactions`):

- `events_xxx_current`: The “current events” table stores the current monitored event for each thread (one row per thread).
- `events_xxx_history`: The “recent history” table stores the most recent events that have ended per thread (up to a maximum number of rows per thread).
- `events_xxx_history_long`: The “long history” table stores the most recent events that have ended globally (across all threads, up to a maximum number of rows per table).

The `_current` table for each event type contains one row per thread, so there is no system variable for configuring its maximum size. The Performance Schema autosizes the history tables, or the sizes can be configured explicitly at server startup using table-specific system variables, as indicated in the sections that describe the individual history tables. Typical autosized values are 10 rows per thread for `_history` tables, and 10,000 rows total for `_history_long` tables.

For each event type, the `_current`, `_history`, and `_history_long` tables have the same columns. The `_current` and `_history` tables have the same indexing. The `_history_long` table has no indexing.

The `_current` tables show what is currently happening within the server. When a current event ends, it is removed from its `_current` table.

The `_history` and `_history_long` tables show what has happened in the recent past. When the history tables become full, old events are discarded as new events are added. Rows expire from the `_history` and `_history_long` tables in different ways because the tables serve different purposes:

- `_history` is meant to investigate individual threads, independently of the global server load.
- `_history_long` is meant to investigate the server globally, not each thread.

The difference between the two types of history tables relates to the data retention policy. Both tables contains the same data when an event is first seen. However, data within each table expires differently over time, so that data might be preserved for a longer or shorter time in each table:

- For `_history`, when the table contains the maximum number of rows for a given thread, the oldest thread row is discarded when a new row for that thread is added.
- For `_history_long`, when the table becomes full, the oldest row is discarded when a new row is added, regardless of which thread generated either row.

When a thread ends, all its rows are discarded from the `_history` table but not from the `_history_long` table.

The following example illustrates the differences in how events are added to and discarded from the two types of history tables. The principles apply equally to all event types. The example is based on these assumptions:

- The Performance Schema is configured to retain 10 rows per thread in the `_history` table and 10,000 rows total in the `_history_long` table.
- Thread A generates 1 event per second.

Thread B generates 100 events per second.

- No other threads are running.

After 5 seconds of execution:

- A and B have generated 5 and 500 events, respectively.
- `_history` contains 5 rows for A and 10 rows for B. Because storage per thread is limited to 10 rows, no rows have been discarded for A, whereas 490 rows have been discarded for B.
- `_history_long` contains 5 rows for A and 500 rows for B. Because the table has a maximum size of 10,000 rows, no rows have been discarded for either thread.

After 5 minutes (300 seconds) of execution:

- A and B have generated 300 and 30,000 events, respectively.
- `_history` contains 10 rows for A and 10 rows for B. Because storage per thread is limited to 10 rows, 290 rows have been discarded for A, whereas 29,990 rows have been discarded for B. Rows for A include data up to 10 seconds old, whereas rows for B include data up to only .1 seconds old.
- `_history_long` contains 10,000 rows. Because A and B together generate 101 events per second, the table contains data up to approximately  $10,000/101 = 99$  seconds old, with a mix of rows approximately 100 to 1 from B as opposed to A.

## 27.10 Performance Schema Statement Digests and Sampling

The MySQL server is capable of maintaining statement digest information. The digesting process converts each SQL statement to normalized form (the statement digest) and computes a SHA-256 hash value (the digest hash value) from the normalized result. Normalization permits statements that are similar to be grouped and summarized to expose information about the types of statements the server is executing and how often they occur. For each digest, a representative statement that produces the digest is stored as a sample. This section describes how statement digesting and sampling occur and how they can be useful.

Digesting occurs in the parser regardless of whether the Performance Schema is available, so that other features such as MySQL Enterprise Firewall and query rewrite plugins have access to statement digests.

- [Statement Digest General Concepts](#)
- [Statement Digests in the Performance Schema](#)
- [Statement Digest Memory Use](#)
- [Statement Sampling](#)

### Statement Digest General Concepts

When the parser receives an SQL statement, it computes a statement digest if that digest is needed, which is true if any of the following conditions are true:

- Performance Schema digest instrumentation is enabled
- MySQL Enterprise Firewall is enabled
- A Query Rewrite Plugin is enabled

The parser is also used by the `STATEMENT_DIGEST_TEXT()` and `STATEMENT_DIGEST()` functions, which applications can call to compute a normalized statement digest and a digest hash value, respectively, from an SQL statement.

The `max_digest_length` system variable value determines the maximum number of bytes available per session for computation of normalized statement digests. Once that amount of space is used during digest computation, truncation occurs: no further tokens from a parsed statement are collected or figure into its digest value. Statements that differ only after that many bytes of parsed tokens produce the same normalized statement digest and are considered identical if compared or if aggregated for digest statistics.

#### Warning

Setting the `max_digest_length` system variable to zero disables digest production, which also disables server functionality that requires digests.

After the normalized statement has been computed, a SHA-256 hash value is computed from it. In addition:

- If MySQL Enterprise Firewall is enabled, it is called and the digest as computed is available to it.
- If any Query Rewrite Plugin is enabled, it is called and the statement digest and digest value are available to it.
- If the Performance Schema has digest instrumentation enabled, it makes a copy of the normalized statement digest, allocating a maximum of `performance_schema_max_digest_length` bytes for it. Consequently, if `performance_schema_max_digest_length` is less than `max_digest_length`, the copy is truncated relative to the original. The copy of the normalized

statement digest is stored in the appropriate Performance Schema tables, along with the SHA-256 hash value computed from the original normalized statement. (If the Performance Schema truncates its copy of the normalized statement digest relative to the original, it does not recompute the SHA-256 hash value.)

Statement normalization transforms the statement text to a more standardized digest string representation that preserves the general statement structure while removing information not essential to the structure:

- Object identifiers such as database and table names are preserved.
- Literal values are converted to parameter markers. A normalized statement does not retain information such as names, passwords, dates, and so forth.
- Comments are removed and whitespace is adjusted.

Consider these statements:

```
SELECT * FROM orders WHERE customer_id=10 AND quantity>20
SELECT * FROM orders WHERE customer_id = 20 AND quantity > 100
```

To normalize these statements, the parser replaces data values by ? and adjusts whitespace. Both statements yield the same normalized form and thus are considered “the same”:

```
SELECT * FROM orders WHERE customer_id = ? AND quantity > ?
```

The normalized statement contains less information but is still representative of the original statement. Other similar statements that have different data values have the same normalized form.

Now consider these statements:

```
SELECT * FROM customers WHERE customer_id = 1000
SELECT * FROM orders WHERE customer_id = 1000
```

In this case, the normalized statements differ because the object identifiers differ:

```
SELECT * FROM customers WHERE customer_id = ?
SELECT * FROM orders WHERE customer_id = ?
```

If normalization produces a statement that exceeds the space available in the digest buffer (as determined by `max_digest_length`), truncation occurs and the text ends with “...”. Long normalized statements that differ only in the part that occurs following the “...” are considered the same. Consider these statements:

```
SELECT * FROM mytable WHERE cola = 10 AND colb = 20
SELECT * FROM mytable WHERE cola = 10 AND colc = 20
```

If the cutoff happens to be right after the `AND`, both statements have this normalized form:

```
SELECT * FROM mytable WHERE cola = ? AND ...
```

In this case, the difference in the second column name is lost and both statements are considered the same.

## Statement Digests in the Performance Schema

In the Performance Schema, statement digesting involves these elements:

- A `statements_digest` consumer in the `setup_consumers` table controls whether the Performance Schema maintains digest information. See [Statement Digest Consumer](#).
- The statement event tables (`events_statements_current`, `events_statements_history`, and `events_statements_history_long`) have columns for storing normalized statement digests and the corresponding digest SHA-256 hash values:

- `DIGEST_TEXT` is the text of the normalized statement digest. This is a copy of the original normalized statement that was computed to a maximum of `max_digest_length` bytes, further truncated as necessary to `performance_schema_max_digest_length` bytes.
- `DIGEST` is the digest SHA-256 hash value computed from the original normalized statement.

See [Section 27.12.6, “Performance Schema Statement Event Tables”](#).

- The `events_statements_summary_by_digest` summary table provides aggregated statement digest information. This table aggregates information for statements per `SCHEMA_NAME` and `DIGEST` combination. The Performance Schema uses SHA-256 hash values for aggregation because they are fast to compute and have a favorable statistical distribution that minimizes collisions. See [Section 27.12.20.3, “Statement Summary Tables”](#).

Some Performance Tables have a column that stores original SQL statements from which digests are computed:

- The `SQL_TEXT` column of the `events_statements_current`, `events_statements_history`, and `events_statements_history_long` statement event tables.
- The `QUERY_SAMPLE_TEXT` column of the `events_statements_summary_by_digest` summary table.

The maximum space available for statement display is 1024 bytes by default. To change this value, set the `performance_schema_max_sql_text_length` system variable at server startup. Changes affect the storage required for all the columns just named.

The `performance_schema_max_digest_length` system variable determines the maximum number of bytes available per statement for digest value storage in the Performance Schema. However, the display length of statement digests may be longer than the available buffer size due to internal encoding of statement elements such as keywords and literal values. Consequently, values selected from the `DIGEST_TEXT` column of statement event tables may appear to exceed the `performance_schema_max_digest_length` value.

The `events_statements_summary_by_digest` summary table provides a profile of the statements executed by the server. It shows what kinds of statements an application is executing and how often. An application developer can use this information together with other information in the table to assess the application's performance characteristics. For example, table columns that show wait times, lock times, or index use may highlight types of queries that are inefficient. This gives the developer insight into which parts of the application need attention.

The `events_statements_summary_by_digest` summary table has a fixed size. By default the Performance Schema estimates the size to use at startup. To specify the table size explicitly, set the `performance_schema_digests_size` system variable at server startup. If the table becomes full, the Performance Schema groups statements that have `SCHEMA_NAME` and `DIGEST` values not matching existing values in the table in a special row with `SCHEMA_NAME` and `DIGEST` set to `NULL`. This permits all statements to be counted. However, if the special row accounts for a significant percentage of the statements executed, it might be desirable to increase the summary table size by increasing `performance_schema_digests_size`.

## Statement Digest Memory Use

For applications that generate very long statements that differ only at the end, increasing `max_digest_length` enables computation of digests that distinguish statements that would otherwise aggregate to the same digest. Conversely, decreasing `max_digest_length` causes the server to devote less memory to digest storage but increases the likelihood of longer statements aggregating to the same digest. Administrators should keep in mind that larger values result in correspondingly increased memory requirements, particularly for workloads that involve large numbers of simultaneous sessions (the server allocates `max_digest_length` bytes per session).

As described previously, normalized statement digests as computed by the parser are constrained to a maximum of `max_digest_length` bytes, whereas normalized statement digests stored in the Performance Schema use `performance_schema_max_digest_length` bytes. The following memory-use considerations apply regarding the relative values of `max_digest_length` and `performance_schema_max_digest_length`:

- If `max_digest_length` is less than `performance_schema_max_digest_length`:
  - Server features other than the Performance Schema use normalized statement digests that take up to `max_digest_length` bytes.
  - The Performance Schema does not further truncate normalized statement digests that it stores, but allocates more memory than `max_digest_length` bytes per digest, which is unnecessary.
- If `max_digest_length` equals `performance_schema_max_digest_length`:
  - Server features other than the Performance Schema use normalized statement digests that take up to `max_digest_length` bytes.
  - The Performance Schema does not further truncate normalized statement digests that it stores, and allocates the same amount of memory as `max_digest_length` bytes per digest.
- If `max_digest_length` is greater than `performance_schema_max_digest_length`:
  - Server features other than the Performance Schema use normalized statement digests that take up to `max_digest_length` bytes.
  - The Performance Schema further truncates normalized statement digests that it stores, and allocates less memory than `max_digest_length` bytes per digest.

Because the Performance Schema statement event tables might store many digests, setting `performance_schema_max_digest_length` smaller than `max_digest_length` enables administrators to balance these factors:

- The need to have long normalized statement digests available to server features outside the Performance Schema
- Many concurrent sessions, each of which allocates digest-computation memory
- The need to limit memory consumption by the Performance Schema statement event tables when storing many statement digests

The `performance_schema_max_digest_length` setting is not per session, it is per statement, and a session can store multiple statements in the `events_statements_history` table. A typical number of statements in this table is 10 per session, so each session consumes 10 times the memory indicated by the `performance_schema_max_digest_length` value, for this table alone.

Also, there are many statements (and digests) collected globally, most notably in the `events_statements_history_long` table. Here, too, *N* statements stored consumes *N* times the memory indicated by the `performance_schema_max_digest_length` value.

To assess the amount of memory used for SQL statement storage and digest computation, use the `SHOW ENGINE PERFORMANCE_SCHEMA STATUS` statement, or monitor these instruments:

```
mysql> SELECT NAME
 FROM performance_schema.setup_instruments
 WHERE NAME LIKE '%.sqltext';
```

| NAME                                                             |
|------------------------------------------------------------------|
| memory/performance_schema/events_statements_history.sqltext      |
| memory/performance_schema/events_statements_current.sqltext      |
| memory/performance_schema/events_statements_history_long.sqltext |

```

+-----+
mysql> SELECT NAME
 FROM performance_schema.setup_instruments
 WHERE NAME LIKE 'memory/performance_schema/%.tokens';
+-----+
| NAME |
+-----+
| memory/performance_schema/events_statements_history.tokens |
| memory/performance_schema/events_statements_current.tokens |
| memory/performance_schema/events_statements_summary_by_digest.tokens |
| memory/performance_schema/events_statements_history_long.tokens |
+-----+

```

## Statement Sampling

The Performance Schema uses statement sampling to collect representative statements that produce each digest value in the `events_statements_summary_by_digest` table. These columns store sample statement information: `QUERY_SAMPLE_TEXT` (the text of the statement), `QUERY_SAMPLE_SEEN` (when the statement was seen), and `QUERY_SAMPLE_TIMER_WAIT` (the statement wait or execution time). The Performance Schema updates all three columns each time it chooses a sample statement.

When a new table row is inserted, the statement that produced the row digest value is stored as the current sample statement associated with the digest. Thereafter, when the server sees other statements with the same digest value, it determines whether to use the new statement to replace the current sample statement (that is, whether to resample). Resampling policy is based on the comparative wait times of the current sample statement and new statement and, optionally, the age of the current sample statement:

- Resampling based on wait times: If the new statement wait time has a wait time greater than that of the current sample statement, it becomes the current sample statement.
- Resampling based on age: If the `performance_schema_max_digest_sample_age` system variable has a value greater than zero and the current sample statement is more than that many seconds old, the current statement is considered “too old” and the new statement replaces it. This occurs even if the new statement wait time is less than that of the current sample statement.

By default, `performance_schema_max_digest_sample_age` is 60 seconds (1 minute). To change how quickly sample statements “expire” due to age, increase or decrease the value. To disable the age-based part of the resampling policy, set `performance_schema_max_digest_sample_age` to 0.

## 27.11 Performance Schema General Table Characteristics

The name of the `performance_schema` database is lowercase, as are the names of tables within it. Queries should specify the names in lowercase.

Many tables in the `performance_schema` database are read only and cannot be modified:

```

mysql> TRUNCATE TABLE performance_schema.setup_instruments;
ERROR 1683 (HY000): Invalid performance_schema usage.

```

Some of the setup tables have columns that can be modified to affect Performance Schema operation; some also permit rows to be inserted or deleted. Truncation is permitted to clear collected events, so `TRUNCATE TABLE` can be used on tables containing those kinds of information, such as tables named with a prefix of `events_waits_`.

Summary tables can be truncated with `TRUNCATE TABLE`. Generally, the effect is to reset the summary columns to 0 or `NULL`, not to remove rows. This enables you to clear collected values and restart aggregation. That might be useful, for example, after you have made a runtime configuration change. Exceptions to this truncation behavior are noted in individual summary table sections.

Privileges are as for other databases and tables:

- To retrieve from `performance_schema` tables, you must have the `SELECT` privilege.
- To change those columns that can be modified, you must have the `UPDATE` privilege.
- To truncate tables that can be truncated, you must have the `DROP` privilege.

Because only a limited set of privileges apply to Performance Schema tables, attempts to use `GRANT ALL` as shorthand for granting privileges at the database or table level fail with an error:

```
mysql> GRANT ALL ON performance_schema.*
 TO 'u1'@'localhost';
ERROR 1044 (42000): Access denied for user 'root'@'localhost'
to database 'performance_schema'
mysql> GRANT ALL ON performance_schema.setup_instruments
 TO 'u2'@'localhost';
ERROR 1044 (42000): Access denied for user 'root'@'localhost'
to database 'performance_schema'
```

Instead, grant exactly the desired privileges:

```
mysql> GRANT SELECT ON performance_schema.*
 TO 'u1'@'localhost';
Query OK, 0 rows affected (0.03 sec)

mysql> GRANT SELECT, UPDATE ON performance_schema.setup_instruments
 TO 'u2'@'localhost';
Query OK, 0 rows affected (0.02 sec)
```

## 27.12 Performance Schema Table Descriptions

Tables in the `performance_schema` database can be grouped as follows:

- Setup tables. These tables are used to configure and display monitoring characteristics.
- Current events tables. The `events_waits_current` table contains the most recent event for each thread. Other similar tables contain current events at different levels of the event hierarchy: `events_stages_current` for stage events, `events_statements_current` for statement events, and `events_transactions_current` for transaction events.
- History tables. These tables have the same structure as the current events tables, but contain more rows. For example, for wait events, `events_waits_history` table contains the most recent 10 events per thread. `events_waits_history_long` contains the most recent 10,000 events. Other similar tables exist for stage, statement, and transaction histories.

To change the sizes of the history tables, set the appropriate system variables at server startup. For example, to set the sizes of the wait event history tables, set `performance_schema_events_waits_history_size` and `performance_schema_events_waits_history_long_size`.

- Summary tables. These tables contain information aggregated over groups of events, including those that have been discarded from the history tables.
- Instance tables. These tables document what types of objects are instrumented. An instrumented object, when used by the server, produces an event. These tables provide event names and explanatory notes or status information.
- Miscellaneous tables. These do not fall into any of the other table groups.

### 27.12.1 Performance Schema Table Reference

The following table summarizes all available Performance Schema tables. For greater detail, see the individual table descriptions.

**Table 27.1 Performance Schema Tables**

| Table Name                                                         | Description                                      | Introduced |
|--------------------------------------------------------------------|--------------------------------------------------|------------|
| <a href="#">accounts</a>                                           | Connection statistics per client account         |            |
| <a href="#">binary_log_transaction_compression</a>                 | Binary log transaction compression               | 8.0.20     |
| <a href="#">clone_progress</a>                                     | Clone operation progress                         | 8.0.17     |
| <a href="#">clone_status</a>                                       | Clone operation status                           | 8.0.17     |
| <a href="#">cond_instances</a>                                     | Synchronization object instances                 |            |
| <a href="#">data_lock_waits</a>                                    | Data lock wait relationships                     |            |
| <a href="#">data_locks</a>                                         | Data locks held and requested                    |            |
| <a href="#">error_log</a>                                          | Server error log recent entries                  | 8.0.22     |
| <a href="#">events_errors_summary_by_account_by_event_code</a>     | Errors per account and error code                |            |
| <a href="#">events_errors_summary_by_host_by_event_code</a>        | Errors per host and error code                   |            |
| <a href="#">events_errors_summary_by_thread_by_event_code</a>      | Errors per thread and error code                 |            |
| <a href="#">events_errors_summary_by_user_by_event_code</a>        | Errors per user and error code                   |            |
| <a href="#">events_errors_summary_global_by_event_code</a>         | Errors per error code                            |            |
| <a href="#">events_stages_current</a>                              | Current stage events                             |            |
| <a href="#">events_stages_history</a>                              | Most recent stage events per thread              |            |
| <a href="#">events_stages_history_long</a>                         | Most recent stage events overall                 |            |
| <a href="#">events_stages_summary_by_account_by_event_name</a>     | Stage events per account and event name          |            |
| <a href="#">events_stages_summary_by_host_by_event_name</a>        | Stage events per host name and event name        |            |
| <a href="#">events_stages_summary_by_thread_by_event_name</a>      | Stage waits per thread and event name            |            |
| <a href="#">events_stages_summary_by_user_by_event_name</a>        | Stage events per user name and event name        |            |
| <a href="#">events_stages_summary_global_by_event_name</a>         | Stage waits per event name                       |            |
| <a href="#">events_statements_current</a>                          | Current statement events                         |            |
| <a href="#">events_statements_histogram_by_digest</a>              | Statement histograms per schema and digest value |            |
| <a href="#">events_statements_histogram_global</a>                 | Statement histogram summarized globally          |            |
| <a href="#">events_statements_history</a>                          | Most recent statement events per thread          |            |
| <a href="#">events_statements_history_long</a>                     | Most recent statement events overall             |            |
| <a href="#">events_statements_summary_by_account_by_event_name</a> | Statement events per account and event name      |            |
| <a href="#">events_statements_summary_by_digest</a>                | Statement events per schema and digest value     |            |
| <a href="#">events_statements_summary_by_host_by_event_name</a>    | Statement events per host name and event name    |            |

# Performance Schema Table Reference

| <code>tp_thread_group_state</code>             | Thread pool thread group states             | 8.0.14     |
| <code>tp_thread_group_stats</code>             | Thread pool thread group statistics         | 8.0.14     |
| <code>tp_thread_state</code>                   | Thread pool thread information              | 8.0.14     |
| <code>user_defined_functions</code>            | Registered loadable functions               |            |
| <code>user_variables_by_thread</code>          | User-defined variables per thread           |            |
| <code>users</code>                             | Connection statistics per client user name  |            |
| <code>variables_by_thread</code>               | Session system variables per session        |            |
| <code>variables_info</code>                    | How system variables were most recently set |            |

## 27.12.2 Performance Schema Setup Tables

The setup tables provide information about the current instrumentation and enable the monitoring configuration to be changed. For this reason, some columns in these tables can be changed if you have the `UPDATE` privilege.

The use of tables rather than individual variables for setup information provides a high degree of flexibility in modifying Performance Schema configuration. For example, you can use a single statement with standard SQL syntax to make multiple simultaneous configuration changes.

These setup tables are available:

- `setup_actors`: How to initialize monitoring for new foreground threads
- `setup_consumers`: The destinations to which event information can be sent and stored
- `setup_instruments`: The classes of instrumented objects for which events can be collected
- `setup_objects`: Which objects should be monitored
- `setup_threads`: Instrumented thread names and attributes

### 27.12.2.1 The `setup_actors` Table

The `setup_actors` table contains information that determines whether to enable monitoring and historical event logging for new foreground server threads (threads associated with client connections). This table has a maximum size of 100 rows by default. To change the table size, modify the `performance_schema_setup_actors_size` system variable at server startup.

For each new foreground thread, the Performance Schema matches the user and host for the thread against the rows of the `setup_actors` table. If a row from that table matches, its `ENABLED` and `HISTORY` column values are used to set the `INSTRUMENTED` and `HISTORY` columns, respectively, of the `threads` table row for the thread. This enables instrumenting and historical event logging to be applied selectively per host, user, or account (user and host combination). If there is no match, the `INSTRUMENTED` and `HISTORY` columns for the thread are set to `NO`.

For background threads, there is no associated user. `INSTRUMENTED` and `HISTORY` are `YES` by default and `setup_actors` is not consulted.

The initial contents of the `setup_actors` table match any user and host combination, so monitoring and historical event collection are enabled by default for all foreground threads:

```
mysql> SELECT * FROM performance_schema.setup_actors;
+-----+-----+-----+-----+-----+
| HOST | USER | ROLE | ENABLED | HISTORY |
+-----+-----+-----+-----+-----+
| % | % | % | YES | YES |
+-----+-----+-----+-----+-----+
```

For information about how to use the `setup_actors` table to affect event monitoring, see [Section 27.4.6, “Pre-Filtering by Thread”](#).

Modifications to the `setup_actors` table affect only foreground threads created subsequent to the modification, not existing threads. To affect existing threads, modify the `INSTRUMENTED` and `HISTORY` columns of `threads` table rows.

The `setup_actors` table has these columns:

- `HOST`

The host name. This should be a literal name, or `'%'` to mean “any host.”

- `USER`

The user name. This should be a literal name, or `'%'` to mean “any user.”

- `ROLE`

Unused.

- `ENABLED`

Whether to enable instrumentation for foreground threads matched by the row. The value is `YES` or `NO`.

- `HISTORY`

Whether to log historical events for foreground threads matched by the row. The value is `YES` or `NO`.

The `setup_actors` table has these indexes:

- Primary key on (`HOST`, `USER`, `ROLE`)

`TRUNCATE TABLE` is permitted for the `setup_actors` table. It removes the rows.

### 27.12.2.2 The `setup_consumers` Table

The `setup_consumers` table lists the types of consumers for which event information can be stored and which are enabled:

```
mysql> SELECT * FROM performance_schema.setup_consumers;
+-----+-----+
| NAME | ENABLED |
+-----+-----+
events_stages_current	NO
events_stages_history	NO
events_stages_history_long	NO
events_statements_current	YES
events_statements_history	YES
events_statements_history_long	NO
events_transactions_current	YES
events_transactions_history	YES
events_transactions_history_long	NO
events_waits_current	NO
```

|                           |     |  |
|---------------------------|-----|--|
| events_waits_history      | NO  |  |
| events_waits_history_long | NO  |  |
| global_instrumentation    | YES |  |
| thread_instrumentation    | YES |  |
| statements_digest         | YES |  |
| +-----+-----+             |     |  |

The consumer settings in the `setup_consumers` table form a hierarchy from higher levels to lower. For detailed information about the effect of enabling different consumers, see [Section 27.4.7, “Pre-Filtering by Consumer”](#).

Modifications to the `setup_consumers` table affect monitoring immediately.

The `setup_consumers` table has these columns:

- `NAME`

The consumer name.

- `ENABLED`

Whether the consumer is enabled. The value is `YES` or `NO`. This column can be modified. If you disable a consumer, the server does not spend time adding event information to it.

The `setup_consumers` table has these indexes:

- Primary key on (`NAME`)

`TRUNCATE TABLE` is not permitted for the `setup_consumers` table.

### 27.12.2.3 The `setup_instruments` Table

The `setup_instruments` table lists classes of instrumented objects for which events can be collected:

```
mysql> SELECT * FROM performance_schema.setup_instruments\G
***** 1. row *****
 NAME: wait/synch/mutex/pfs/LOCK_pfs_share_list
 ENABLED: NO
 TIMED: NO
 PROPERTIES: singleton
 VOLATILITY: 1
DOCUMENTATION: Components can provide their own performance_schema tables.
 This lock protects the list of such tables definitions.
...
***** 369. row *****
 NAME: stage/sql/executing
 ENABLED: NO
 TIMED: NO
 PROPERTIES:
 VOLATILITY: 0
DOCUMENTATION: NULL
...
***** 687. row *****
 NAME: statement/abstract/Query

...

Each instrument added to the source code provides a row for the `setup_instruments` table, even when the instrumented code is not executed. When an instrument is enabled and executed, instrumented instances are created, which are visible in the `xxx_instances` tables, such as `file_instances` or `rwlock_instances`.

Modifications to most `setup_instruments` rows affect monitoring immediately. For some instruments, modifications are effective only at server startup; changing them at runtime has no effect. This affects primarily mutexes, conditions, and rwlocks in the server, although there may be other instruments for which this is true.

For more information about the role of the `setup_instruments` table in event filtering, see [Section 27.4.3, “Event Pre-Filtering”](#).

The `setup_instruments` table has these columns:

- `NAME`

The instrument name. Instrument names may have multiple parts and form a hierarchy, as discussed in [Section 27.6, “Performance Schema Instrument Naming Conventions”](#). Events produced from execution of an instrument have an `EVENT_NAME` value that is taken from the instrument `NAME` value. (Events do not really have a “name,” but this provides a way to associate events with instruments.)

- `ENABLED`

Whether the instrument is enabled. The value is `YES` or `NO`. A disabled instrument produces no events. This column can be modified, although setting `ENABLED` has no effect for instruments that have already been created.

- `TIMED`

Whether the instrument is timed. The value is `YES`, `NO`, or `NULL`. This column can be modified, although setting `TIMED` has no effect for instruments that have already been created.

A `TIMED` value of `NULL` indicates that the instrument does not support timing. For example, memory operations are not timed, so their `TIMED` column is `NULL`.

Setting `TIMED` to `NULL` for an instrument that supports timing has no effect, as does setting `TIMED` to non-`NULL` for an instrument that does not support timing.

If an enabled instrument is not timed, the instrument code is enabled, but the timer is not. Events produced by the instrument have `NULL` for the `TIMER_START`, `TIMER_END`, and `TIMER_WAIT` timer values. This in turn causes those values to be ignored when calculating the sum, minimum, maximum, and average time values in summary tables.

- `PROPERTIES`

The instrument properties. This column uses the `SET` data type, so multiple flags from the following list can be set per instrument:

- `global_statistics`: The instrument produces only global summaries. Summaries for finer levels are unavailable, such as per thread, account, user, or host. For example, most memory instruments produce only global summaries.
- `mutable`: The instrument can “mutate” into a more specific one. This property applies only to statement instruments.
- `progress`: The instrument is capable of reporting progress data. This property applies only to stage instruments.

- **singleton**: The instrument has a single instance. For example, most global mutex locks in the server are singletons, so the corresponding instruments are as well.
- **user**: The instrument is directly related to user workload (as opposed to system workload). One such instrument is `wait/io/socket/sql/client_connection`.
- **VOLATILITY**

The instrument volatility. Volatility values range from low to high. The values correspond to the `PSI_VOLATILITY_XXX` constants defined in the `mysql/psi/psi_base.h` header file:

```
#define PSI_VOLATILITY_UNKNOWN 0
#define PSI_VOLATILITY_PERMANENT 1
#define PSI_VOLATILITY_PROVISIONING 2
#define PSI_VOLATILITY_DDL 3
#define PSI_VOLATILITY_CACHE 4
#define PSI_VOLATILITY_SESSION 5
#define PSI_VOLATILITY_TRANSACTION 6
#define PSI_VOLATILITY_QUERY 7
#define PSI_VOLATILITY_INTRA_QUERY 8
```

The **VOLATILITY** column is purely informational, to provide users (and the Performance Schema code) some hint about the instrument runtime behavior.

Instruments with a low volatility index (`PERMANENT = 1`) are created once at server startup, and never destroyed or re-created during normal server operation. They are destroyed only during server shutdown.

For example, the `wait/synch/mutex/pfs/LOCK_pfs_share_list` mutex is defined with a volatility of 1, which means it is created once. Possible overhead from the instrumentation itself (namely, mutex initialization) has no effect for this instrument then. Runtime overhead occurs only when locking or unlocking the mutex.

Instruments with a higher volatility index (for example, `SESSION = 5`) are created and destroyed for every user session. For example, the `wait/synch/mutex/sql/THD::LOCK_query_plan` mutex is created each time a session connects, and destroyed when the session disconnects.

This mutex is more sensitive to Performance Schema overhead, because overhead comes not only from the lock and unlock instrumentation, but also from mutex create and destroy instrumentation, which is executed more often.

Another aspect of volatility concerns whether and when an update to the **ENABLED** column actually has some effect:

- An update to **ENABLED** affects instrumented objects created subsequently, but has no effect on instruments already created.
- Instruments that are more “volatile” use new settings from the `setup_instruments` table sooner.

For example, this statement does not affect the `LOCK_query_plan` mutex for existing sessions, but does have an effect on new sessions created subsequent to the update:

```
UPDATE performance_schema.setup_instruments
SET ENABLED=value
WHERE NAME = 'wait/synch/mutex/sql/THD::LOCK_query_plan';
```

This statement actually has no effect at all:

```
UPDATE performance_schema.setup_instruments
SET ENABLED=value
```

```
WHERE NAME = 'wait/synch/mutex/pfs/LOCK_pfs_share_list';
```

This mutex is permanent, and was created already before the update is executed. The mutex is never created again, so the `ENABLED` value in `setup_instruments` is never used. To enable or disable this mutex, use the `mutex_instances` table instead.

- [DOCUMENTATION](#)

A string describing the instrument purpose. The value is `NULL` if no description is available.

The `setup_instruments` table has these indexes:

- Primary key on (`NAME`)

`TRUNCATE TABLE` is not permitted for the `setup_instruments` table.

As of MySQL 8.0.27, to assist monitoring and troubleshooting, the Performance Schema instrumentation is used to export names of instrumented threads to the operating system. This enables utilities that display thread names, such as debuggers and the Unix `ps` command, to display distinct `mysqld` thread names rather than “mysqld”. This feature is supported only on Linux, macOS, and Windows.

Suppose that `mysqld` is running on a system that has a version of `ps` that supports this invocation syntax:

```
ps -C mysqld H -o "pid tid cmd comm"
```

Without export of thread names to the operating system, the command displays output like this, where most `COMMAND` values are `mysqld`:

| PID  | TID  | CMD              | COMMAND     |
|------|------|------------------|-------------|
| 1377 | 1377 | /usr/sbin/mysqld | mysqld      |
| 1377 | 1528 | /usr/sbin/mysqld | mysqld      |
| 1377 | 1529 | /usr/sbin/mysqld | mysqld      |
| 1377 | 1530 | /usr/sbin/mysqld | mysqld      |
| 1377 | 1531 | /usr/sbin/mysqld | mysqld      |
| 1377 | 1534 | /usr/sbin/mysqld | mysqld      |
| 1377 | 1535 | /usr/sbin/mysqld | mysqld      |
| 1377 | 1588 | /usr/sbin/mysqld | xpl_worker1 |
| 1377 | 1589 | /usr/sbin/mysqld | xpl_worker0 |
| 1377 | 1590 | /usr/sbin/mysqld | mysqld      |
| 1377 | 1594 | /usr/sbin/mysqld | mysqld      |
| 1377 | 1595 | /usr/sbin/mysqld | mysqld      |

With export of thread names to the operating system, the output looks like this, with threads having a name similar to their instrument name:

| PID   | TID   | CMD              | COMMAND      |
|-------|-------|------------------|--------------|
| 27668 | 27668 | /usr/sbin/mysqld | mysqld       |
| 27668 | 27671 | /usr/sbin/mysqld | ib_io_ibuf   |
| 27668 | 27672 | /usr/sbin/mysqld | ib_io_log    |
| 27668 | 27673 | /usr/sbin/mysqld | ib_io_rd-1   |
| 27668 | 27674 | /usr/sbin/mysqld | ib_io_rd-2   |
| 27668 | 27677 | /usr/sbin/mysqld | ib_io_wr-1   |
| 27668 | 27678 | /usr/sbin/mysqld | ib_io_wr-2   |
| 27668 | 27699 | /usr/sbin/mysqld | xpl_worker-2 |
| 27668 | 27700 | /usr/sbin/mysqld | xpl_accept-1 |
| 27668 | 27710 | /usr/sbin/mysqld | evt_sched    |
| 27668 | 27711 | /usr/sbin/mysqld | sig_handler  |
| 27668 | 27933 | /usr/sbin/mysqld | connection   |

Different thread instances within the same class are numbered to provide distinct names where that is feasible. Due to constraints on name lengths with respect to potentially large numbers of connections, connections are named simply `connection`.

#### 27.12.2.4 The `setup_objects` Table

The `setup_objects` table controls whether the Performance Schema monitors particular objects. This table has a maximum size of 100 rows by default. To change the table size, modify the `performance_schema_setup_objects_size` system variable at server startup.

The initial `setup_objects` contents look like this:

```
mysql> SELECT * FROM performance_schema.setup_objects;
```

| OBJECT_TYPE | OBJECT_SCHEMA      | OBJECT_NAME | ENABLED | TIMED |
|-------------|--------------------|-------------|---------|-------|
| EVENT       | mysql              | %           | NO      | NO    |
| EVENT       | performance_schema | %           | NO      | NO    |
| EVENT       | information_schema | %           | NO      | NO    |
| EVENT       | %                  | %           | YES     | YES   |
| FUNCTION    | mysql              | %           | NO      | NO    |
| FUNCTION    | performance_schema | %           | NO      | NO    |
| FUNCTION    | information_schema | %           | NO      | NO    |
| FUNCTION    | %                  | %           | YES     | YES   |
| PROCEDURE   | mysql              | %           | NO      | NO    |
| PROCEDURE   | performance_schema | %           | NO      | NO    |
| PROCEDURE   | information_schema | %           | NO      | NO    |
| PROCEDURE   | %                  | %           | YES     | YES   |
| TABLE       | mysql              | %           | NO      | NO    |
| TABLE       | performance_schema | %           | NO      | NO    |
| TABLE       | information_schema | %           | NO      | NO    |
| TABLE       | %                  | %           | YES     | YES   |
| TRIGGER     | mysql              | %           | NO      | NO    |
| TRIGGER     | performance_schema | %           | NO      | NO    |
| TRIGGER     | information_schema | %           | NO      | NO    |
| TRIGGER     | %                  | %           | YES     | YES   |

Modifications to the `setup_objects` table affect object monitoring immediately.

For object types listed in `setup_objects`, the Performance Schema uses the table to how to monitor them. Object matching is based on the `OBJECT_SCHEMA` and `OBJECT_NAME` columns. Objects for which there is no match are not monitored.

The effect of the default object configuration is to instrument all tables except those in the `mysql`, `INFORMATION_SCHEMA`, and `performance_schema` databases. (Tables in the `INFORMATION_SCHEMA` database are not instrumented regardless of the contents of `setup_objects`; the row for `information_schema.%` simply makes this default explicit.)

When the Performance Schema checks for a match in `setup_objects`, it tries to find more specific matches first. For example, with a table `db1.t1`, it looks for a match for `'db1'` and `'t1'`, then for `'db1'` and `'%'`, then for `'%'` and `'%'`. The order in which matching occurs matters because different matching `setup_objects` rows can have different `ENABLED` and `TIMED` values.

Rows can be inserted into or deleted from `setup_objects` by users with the `INSERT` or `DELETE` privilege on the table. For existing rows, only the `ENABLED` and `TIMED` columns can be modified, by users with the `UPDATE` privilege on the table.

For more information about the role of the `setup_objects` table in event filtering, see [Section 27.4.3, “Event Pre-Filtering”](#).

The `setup_objects` table has these columns:

- `OBJECT_TYPE`

The type of object to instrument. The value is one of `'EVENT'` (Event Scheduler event), `'FUNCTION'` (stored function), `'PROCEDURE'` (stored procedure), `'TABLE'` (base table), or `'TRIGGER'` (trigger).

`TABLE` filtering affects table I/O events (`wait/io/table/sql/handler` instrument) and table lock events (`wait/lock/table/sql/handler` instrument).

- `OBJECT_SCHEMA`

The schema that contains the object. This should be a literal name, or `'%'` to mean “any schema.”

- `OBJECT_NAME`

The name of the instrumented object. This should be a literal name, or `'%'` to mean “any object.”

- `ENABLED`

Whether events for the object are instrumented. The value is `YES` or `NO`. This column can be modified.

- `TIMED`

Whether events for the object are timed. This column can be modified.

The `setup_objects` table has these indexes:

- Index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)

`TRUNCATE TABLE` is permitted for the `setup_objects` table. It removes the rows.

### 27.12.2.5 The `setup_threads` Table

The `setup_threads` table lists instrumented thread classes. It exposes thread class names and attributes:

```
mysql> SELECT * FROM performance_schema.setup_threads\G
***** 1. row *****
 NAME: thread/performance_schema/setup
 ENABLED: YES
 HISTORY: YES
 PROPERTIES: singleton
 VOLATILITY: 0
DOCUMENTATION: NULL
...
***** 4. row *****
 NAME: thread/sql/main
 ENABLED: YES
 HISTORY: YES
 PROPERTIES: singleton
 VOLATILITY: 0
DOCUMENTATION: NULL
***** 5. row *****
 NAME: thread/sql/one_connection
 ENABLED: YES
 HISTORY: YES
 PROPERTIES: user
 VOLATILITY: 0
DOCUMENTATION: NULL
...
***** 10. row *****
 NAME: thread/sql/event_scheduler
 ENABLED: YES
 HISTORY: YES
 PROPERTIES: singleton
 VOLATILITY: 0
DOCUMENTATION: NULL
```

The `setup_threads` table has these columns:

- `NAME`

The instrument name. Thread instruments begin with `thread` (for example, `thread/sql/parser_service` or `thread/performance_schema/setup`).

- `ENABLED`

Whether the instrument is enabled. The value is `YES` or `NO`. This column can be modified, although setting `ENABLED` has no effect for threads that are already running.

For background threads, setting the `ENABLED` value controls whether `INSTRUMENTED` is set to `YES` or `NO` for threads that are subsequently created for this instrument and listed in the `threads` table. For foreground threads, this column has no effect; the `setup_actors` table takes precedence.

- `HISTORY`

Whether to log historical events for the instrument. The value is `YES` or `NO`. This column can be modified, although setting `HISTORY` has no effect for threads that are already running.

For background threads, setting the `HISTORY` value controls whether `HISTORY` is set to `YES` or `NO` for threads that are subsequently created for this instrument and listed in the `threads` table. For foreground threads, this column has no effect; the `setup_actors` table takes precedence.

- `PROPERTIES`

The instrument properties. This column uses the `SET` data type, so multiple flags from the following list can be set per instrument:

- `singleton`: The instrument has a single instance. For example, there is only one thread for the `thread/sql/main` instrument.
- `user`: The instrument is directly related to user workload (as opposed to system workload). For example, threads such as `thread/sql/one_connection` executing a user session have the `user` property to differentiate them from system threads.

- `VOLATILITY`

The instrument volatility. This column has the same meaning as in the `setup_instruments` table. See [Section 27.12.2.3, “The setup\\_instruments Table”](#).

- `DOCUMENTATION`

A string describing the instrument purpose. The value is `NULL` if no description is available.

The `setup_threads` table has these indexes:

- Primary key on (`NAME`)

`TRUNCATE TABLE` is not permitted for the `setup_threads` table.

## 27.12.3 Performance Schema Instance Tables

Instance tables document what types of objects are instrumented. They provide event names and explanatory notes or status information:

- `cond_instances`: Condition synchronization object instances
- `file_instances`: File instances
- `mutex_instances`: Mutex synchronization object instances
- `rwlock_instances`: Lock synchronization object instances
- `socket_instances`: Active connection instances

These tables list instrumented synchronization objects, files, and connections. There are three types of synchronization objects: `cond`, `mutex`, and `rwlock`. Each instance table has an `EVENT_NAME` or `NAME` column to indicate the instrument associated with each row. Instrument names may have multiple

parts and form a hierarchy, as discussed in [Section 27.6, “Performance Schema Instrument Naming Conventions”](#).

The `mutex_instances.LOCKED_BY_THREAD_ID` and `rwlock_instances.WRITE_LOCKED_BY_THREAD_ID` columns are extremely important for investigating performance bottlenecks or deadlocks. For examples of how to use them for this purpose, see [Section 27.19, “Using the Performance Schema to Diagnose Problems”](#)

### 27.12.3.1 The `cond_instances` Table

The `cond_instances` table lists all the conditions seen by the Performance Schema while the server executes. A condition is a synchronization mechanism used in the code to signal that a specific event has happened, so that a thread waiting for this condition can resume work.

When a thread is waiting for something to happen, the condition name is an indication of what the thread is waiting for, but there is no immediate way to tell which other thread, or threads, causes the condition to happen.

The `cond_instances` table has these columns:

- `NAME`

The instrument name associated with the condition.

- `OBJECT_INSTANCE_BEGIN`

The address in memory of the instrumented condition.

The `cond_instances` table has these indexes:

- Primary key on (`OBJECT_INSTANCE_BEGIN`)
- Index on (`NAME`)

`TRUNCATE TABLE` is not permitted for the `cond_instances` table.

### 27.12.3.2 The `file_instances` Table

The `file_instances` table lists all the files seen by the Performance Schema when executing file I/O instrumentation. If a file on disk has never been opened, it is not shown in `file_instances`. When a file is deleted from the disk, it is also removed from the `file_instances` table.

The `file_instances` table has these columns:

- `FILE_NAME`

The file name.

- `EVENT_NAME`

The instrument name associated with the file.

- `OPEN_COUNT`

The count of open handles on the file. If a file was opened and then closed, it was opened 1 time, but `OPEN_COUNT` is 0. To list all the files currently opened by the server, use `WHERE OPEN_COUNT > 0`.

The `file_instances` table has these indexes:

- Primary key on (`FILE_NAME`)
- Index on (`EVENT_NAME`)

`TRUNCATE TABLE` is not permitted for the `file_instances` table.

### 27.12.3.3 The `mutex_instances` Table

The `mutex_instances` table lists all the mutexes seen by the Performance Schema while the server executes. A mutex is a synchronization mechanism used in the code to enforce that only one thread at a given time can have access to some common resource. The resource is said to be “protected” by the mutex.

When two threads executing in the server (for example, two user sessions executing a query simultaneously) do need to access the same resource (a file, a buffer, or some piece of data), these two threads compete against each other, so that the first query to obtain a lock on the mutex causes the other query to wait until the first is done and unlocks the mutex.

The work performed while holding a mutex is said to be in a “critical section,” and multiple queries do execute this critical section in a serialized way (one at a time), which is a potential bottleneck.

The `mutex_instances` table has these columns:

- `NAME`

The instrument name associated with the mutex.

- `OBJECT_INSTANCE_BEGIN`

The address in memory of the instrumented mutex.

- `LOCKED_BY_THREAD_ID`

When a thread currently has a mutex locked, `LOCKED_BY_THREAD_ID` is the `THREAD_ID` of the locking thread, otherwise it is `NULL`.

The `mutex_instances` table has these indexes:

- Primary key on (`OBJECT_INSTANCE_BEGIN`)
- Index on (`NAME`)
- Index on (`LOCKED_BY_THREAD_ID`)

`TRUNCATE TABLE` is not permitted for the `mutex_instances` table.

For every mutex instrumented in the code, the Performance Schema provides the following information.

- The `setup_instruments` table lists the name of the instrumentation point, with the prefix `wait/synch/mutex/`.
- When some code creates a mutex, a row is added to the `mutex_instances` table. The `OBJECT_INSTANCE_BEGIN` column is a property that uniquely identifies the mutex.
- When a thread attempts to lock a mutex, the `events_waits_current` table shows a row for that thread, indicating that it is waiting on a mutex (in the `EVENT_NAME` column), and indicating which mutex is waited on (in the `OBJECT_INSTANCE_BEGIN` column).
- When a thread succeeds in locking a mutex:
  - `events_waits_current` shows that the wait on the mutex is completed (in the `TIMER_END` and `TIMER_WAIT` columns)
  - The completed wait event is added to the `events_waits_history` and `events_waits_history_long` tables

- `mutex_instances` shows that the mutex is now owned by the thread (in the `THREAD_ID` column).
- When a thread unlocks a mutex, `mutex_instances` shows that the mutex now has no owner (the `THREAD_ID` column is `NULL`).
- When a mutex object is destroyed, the corresponding row is removed from `mutex_instances`.

By performing queries on both of the following tables, a monitoring application or a DBA can detect bottlenecks or deadlocks between threads that involve mutexes:

- `events_waits_current`, to see what mutex a thread is waiting for
- `mutex_instances`, to see which other thread currently owns a mutex

### 27.12.3.4 The `rwlock_instances` Table

The `rwlock_instances` table lists all the `rwlock` (read write lock) instances seen by the Performance Schema while the server executes. An `rwlock` is a synchronization mechanism used in the code to enforce that threads at a given time can have access to some common resource following certain rules. The resource is said to be “protected” by the `rwlock`. The access is either shared (many threads can have a read lock at the same time), exclusive (only one thread can have a write lock at a given time), or shared-exclusive (a thread can have a write lock while permitting inconsistent reads by other threads). Shared-exclusive access is otherwise known as an `sxlock` and optimizes concurrency and improves scalability for read-write workloads.

Depending on how many threads are requesting a lock, and the nature of the locks requested, access can be either granted in shared mode, exclusive mode, shared-exclusive mode or not granted at all, waiting for other threads to finish first.

The `rwlock_instances` table has these columns:

- `NAME`

The instrument name associated with the lock.

- `OBJECT_INSTANCE_BEGIN`

The address in memory of the instrumented lock.

- `WRITE_LOCKED_BY_THREAD_ID`

When a thread currently has an `rwlock` locked in exclusive (write) mode, `WRITE_LOCKED_BY_THREAD_ID` is the `THREAD_ID` of the locking thread, otherwise it is `NULL`.

- `READ_LOCKED_BY_COUNT`

When a thread currently has an `rwlock` locked in shared (read) mode, `READ_LOCKED_BY_COUNT` is incremented by 1. This is a counter only, so it cannot be used directly to find which thread holds a read lock, but it can be used to see whether there is a read contention on an `rwlock`, and see how many readers are currently active.

The `rwlock_instances` table has these indexes:

- Primary key on (`OBJECT_INSTANCE_BEGIN`)
- Index on (`NAME`)
- Index on (`WRITE_LOCKED_BY_THREAD_ID`)

`TRUNCATE TABLE` is not permitted for the `rwlock_instances` table.

By performing queries on both of the following tables, a monitoring application or a DBA may detect some bottlenecks or deadlocks between threads that involve locks:

- `events_waits_current`, to see what `rwlock` a thread is waiting for
- `rwlock_instances`, to see which other thread currently owns an `rwlock`

There is a limitation: The `rwlock_instances` can be used only to identify the thread holding a write lock, but not the threads holding a read lock.

### 27.12.3.5 The `socket_instances` Table

The `socket_instances` table provides a real-time snapshot of the active connections to the MySQL server. The table contains one row per TCP/IP or Unix socket file connection. Information available in this table provides a real-time snapshot of the active connections to the server. (Additional information is available in socket summary tables, including network activity such as socket operations and number of bytes transmitted and received; see [Section 27.12.20.9, “Socket Summary Tables”](#)).

```
mysql> SELECT * FROM performance_schema.socket_instances\G
***** 1. row *****
 EVENT_NAME: wait/io/socket/sql/server_unix_socket
OBJECT_INSTANCE_BEGIN: 4316619408
 THREAD_ID: 1
 SOCKET_ID: 16
 IP:
 PORT: 0
 STATE: ACTIVE
***** 2. row *****
 EVENT_NAME: wait/io/socket/sql/client_connection
OBJECT_INSTANCE_BEGIN: 4316644608
 THREAD_ID: 21
 SOCKET_ID: 39
 IP: 127.0.0.1
 PORT: 55233
 STATE: ACTIVE
***** 3. row *****
 EVENT_NAME: wait/io/socket/sql/server_tcpip_socket
OBJECT_INSTANCE_BEGIN: 4316699040
 THREAD_ID: 1
 SOCKET_ID: 14
 IP: 0.0.0.0
 PORT: 50603
 STATE: ACTIVE
```

Socket instruments have names of the form `wait/io/socket/sql/socket_type` and are used like this:

1. The server has a listening socket for each network protocol that it supports. The instruments associated with listening sockets for TCP/IP or Unix socket file connections have a `socket_type` value of `server_tcpip_socket` or `server_unix_socket`, respectively.
2. When a listening socket detects a connection, the server transfers the connection to a new socket managed by a separate thread. The instrument for the new connection thread has a `socket_type` value of `client_connection`.
3. When a connection terminates, the row in `socket_instances` corresponding to it is deleted.

The `socket_instances` table has these columns:

- `EVENT_NAME`

The name of the `wait/io/socket/*` instrument that produced the event. This is a `NAME` value from the `setup_instruments` table. Instrument names may have multiple parts and form a hierarchy, as discussed in [Section 27.6, “Performance Schema Instrument Naming Conventions”](#).

- `OBJECT_INSTANCE_BEGIN`

This column uniquely identifies the socket. The value is the address of an object in memory.

- `THREAD_ID`

The internal thread identifier assigned by the server. Each socket is managed by a single thread, so each socket can be mapped to a thread which can be mapped to a server process.

- `SOCKET_ID`

The internal file handle assigned to the socket.

- `IP`

The client IP address. The value may be either an IPv4 or IPv6 address, or blank to indicate a Unix socket file connection.

- `PORT`

The TCP/IP port number, in the range from 0 to 65535.

- `STATE`

The socket status, either `IDLE` or `ACTIVE`. Wait times for active sockets are tracked using the corresponding socket instrument. Wait times for idle sockets are tracked using the `idle` instrument.

A socket is idle if it is waiting for a request from the client. When a socket becomes idle, the event row in `socket_instances` that is tracking the socket switches from a status of `ACTIVE` to `IDLE`. The `EVENT_NAME` value remains `wait/io/socket/*`, but timing for the instrument is suspended. Instead, an event is generated in the `events_waits_current` table with an `EVENT_NAME` value of `idle`.

When the next request is received, the `idle` event terminates, the socket instance switches from `IDLE` to `ACTIVE`, and timing of the socket instrument resumes.

The `socket_instances` table has these indexes:

- Primary key on (`OBJECT_INSTANCE_BEGIN`)
- Index on (`THREAD_ID`)
- Index on (`SOCKET_ID`)
- Index on (`IP`, `PORT`)

`TRUNCATE TABLE` is not permitted for the `socket_instances` table.

The `IP:PORT` column combination value identifies the connection. This combination value is used in the `OBJECT_NAME` column of the `events_waits_XXX` tables, to identify the connection from which socket events come:

- For the Unix domain listener socket (`server_unix_socket`), the port is 0, and the IP is ''.
- For client connections via the Unix domain listener (`client_connection`), the port is 0, and the IP is ''.
- For the TCP/IP server listener socket (`server_tcpip_socket`), the port is always the master port (for example, 3306), and the IP is always 0.0.0.0.
- For client connections via the TCP/IP listener (`client_connection`), the port is whatever the server assigns, but never 0. The IP is the IP of the originating host (127.0.0.1 or ::1 for the local host)

## 27.12.4 Performance Schema Wait Event Tables

The Performance Schema instruments waits, which are events that take time. Within the event hierarchy, wait events nest within stage events, which nest within statement events, which nest within transaction events.

These tables store wait events:

- `events_waits_current`: The current wait event for each thread.
- `events_waits_history`: The most recent wait events that have ended per thread.
- `events_waits_history_long`: The most recent wait events that have ended globally (across all threads).

The following sections describe the wait event tables. There are also summary tables that aggregate information about wait events; see [Section 27.12.20.1, “Wait Event Summary Tables”](#).

For more information about the relationship between the three wait event tables, see [Section 27.9, “Performance Schema Tables for Current and Historical Events”](#).

### Configuring Wait Event Collection

To control whether to collect wait events, set the state of the relevant instruments and consumers:

- The `setup_instruments` table contains instruments with names that begin with `wait`. Use these instruments to enable or disable collection of individual wait event classes.
- The `setup_consumers` table contains consumer values with names corresponding to the current and historical wait event table names. Use these consumers to filter collection of wait events.

Some wait instruments are enabled by default; others are disabled. For example:

```
mysql> SELECT NAME, ENABLED, TIMED
FROM performance_schema.setup_instruments
WHERE NAME LIKE 'wait/io/file/innodb%';
```

| NAME                                            | ENABLED | TIMED |
|-------------------------------------------------|---------|-------|
| wait/io/file/innodb/innodb_tablespace_open_file | YES     | YES   |
| wait/io/file/innodb/innodb_data_file            | YES     | YES   |
| wait/io/file/innodb/innodb_log_file             | YES     | YES   |
| wait/io/file/innodb/innodb_temp_file            | YES     | YES   |
| wait/io/file/innodb/innodb_arch_file            | YES     | YES   |
| wait/io/file/innodb/innodb_clone_file           | YES     | YES   |

```
mysql> SELECT NAME, ENABLED, TIMED
FROM performance_schema.setup_instruments
WHERE NAME LIKE 'wait/io/socket/%';
```

| NAME                                   | ENABLED | TIMED |
|----------------------------------------|---------|-------|
| wait/io/socket/sql/server_tcpip_socket | NO      | NO    |
| wait/io/socket/sql/server_unix_socket  | NO      | NO    |
| wait/io/socket/sql/client_connection   | NO      | NO    |

The wait consumers are disabled by default:

```
mysql> SELECT *
FROM performance_schema.setup_consumers
WHERE NAME LIKE 'events_waits%';
```

| NAME                      | ENABLED |
|---------------------------|---------|
| events_waits_current      | NO      |
| events_waits_history      | NO      |
| events_waits_history_long | NO      |

```
+-----+-----+
```

To control wait event collection at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='wait/%=ON'
performance-schema-consumer-events-waits-current=ON
performance-schema-consumer-events-waits-history=ON
performance-schema-consumer-events-waits-history-long=ON
```

- Disable:

```
[mysqld]
performance-schema-instrument='wait/%=OFF'
performance-schema-consumer-events-waits-current=OFF
performance-schema-consumer-events-waits-history=OFF
performance-schema-consumer-events-waits-history-long=OFF
```

To control wait event collection at runtime, update the `setup_instruments` and `setup_consumers` tables:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME LIKE 'wait/%';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'YES'
WHERE NAME LIKE 'events_waits%';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME LIKE 'wait/%';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'NO'
WHERE NAME LIKE 'events_waits%';
```

To collect only specific wait events, enable only the corresponding wait instruments. To collect wait events only for specific wait event tables, enable the wait instruments but only the wait consumers corresponding to the desired tables.

For additional information about configuring event collection, see [Section 27.3, “Performance Schema Startup Configuration”](#), and [Section 27.4, “Performance Schema Runtime Configuration”](#).

#### 27.12.4.1 The `events_waits_current` Table

The `events_waits_current` table contains current wait events. The table stores one row per thread showing the current status of the thread's most recent monitored wait event, so there is no system variable for configuring the table size.

Of the tables that contain wait event rows, `events_waits_current` is the most fundamental. Other tables that contain wait event rows are logically derived from the current events. For example, the `events_waits_history` and `events_waits_history_long` tables are collections of the most recent wait events that have ended, up to a maximum number of rows per thread and globally across all threads, respectively.

For more information about the relationship between the three wait event tables, see [Section 27.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect wait events, see [Section 27.12.4, “Performance Schema Wait Event Tables”](#).

The `events_waits_current` table has these columns:

- `THREAD_ID`, `EVENT_ID`

The thread associated with the event and the thread current event number when the event starts. The `THREAD_ID` and `EVENT_ID` values taken together uniquely identify the row. No two rows have the same pair of values.

- `END_EVENT_ID`

This column is set to `NULL` when the event starts and updated to the thread current event number when the event ends.

- `EVENT_NAME`

The name of the instrument that produced the event. This is a `NAME` value from the `setup_instruments` table. Instrument names may have multiple parts and form a hierarchy, as discussed in [Section 27.6, “Performance Schema Instrument Naming Conventions”](#).

- `SOURCE`

The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved. For example, if a mutex or lock is being blocked, you can check the context in which this occurs.

- `TIMER_START`, `TIMER_END`, `TIMER_WAIT`

Timing information for the event. The unit for these values is picoseconds (trillionths of a second). The `TIMER_START` and `TIMER_END` values indicate when event timing started and ended. `TIMER_WAIT` is the event elapsed time (duration).

If an event has not finished, `TIMER_END` is the current timer value and `TIMER_WAIT` is the time elapsed so far (`TIMER_END - TIMER_START`).

If an event is produced from an instrument that has `TIMED = NO`, timing information is not collected, and `TIMER_START`, `TIMER_END`, and `TIMER_WAIT` are all `NULL`.

For discussion of picoseconds as the unit for event times and factors that affect time values, see [Section 27.4.1, “Performance Schema Event Timing”](#).

- `SPINS`

For a mutex, the number of spin rounds. If the value is `NULL`, the code does not use spin rounds or spinning is not instrumented.

- `OBJECT_SCHEMA`, `OBJECT_NAME`, `OBJECT_TYPE`, `OBJECT_INSTANCE_BEGIN`

These columns identify the object “being acted on.” What that means depends on the object type.

For a synchronization object (`cond`, `mutex`, `rwlock`):

- `OBJECT_SCHEMA`, `OBJECT_NAME`, and `OBJECT_TYPE` are `NULL`.
- `OBJECT_INSTANCE_BEGIN` is the address of the synchronization object in memory.

For a file I/O object:

- `OBJECT_SCHEMA` is `NULL`.
- `OBJECT_NAME` is the file name.
- `OBJECT_TYPE` is `FILE`.

- `OBJECT_INSTANCE_BEGIN` is an address in memory.

For a socket object:

- `OBJECT_NAME` is the `IP:PORT` value for the socket.
- `OBJECT_INSTANCE_BEGIN` is an address in memory.

For a table I/O object:

- `OBJECT_SCHEMA` is the name of the schema that contains the table.
- `OBJECT_NAME` is the table name.
- `OBJECT_TYPE` is `TABLE` for a persistent base table or `TEMPORARY TABLE` for a temporary table.
- `OBJECT_INSTANCE_BEGIN` is an address in memory.

An `OBJECT_INSTANCE_BEGIN` value itself has no meaning, except that different values indicate different objects. `OBJECT_INSTANCE_BEGIN` can be used for debugging. For example, it can be used with `GROUP BY OBJECT_INSTANCE_BEGIN` to see whether the load on 1,000 mutexes (that protect, say, 1,000 pages or blocks of data) is spread evenly or just hitting a few bottlenecks. This can help you correlate with other sources of information if you see the same object address in a log file or another debugging or performance tool.

- `INDEX_NAME`

The name of the index used. `PRIMARY` indicates the table primary index. `NULL` means that no index was used.

- `NESTING_EVENT_ID`

The `EVENT_ID` value of the event within which this event is nested.

- `NESTING_EVENT_TYPE`

The nesting event type. The value is `TRANSACTION`, `STATEMENT`, `STAGE`, or `WAIT`.

- `OPERATION`

The type of operation performed, such as `lock`, `read`, or `write`.

- `NUMBER_OF_BYTES`

The number of bytes read or written by the operation. For table I/O waits (events for the `wait/io/table/sql/handler` instrument), `NUMBER_OF_BYTES` indicates the number of rows. If the value is greater than 1, the event is for a batch I/O operation. The following discussion describes the difference between exclusively single-row reporting and reporting that reflects batch I/O.

MySQL executes joins using a nested-loop implementation. The job of the Performance Schema instrumentation is to provide row count and accumulated execution time per table in the join. Assume a join query of the following form that is executed using a table join order of `t1`, `t2`, `t3`:

```
SELECT ... FROM t1 JOIN t2 ON ... JOIN t3 ON ...
```

Table “fanout” is the increase or decrease in number of rows from adding a table during join processing. If the fanout for table `t3` is greater than 1, the majority of row-fetch operations are for that table. Suppose that the join accesses 10 rows from `t1`, 20 rows from `t2` per row from `t1`, and 30 rows from `t3` per row of table `t2`. With single-row reporting, the total number of instrumented operations is:

```
10 + (10 * 20) + (10 * 20 * 30) = 6210
```

A significant reduction in the number of instrumented operations is achievable by aggregating them per scan (that is, per unique combination of rows from `t1` and `t2`). With batch I/O reporting, the Performance Schema produces an event for each scan of the innermost table `t3` rather than for each row, and the number of instrumented row operations reduces to:

```
10 + (10 * 20) + (10 * 20) = 410
```

That is a reduction of 93%, illustrating how the batch-reporting strategy significantly reduces Performance Schema overhead for table I/O by reducing the number of reporting calls. The tradeoff is lesser accuracy for event timing. Rather than time for an individual row operation as in per-row reporting, timing for batch I/O includes time spent for operations such as join buffering, aggregation, and returning rows to the client.

For batch I/O reporting to occur, these conditions must be true:

- Query execution accesses the innermost table of a query block (for a single-table query, that table counts as innermost)
- Query execution does not request a single row from the table (so, for example, `eq_ref` access prevents use of batch reporting)
- Query execution does not evaluate a subquery containing table access for the table

- `FLAGS`

Reserved for future use.

The `events_waits_current` table has these indexes:

- Primary key on (`THREAD_ID`, `EVENT_ID`)

`TRUNCATE TABLE` is permitted for the `events_waits_current` table. It removes the rows.

#### 27.12.4.2 The `events_waits_history` Table

The `events_waits_history` table contains the *N* most recent wait events that have ended per thread. Wait events are not added to the table until they have ended. When the table contains the maximum number of rows for a given thread, the oldest thread row is discarded when a new row for that thread is added. When a thread ends, all its rows are discarded.

The Performance Schema autosizes the value of *N* during server startup. To set the number of rows per thread explicitly, set the `performance_schema_events_waits_history_size` system variable at server startup.

The `events_waits_history` table has the same columns and indexing as `events_waits_current`. See [Section 27.12.4.1, “The `events\_waits\_current` Table”](#).

`TRUNCATE TABLE` is permitted for the `events_waits_history` table. It removes the rows.

For more information about the relationship between the three wait event tables, see [Section 27.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect wait events, see [Section 27.12.4, “Performance Schema Wait Event Tables”](#).

#### 27.12.4.3 The `events_waits_history_long` Table

The `events_waits_history_long` table contains *N* the most recent wait events that have ended globally, across all threads. Wait events are not added to the table until they have ended. When the table becomes full, the oldest row is discarded when a new row is added, regardless of which thread generated either row.

The Performance Schema autosizes the value of *N* during server startup. To set the table size explicitly, set the `performance_schema_events_waits_history_long_size` system variable at server startup.

The `events_waits_history_long` table has the same columns as `events_waits_current`. See [Section 27.12.4.1, “The events\\_waits\\_current Table”](#). Unlike `events_waits_current`, `events_waits_history_long` has no indexing.

`TRUNCATE TABLE` is permitted for the `events_waits_history_long` table. It removes the rows.

For more information about the relationship between the three wait event tables, see [Section 27.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect wait events, see [Section 27.12.4, “Performance Schema Wait Event Tables”](#).

## 27.12.5 Performance Schema Stage Event Tables

The Performance Schema instruments stages, which are steps during the statement-execution process, such as parsing a statement, opening a table, or performing a `filesort` operation. Stages correspond to the thread states displayed by `SHOW PROCESSLIST` or that are visible in the `INFORMATION_SCHEMA.PROCESSLIST` table. Stages begin and end when state values change.

Within the event hierarchy, wait events nest within stage events, which nest within statement events, which nest within transaction events.

These tables store stage events:

- `events_stages_current`: The current stage event for each thread.
- `events_stages_history`: The most recent stage events that have ended per thread.
- `events_stages_history_long`: The most recent stage events that have ended globally (across all threads).

The following sections describe the stage event tables. There are also summary tables that aggregate information about stage events; see [Section 27.12.20.2, “Stage Summary Tables”](#).

For more information about the relationship between the three stage event tables, see [Section 27.9, “Performance Schema Tables for Current and Historical Events”](#).

- [Configuring Stage Event Collection](#)
- [Stage Event Progress Information](#)

### Configuring Stage Event Collection

To control whether to collect stage events, set the state of the relevant instruments and consumers:

- The `setup_instruments` table contains instruments with names that begin with `stage`. Use these instruments to enable or disable collection of individual stage event classes.
- The `setup_consumers` table contains consumer values with names corresponding to the current and historical stage event table names. Use these consumers to filter collection of stage events.

Other than those instruments that provide statement progress information, the stage instruments are disabled by default. For example:

```
mysql> SELECT NAME, ENABLED, TIMED
 FROM performance_schema.setup_instruments
 WHERE NAME RLIKE 'stage/sql/[a-c]';
```

| NAME                   | ENABLED | TIMED |
|------------------------|---------|-------|
| stage/sql/After create | NO      | NO    |

|                                                    |    |    |
|----------------------------------------------------|----|----|
| stage/sql/allocating local table                   | NO | NO |
| stage/sql/altering table                           | NO | NO |
| stage/sql/committing alter table to storage engine | NO | NO |
| stage/sql/Changing master                          | NO | NO |
| stage/sql/Checking master version                  | NO | NO |
| stage/sql/checking permissions                     | NO | NO |
| stage/sql/cleaning up                              | NO | NO |
| stage/sql/closing tables                           | NO | NO |
| stage/sql/Connecting to master                     | NO | NO |
| stage/sql/converting HEAP to MyISAM                | NO | NO |
| stage/sql/Copying to group table                   | NO | NO |
| stage/sql/Copying to tmp table                     | NO | NO |
| stage/sql/copy to tmp table                        | NO | NO |
| stage/sql/Creating sort index                      | NO | NO |
| stage/sql/creating table                           | NO | NO |
| stage/sql/Creating tmp table                       | NO | NO |

Stage event instruments that provide statement progress information are enabled and timed by default:

```
mysql> SELECT NAME, ENABLED, TIMED
FROM performance_schema.setup_instruments
WHERE ENABLED='YES' AND NAME LIKE "stage/%";
```

| NAME                                                 | ENABLED | TIMED |
|------------------------------------------------------|---------|-------|
| stage/sql/copy to tmp table                          | YES     | YES   |
| stage/sql/Applying batch of row changes (write)      | YES     | YES   |
| stage/sql/Applying batch of row changes (update)     | YES     | YES   |
| stage/sql/Applying batch of row changes (delete)     | YES     | YES   |
| stage/innodb/alter table (end)                       | YES     | YES   |
| stage/innodb/alter table (flush)                     | YES     | YES   |
| stage/innodb/alter table (insert)                    | YES     | YES   |
| stage/innodb/alter table (log apply index)           | YES     | YES   |
| stage/innodb/alter table (log apply table)           | YES     | YES   |
| stage/innodb/alter table (merge sort)                | YES     | YES   |
| stage/innodb/alter table (read PK and internal sort) | YES     | YES   |
| stage/innodb/buffer pool load                        | YES     | YES   |
| stage/innodb/clone (file copy)                       | YES     | YES   |
| stage/innodb/clone (redo copy)                       | YES     | YES   |
| stage/innodb/clone (page copy)                       | YES     | YES   |

The stage consumers are disabled by default:

```
mysql> SELECT *
FROM performance_schema.setup_consumers
WHERE NAME LIKE 'events_stages%';
```

| NAME                       | ENABLED |
|----------------------------|---------|
| events_stages_current      | NO      |
| events_stages_history      | NO      |
| events_stages_history_long | NO      |

To control stage event collection at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='stage/%=ON'
performance-schema-consumer-events-stages-current=ON
performance-schema-consumer-events-stages-history=ON
performance-schema-consumer-events-stages-history-long=ON
```

- Disable:

```
[mysqld]
performance-schema-instrument='stage/%=OFF'
performance-schema-consumer-events-stages-current=OFF
performance-schema-consumer-events-stages-history=OFF
```

```
performance-schema-consumer-events-stages-history-long=OFF
```

To control stage event collection at runtime, update the [setup\\_instruments](#) and [setup\\_consumers](#) tables:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME LIKE 'stage/%';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'YES'
WHERE NAME LIKE 'events_stages%';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME LIKE 'stage/%';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'NO'
WHERE NAME LIKE 'events_stages%';
```

To collect only specific stage events, enable only the corresponding stage instruments. To collect stage events only for specific stage event tables, enable the stage instruments but only the stage consumers corresponding to the desired tables.

For additional information about configuring event collection, see [Section 27.3, “Performance Schema Startup Configuration”](#), and [Section 27.4, “Performance Schema Runtime Configuration”](#).

## Stage Event Progress Information

The Performance Schema stage event tables contain two columns that, taken together, provide a stage progress indicator for each row:

- [WORK\\_COMPLETED](#): The number of work units completed for the stage
- [WORK\\_ESTIMATED](#): The number of work units expected for the stage

Each column is [NULL](#) if no progress information is provided for an instrument. Interpretation of the information, if it is available, depends entirely on the instrument implementation. The Performance Schema tables provide a container to store progress data, but make no assumptions about the semantics of the metric itself:

- A “work unit” is an integer metric that increases over time during execution, such as the number of bytes, rows, files, or tables processed. The definition of “work unit” for a particular instrument is left to the instrumentation code providing the data.
- The [WORK\\_COMPLETED](#) value can increase one or many units at a time, depending on the instrumented code.
- The [WORK\\_ESTIMATED](#) value can change during the stage, depending on the instrumented code.

Instrumentation for a stage event progress indicator can implement any of the following behaviors:

- No progress instrumentation

This is the most typical case, where no progress data is provided. The [WORK\\_COMPLETED](#) and [WORK\\_ESTIMATED](#) columns are both [NULL](#).

- Unbounded progress instrumentation

Only the [WORK\\_COMPLETED](#) column is meaningful. No data is provided for the [WORK\\_ESTIMATED](#) column, which displays 0.

By querying the `events_stages_current` table for the monitored session, a monitoring application can report how much work has been performed so far, but cannot report whether the stage is near completion. Currently, no stages are instrumented like this.

- Bounded progress instrumentation

The `WORK_COMPLETED` and `WORK_ESTIMATED` columns are both meaningful.

This type of progress indicator is appropriate for an operation with a defined completion criterion, such as the table-copy instrument described later. By querying the `events_stages_current` table for the monitored session, a monitoring application can report how much work has been performed so far, and can report the overall completion percentage for the stage, by computing the `WORK_COMPLETED` / `WORK_ESTIMATED` ratio.

The `stage/sql/copy to tmp table` instrument illustrates how progress indicators work. During execution of an `ALTER TABLE` statement, the `stage/sql/copy to tmp table` stage is used, and this stage can execute potentially for a long time, depending on the size of the data to copy.

The table-copy task has a defined termination (all rows copied), and the `stage/sql/copy to tmp table` stage is instrumented to provide bounded progress information: The work unit used is number of rows copied, `WORK_COMPLETED` and `WORK_ESTIMATED` are both meaningful, and their ratio indicates task percentage complete.

To enable the instrument and the relevant consumers, execute these statements:

```
UPDATE performance_schema.setup_instruments
SET ENABLED='YES'
WHERE NAME='stage/sql/copy to tmp table';

UPDATE performance_schema.setup_consumers
SET ENABLED='YES'
WHERE NAME LIKE 'events_stages_%';
```

To see the progress of an ongoing `ALTER TABLE` statement, select from the `events_stages_current` table.

### 27.12.5.1 The `events_stages_current` Table

The `events_stages_current` table contains current stage events. The table stores one row per thread showing the current status of the thread's most recent monitored stage event, so there is no system variable for configuring the table size.

Of the tables that contain stage event rows, `events_stages_current` is the most fundamental. Other tables that contain stage event rows are logically derived from the current events. For example, the `events_stages_history` and `events_stages_history_long` tables are collections of the most recent stage events that have ended, up to a maximum number of rows per thread and globally across all threads, respectively.

For more information about the relationship between the three stage event tables, see [Section 27.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect stage events, see [Section 27.12.5, “Performance Schema Stage Event Tables”](#).

The `events_stages_current` table has these columns:

- `THREAD_ID`, `EVENT_ID`

The thread associated with the event and the thread current event number when the event starts. The `THREAD_ID` and `EVENT_ID` values taken together uniquely identify the row. No two rows have the same pair of values.

- `END_EVENT_ID`

This column is set to `NULL` when the event starts and updated to the thread current event number when the event ends.

- `EVENT_NAME`

The name of the instrument that produced the event. This is a `NAME` value from the `setup_instruments` table. Instrument names may have multiple parts and form a hierarchy, as discussed in [Section 27.6, “Performance Schema Instrument Naming Conventions”](#).

- `SOURCE`

The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved.

- `TIMER_START`, `TIMER_END`, `TIMER_WAIT`

Timing information for the event. The unit for these values is picoseconds (trillionths of a second). The `TIMER_START` and `TIMER_END` values indicate when event timing started and ended. `TIMER_WAIT` is the event elapsed time (duration).

If an event has not finished, `TIMER_END` is the current timer value and `TIMER_WAIT` is the time elapsed so far (`TIMER_END - TIMER_START`).

If an event is produced from an instrument that has `TIMED = NO`, timing information is not collected, and `TIMER_START`, `TIMER_END`, and `TIMER_WAIT` are all `NULL`.

For discussion of picoseconds as the unit for event times and factors that affect time values, see [Section 27.4.1, “Performance Schema Event Timing”](#).

- `WORK_COMPLETED`, `WORK_ESTIMATED`

These columns provide stage progress information, for instruments that have been implemented to produce such information. `WORK_COMPLETED` indicates how many work units have been completed for the stage, and `WORK_ESTIMATED` indicates how many work units are expected for the stage. For more information, see [Stage Event Progress Information](#).

- `NESTING_EVENT_ID`

The `EVENT_ID` value of the event within which this event is nested. The nesting event for a stage event is usually a statement event.

- `NESTING_EVENT_TYPE`

The nesting event type. The value is `TRANSACTION`, `STATEMENT`, `STAGE`, or `WAIT`.

The `events_stages_current` table has these indexes:

- Primary key on (`THREAD_ID`, `EVENT_ID`)

`TRUNCATE TABLE` is permitted for the `events_stages_current` table. It removes the rows.

### 27.12.5.2 The `events_stages_history` Table

The `events_stages_history` table contains the `N` most recent stage events that have ended per thread. Stage events are not added to the table until they have ended. When the table contains the maximum number of rows for a given thread, the oldest thread row is discarded when a new row for that thread is added. When a thread ends, all its rows are discarded.

The Performance Schema autosizes the value of `N` during server startup. To set the number of rows per thread explicitly, set the `performance_schema_events_stages_history_size` system variable at server startup.

The `events_stages_history` table has the same columns and indexing as `events_stages_current`. See [Section 27.12.5.1, “The `events\_stages\_current` Table”](#).

`TRUNCATE TABLE` is permitted for the `events_stages_history` table. It removes the rows.

For more information about the relationship between the three stage event tables, see [Section 27.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect stage events, see [Section 27.12.5, “Performance Schema Stage Event Tables”](#).

### 27.12.5.3 The `events_stages_history_long` Table

The `events_stages_history_long` table contains the *N* most recent stage events that have ended globally, across all threads. Stage events are not added to the table until they have ended. When the table becomes full, the oldest row is discarded when a new row is added, regardless of which thread generated either row.

The Performance Schema autosizes the value of *N* during server startup. To set the table size explicitly, set the `performance_schema_events_stages_history_long_size` system variable at server startup.

The `events_stages_history_long` table has the same columns as `events_stages_current`. See [Section 27.12.5.1, “The `events\_stages\_current` Table”](#). Unlike `events_stages_current`, `events_stages_history_long` has no indexing.

`TRUNCATE TABLE` is permitted for the `events_stages_history_long` table. It removes the rows.

For more information about the relationship between the three stage event tables, see [Section 27.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect stage events, see [Section 27.12.5, “Performance Schema Stage Event Tables”](#).

## 27.12.6 Performance Schema Statement Event Tables

The Performance Schema instruments statement execution. Statement events occur at a high level of the event hierarchy. Within the event hierarchy, wait events nest within stage events, which nest within statement events, which nest within transaction events.

These tables store statement events:

- `events_statements_current`: The current statement event for each thread.
- `events_statements_history`: The most recent statement events that have ended per thread.
- `events_statements_history_long`: The most recent statement events that have ended globally (across all threads).
- `prepared_statements_instances`: Prepared statement instances and statistics

The following sections describe the statement event tables. There are also summary tables that aggregate information about statement events; see [Section 27.12.20.3, “Statement Summary Tables”](#).

For more information about the relationship between the three `events_statements_xxx` event tables, see [Section 27.9, “Performance Schema Tables for Current and Historical Events”](#).

- [Configuring Statement Event Collection](#)
- [Statement Monitoring](#)

### Configuring Statement Event Collection

To control whether to collect statement events, set the state of the relevant instruments and consumers:

- The `setup_instruments` table contains instruments with names that begin with `statement`. Use these instruments to enable or disable collection of individual statement event classes.
- The `setup_consumers` table contains consumer values with names corresponding to the current and historical statement event table names, and the statement digest consumer. Use these consumers to filter collection of statement events and statement digesting.

The statement instruments are enabled by default, and the `events_statements_current`, `events_statements_history`, and `statements_digest` statement consumers are enabled by default:

```
mysql> SELECT NAME, ENABLED, TIMED
FROM performance_schema.setup_instruments
WHERE NAME LIKE 'statement/%';
```

| NAME                           | ENABLED | TIMED |
|--------------------------------|---------|-------|
| statement/sql/select           | YES     | YES   |
| statement/sql/create_table     | YES     | YES   |
| statement/sql/create_index     | YES     | YES   |
| ...                            |         |       |
| statement/sp/stmt              | YES     | YES   |
| statement/sp/set               | YES     | YES   |
| statement/sp/set_trigger_field | YES     | YES   |
| statement/scheduler/event      | YES     | YES   |
| statement/com/Sleep            | YES     | YES   |
| statement/com/Quit             | YES     | YES   |
| statement/com/Init DB          | YES     | YES   |
| ...                            |         |       |
| statement/abstract/Query       | YES     | YES   |
| statement/abstract/new_packet  | YES     | YES   |
| statement/abstract/relay_log   | YES     | YES   |

```
mysql> SELECT *
FROM performance_schema.setup_consumers
WHERE NAME LIKE '%statements%';
```

| NAME                           | ENABLED |
|--------------------------------|---------|
| events_statements_current      | YES     |
| events_statements_history      | YES     |
| events_statements_history_long | NO      |
| statements_digest              | YES     |

To control statement event collection at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='statement/%=ON'
performance-schema-consumer-events-statements-current=ON
performance-schema-consumer-events-statements-history=ON
performance-schema-consumer-events-statements-history-long=ON
performance-schema-consumer-statements-digest=ON
```

- Disable:

```
[mysqld]
performance-schema-instrument='statement/%=OFF'
performance-schema-consumer-events-statements-current=OFF
performance-schema-consumer-events-statements-history=OFF
performance-schema-consumer-events-statements-history-long=OFF
performance-schema-consumer-statements-digest=OFF
```

To control statement event collection at runtime, update the `setup_instruments` and `setup_consumers` tables:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME LIKE 'statement/%';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'YES'
WHERE NAME LIKE '%statements%';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME LIKE 'statement/%';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'NO'
WHERE NAME LIKE '%statements%';
```

To collect only specific statement events, enable only the corresponding statement instruments. To collect statement events only for specific statement event tables, enable the statement instruments but only the statement consumers corresponding to the desired tables.

For additional information about configuring event collection, see [Section 27.3, “Performance Schema Startup Configuration”](#), and [Section 27.4, “Performance Schema Runtime Configuration”](#).

## Statement Monitoring

Statement monitoring begins from the moment the server sees that activity is requested on a thread, to the moment when all activity has ceased. Typically, this means from the time the server gets the first packet from the client to the time the server has finished sending the response. Statements within stored programs are monitored like other statements.

When the Performance Schema instruments a request (server command or SQL statement), it uses instrument names that proceed in stages from more general (or “abstract”) to more specific until it arrives at a final instrument name.

Final instrument names correspond to server commands and SQL statements:

- Server commands correspond to the `COM_xxx` codes defined in the `mysql_com.h` header file and processed in `sql/sql_parse.cc`. Examples are `COM_PING` and `COM_QUIT`. Instruments for commands have names that begin with `statement/com`, such as `statement/com/Ping` and `statement/com/Quit`.
- SQL statements are expressed as text, such as `DELETE FROM t1` or `SELECT * FROM t2`. Instruments for SQL statements have names that begin with `statement/sql`, such as `statement/sql/delete` and `statement/sql/select`.

Some final instrument names are specific to error handling:

- `statement/com/Error` accounts for messages received by the server that are out of band. It can be used to detect commands sent by clients that the server does not understand. This may be helpful for purposes such as identifying clients that are misconfigured or using a version of MySQL more recent than that of the server, or clients that are attempting to attack the server.
- `statement/sql/error` accounts for SQL statements that fail to parse. It can be used to detect malformed queries sent by clients. A query that fails to parse differs from a query that parses but fails due to an error during execution. For example, `SELECT * FROM` is malformed, and the `statement/sql/error` instrument is used. By contrast, `SELECT *` parses but fails with a `No tables used` error. In this case, `statement/sql/select` is used and the statement event contains information to indicate the nature of the error.

A request can be obtained from any of these sources:

- As a command or statement request from a client, which sends the request as packets

- As a statement string read from the relay log on a replica
- As an event from the Event Scheduler

The details for a request are not initially known and the Performance Schema proceeds from abstract to specific instrument names in a sequence that depends on the source of the request.

For a request received from a client:

1. When the server detects a new packet at the socket level, a new statement is started with an abstract instrument name of `statement/abstract/new_packet`.
2. When the server reads the packet number, it knows more about the type of request received, and the Performance Schema refines the instrument name. For example, if the request is a `COM_PING` packet, the instrument name becomes `statement/com/Ping` and that is the final name. If the request is a `COM_QUERY` packet, it is known to correspond to an SQL statement but not the particular type of statement. In this case, the instrument changes from one abstract name to a more specific but still abstract name, `statement/abstract/Query`, and the request requires further classification.
3. If the request is a statement, the statement text is read and given to the parser. After parsing, the exact statement type is known. If the request is, for example, an `INSERT` statement, the Performance Schema refines the instrument name from `statement/abstract/Query` to `statement/sql/insert`, which is the final name.

For a request read as a statement from the relay log on a replica:

1. Statements in the relay log are stored as text and are read as such. There is no network protocol, so the `statement/abstract/new_packet` instrument is not used. Instead, the initial instrument is `statement/abstract/relay_log`.
2. When the statement is parsed, the exact statement type is known. If the request is, for example, an `INSERT` statement, the Performance Schema refines the instrument name from `statement/abstract/Query` to `statement/sql/insert`, which is the final name.

The preceding description applies only for statement-based replication. For row-based replication, table I/O done on the replica as it processes row changes can be instrumented, but row events in the relay log do not appear as discrete statements.

For a request received from the Event Scheduler:

The event execution is instrumented using the name `statement/scheduler/event`. This is the final name.

Statements executed within the event body are instrumented using `statement/sql/*` names, without use of any preceding abstract instrument. An event is a stored program, and stored programs are precompiled in memory before execution. Consequently, there is no parsing at runtime and the type of each statement is known by the time it executes.

Statements executed within the event body are child statements. For example, if an event executes an `INSERT` statement, execution of the event itself is the parent, instrumented using `statement/scheduler/event`, and the `INSERT` is the child, instrumented using `statement/sql/insert`. The parent/child relationship holds *between* separate instrumented operations. This differs from the sequence of refinement that occurs *within* a single instrumented operation, from abstract to final instrument names.

For statistics to be collected for statements, it is not sufficient to enable only the final `statement/sql/*` instruments used for individual statement types. The abstract `statement/abstract/*` instruments must be enabled as well. This should not normally be an issue because all statement instruments are enabled by default. However, an application that enables or disables statement instruments selectively must take into account that disabling abstract instruments also disables statistics collection for the individual statement instruments. For example, to collect statistics for `INSERT` statements, `statement/sql/insert` must be enabled, but also `statement/abstract/`

`new_packet` and `statement/abstract/Query`. Similarly, for replicated statements to be instrumented, `statement/abstract/relay_log` must be enabled.

No statistics are aggregated for abstract instruments such as `statement/abstract/Query` because no statement is ever classified with an abstract instrument as the final statement name.

### 27.12.6.1 The `events_statements_current` Table

The `events_statements_current` table contains current statement events. The table stores one row per thread showing the current status of the thread's most recent monitored statement event, so there is no system variable for configuring the table size.

Of the tables that contain statement event rows, `events_statements_current` is the most fundamental. Other tables that contain statement event rows are logically derived from the current events. For example, the `events_statements_history` and `events_statements_history_long` tables are collections of the most recent statement events that have ended, up to a maximum number of rows per thread and globally across all threads, respectively.

For more information about the relationship between the three `events_statements_XXX` event tables, see [Section 27.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect statement events, see [Section 27.12.6, “Performance Schema Statement Event Tables”](#).

The `events_statements_current` table has these columns:

- `THREAD_ID`, `EVENT_ID`

The thread associated with the event and the thread current event number when the event starts. The `THREAD_ID` and `EVENT_ID` values taken together uniquely identify the row. No two rows have the same pair of values.

- `END_EVENT_ID`

This column is set to `NULL` when the event starts and updated to the thread current event number when the event ends.

- `EVENT_NAME`

The name of the instrument from which the event was collected. This is a `NAME` value from the `setup_instruments` table. Instrument names may have multiple parts and form a hierarchy, as discussed in [Section 27.6, “Performance Schema Instrument Naming Conventions”](#).

For SQL statements, the `EVENT_NAME` value initially is `statement/com/Query` until the statement is parsed, then changes to a more appropriate value, as described in [Section 27.12.6, “Performance Schema Statement Event Tables”](#).

- `SOURCE`

The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved.

- `TIMER_START`, `TIMER_END`, `TIMER_WAIT`

Timing information for the event. The unit for these values is picoseconds (trillionths of a second). The `TIMER_START` and `TIMER_END` values indicate when event timing started and ended. `TIMER_WAIT` is the event elapsed time (duration).

If an event has not finished, `TIMER_END` is the current timer value and `TIMER_WAIT` is the time elapsed so far (`TIMER_END - TIMER_START`).

If an event is produced from an instrument that has `TIMED = NO`, timing information is not collected, and `TIMER_START`, `TIMER_END`, and `TIMER_WAIT` are all `NULL`.

For discussion of picoseconds as the unit for event times and factors that affect time values, see [Section 27.4.1, “Performance Schema Event Timing”](#).

- `LOCK_TIME`

The time spent waiting for table locks. This value is computed in microseconds but normalized to picoseconds for easier comparison with other Performance Schema timers.

- `SQL_TEXT`

The text of the SQL statement. For a command not associated with an SQL statement, the value is `NULL`.

The maximum space available for statement display is 1024 bytes by default. To change this value, set the `performance_schema_max_sql_text_length` system variable at server startup. (Changing this value affects columns in other Performance Schema tables as well. See [Section 27.10, “Performance Schema Statement Digests and Sampling”](#).)

- `DIGEST`

The statement digest SHA-256 value as a string of 64 hexadecimal characters, or `NULL` if the `statements_digest` consumer is `no`. For more information about statement digesting, see [Section 27.10, “Performance Schema Statement Digests and Sampling”](#).

- `DIGEST_TEXT`

The normalized statement digest text, or `NULL` if the `statements_digest` consumer is `no`. For more information about statement digesting, see [Section 27.10, “Performance Schema Statement Digests and Sampling”](#).

The `performance_schema_max_digest_length` system variable determines the maximum number of bytes available per session for digest value storage. However, the display length of statement digests may be longer than the available buffer size due to encoding of statement elements such as keywords and literal values in digest buffer. Consequently, values selected from the `DIGEST_TEXT` column of statement event tables may appear to exceed the `performance_schema_max_digest_length` value.

- `CURRENT_SCHEMA`

The default database for the statement, `NULL` if there is none.

- `OBJECT_SCHEMA`, `OBJECT_NAME`, `OBJECT_TYPE`

For nested statements (stored programs), these columns contain information about the parent statement. Otherwise they are `NULL`.

- `OBJECT_INSTANCE_BEGIN`

This column identifies the statement. The value is the address of an object in memory.

- `MYSQL_ERRNO`

The statement error number, from the statement diagnostics area.

- `RETURNED_SQLSTATE`

The statement SQLSTATE value, from the statement diagnostics area.

- `MESSAGE_TEXT`

The statement error message, from the statement diagnostics area.

- [ERRORS](#)

Whether an error occurred for the statement. The value is 0 if the SQLSTATE value begins with 00 (completion) or 01 (warning). The value is 1 if the SQLSTATE value is anything else.

- [WARNINGS](#)

The number of warnings, from the statement diagnostics area.

- [ROWS\\_AFFECTED](#)

The number of rows affected by the statement. For a description of the meaning of “affected,” see [mysql\\_affected\\_rows\(\)](#).

- [ROWS\\_SENT](#)

The number of rows returned by the statement.

- [ROWS\\_EXAMINED](#)

The number of rows examined by the server layer (not counting any processing internal to storage engines).

- [CREATED\\_TMP\\_DISK\\_TABLES](#)

Like the [Created\\_tmp\\_disk\\_tables](#) status variable, but specific to the statement.

- [CREATED\\_TMP\\_TABLES](#)

Like the [Created\\_tmp\\_tables](#) status variable, but specific to the statement.

- [SELECT\\_FULL\\_JOIN](#)

Like the [Select\\_full\\_join](#) status variable, but specific to the statement.

- [SELECT\\_FULL\\_RANGE\\_JOIN](#)

Like the [Select\\_full\\_range\\_join](#) status variable, but specific to the statement.

- [SELECT\\_RANGE](#)

Like the [Select\\_range](#) status variable, but specific to the statement.

- [SELECT\\_RANGE\\_CHECK](#)

Like the [Select\\_range\\_check](#) status variable, but specific to the statement.

- [SELECT\\_SCAN](#)

Like the [Select\\_scan](#) status variable, but specific to the statement.

- [SORT\\_MERGE\\_PASSES](#)

Like the [Sort\\_merge\\_passes](#) status variable, but specific to the statement.

- [SORT\\_RANGE](#)

Like the [Sort\\_range](#) status variable, but specific to the statement.

- [SORT\\_ROWS](#)

Like the [Sort\\_rows](#) status variable, but specific to the statement.

- [SORT\\_SCAN](#)

Like the [Sort\\_scan](#) status variable, but specific to the statement.

- [NO\\_INDEX\\_USED](#)

1 if the statement performed a table scan without using an index, 0 otherwise.

- [NO\\_GOOD\\_INDEX\\_USED](#)

1 if the server found no good index to use for the statement, 0 otherwise. For additional information, see the description of the [Extra](#) column from [EXPLAIN](#) output for the [Range checked for each record](#) value in [Section 8.8.2, “EXPLAIN Output Format”](#).

- [NESTING\\_EVENT\\_ID](#), [NESTING\\_EVENT\\_TYPE](#), [NESTING\\_EVENT\\_LEVEL](#)

These three columns are used with other columns to provide information as follows for top-level (unnested) statements and nested statements (executed within a stored program).

For top level statements:

```
OBJECT_TYPE = NULL
OBJECT_SCHEMA = NULL
OBJECT_NAME = NULL
NESTING_EVENT_ID = NULL
NESTING_EVENT_TYPE = NULL
NESTING_LEVEL = 0
```

For nested statements:

```
OBJECT_TYPE = the parent statement object type
OBJECT_SCHEMA = the parent statement object schema
OBJECT_NAME = the parent statement object name
NESTING_EVENT_ID = the parent statement EVENT_ID
NESTING_EVENT_TYPE = 'STATEMENT'
NESTING_LEVEL = the parent statement NESTING_LEVEL plus one
```

- [STATEMENT\\_ID](#)

The query ID maintained by the server at the SQL level. The value is unique for the server instance because these IDs are generated using a global counter that is incremented atomically. This column was added in MySQL 8.0.14.

The [events\\_statements\\_current](#) table has these indexes:

- Primary key on ([THREAD\\_ID](#), [EVENT\\_ID](#))

[TRUNCATE TABLE](#) is permitted for the [events\\_statements\\_current](#) table. It removes the rows.

## 27.12.6.2 The [events\\_statements\\_history](#) Table

The [events\\_statements\\_history](#) table contains the *N* most recent statement events that have ended per thread. Statement events are not added to the table until they have ended. When the table contains the maximum number of rows for a given thread, the oldest thread row is discarded when a new row for that thread is added. When a thread ends, all its rows are discarded.

The Performance Schema autosizes the value of *N* during server startup. To set the number of rows per thread explicitly, set the [performance\\_schema\\_events\\_statements\\_history\\_size](#) system variable at server startup.

The [events\\_statements\\_history](#) table has the same columns and indexing as [events\\_statements\\_current](#). See [Section 27.12.6.1, “The \[events\\\_statements\\\_current\]\(#\) Table”](#).

[TRUNCATE TABLE](#) is permitted for the [events\\_statements\\_history](#) table. It removes the rows.

For more information about the relationship between the three `events_statements_xxx` event tables, see [Section 27.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect statement events, see [Section 27.12.6, “Performance Schema Statement Event Tables”](#).

### 27.12.6.3 The `events_statements_history_long` Table

The `events_statements_history_long` table contains the *N* most recent statement events that have ended globally, across all threads. Statement events are not added to the table until they have ended. When the table becomes full, the oldest row is discarded when a new row is added, regardless of which thread generated either row.

The value of *N* is autosized at server startup. To set the table size explicitly, set the `performance_schema_events_statements_history_long_size` system variable at server startup.

The `events_statements_history_long` table has the same columns as `events_statements_current`. See [Section 27.12.6.1, “The `events\_statements\_current` Table”](#). Unlike `events_statements_current`, `events_statements_history_long` has no indexing.

`TRUNCATE TABLE` is permitted for the `events_statements_history_long` table. It removes the rows.

For more information about the relationship between the three `events_statements_xxx` event tables, see [Section 27.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect statement events, see [Section 27.12.6, “Performance Schema Statement Event Tables”](#).

### 27.12.6.4 The `prepared_statements_instances` Table

The Performance Schema provides instrumentation for prepared statements, for which there are two protocols:

- The binary protocol. This is accessed through the MySQL C API and maps onto underlying server commands as shown in the following table.

| C API Function                    | Corresponding Server Command  |
|-----------------------------------|-------------------------------|
| <code>mysql_stmt_prepare()</code> | <code>COM_STMT_PREPARE</code> |
| <code>mysql_stmt_execute()</code> | <code>COM_STMT_EXECUTE</code> |
| <code>mysql_stmt_close()</code>   | <code>COM_STMT_CLOSE</code>   |

- The text protocol. This is accessed using SQL statements and maps onto underlying server commands as shown in the following table.

| SQL Statement                                 | Corresponding Server Command           |
|-----------------------------------------------|----------------------------------------|
| <code>PREPARE</code>                          | <code>SQLCOM_PREPARE</code>            |
| <code>EXECUTE</code>                          | <code>SQLCOM_EXECUTE</code>            |
| <code>DEALLOCATE PREPARE, DROP PREPARE</code> | <code>SQLCOM_DEALLOCATE PREPARE</code> |

Performance Schema prepared statement instrumentation covers both protocols. The following discussion refers to the server commands rather than the C API functions or SQL statements.

Information about prepared statements is available in the `prepared_statements_instances` table. This table enables inspection of prepared statements used in the server and provides aggregated statistics about them. To control the size of this table, set the

`performance_schema_max_prepared_statements_instances` system variable at server startup.

Collection of prepared statement information depends on the statement instruments shown in the following table. These instruments are enabled by default. To modify them, update the `setup_instruments` table.

| Instrument                             | Server Command                |
|----------------------------------------|-------------------------------|
| <code>statement/com/Prepare</code>     | <code>COM_STMT_PREPARE</code> |
| <code>statement/com/Execute</code>     | <code>COM_STMT_EXECUTE</code> |
| <code>statement/sql/prepare_sql</code> | <code>SQLCOM_PREPARE</code>   |
| <code>statement/sql/execute_sql</code> | <code>SQLCOM_EXECUTE</code>   |

The Performance Schema manages the contents of the `prepared_statements_instances` table as follows:

- Statement preparation

A `COM_STMT_PREPARE` or `SQLCOM_PREPARE` command creates a prepared statement in the server. If the statement is successfully instrumented, a new row is added to the `prepared_statements_instances` table. If the statement cannot be instrumented, `Performance_schema_prepared_statements_lost` status variable is incremented.

- Prepared statement execution

Execution of a `COM_STMT_EXECUTE` or `SQLCOM_EXECUTE` command for an instrumented prepared statement instance updates the corresponding `prepared_statements_instances` table row.

- Prepared statement deallocation

Execution of a `COM_STMT_CLOSE` or `SQLCOM_DEALLOCATE_PREPARE` command for an instrumented prepared statement instance removes the corresponding `prepared_statements_instances` table row. To avoid resource leaks, removal occurs even if the prepared statement instruments described previously are disabled.

The `prepared_statements_instances` table has these columns:

- `OBJECT_INSTANCE_BEGIN`

The address in memory of the instrumented prepared statement.

- `STATEMENT_ID`

The internal statement ID assigned by the server. The text and binary protocols both use statement IDs.

- `STATEMENT_NAME`

For the binary protocol, this column is `NULL`. For the text protocol, this column is the external statement name assigned by the user. For example, for the following SQL statement, the name of the prepared statement is `stmt`:

```
PREPARE stmt FROM 'SELECT 1';
```

- `SQL_TEXT`

The prepared statement text, with `?` placeholder markers.

- `OWNER_THREAD_ID`, `OWNER_EVENT_ID`

These columns indicate the event that created the prepared statement.

- `OWNER_OBJECT_TYPE`, `OWNER_OBJECT_SCHEMA`, `OWNER_OBJECT_NAME`

For a prepared statement created by a client session, these columns are `NULL`. For a prepared statement created by a stored program, these columns point to the stored program. A typical user error is forgetting to deallocate prepared statements. These columns can be used to find stored programs that leak prepared statements:

```
SELECT
 OWNER_OBJECT_TYPE, OWNER_OBJECT_SCHEMA, OWNER_OBJECT_NAME,
 STATEMENT_NAME, SQL_TEXT
FROM performance_schema.prepared_statements_instances
WHERE OWNER_OBJECT_TYPE IS NOT NULL;
```

- `TIMER_PREPARE`

The time spent executing the statement preparation itself.

- `COUNT_REPREPARE`

The number of times the statement was reprepared internally (see [Section 8.10.3, “Caching of Prepared Statements and Stored Programs”](#)). Timing statistics for reparation are not available because it is counted as part of statement execution, not as a separate operation.

- `COUNT_EXECUTE`, `SUM_TIMER_EXECUTE`, `MIN_TIMER_EXECUTE`, `AVG_TIMER_EXECUTE`, `MAX_TIMER_EXECUTE`

Aggregated statistics for executions of the prepared statement.

- `SUM_XXX`

The remaining `SUM_XXX` columns are the same as for the statement summary tables (see [Section 27.12.20.3, “Statement Summary Tables”](#)).

The `prepared_statements_instances` table has these indexes:

- Primary key on (`OBJECT_INSTANCE_BEGIN`)
- Index on (`STATEMENT_ID`)
- Index on (`STATEMENT_NAME`)
- Index on (`OWNER_THREAD_ID`, `OWNER_EVENT_ID`)
- Index on (`OWNER_OBJECT_TYPE`, `OWNER_OBJECT_SCHEMA`, `OWNER_OBJECT_NAME`)

`TRUNCATE TABLE` resets the statistics columns of the `prepared_statements_instances` table.

## 27.12.7 Performance Schema Transaction Tables

The Performance Schema instruments transactions. Within the event hierarchy, wait events nest within stage events, which nest within statement events, which nest within transaction events.

These tables store transaction events:

- `events_transactions_current`: The current transaction event for each thread.
- `events_transactions_history`: The most recent transaction events that have ended per thread.
- `events_transactions_history_long`: The most recent transaction events that have ended globally (across all threads).

The following sections describe the transaction event tables. There are also summary tables that aggregate information about transaction events; see [Section 27.12.20.5, “Transaction Summary Tables”](#).

For more information about the relationship between the three transaction event tables, see [Section 27.9, “Performance Schema Tables for Current and Historical Events”](#).

- [Configuring Transaction Event Collection](#)
- [Transaction Boundaries](#)
- [Transaction Instrumentation](#)
- [Transactions and Nested Events](#)
- [Transactions and Stored Programs](#)
- [Transactions and Savepoints](#)
- [Transactions and Errors](#)

## Configuring Transaction Event Collection

To control whether to collect transaction events, set the state of the relevant instruments and consumers:

- The `setup_instruments` table contains an instrument named `transaction`. Use this instrument to enable or disable collection of individual transaction event classes.
- The `setup_consumers` table contains consumer values with names corresponding to the current and historical transaction event table names. Use these consumers to filter collection of transaction events.

The `transaction` instrument and the `events_transactions_current` and `events_transactions_history` transaction consumers are enabled by default:

```
mysql> SELECT NAME, ENABLED, TIMED
 FROM performance_schema.setup_instruments
 WHERE NAME = 'transaction';
+-----+-----+-----+
| NAME | ENABLED | TIMED |
+-----+-----+-----+
| transaction | YES | YES |
+-----+-----+-----+

mysql> SELECT *
 FROM performance_schema.setup_consumers
 WHERE NAME LIKE 'events_transactions%';
+-----+-----+
| NAME | ENABLED |
+-----+-----+
events_transactions_current	YES
events_transactions_history	YES
events_transactions_history_long	NO
+-----+-----+
```

To control transaction event collection at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='transaction=ON'
performance-schema-consumer-events-transactions-current=ON
performance-schema-consumer-events-transactions-history=ON
performance-schema-consumer-events-transactions-history-long=ON
```

- Disable:

```
[mysqld]
performance-schema-instrument='transaction=OFF'
performance-schema-consumer-events-transactions-current=OFF
performance-schema-consumer-events-transactions-history=OFF
performance-schema-consumer-events-transactions-history-long=OFF
```

To control transaction event collection at runtime, update the [setup\\_instruments](#) and [setup\\_consumers](#) tables:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME = 'transaction';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'YES'
WHERE NAME LIKE 'events_transactions%';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME = 'transaction';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'NO'
WHERE NAME LIKE 'events_transactions%';
```

To collect transaction events only for specific transaction event tables, enable the [transaction](#) instrument but only the transaction consumers corresponding to the desired tables.

For additional information about configuring event collection, see [Section 27.3, “Performance Schema Startup Configuration”](#), and [Section 27.4, “Performance Schema Runtime Configuration”](#).

## Transaction Boundaries

In MySQL Server, transactions start explicitly with these statements:

```
START TRANSACTION | BEGIN | XA START | XA BEGIN
```

Transactions also start implicitly. For example, when the [autocommit](#) system variable is enabled, the start of each statement starts a new transaction.

When [autocommit](#) is disabled, the first statement following a committed transaction marks the start of a new transaction. Subsequent statements are part of the transaction until it is committed.

Transactions explicitly end with these statements:

```
COMMIT | ROLLBACK | XA COMMIT | XA ROLLBACK
```

Transactions also end implicitly, by execution of DDL statements, locking statements, and server administration statements.

In the following discussion, references to [START TRANSACTION](#) also apply to [BEGIN](#), [XA START](#), and [XA BEGIN](#). Similarly, references to [COMMIT](#) and [ROLLBACK](#) apply to [XA COMMIT](#) and [XA ROLLBACK](#), respectively.

The Performance Schema defines transaction boundaries similarly to that of the server. The start and end of a transaction event closely match the corresponding state transitions in the server:

- For an explicitly started transaction, the transaction event starts during processing of the [START TRANSACTION](#) statement.
- For an implicitly started transaction, the transaction event starts on the first statement that uses a transactional engine after the previous transaction has ended.

- For any transaction, whether explicitly or implicitly ended, the transaction event ends when the server transitions out of the active transaction state during the processing of `COMMIT` or `ROLLBACK`.

There are subtle implications to this approach:

- Transaction events in the Performance Schema do not fully include the statement events associated with the corresponding `START TRANSACTION`, `COMMIT`, or `ROLLBACK` statements. There is a trivial amount of timing overlap between the transaction event and these statements.
- Statements that work with nontransactional engines have no effect on the transaction state of the connection. For implicit transactions, the transaction event begins with the first statement that uses a transactional engine. This means that statements operating exclusively on nontransactional tables are ignored, even following `START TRANSACTION`.

To illustrate, consider the following scenario:

```
1. SET autocommit = OFF;
2. CREATE TABLE t1 (a INT) ENGINE = InnoDB;
3. START TRANSACTION; -- Transaction 1 START
4. INSERT INTO t1 VALUES (1), (2), (3);
5. CREATE TABLE t2 (a INT) ENGINE = MyISAM; -- Transaction 1 COMMIT
 -- (implicit; DDL forces commit)
6. INSERT INTO t2 VALUES (1), (2), (3); -- Update nontransactional table
7. UPDATE t2 SET a = a + 1; -- ... and again
8. INSERT INTO t1 VALUES (4), (5), (6); -- Write to transactional table
 -- Transaction 2 START (implicit)
9. COMMIT; -- Transaction 2 COMMIT
```

From the perspective of the server, Transaction 1 ends when table `t2` is created. Transaction 2 does not start until a transactional table is accessed, despite the intervening updates to nontransactional tables.

From the perspective of the Performance Schema, Transaction 2 starts when the server transitions into an active transaction state. Statements 6 and 7 are not included within the boundaries of Transaction 2, which is consistent with how the server writes transactions to the binary log.

## Transaction Instrumentation

Three attributes define transactions:

- Access mode (read only, read write)
- Isolation level (`SERIALIZABLE`, `REPEATABLE READ`, and so forth)
- Implicit (`autocommit` enabled) or explicit (`autocommit` disabled)

To reduce complexity of the transaction instrumentation and to ensure that the collected transaction data provides complete, meaningful results, all transactions are instrumented independently of access mode, isolation level, or autocommit mode.

To selectively examine transaction history, use the attribute columns in the transaction event tables: `ACCESS_MODE`, `ISOLATION_LEVEL`, and `AUTOCOMMIT`.

The cost of transaction instrumentation can be reduced various ways, such as enabling or disabling transaction instrumentation according to user, account, host, or thread (client connection).

## Transactions and Nested Events

The parent of a transaction event is the event that initiated the transaction. For an explicitly started transaction, this includes the `START TRANSACTION` and `COMMIT AND CHAIN` statements. For an implicitly started transaction, it is the first statement that uses a transactional engine after the previous transaction ends.

In general, a transaction is the top-level parent to all events initiated during the transaction, including statements that explicitly end the transaction such as `COMMIT` and `ROLLBACK`. Exceptions are statements that implicitly end a transaction, such as DDL statements, in which case the current transaction must be committed before the new statement is executed.

## Transactions and Stored Programs

Transactions and stored program events are related as follows:

- **Stored Procedures**

Stored procedures operate independently of transactions. A stored procedure can be started within a transaction, and a transaction can be started or ended from within a stored procedure. If called from within a transaction, a stored procedure can execute statements that force a commit of the parent transaction and then start a new transaction.

If a stored procedure is started within a transaction, that transaction is the parent of the stored procedure event.

If a transaction is started by a stored procedure, the stored procedure is the parent of the transaction event.

- **Stored Functions**

Stored functions are restricted from causing an explicit or implicit commit or rollback. Stored function events can reside within a parent transaction event.

- **Triggers**

Triggers activate as part of a statement that accesses the table with which it is associated, so the parent of a trigger event is always the statement that activates it.

Triggers cannot issue statements that cause an explicit or implicit commit or rollback of a transaction.

- **Scheduled Events**

The execution of the statements in the body of a scheduled event takes place in a new connection. Nesting of a scheduled event within a parent transaction is not applicable.

## Transactions and Savepoints

Savepoint statements are recorded as separate statement events. Transaction events include separate counters for `SAVEPOINT`, `ROLLBACK TO SAVEPOINT`, and `RELEASE SAVEPOINT` statements issued during the transaction.

## Transactions and Errors

Errors and warnings that occur within a transaction are recorded in statement events, but not in the corresponding transaction event. This includes transaction-specific errors and warnings, such as a rollback on a nontransactional table or GTID consistency errors.

### 27.12.7.1 The `events_transactions_current` Table

The `events_transactions_current` table contains current transaction events. The table stores one row per thread showing the current status of the thread's most recent monitored transaction event, so there is no system variable for configuring the table size. For example:

```
mysql> SELECT *
 FROM performance_schema.events_transactions_current LIMIT 1\G
***** 1. row *****
 THREAD_ID: 26
 EVENT_ID: 7
 END_EVENT_ID: NULL
```

```

EVENT_NAME: transaction
STATE: ACTIVE
TRX_ID: NULL
GTID: 3E11FA47-71CA-11E1-9E33-C80AA9429562:56
XID: NULL
XA_STATE: NULL
SOURCE: transaction.cc:150
TIMER_START: 420833537900000
TIMER_END: NULL
TIMER_WAIT: NULL
ACCESS_MODE: READ WRITE
ISOLATION_LEVEL: REPEATABLE READ
AUTOCOMMIT: NO
NUMBER_OF_SAVEPOINTS: 0
NUMBER_OF_ROLLBACK_TO_SAVEPOINT: 0
NUMBER_OF_RELEASE_SAVEPOINT: 0
OBJECT_INSTANCE_BEGIN: NULL
NESTING_EVENT_ID: 6
NESTING_EVENT_TYPE: STATEMENT

```

Of the tables that contain transaction event rows, `events_transactions_current` is the most fundamental. Other tables that contain transaction event rows are logically derived from the current events. For example, the `events_transactions_history` and `events_transactions_history_long` tables are collections of the most recent transaction events that have ended, up to a maximum number of rows per thread and globally across all threads, respectively.

For more information about the relationship between the three transaction event tables, see [Section 27.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect transaction events, see [Section 27.12.7, “Performance Schema Transaction Tables”](#).

The `events_transactions_current` table has these columns:

- `THREAD_ID`, `EVENT_ID`

The thread associated with the event and the thread current event number when the event starts. The `THREAD_ID` and `EVENT_ID` values taken together uniquely identify the row. No two rows have the same pair of values.

- `END_EVENT_ID`

This column is set to `NULL` when the event starts and updated to the thread current event number when the event ends.

- `EVENT_NAME`

The name of the instrument from which the event was collected. This is a `NAME` value from the `setup_instruments` table. Instrument names may have multiple parts and form a hierarchy, as discussed in [Section 27.6, “Performance Schema Instrument Naming Conventions”](#).

- `STATE`

The current transaction state. The value is `ACTIVE` (after `START TRANSACTION` or `BEGIN`), `COMMITTED` (after `COMMIT`), or `ROLLED BACK` (after `ROLLBACK`).

- `TRX_ID`

Unused.

- `GTID`

The GTID column contains the value of `gtid_next`, which can be one of `ANONYMOUS`, `AUTOMATIC`, or a GTID using the format `UUID:NUMBER`. For transactions that use `gtid_next=AUTOMATIC`,

which is all normal client transactions, the GTID column changes when the transaction commits and the actual GTID is assigned. If `gtid_mode` is either `ON` or `ON_PERMISSIVE`, the GTID column changes to the transaction's GTID. If `gtid_mode` is either `OFF` or `OFF_PERMISSIVE`, the GTID column changes to `ANONYMOUS`.

- `XID_FORMAT_ID`, `XID_GTRID`, and `XID_BQUAL`

The elements of the XA transaction identifier. They have the format described in [Section 13.3.8.1, “XA Transaction SQL Statements”](#).

- `XA_STATE`

The state of the XA transaction. The value is `ACTIVE` (after `XA START`), `IDLE` (after `XA END`), `PREPARED` (after `XA PREPARE`), `ROLLED BACK` (after `XA ROLLBACK`), or `COMMITTED` (after `XA COMMIT`).

On a replica, the same XA transaction can appear in the `events_transactions_current` table with different states on different threads. This is because immediately after the XA transaction is prepared, it is detached from the replica's applier thread, and can be committed or rolled back by any thread on the replica. The `events_transactions_current` table displays the current status of the most recent monitored transaction event on the thread, and does not update this status when the thread is idle. So the XA transaction can still be displayed in the `PREPARED` state for the original applier thread, after it has been processed by another thread. To positively identify XA transactions that are still in the `PREPARED` state and need to be recovered, use the `XA RECOVER` statement rather than the Performance Schema transaction tables.

- `SOURCE`

The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved.

- `TIMER_START`, `TIMER_END`, `TIMER_WAIT`

Timing information for the event. The unit for these values is picoseconds (trillionths of a second). The `TIMER_START` and `TIMER_END` values indicate when event timing started and ended. `TIMER_WAIT` is the event elapsed time (duration).

If an event has not finished, `TIMER_END` is the current timer value and `TIMER_WAIT` is the time elapsed so far (`TIMER_END - TIMER_START`).

If an event is produced from an instrument that has `TIMED = NO`, timing information is not collected, and `TIMER_START`, `TIMER_END`, and `TIMER_WAIT` are all `NULL`.

For discussion of picoseconds as the unit for event times and factors that affect time values, see [Section 27.4.1, “Performance Schema Event Timing”](#).

- `ACCESS_MODE`

The transaction access mode. The value is `READ WRITE` or `READ ONLY`.

- `ISOLATION_LEVEL`

The transaction isolation level. The value is `REPEATABLE READ`, `READ COMMITTED`, `READ UNCOMMITTED`, or `SERIALIZABLE`.

- `AUTOCOMMIT`

Whether autocommit mode was enabled when the transaction started.

- `NUMBER_OF_SAVEPOINTS`, `NUMBER_OF_ROLLBACK_TO_SAVEPOINT`,  
`NUMBER_OF_RELEASE_SAVEPOINT`

The number of `SAVEPOINT`, `ROLLBACK TO SAVEPOINT`, and `RELEASE SAVEPOINT` statements issued during the transaction.

- `OBJECT_INSTANCE_BEGIN`

Unused.

- `NESTING_EVENT_ID`

The `EVENT_ID` value of the event within which this event is nested.

- `NESTING_EVENT_TYPE`

The nesting event type. The value is `TRANSACTION`, `STATEMENT`, `STAGE`, or `WAIT`. (`TRANSACTION` does not appear because transactions cannot be nested.)

The `events_transactions_current` table has these indexes:

- Primary key on (`THREAD_ID`, `EVENT_ID`)

`TRUNCATE TABLE` is permitted for the `events_transactions_current` table. It removes the rows.

### 27.12.7.2 The `events_transactions_history` Table

The `events_transactions_history` table contains the *N* most recent transaction events that have ended per thread. Transaction events are not added to the table until they have ended. When the table contains the maximum number of rows for a given thread, the oldest thread row is discarded when a new row for that thread is added. When a thread ends, all its rows are discarded.

The Performance Schema autosizes the value of *N* during server startup. To set the number of rows per thread explicitly, set the `performance_schema_events_transactions_history_size` system variable at server startup.

The `events_transactions_history` table has the same columns and indexing as `events_transactions_current`. See [Section 27.12.7.1, “The `events\_transactions\_current` Table”](#).

`TRUNCATE TABLE` is permitted for the `events_transactions_history` table. It removes the rows.

For more information about the relationship between the three transaction event tables, see [Section 27.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect transaction events, see [Section 27.12.7, “Performance Schema Transaction Tables”](#).

### 27.12.7.3 The `events_transactions_history_long` Table

The `events_transactions_history_long` table contains the *N* most recent transaction events that have ended globally, across all threads. Transaction events are not added to the table until they have ended. When the table becomes full, the oldest row is discarded when a new row is added, regardless of which thread generated either row.

The Performance Schema autosizes the value of *N* is autosized at server startup. To set the table size explicitly, set the `performance_schema_events_transactions_history_long_size` system variable at server startup.

The `events_transactions_history_long` table has the same columns as `events_transactions_current`. See [Section 27.12.7.1, “The `events\_transactions\_current` Table”](#). Unlike `events_transactions_current`, `events_transactions_history_long` has no indexing.

`TRUNCATE TABLE` is permitted for the `events_transactions_history_long` table. It removes the rows.

For more information about the relationship between the three transaction event tables, see [Section 27.9, “Performance Schema Tables for Current and Historical Events”](#).

For information about configuring whether to collect transaction events, see [Section 27.12.7, “Performance Schema Transaction Tables”](#).

## 27.12.8 Performance Schema Connection Tables

When a client connects to the MySQL server, it does so under a particular user name and from a particular host. The Performance Schema provides statistics about these connections, tracking them per account (user and host combination) as well as separately per user name and host name, using these tables:

- `accounts`: Connection statistics per client account
- `hosts`: Connection statistics per client host name
- `users`: Connection statistics per client user name

The meaning of “account” in the connection tables is similar to its meaning in the MySQL grant tables in the `mysql` system database, in the sense that the term refers to a combination of user and host values. They differ in that, for grant tables, the host part of an account can be a pattern, whereas for Performance Schema tables, the host value is always a specific nonpattern host name.

Each connection table has `CURRENT_CONNECTIONS` and `TOTAL_CONNECTIONS` columns to track the current and total number of connections per “tracking value” on which its statistics are based. The tables differ in what they use for the tracking value. The `accounts` table has `USER` and `HOST` columns to track connections per user and host combination. The `users` and `hosts` tables have a `USER` and `HOST` column, respectively, to track connections per user name and host name.

The Performance Schema also counts internal threads and threads for user sessions that failed to authenticate, using rows with `USER` and `HOST` column values of `NULL`.

Suppose that clients named `user1` and `user2` each connect one time from `hosta` and `hostb`. The Performance Schema tracks the connections as follows:

- The `accounts` table has four rows, for the `user1/hosta`, `user1/hostb`, `user2/hosta`, and `user2/hostb` account values, each row counting one connection per account.
- The `hosts` table has two rows, for `hosta` and `hostb`, each row counting two connections per host name.
- The `users` table has two rows, for `user1` and `user2`, each row counting two connections per user name.

When a client connects, the Performance Schema determines which row in each connection table applies, using the tracking value appropriate to each table. If there is no such row, one is added. Then the Performance Schema increments by one the `CURRENT_CONNECTIONS` and `TOTAL_CONNECTIONS` columns in that row.

When a client disconnects, the Performance Schema decrements by one the `CURRENT_CONNECTIONS` column in the row and leaves the `TOTAL_CONNECTIONS` column unchanged.

`TRUNCATE TABLE` is permitted for connection tables. It has these effects:

- Rows are removed for accounts, hosts, or users that have no current connections (rows with `CURRENT_CONNECTIONS = 0`).
- Nonremoved rows are reset to count only current connections: For rows with `CURRENT_CONNECTIONS > 0`, `TOTAL_CONNECTIONS` is reset to `CURRENT_CONNECTIONS`.

- Summary tables that depend on the connection table are implicitly truncated, as described later in this section.

The Performance Schema maintains summary tables that aggregate connection statistics for various event types by account, host, or user. These tables have `_summary_by_account`, `_summary_by_host`, or `_summary_by_user` in the name. To identify them, use this query:

```
mysql> SELECT TABLE_NAME FROM INFORMATION_SCHEMA.TABLES
 WHERE TABLE_SCHEMA = 'performance_schema'
 AND TABLE_NAME REGEXP '_summary_by_(account|host|user)'
 ORDER BY TABLE_NAME;
```

```
+-----+
| TABLE_NAME |
+-----+-----+
| events_errors_summary_by_account_by_error |
| events_errors_summary_by_host_by_error |
| events_errors_summary_by_user_by_error |
| events_stages_summary_by_account_by_event_name |
| events_stages_summary_by_host_by_event_name |
| events_stages_summary_by_user_by_event_name |
| events_statements_summary_by_account_by_event_name |
| events_statements_summary_by_host_by_event_name |
| events_statements_summary_by_user_by_event_name |
| events_transactions_summary_by_account_by_event_name |
| events_transactions_summary_by_host_by_event_name |
| events_transactions_summary_by_user_by_event_name |
| events_waits_summary_by_account_by_event_name |
| events_waits_summary_by_host_by_event_name |
| events_waits_summary_by_user_by_event_name |
| memory_summary_by_account_by_event_name |
| memory_summary_by_host_by_event_name |
| memory_summary_by_user_by_event_name |
+-----+-----+
```

For details about individual connection summary tables, consult the section that describes tables for the summarized event type:

- Wait event summaries: [Section 27.12.20.1, “Wait Event Summary Tables”](#)
- Stage event summaries: [Section 27.12.20.2, “Stage Summary Tables”](#)
- Statement event summaries: [Section 27.12.20.3, “Statement Summary Tables”](#)
- Transaction event summaries: [Section 27.12.20.5, “Transaction Summary Tables”](#)
- Memory event summaries: [Section 27.12.20.10, “Memory Summary Tables”](#)
- Error event summaries: [Section 27.12.20.11, “Error Summary Tables”](#)

`TRUNCATE TABLE` is permitted for connection summary tables. It removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows. In addition, each summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends. The following table describes the relationship between connection table truncation and implicitly truncated tables.

**Table 27.2 Implicit Effects of Connection Table Truncation**

| Truncated Connection Table | Implicitly Truncated Summary Tables                                                                                                   |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <code>accounts</code>      | Tables with names containing<br><code>_summary_by_account</code> ,<br><code>_summary_by_thread</code>                                 |
| <code>hosts</code>         | Tables with names containing<br><code>_summary_by_account</code> , <code>_summary_by_host</code> ,<br><code>_summary_by_thread</code> |

| Truncated Connection Table | Implicitly Truncated Summary Tables                                                                                                   |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <code>users</code>         | Tables with names containing<br><code>_summary_by_account</code> , <code>_summary_by_user</code> ,<br><code>_summary_by_thread</code> |

Truncating a `_summary_global` summary table also implicitly truncates its corresponding connection and thread summary tables. For example, truncating `events_waits_summary_global_by_event_name` implicitly truncates the wait event summary tables that are aggregated by account, host, user, or thread.

### 27.12.8.1 The accounts Table

The `accounts` table contains a row for each account that has connected to the MySQL server. For each account, the table counts the current and total number of connections. The table size is autosized at server startup. To set the table size explicitly, set the `performance_schema_accounts_size` system variable at server startup. To disable account statistics, set this variable to 0.

The `accounts` table has the following columns. For a description of how the Performance Schema maintains rows in this table, including the effect of `TRUNCATE TABLE`, see [Section 27.12.8, “Performance Schema Connection Tables”](#).

- `USER`

The client user name for the connection. This is `NULL` for an internal thread, or for a user session that failed to authenticate.

- `HOST`

The host from which the client connected. This is `NULL` for an internal thread, or for a user session that failed to authenticate.

- `CURRENT_CONNECTIONS`

The current number of connections for the account.

- `TOTAL_CONNECTIONS`

The total number of connections for the account.

The `accounts` table has these indexes:

- Primary key on (`USER`, `HOST`)

### 27.12.8.2 The hosts Table

The `hosts` table contains a row for each host from which clients have connected to the MySQL server. For each host name, the table counts the current and total number of connections. The table size is autosized at server startup. To set the table size explicitly, set the `performance_schema_hosts_size` system variable at server startup. To disable host statistics, set this variable to 0.

The `hosts` table has the following columns. For a description of how the Performance Schema maintains rows in this table, including the effect of `TRUNCATE TABLE`, see [Section 27.12.8, “Performance Schema Connection Tables”](#).

- `HOST`

The host from which the client connected. This is `NULL` for an internal thread, or for a user session that failed to authenticate.

- `CURRENT_CONNECTIONS`

The current number of connections for the host.

- `TOTAL_CONNECTIONS`

The total number of connections for the host.

The `hosts` table has these indexes:

- Primary key on (`HOST`)

### 27.12.8.3 The users Table

The `users` table contains a row for each user who has connected to the MySQL server. For each user name, the table counts the current and total number of connections. The table size is autosized at server startup. To set the table size explicitly, set the `performance_schema_users_size` system variable at server startup. To disable user statistics, set this variable to 0.

The `users` table has the following columns. For a description of how the Performance Schema maintains rows in this table, including the effect of `TRUNCATE TABLE`, see [Section 27.12.8, “Performance Schema Connection Tables”](#).

- `USER`

The client user name for the connection. This is `NULL` for an internal thread, or for a user session that failed to authenticate.

- `CURRENT_CONNECTIONS`

The current number of connections for the user.

- `TOTAL_CONNECTIONS`

The total number of connections for the user.

The `users` table has these indexes:

- Primary key on (`USER`)

## 27.12.9 Performance Schema Connection Attribute Tables

Connection attributes are key-value pairs that application programs can pass to the server at connect time. For applications based on the C API implemented by the `libmysqlclient` client library, the `mysql_options()` and `mysql_options4()` functions define the connection attribute set. Other MySQL Connectors may provide their own attribute-definition methods.

These Performance Schema tables expose attribute information:

- `session_account_connect_attrs`: Connection attributes for the current session, and other sessions associated with the session account
- `session_connect_attrs`: Connection attributes for all sessions

In addition, connect events written to the audit log may include connection attributes. See [Section 6.4.5.4, “Audit Log File Formats”](#).

Attribute names that begin with an underscore (`_`) are reserved for internal use and should not be created by application programs. This convention permits new attributes to be introduced by MySQL without colliding with application attributes, and enables application programs to define their own attributes that do not collide with internal attributes.

- [Available Connection Attributes](#)

- [Connection Attribute Limits](#)

## Available Connection Attributes

The set of connection attributes visible within a given connection varies depending on factors such as your platform, MySQL Connector used to establish the connection, or client program.

The `libmysqlclient` client library sets these attributes:

- `_client_name`: The client name (`libmysql` for the client library).
- `_client_version`: The client library version.
- `_os`: The operating system (for example, `Linux`, `Win64`).
- `_pid`: The client process ID.
- `_platform`: The machine platform (for example, `x86_64`).
- `_thread`: The client thread ID (Windows only).

Other MySQL Connectors may define their own connection attributes.

MySQL Connector/C++ 8.0.16 and higher defines these attributes for applications that use X DevAPI or X DevAPI for C:

- `_client_license`: The connector license (for example `GPL-2.0`).
- `_client_name`: The connector name (`mysql-connector-cpp`).
- `_client_version`: The connector version.
- `_os`: The operating system (for example, `Linux`, `Win64`).
- `_pid`: The client process ID.
- `_platform`: The machine platform (for example, `x86_64`).
- `_source_host`: The host name of the machine on which the client is running.
- `_thread`: The client thread ID (Windows only).

MySQL Connector/J defines these attributes:

- `_client_name`: The client name
- `_client_version`: The client library version
- `_os`: The operating system (for example, `Linux`, `Win64`)
- `_client_license`: The connector license type
- `_platform`: The machine platform (for example, `x86_64`)
- `_runtime_vendor`: The Java runtime environment (JRE) vendor
- `_runtime_version`: The Java runtime environment (JRE) version

MySQL Connector/NET defines these attributes:

- `_client_version`: The client library version.
- `_os`: The operating system (for example, `Linux`, `Win64`).

- `_pid`: The client process ID.
- `_platform`: The machine platform (for example, `x86_64`).
- `_program_name`: The client name.
- `_thread`: The client thread ID (Windows only).

PHP defines attributes that depend on how it was compiled:

- Compiled using `libmysqlclient`: The standard `libmysqlclient` attributes, described previously.
- Compiled using `mysqlnd`: Only the `_client_name` attribute, with a value of `mysqlnd`.

Many MySQL client programs set a `program_name` attribute with a value equal to the client name. For example, `mysqladmin` and `mysqldump` set `program_name` to `mysqladmin` and `mysqldump`, respectively. MySQL Shell sets `program_name` to `mysqlsh`.

Some MySQL client programs define additional attributes:

- `mysql` (as of MySQL 8.0.17):
  - `os_user`: The name of the operating system user running the program. Available on Unix and Unix-like systems and Windows.
  - `os_sudouser`: The value of the `SUDO_USER` environment variable. Available on Unix and Unix-like systems.

`mysql` connection attributes for which the value is empty are not sent.

- `mysqlbinlog`:
  - `_client_role`: `binary_log_listener`
- Replica connections:
  - `program_name`: `mysqld`
  - `_client_role`: `binary_log_listener`
  - `_client_replication_channel_name`: The channel name.
- `FEDERATED` storage engine connections:
  - `program_name`: `mysqld`
  - `_client_role`: `federated_storage`

## Connection Attribute Limits

There are limits on the amount of connection attribute data transmitted from client to server:

- A fixed limit imposed by the client prior to connect time.
- A fixed limit imposed by the server at connect time.
- A configurable limit imposed by the Performance Schema at connect time.

For connections initiated using the C API, the `libmysqlclient` library imposes a limit of 64KB on the aggregate size of connection attribute data on the client side: Calls to `mysql_options()` that cause this limit to be exceeded produce a `CR_INVALID_PARAMETER_NO` error. Other MySQL Connectors

may impose their own client-side limits on how much connection attribute data can be transmitted to the server.

On the server side, these size checks on connection attribute data occur:

- The server imposes a limit of 64KB on the aggregate size of connection attribute data it accepts. If a client attempts to send more than 64KB of attribute data, the server rejects the connection. Otherwise, the server considers the attribute buffer valid and tracks the size of the longest such buffer in the `Performance_schema_session_connect_attrs_longest_seen` status variable.
- For accepted connections, the Performance Schema checks aggregate attribute size against the value of the `performance_schema_session_connect_attrs_size` system variable. If attribute size exceeds this value, these actions take place:
  - The Performance Schema truncates the attribute data and increments the `Performance_schema_session_connect_attrs_lost` status variable, which indicates the number of connections for which attribute truncation occurred.
  - The Performance Schema writes a message to the error log if the `log_error_verbosity` system variable is greater than 1:

```
Connection attributes of length N were truncated
(N bytes lost)
for connection N, user user_name@host_name
(as user_name), auth: {yes|no}
```

The information in the warning message is intended to help DBAs identify clients for which attribute truncation occurred.

- A `_truncated` attribute is added to the session attributes with a value indicating how many bytes were lost, if the attribute buffer has sufficient space. This enables the Performance Schema to expose per-connection truncation information in the connection attribute tables. This information can be examined without having to check the error log.

### 27.12.9.1 The `session_account_connect_attrs` Table

Application programs can provide key-value connection attributes to be passed to the server at connect time. For descriptions of common attributes, see [Section 27.12.9, “Performance Schema Connection Attribute Tables”](#).

The `session_account_connect_attrs` table contains connection attributes only for the current session, and other sessions associated with the session account. To see connection attributes for all sessions, use the `session_connect_attrs` table.

The `session_account_connect_attrs` table has these columns:

- `PROCESSLIST_ID`

The connection identifier for the session.

- `ATTR_NAME`

The attribute name.

- `ATTR_VALUE`

The attribute value.

- `ORDINAL_POSITION`

The order in which the attribute was added to the set of connection attributes.

The `session_account_connect_attrs` table has these indexes:

- Primary key on (`PROCESSLIST_ID`, `ATTR_NAME`)

`TRUNCATE TABLE` is not permitted for the `session_account_connect_attrs` table.

### 27.12.9.2 The `session_connect_attrs` Table

Application programs can provide key-value connection attributes to be passed to the server at connect time. For descriptions of common attributes, see [Section 27.12.9, “Performance Schema Connection Attribute Tables”](#).

The `session_connect_attrs` table contains connection attributes for all sessions. To see connection attributes only for the current session, and other sessions associated with the session account, use the `session_account_connect_attrs` table.

The `session_connect_attrs` table has these columns:

- `PROCESSLIST_ID`

The connection identifier for the session.

- `ATTR_NAME`

The attribute name.

- `ATTR_VALUE`

The attribute value.

- `ORDINAL_POSITION`

The order in which the attribute was added to the set of connection attributes.

The `session_connect_attrs` table has these indexes:

- Primary key on (`PROCESSLIST_ID`, `ATTR_NAME`)

`TRUNCATE TABLE` is not permitted for the `session_connect_attrs` table.

## 27.12.10 Performance Schema User-Defined Variable Tables

The Performance Schema provides a `user_variables_by_thread` table that exposes user-defined variables. These are variables defined within a specific session and include a `@` character preceding the name; see [Section 9.4, “User-Defined Variables”](#).

The `user_variables_by_thread` table has these columns:

- `THREAD_ID`

The thread identifier of the session in which the variable is defined.

- `VARIABLE_NAME`

The variable name, without the leading `@` character.

- `VARIABLE_VALUE`

The variable value.

The `user_variables_by_thread` table has these indexes:

- Primary key on (`THREAD_ID`, `VARIABLE_NAME`)

`TRUNCATE TABLE` is not permitted for the `user_variables_by_thread` table.

## 27.12.11 Performance Schema Replication Tables

The Performance Schema provides tables that expose replication information. This is similar to the information available from the `SHOW REPLICATION | SLAVE STATUS` statement, but representation in table form is more accessible and has usability benefits:

- `SHOW REPLICATION | SLAVE STATUS` output is useful for visual inspection, but not so much for programmatic use. By contrast, using the Performance Schema tables, information about replica status can be searched using general `SELECT` queries, including complex `WHERE` conditions, joins, and so forth.
- Query results can be saved in tables for further analysis, or assigned to variables and thus used in stored procedures.
- The replication tables provide better diagnostic information. For multithreaded replica operation, `SHOW REPLICATION | SLAVE STATUS` reports all coordinator and worker thread errors using the `Last_SQL_Errno` and `Last_SQL_Error` fields, so only the most recent of those errors is visible and information can be lost. The replication tables store errors on a per-thread basis without loss of information.
- The last seen transaction is visible in the replication tables on a per-worker basis. This is information not available from `SHOW REPLICATION | SLAVE STATUS`.
- Developers familiar with the Performance Schema interface can extend the replication tables to provide additional information by adding rows to the tables.

### Replication Table Descriptions

The Performance Schema provides the following replication-related tables:

- Tables that contain information about the connection of the replica to the source:
  - `replication_connection_configuration`: Configuration parameters for connecting to the source
  - `replication_connection_status`: Current status of the connection to the source
  - `replication_asynchronous_connection_failover`: Source lists for the asynchronous connection failover mechanism
- Tables that contain general (not thread-specific) information about the transaction applier:
  - `replication_applier_configuration`: Configuration parameters for the transaction applier on the replica.
  - `replication_applier_status`: Current status of the transaction applier on the replica.
- Tables that contain information about specific threads responsible for applying transactions received from the source:
  - `replication_applier_status_by_coordinator`: Status of the coordinator thread (empty unless the replica is multithreaded).
  - `replication_applier_status_by_worker`: Status of the applier thread or worker threads if the replica is multithreaded.
- Tables that contain information about channel based replication filters:
  - `replication_applier_filters`: Provides information about the replication filters configured on specific replication channels.

- `replication_applier_global_filters`: Provides information about global replication filters, which apply to all replication channels.
- Tables that contain information about Group Replication members:
  - `replication_group_members`: Provides network and status information for group members.
  - `replication_group_member_stats`: Provides statistical information about group members and transactions in which they participate.

For more information see [Section 18.4, “Monitoring Group Replication”](#).

The following Performance Schema replication tables continue to be populated when the Performance Schema is disabled:

- `replication_connection_configuration`
- `replication_connection_status`
- `replication_asynchronous_connection_failover`
- `replication_applier_configuration`
- `replication_applier_status`
- `replication_applier_status_by_coordinator`
- `replication_applier_status_by_worker`

The exception is local timing information (start and end timestamps for transactions) in the replication tables `replication_connection_status`, `replication_applier_status_by_coordinator`, and `replication_applier_status_by_worker`. This information is not collected when the Performance Schema is disabled.

The following sections describe each replication table in more detail, including the correspondence between the columns produced by `SHOW REPLICATION | SLAVE STATUS` and the replication table columns in which the same information appears.

The remainder of this introduction to the replication tables describes how the Performance Schema populates them and which fields from `SHOW REPLICATION | SLAVE STATUS` are not represented in the tables.

## Replication Table Life Cycle

The Performance Schema populates the replication tables as follows:

- Prior to execution of `CHANGE REPLICATION SOURCE TO | CHANGE MASTER TO`, the tables are empty.
- After `CHANGE REPLICATION SOURCE TO | CHANGE MASTER TO`, the configuration parameters can be seen in the tables. At this time, there are no active replication threads, so the `THREAD_ID` columns are `NULL` and the `SERVICE_STATE` columns have a value of `OFF`.
- After `START REPLICATION | SLAVE`, non-`NULL` `THREAD_ID` values can be seen. Threads that are idle or active have a `SERVICE_STATE` value of `ON`. The thread that connects to the source has a value of `CONNECTING` while it establishes the connection, and `ON` thereafter as long as the connection lasts.
- After `STOP REPLICATION | SLAVE`, the `THREAD_ID` columns become `NULL` and the `SERVICE_STATE` columns for threads that no longer exist have a value of `OFF`.
- The tables are preserved after `STOP REPLICATION | SLAVE` or threads stopping due to an error.

- The `replication_applier_status_by_worker` table is nonempty only when the replica is operating in multithreaded mode. That is, if the `slave_parallel_workers` system variable is greater than 0, this table is populated when `START REPLICA | SLAVE` is executed, and the number of rows shows the number of workers.

## Replica Status Information Not In the Replication Tables

The information in the Performance Schema replication tables differs somewhat from the information available from `SHOW REPLICA | SLAVE STATUS` because the tables are oriented toward use of global transaction identifiers (GTIDs), not file names and positions, and they represent server UUID values, not server ID values. Due to these differences, several `SHOW REPLICA | SLAVE STATUS` columns are not preserved in the Performance Schema replication tables, or are represented a different way:

- The following fields refer to file names and positions and are not preserved:

```
Master_Log_File
Read_Master_Log_Pos
Relay_Log_File
Relay_Log_Pos
Relay_Master_Log_File
Exec_Master_Log_Pos
Until_Condition
Until_Log_File
Until_Log_Pos
```

- The `Master_Info_File` field is not preserved. It refers to the `master.info` file used for the replica's source metadata repository, which has been superseded by the use of crash-safe tables for the repository.
- The following fields are based on `server_id`, not `server_uuid`, and are not preserved:

```
Master_Server_Id
Replicate_Ignore_Server_Ids
```

- The `Skip_Counter` field is based on event counts, not GTIDs, and is not preserved.
- These error fields are aliases for `Last_SQL_Errno` and `Last_SQL_Error`, so they are not preserved:

```
Last_Errno
Last_Error
```

In the Performance Schema, this error information is available in the `LAST_ERROR_NUMBER` and `LAST_ERROR_MESSAGE` columns of the `replication_applier_status_by_worker` table (and `replication_applier_status_by_coordinator` if the replica is multithreaded). Those tables provide more specific per-thread error information than is available from `Last_Errno` and `Last_Error`.

- Fields that provide information about command-line filtering options is not preserved:

```
Replicate_Do_DB
Replicate_Ignore_DB
Replicate_Do_Table
Replicate_Ignore_Table
Replicate_Wild_Do_Table
Replicate_Wild_Ignore_Table
```

- The `Replica_IO_State` and `Replica_SQL_Running_State` fields are not preserved. If needed, these values can be obtained from the process list by using the `THREAD_ID` column of the appropriate replication table and joining it with the `ID` column in the `INFORMATION_SCHEMA.PROCESSLIST` table to select the `STATE` column of the latter table.
- The `Executed_Gtid_Set` field can show a large set with a great deal of text. Instead, the Performance Schema tables show GTIDs of transactions that are currently being applied by

the replica. Alternatively, the set of executed GTIDs can be obtained from the value of the `gtid_executed` system variable.

- The `Seconds_Behind_Master` and `Relay_Log_Space` fields are in to-be-decided status and are not preserved.

## Replication Channels

The first column of the replication Performance Schema tables is `CHANNEL_NAME`. This enables the tables to be viewed per replication channel. In a non-multisource replication setup there is a single default replication channel. When you are using multiple replication channels on a replica, you can filter the tables per replication channel to monitor a specific replication channel. See [Section 17.2.2, “Replication Channels”](#) and [Section 17.1.5.8, “Monitoring Multi-Source Replication”](#) for more information.

### 27.12.11.1 The `replication_connection_configuration` Table

This table shows the configuration parameters used by the replica for connecting to the source. Parameters stored in the table can be changed at runtime with the `CHANGE REPLICATION SOURCE TO` statement (from MySQL 8.0.23) or `CHANGE MASTER TO` statement (before MySQL 8.0.23).

Compared to the `replication_connection_status` table, `replication_connection_configuration` changes less frequently. It contains values that define how the replica connects to the source and that remain constant during the connection, whereas `replication_connection_status` contains values that change during the connection.

The `replication_connection_configuration` table has the following columns. The column descriptions indicate the corresponding `CHANGE REPLICATION SOURCE TO` | `CHANGE MASTER TO` options from which the column values are taken, and the table given later in this section shows the correspondence between `replication_connection_configuration` columns and `SHOW REPLICA | SLAVE STATUS` columns.

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 17.2.2, “Replication Channels”](#) for more information. (`CHANGE REPLICATION SOURCE TO` option: `FOR CHANNEL`, `CHANGE MASTER TO` option: `FOR CHANNEL`)

- `HOST`

The host name of the source that the replica is connected to. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_HOST`, `CHANGE MASTER TO` option: `MASTER_HOST`)

- `PORT`

The port used to connect to the source. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_PORT`, `CHANGE MASTER TO` option: `MASTER_PORT`)

- `USER`

The user name of the replication user account used to connect to the source. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_USER`, `CHANGE MASTER TO` option: `MASTER_USER`)

- `NETWORK_INTERFACE`

The network interface that the replica is bound to, if any. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_BIND`, `CHANGE MASTER TO` option: `MASTER_BIND`)

- `AUTO_POSITION`

1 if GTID auto-positioning is in use; otherwise 0. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_AUTO_POSITION`, `CHANGE MASTER TO` option: `MASTER_AUTO_POSITION`)

- `SSL_ALLOWED`, `SSL_CA_FILE`, `SSL_CA_PATH`, `SSL_CERTIFICATE`, `SSL_CIPHER`, `SSL_KEY`, `SSL_VERIFY_SERVER_CERTIFICATE`, `SSL_CRL_FILE`, `SSL_CRL_PATH`

These columns show the SSL parameters used by the replica to connect to the source, if any.

`SSL_ALLOWED` has these values:

- `Yes` if an SSL connection to the source is permitted
- `No` if an SSL connection to the source is not permitted
- `Ignored` if an SSL connection is permitted but the replica does not have SSL support enabled

(`CHANGE REPLICATION SOURCE TO` options for the other SSL columns: `SOURCE_SSL_CA`, `SOURCE_SSL_CAPATH`, `SOURCE_SSL_CERT`, `SOURCE_SSL_CIPHER`, `SOURCE_SSL_CRL`, `SOURCE_SSL_CRLPATH`, `SOURCE_SSL_KEY`, `SOURCE_SSL_VERIFY_SERVER_CERT`.)

`CHANGE MASTER TO` options for the other SSL columns: `MASTER_SSL_CA`, `MASTER_SSL_CAPATH`, `MASTER_SSL_CERT`, `MASTER_SSL_CIPHER`, `MASTER_SSL_CRL`, `MASTER_SSL_CRLPATH`, `MASTER_SSL_KEY`, `MASTER_SSL_VERIFY_SERVER_CERT`.

- `CONNECTION_RETRY_INTERVAL`

The number of seconds between connect retries. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_CONNECT_RETRY`, `CHANGE MASTER TO` option: `MASTER_CONNECT_RETRY`)

- `CONNECTION_RETRY_COUNT`

The number of times the replica can attempt to reconnect to the source in the event of a lost connection. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_RETRY_COUNT`, `CHANGE MASTER TO` option: `MASTER_RETRY_COUNT`)

- `HEARTBEAT_INTERVAL`

The replication heartbeat interval on a replica, measured in seconds. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_HEARTBEAT_PERIOD`, `CHANGE MASTER TO` option: `MASTER_HEARTBEAT_PERIOD`)

- `TLS_VERSION`

The list of TLS protocol versions that are permitted by the replica for the replication connection. For TLS version information, see [Section 6.3.2, “Encrypted Connection TLS Protocols and Ciphers”](#). (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_TLS_VERSION`, `CHANGE MASTER TO` option: `MASTER_TLS_VERSION`)

- `TLS_CIPHERSUITES`

The list of ciphersuites that are permitted by the replica for the replication connection. For TLS ciphersuite information, see [Section 6.3.2, “Encrypted Connection TLS Protocols and Ciphers”](#). (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_TLS_CIPHERSUITES`, `CHANGE MASTER TO` option: `MASTER_TLS_CIPHERSUITES`)

- `PUBLIC_KEY_PATH`

The path name to a file containing a replica-side copy of the public key required by the source for RSA key pair-based password exchange. The file must be in PEM format. This column applies to replicas that authenticate with the `sha256_password` or `caching_sha2_password` authentication plugin. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_PUBLIC_KEY_PATH`, `CHANGE MASTER TO` option: `MASTER_PUBLIC_KEY_PATH`)

If `PUBLIC_KEY_PATH` is given and specifies a valid public key file, it takes precedence over `GET_PUBLIC_KEY`.

- `GET_PUBLIC_KEY`

Whether to request from the source the public key required for RSA key pair-based password exchange. This column applies to replicas that authenticate with the `caching_sha2_password` authentication plugin. For that plugin, the source does not send the public key unless requested. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_GET_PUBLIC_KEY`, `CHANGE MASTER TO` option: `MASTER_GET_PUBLIC_KEY`)

If `PUBLIC_KEY_PATH` is given and specifies a valid public key file, it takes precedence over `GET_PUBLIC_KEY`.

- `NETWORK_NAMESPACE`

The network namespace name; empty if the connection uses the default (global) namespace. For information about network namespaces, see [Section 5.1.14, “Network Namespace Support”](#). This column was added in MySQL 8.0.22.

- `COMPRESSION_ALGORITHMS`

The permitted compression algorithms for connections to the source. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_COMPRESSION_ALGORITHMS`, `CHANGE MASTER TO` option: `MASTER_COMPRESSION_ALGORITHMS`)

For more information, see [Section 4.2.8, “Connection Compression Control”](#).

This column was added in MySQL 8.0.18.

- `ZSTD_COMPRESSION_LEVEL`

The compression level to use for connections to the source that use the `zstd` compression algorithm. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_ZSTD_COMPRESSION_LEVEL`, `CHANGE MASTER TO` option: `MASTER_ZSTD_COMPRESSION_LEVEL`)

For more information, see [Section 4.2.8, “Connection Compression Control”](#).

This column was added in MySQL 8.0.18.

- `SOURCE_CONNECTION_AUTO_FAILOVER`

Whether the asynchronous connection failover mechanism is activated for this replication channel. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_CONNECTION_AUTO_FAILOVER`, `CHANGE MASTER TO` option: `SOURCE_CONNECTION_AUTO_FAILOVER`)

This column was added in MySQL 8.0.22.

The `replication_connection_configuration` table has these indexes:

- Primary key on (`CHANNEL_NAME`)

`TRUNCATE TABLE` is not permitted for the `replication_connection_configuration` table.

The following table shows the correspondence between `replication_connection_configuration` columns and `SHOW REPLICA | SLAVE STATUS` columns.

| <code>replication_connection_configuration</code> Column | <code>SHOW REPLICA   SLAVE STATUS</code> Column |
|----------------------------------------------------------|-------------------------------------------------|
| <code>CHANNEL_NAME</code>                                | <code>Channel_name</code>                       |
| <code>HOST</code>                                        | <code>Source_Host</code>                        |
| <code>PORT</code>                                        | <code>Source_Port</code>                        |

| <code>replication_connection_configuration</code> Column | SHOW REPLICA   SLAVE STATUS Column         |
|----------------------------------------------------------|--------------------------------------------|
| <code>USER</code>                                        | <code>Source_User</code>                   |
| <code>NETWORK_INTERFACE</code>                           | <code>Source_Bind</code>                   |
| <code>AUTO_POSITION</code>                               | <code>Auto_Position</code>                 |
| <code>SSL_ALLOWED</code>                                 | <code>Source_SSL_Allowed</code>            |
| <code>SSL_CA_FILE</code>                                 | <code>Source_SSL_CA_File</code>            |
| <code>SSL_CA_PATH</code>                                 | <code>Source_SSL_CA_Path</code>            |
| <code>SSL_CERTIFICATE</code>                             | <code>Source_SSL_Cert</code>               |
| <code>SSL_CIPHER</code>                                  | <code>Source_SSL_Cipher</code>             |
| <code>SSL_KEY</code>                                     | <code>Source_SSL_Key</code>                |
| <code>SSL_VERIFY_SERVER_CERTIFICATE</code>               | <code>Source_SSL_Verify_Server_Cert</code> |
| <code>SSL_CRL_FILE</code>                                | <code>Source_SSL_Crl</code>                |
| <code>SSL_CRL_PATH</code>                                | <code>Source_SSL_Crlpath</code>            |
| <code>CONNECTION_RETRY_INTERVAL</code>                   | <code>Source_Connect_Retry</code>          |
| <code>CONNECTION_RETRY_COUNT</code>                      | <code>Source_Retry_Count</code>            |
| <code>HEARTBEAT_INTERVAL</code>                          | <code>None</code>                          |
| <code>TLS_VERSION</code>                                 | <code>Source_TLS_Version</code>            |
| <code>PUBLIC_KEY_PATH</code>                             | <code>Source_public_key_path</code>        |
| <code>GET_PUBLIC_KEY</code>                              | <code>Get_source_public_key</code>         |
| <code>NETWORK_NAMESPACE</code>                           | <code>Network_Namespace</code>             |
| <code>COMPRESSION_ALGORITHMS</code>                      | <code>[None]</code>                        |
| <code>ZSTD_COMPRESSION_LEVEL</code>                      | <code>[None]</code>                        |

### 27.12.11.2 The `replication_connection_status` Table

This table shows the current status of the I/O thread that handles the replica's connection to the source, information on the last transaction queued in the relay log, and information on the transaction currently being queued in the relay log.

Compared to the `replication_connection_configuration` table, `replication_connection_status` changes more frequently. It contains values that change during the connection, whereas `replication_connection_configuration` contains values which define how the replica connects to the source and that remain constant during the connection.

The `replication_connection_status` table has these columns:

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 17.2.2, “Replication Channels”](#) for more information.

- `GROUP_NAME`

If this server is a member of a group, shows the name of the group the server belongs to.

- `SOURCE_UUID`

The `server_uuid` value from the source.

- `THREAD_ID`

The I/O thread ID.

- `SERVICE_STATE`

`ON` (thread exists and is active or idle), `OFF` (thread no longer exists), or `CONNECTING` (thread exists and is connecting to the source).

- `RECEIVED_TRANSACTION_SET`

The set of global transaction IDs (GTIDs) corresponding to all transactions received by this replica. Empty if GTIDs are not in use. See [GTID Sets](#) for more information.

- `LAST_ERROR_NUMBER`, `LAST_ERROR_MESSAGE`

The error number and error message of the most recent error that caused the I/O thread to stop. An error number of 0 and message of the empty string mean “no error.” If the `LAST_ERROR_MESSAGE` value is not empty, the error values also appear in the replica's error log.

Issuing `RESET MASTER` or `RESET REPLICA | SLAVE` resets the values shown in these columns.

- `LAST_ERROR_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the most recent I/O error took place.

- `LAST_HEARTBEAT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the most recent heartbeat signal was received by a replica.

- `COUNT_RECEIVED_HEARTBEATS`

The total number of heartbeat signals that a replica received since the last time it was restarted or reset, or a `CHANGE REPLICATION SOURCE TO | CHANGE MASTER TO` statement was issued.

- `LAST_QUEUED_TRANSACTION`

The global transaction ID (GTID) of the last transaction that was queued to the relay log.

- `LAST_QUEUED_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the last transaction queued in the relay log was committed on the original source.

- `LAST_QUEUED_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the last transaction queued in the relay log was committed on the immediate source.

- `LAST_QUEUED_TRANSACTION_START_QUEUE_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the last transaction was placed in the relay log queue by this I/O thread.

- `LAST_QUEUED_TRANSACTION_END_QUEUE_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the last transaction was queued to the relay log files.

- `QUEUEING_TRANSACTION`

The global transaction ID (GTID) of the currently queueing transaction in the relay log.

- `QUEUEING_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the currently queueing transaction was committed on the original source.

- `QUEUEING_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the currently queueing transaction was committed on the immediate source.

- `QUEUEING_TRANSACTION_START_QUEUE_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the first event of the currently queueing transaction was written to the relay log by this I/O thread.

When the Performance Schema is disabled, local timing information is not collected, so the fields showing the start and end timestamps for queued transactions are zero.

The `replication_connection_status` table has these indexes:

- Primary key on (`CHANNEL_NAME`)
- Index on (`THREAD_ID`)

The following table shows the correspondence between `replication_connection_status` columns and `SHOW REPLICA | SLAVE STATUS` columns.

| <code>replication_connection_status</code> Column | <code>SHOW REPLICA   SLAVE STATUS</code> Column |
|---------------------------------------------------|-------------------------------------------------|
| <code>SOURCE_UUID</code>                          | <code>Master_UUID</code>                        |
| <code>THREAD_ID</code>                            | <code>None</code>                               |
| <code>SERVICE_STATE</code>                        | <code>Replica_IO_Running</code>                 |
| <code>RECEIVED_TRANSACTION_SET</code>             | <code>Retrieved_Gtid_Set</code>                 |
| <code>LAST_ERROR_NUMBER</code>                    | <code>Last_IO_Errno</code>                      |
| <code>LAST_ERROR_MESSAGE</code>                   | <code>Last_IO_Error</code>                      |
| <code>LAST_ERROR_TIMESTAMP</code>                 | <code>Last_IO_Error_Timestamp</code>            |

### 27.12.11.3 The `replication_asynchronous_connection_failover` Table

This table holds the replica's source lists for each replication channel for the asynchronous connection failover mechanism. The asynchronous connection failover mechanism automatically establishes an asynchronous (source to replica) replication connection to a new source from the appropriate list after the existing connection from the replica to its source fails. You set and manage source lists using the `asynchronous_connection_failover_add_source` and `asynchronous_connection_failover_delete_source` functions to add and remove replication source servers from the source list for a replication channel. To add and remove managed groups of servers, use the `asynchronous_connection_failover_add_managed` and `asynchronous_connection_failover_delete_managed` functions instead. For more information, see [Section 17.4.9, "Switching Sources with Asynchronous Connection Failover"](#).

The `replication_asynchronous_connection_failover` table has these columns:

- `CHANNEL_NAME`

The replication channel for which this replication source server is part of the source list. If this channel's connection to its current source fails, this replication source server is one of its potential new sources.

- `HOST`

The host name for this replication source server.

- `PORT`

The port number for this replication source server.

- `NETWORK_NAMESPACE`

The network namespace for this replication source server. If this value is empty, connections use the default (global) namespace.

- `WEIGHT`

The priority of this replication source server in the replication channel's source list. The weight is from 1 to 100, with 100 being the highest, and 50 being the default. When the asynchronous connection failover mechanism activates, the source with the highest weight setting among the alternative sources listed in the source list for the channel is chosen for the first connection attempt. If this attempt does not work, the replica tries with all the listed sources in descending order of weight, then starts again from the highest weighted source. If multiple sources have the same weight, the replica orders them randomly.

- `MANAGED_NAME`

The identifier for the managed group that the server is a part of. For the `GroupReplication` managed service, the identifier is the value of the `group_replication_group_name` system variable.

The `replication_asynchronous_connection_failover` table has these indexes:

- Primary key on (`CHANNEL_NAME`, `HOST`, `PORT`, `NETWORK_NAMESPACE`, `MANAGED_NAME`)

`TRUNCATE TABLE` is not permitted for the `replication_asynchronous_connection_failover` table.

#### 27.12.11.4 The `replication_asynchronous_connection_failover_managed` Table

This table holds configuration information used by the replica's asynchronous connection failover mechanism to handle managed groups, including Group Replication topologies.

When you add a group member to the source list and define it as part of a managed group, the asynchronous connection failover mechanism updates the source list to keep it in line with membership changes, adding and removing group members automatically as they join or leave. The asynchronous connection failover mechanism fails over the connection if another available server on the source list has a higher priority (weight) setting. For a managed group, a source's weight is assigned depending on whether it is a primary or a secondary server. So assuming that you set up the managed group to give a higher weight to a primary and a lower weight to a secondary, when the primary changes, the higher weight is assigned to the new primary, so the replica changes over the connection to it. The asynchronous connection failover mechanism additionally changes connection if the currently connected managed source server leaves the managed group, or is no longer in the majority in the managed group. For more information, see [Section 17.4.9, “Switching Sources with Asynchronous Connection Failover”](#).

The `replication_asynchronous_connection_failover_managed` table has these columns:

- `CHANNEL_NAME`

The replication channel where the servers for this managed group operate.

- `MANAGED_NAME`

The identifier for the managed group. For the `GroupReplication` managed service, the identifier is the value of the `group_replication_group_name` system variable.

- `MANAGED_TYPE`

The type of managed service that the asynchronous connection failover mechanism provides for this group. The only value currently available is `GroupReplication`.

- `CONFIGURATION`

The configuration information for this managed group. For the `GroupReplication` managed service, the configuration shows the weights assigned to the group's primary server and to the group's secondary servers.

The `replication_asynchronous_connection_failover_managed` table has these indexes:

- Primary key on (`CHANNEL_NAME`, `MANAGED_NAME`)

`TRUNCATE TABLE` is not permitted for the `replication_asynchronous_connection_failover_managed` table.

### 27.12.11.5 The `replication_applier_configuration` Table

This table shows the configuration parameters that affect transactions applied by the replica. Parameters stored in the table can be changed at runtime with the `CHANGE REPLICATION SOURCE TO` statement (from MySQL 8.0.23) or `CHANGE MASTER TO` statement (before MySQL 8.0.23).

The `replication_applier_configuration` table has these columns:

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 17.2.2, “Replication Channels”](#) for more information.

- `DESIRED_DELAY`

The number of seconds that the replica must lag the source. (`CHANGE REPLICATION SOURCE TO` option: `SOURCE_DELAY`, `CHANGE MASTER TO` option: `MASTER_DELAY`) See [Section 17.4.11, “Delayed Replication”](#) for more information.

- `PRIVILEGE_CHECKS_USER`

The user account that provides the security context for the channel (`CHANGE REPLICATION SOURCE TO` option: `PRIVILEGE_CHECKS_USER`, `CHANGE MASTER TO` option: `PRIVILEGE_CHECKS_USER`). This is escaped so that it can be copied into an SQL statement to execute individual transactions. See [Section 17.3.3, “Replication Privilege Checks”](#) for more information.

- `REQUIRE_ROW_FORMAT`

Whether the channel accepts only row-based events (`CHANGE REPLICATION SOURCE TO` option: `REQUIRE_ROW_FORMAT`, `CHANGE MASTER TO` option: `REQUIRE_ROW_FORMAT`). See [Section 17.3.3, “Replication Privilege Checks”](#) for more information.

- `REQUIRE_TABLE_PRIMARY_KEY_CHECK`

Whether the channel requires primary keys always, never, or according to the source's setting (`CHANGE REPLICATION SOURCE TO` option: `REQUIRE_TABLE_PRIMARY_KEY_CHECK`, `CHANGE MASTER TO` option: `REQUIRE_TABLE_PRIMARY_KEY_CHECK`). See [Section 17.3.3, “Replication Privilege Checks”](#) for more information.

- `ASSIGN_GTIDS_TO_ANONYMOUS_TRANSACTIONS_TYPE`

Whether the channel assigns a GTID to replicated transactions that do not already have one (`CHANGE REPLICATION SOURCE TO` option: `ASSIGN_GTIDS_TO_ANONYMOUS_TRANSACTIONS`, `CHANGE MASTER TO` option: `ASSIGN_GTIDS_TO_ANONYMOUS_TRANSACTIONS`). `OFF` means no

GTIDs are assigned. `LOCAL` means a GTID is assigned that includes the replica's own UUID (the `server_uuid` setting). `MANUAL` means a GTID is assigned that includes a manually set UUID. See [Section 17.1.3.6, “Replication From a Source Without GTIDs to a Replica With GTIDs”](#) for more information.

- `ASSIGN_GTIDS_TO_ANONYMOUS_TRANSACTIONS_VALUE`

The UUID that is used as part of the GTIDs assigned to anonymous transactions (`CHANGE REPLICATION SOURCE TO` option: `ASSIGN_GTIDS_TO_ANONYMOUS_TRANSACTIONS`, `CHANGE MASTER TO` option: `ASSIGN_GTIDS_TO_ANONYMOUS_TRANSACTIONS`). See [Section 17.1.3.6, “Replication From a Source Without GTIDs to a Replica With GTIDs”](#) for more information.

The `replication_applier_configuration` table has these indexes:

- Primary key on (`CHANNEL_NAME`)

`TRUNCATE TABLE` is not permitted for the `replication_applier_configuration` table.

The following table shows the correspondence between `replication_applier_configuration` columns and `SHOW REPLICATION | SLAVE STATUS` columns.

| <code>replication_applier_configuration</code><br>Column | <code>SHOW REPLICATION   SLAVE STATUS</code> Column |
|----------------------------------------------------------|-----------------------------------------------------|
| <code>DESIRED_DELAY</code>                               | <code>SQL_Delay</code>                              |

### 27.12.11.6 The `replication_applier_status` Table

This table shows the current general transaction execution status on the replica. The table provides information about general aspects of transaction applier status that are not specific to any thread involved. Thread-specific status information is available in the `replication_applier_status_by_coordinator` table (and `replication_applier_status_by_worker` if the replica is multithreaded).

The `replication_applier_status` table has these columns:

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 17.2.2, “Replication Channels”](#) for more information.

- `SERVICE_STATE`

Shows `ON` when the replication channel's applier threads are active or idle, `OFF` means that the applier threads are not active.

- `REMAINING_DELAY`

If the replica is waiting for `DESIRED_DELAY` seconds to pass since the source applied a transaction, this field contains the number of delay seconds remaining. At other times, this field is `NULL`. (The `DESIRED_DELAY` value is stored in the `replication_applier_configuration` table.) See [Section 17.4.11, “Delayed Replication”](#) for more information.

- `COUNT_TRANSACTIONS_RETRIES`

Shows the number of retries that were made because the replication SQL thread failed to apply a transaction. The maximum number of retries for a given transaction is set by the `slave_transaction_retries` system variable. The `replication_applier_status_by_worker` table shows detailed information on transaction retries for a single-threaded or multithreaded replica.

The `replication_applier_status` table has these indexes:

- Primary key on ([CHANNEL\\_NAME](#))

[TRUNCATE TABLE](#) is not permitted for the [replication\\_applier\\_status](#) table.

The following table shows the correspondence between [replication\\_applier\\_status](#) columns and [SHOW REPLICA | SLAVE STATUS](#) columns.

| <a href="#">replication_applier_status</a> Column | <a href="#">SHOW REPLICA   SLAVE STATUS</a> Column |
|---------------------------------------------------|----------------------------------------------------|
| <a href="#">SERVICE_STATE</a>                     | None                                               |
| <a href="#">REMAINING_DELAY</a>                   | <a href="#">SQL_Remaining_Delay</a>                |

### 27.12.11.7 The [replication\\_applier\\_status\\_by\\_coordinator](#) Table

For a multithreaded replica, the replica uses multiple worker threads and a coordinator thread to manage them, and this table shows the status of the coordinator thread. For a single-threaded replica, this table is empty. For a multithreaded replica, the [replication\\_applier\\_status\\_by\\_worker](#) table shows the status of the worker threads. This table provides information about the last transaction which was buffered by the coordinator thread to a worker's queue, as well as the transaction it is currently buffering. The start timestamp refers to when this thread read the first event of the transaction from the relay log to buffer it to a worker's queue, while the end timestamp refers to when the last event finished buffering to the worker's queue.

The [replication\\_applier\\_status\\_by\\_coordinator](#) table has these columns:

- [CHANNEL\\_NAME](#)

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 17.2.2, "Replication Channels"](#) for more information.

- [THREAD\\_ID](#)

The SQL/coordinator thread ID.

- [SERVICE\\_STATE](#)

[ON](#) (thread exists and is active or idle) or [OFF](#) (thread no longer exists).

- [LAST\\_ERROR\\_NUMBER](#), [LAST\\_ERROR\\_MESSAGE](#)

The error number and error message of the most recent error that caused the SQL/coordinator thread to stop. An error number of 0 and message which is an empty string means "no error". If the [LAST\\_ERROR\\_MESSAGE](#) value is not empty, the error values also appear in the replica's error log.

Issuing [RESET MASTER](#) or [RESET REPLICA | SLAVE](#) resets the values shown in these columns.

All error codes and messages displayed in the [LAST\\_ERROR\\_NUMBER](#) and [LAST\\_ERROR\\_MESSAGE](#) columns correspond to error values listed in [Server Error Message Reference](#).

- [LAST\\_ERROR\\_TIMESTAMP](#)

A timestamp in '[YYYY-MM-DD hh:mm:ss\[.fraction\]](#)' format that shows when the most recent SQL/coordinator error occurred.

- [LAST\\_PROCESSED\\_TRANSACTION](#)

The global transaction ID (GTID) of the last transaction processed by this coordinator.

- [LAST\\_PROCESSED\\_TRANSACTION\\_ORIGINAL\\_COMMIT\\_TIMESTAMP](#)

A timestamp in '[YYYY-MM-DD hh:mm:ss\[.fraction\]](#)' format that shows when the last transaction processed by this coordinator was committed on the original source.

- `LAST_PROCESSED_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the last transaction processed by this coordinator was committed on the immediate source.

- `LAST_PROCESSED_TRANSACTION_START_BUFFER_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when this coordinator thread started writing the last transaction to the buffer of a worker thread.

- `LAST_PROCESSED_TRANSACTION_END_BUFFER_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the last transaction was written to the buffer of a worker thread by this coordinator thread.

- `PROCESSING_TRANSACTION`

The global transaction ID (GTID) of the transaction that this coordinator thread is currently processing.

- `PROCESSING_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the currently processing transaction was committed on the original source.

- `PROCESSING_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the currently processing transaction was committed on the immediate source.

- `PROCESSING_TRANSACTION_START_BUFFER_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when this coordinator thread started writing the currently processing transaction to the buffer of a worker thread.

When the Performance Schema is disabled, local timing information is not collected, so the fields showing the start and end timestamps for buffered transactions are zero.

The `replication_applier_status_by_coordinator` table has these indexes:

- Primary key on (`CHANNEL_NAME`)
- Index on (`THREAD_ID`)

The following table shows the correspondence between `replication_applier_status_by_coordinator` columns and `SHOW REPLICA | SLAVE STATUS` columns.

| <code>replication_applier_status_by_coordinator</code> Column | <code>SHOW REPLICA   SLAVE STATUS</code> Column |
|---------------------------------------------------------------|-------------------------------------------------|
| <code>THREAD_ID</code>                                        | None                                            |
| <code>SERVICE_STATE</code>                                    | <code>Replica_SQL_Running</code>                |
| <code>LAST_ERROR_NUMBER</code>                                | <code>Last_SQL_Errno</code>                     |
| <code>LAST_ERROR_MESSAGE</code>                               | <code>Last_SQL_Error</code>                     |
| <code>LAST_ERROR_TIMESTAMP</code>                             | <code>Last_SQL_Error_Timestamp</code>           |

### 27.12.11.8 The `replication_applier_status_by_worker` Table

This table provides details of the transactions handled by applier threads on a replica or Group Replication group member. For a single-threaded replica, data is shown for the replica's single

applier thread. For a multithreaded replica, data is shown individually for each applier thread. The applier threads on a multithreaded replica are sometimes called workers. The number of applier threads on a replica or Group Replication group member is set by the `slave_parallel_workers` system variable, which is set to zero for a single-threaded replica. A multithreaded replica also has a coordinator thread to manage the applier threads, and the status of this thread is shown in the `replication_applier_status_by_coordinator` table.

All error codes and messages displayed in the columns relating to errors correspond to error values listed in [Server Error Message Reference](#).

When the Performance Schema is disabled, local timing information is not collected, so the fields showing the start and end timestamps for applied transactions are zero. The start timestamps in this table refer to when the worker started applying the first event, and the end timestamps refer to when the last event of the transaction was applied.

When a replica is restarted by a `START REPLICA | SLAVE` statement, the columns beginning `APPLYING_TRANSACTION` are reset. Before MySQL 8.0.13, these columns were not reset on a replica that was operating in single-threaded mode, only on a multithreaded replica.

The `replication_applier_status_by_worker` table has these columns:

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 17.2.2, “Replication Channels”](#) for more information.

- `WORKER_ID`

The worker identifier (same value as the `id` column in the `mysql.slave_worker_info` table). After `STOP REPLICA | SLAVE`, the `THREAD_ID` column becomes `NULL`, but the `WORKER_ID` value is preserved.

- `THREAD_ID`

The worker thread ID.

- `SERVICE_STATE`

`ON` (thread exists and is active or idle) or `OFF` (thread no longer exists).

- `LAST_ERROR_NUMBER`, `LAST_ERROR_MESSAGE`

The error number and error message of the most recent error that caused the worker thread to stop. An error number of 0 and message of the empty string mean “no error”. If the `LAST_ERROR_MESSAGE` value is not empty, the error values also appear in the replica's error log.

Issuing `RESET MASTER` or `RESET REPLICA | SLAVE` resets the values shown in these columns.

- `LAST_ERROR_TIMESTAMP`

A timestamp in `'YYYY-MM-DD hh:mm:ss[.fraction]'` format that shows when the most recent worker error occurred.

- `LAST_APPLIED_TRANSACTION`

The global transaction ID (GTID) of the last transaction applied by this worker.

- `LAST_APPLIED_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP`

A timestamp in `'YYYY-MM-DD hh:mm:ss[.fraction]'` format that shows when the last transaction applied by this worker was committed on the original source.

- `LAST_APPLIED_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the last transaction applied by this worker was committed on the immediate source.

- `LAST_APPLIED_TRANSACTION_START_APPLY_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when this worker started applying the last applied transaction.

- `LAST_APPLIED_TRANSACTION_END_APPLY_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when this worker finished applying the last applied transaction.

- `APPLYING_TRANSACTION`

The global transaction ID (GTID) of the transaction this worker is currently applying.

- `APPLYING_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the transaction this worker is currently applying was committed on the original source.

- `APPLYING_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the transaction this worker is currently applying was committed on the immediate source.

- `APPLYING_TRANSACTION_START_APPLY_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when this worker started its first attempt to apply the transaction that is currently being applied. Before MySQL 8.0.13, this timestamp was refreshed when a transaction was retried due to a transient error, so it showed the timestamp for the most recent attempt to apply the transaction.

- `LAST_APPLIED_TRANSACTION_RETRIES_COUNT`

The number of times the last applied transaction was retried by the worker after the first attempt. If the transaction was applied at the first attempt, this number is zero.

- `LAST_APPLIED_TRANSACTION_LAST_TRANSIENT_ERROR_NUMBER`

The error number of the last transient error that caused the transaction to be retried.

- `LAST_APPLIED_TRANSACTION_LAST_TRANSIENT_ERROR_MESSAGE`

The message text for the last transient error that caused the transaction to be retried.

- `LAST_APPLIED_TRANSACTION_LAST_TRANSIENT_ERROR_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format for the last transient error that caused the transaction to be retried.

- `APPLYING_TRANSACTION_RETRIES_COUNT`

The number of times the transaction that is currently being applied was retried until this moment. If the transaction was applied at the first attempt, this number is zero.

- `APPLYING_TRANSACTION_LAST_TRANSIENT_ERROR_NUMBER`

The error number of the last transient error that caused the current transaction to be retried.

- `APPLYING_TRANSACTION_LAST_TRANSIENT_ERROR_MESSAGE`

The message text for the last transient error that caused the current transaction to be retried.

- `APPLYING_TRANSACTION_LAST_TRANSIENT_ERROR_TIMESTAMP`

A timestamp in 'YYYY-MM-DD hh:mm:ss[.fraction]' format for the last transient error that caused the current transaction to be retried.

The `replication_applier_status_by_worker` table has these indexes:

- Primary key on (`CHANNEL_NAME`, `WORKER_ID`)
- Index on (`THREAD_ID`)

The following table shows the correspondence between `replication_applier_status_by_worker` columns and `SHOW REPLICA | SLAVE STATUS` columns.

| <code>replication_applier_status_by_worker</code> Column | <code>SHOW REPLICA   SLAVE STATUS</code> Column |
|----------------------------------------------------------|-------------------------------------------------|
| <code>WORKER_ID</code>                                   | None                                            |
| <code>THREAD_ID</code>                                   | None                                            |
| <code>SERVICE_STATE</code>                               | None                                            |
| <code>LAST_ERROR_NUMBER</code>                           | <code>Last_SQL_Errno</code>                     |
| <code>LAST_ERROR_MESSAGE</code>                          | <code>Last_SQL_Error</code>                     |
| <code>LAST_ERROR_TIMESTAMP</code>                        | <code>Last_SQL_Error_Timestamp</code>           |

#### 27.12.11.9 The `replication_applier_global_filters` Table

This table shows the global replication filters configured on this replica. The `replication_applier_global_filters` table has these columns:

- `FILTER_NAME`

The type of replication filter that has been configured.

- `FILTER_RULE`

The rules configured for the replication filter type using either `--replicate-*` command options or `CHANGE REPLICATION FILTER`.

- `CONFIGURED_BY`

The method used to configure the replication filter, can be one of:

- `CHANGE_REPLICATION_FILTER` configured by a global replication filter using a `CHANGE REPLICATION FILTER` statement.
- `STARTUP_OPTIONS` configured by a global replication filter using a `--replicate-*` option.
- `ACTIVE_SINCE`

Timestamp of when the replication filter was configured.

#### 27.12.11.10 The `replication_applier_filters` Table

This table shows the replication channel specific filters configured on this replica. Each row provides information on a replication channel's configured type of filter. The `replication_applier_filters` table has these columns:

- `CHANNEL_NAME`

The name of replication channel with a replication filter configured.

- `FILTER_NAME`

The type of replication filter that has been configured for this replication channel.

- `FILTER_RULE`

The rules configured for the replication filter type using either `--replicate-*` command options or `CHANGE REPLICATION FILTER`.

- `CONFIGURED_BY`

The method used to configure the replication filter, can be one of:

- `CHANGE_REPLICATION_FILTER` configured by a global replication filter using a `CHANGE REPLICATION FILTER` statement.

- `STARTUP_OPTIONS` configured by a global replication filter using a `--replicate-*` option.

- `CHANGE_REPLICATION_FILTER_FOR_CHANNEL` configured by a channel specific replication filter using a `CHANGE REPLICATION FILTER FOR CHANNEL` statement.

- `STARTUP_OPTIONS_FOR_CHANNEL` configured by a channel specific replication filter using a `--replicate-*` option.

- `ACTIVE_SINCE`

Timestamp of when the replication filter was configured.

- `COUNTER`

The number of times the replication filter has been used since it was configured.

### 27.12.11.11 The `replication_group_members` Table

This table shows network and status information for replication group members. The network addresses shown are the addresses used to connect clients to the group, and should not be confused with the member's internal group communication address specified by `group_replication_local_address`.

The `replication_group_members` table has these columns:

- `CHANNEL_NAME`

Name of the Group Replication channel.

- `MEMBER_ID`

The member server UUID. This has a different value for each member in the group. This also serves as a key because it is unique to each member.

- `MEMBER_HOST`

Network address of this member (host name or IP address). Retrieved from the member's `hostname` variable. This is the address which clients connect to, unlike the `group_replication_local_address` which is used for internal group communication.

- `MEMBER_PORT`

Port on which the server is listening. Retrieved from the member's `port` variable.

- `MEMBER_STATE`

Current state of this member; can be any one of the following:

- `ONLINE`: The member is in a fully functioning state.
- `RECOVERING`: The server has joined a group from which it is retrieving data.
- `OFFLINE`: The group replication plugin is installed but has not been started.
- `ERROR`: The member has encountered an error, either during applying transactions or during the recovery phase, and is not participating in the group's transactions.
- `UNREACHABLE`: The failure detection process suspects that this member cannot be contacted, because the group messages have timed out.

See [Section 18.4.2, “Group Replication Server States”](#).

- `MEMBER_ROLE`

Role of the member in the group, either `PRIMARY` or `SECONDARY`.

- `MEMBER_VERSION`

MySQL version of the member.

The `replication_group_members` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `replication_group_members` table.

### 27.12.11.12 The `replication_group_member_stats` Table

This table shows statistical information for replication group members. It is populated only when Group Replication is running.

The `replication_group_member_stats` table has these columns:

- `CHANNEL_NAME`

Name of the Group Replication channel

- `VIEW_ID`

Current view identifier for this group.

- `MEMBER_ID`

The member server UUID. This has a different value for each member in the group. This also serves as a key because it is unique to each member.

- `COUNT_TRANSACTIONS_IN_QUEUE`

The number of transactions in the queue pending conflict detection checks. Once the transactions have been checked for conflicts, if they pass the check, they are queued to be applied as well.

- `COUNT_TRANSACTIONS_CHECKED`

The number of transactions that have been checked for conflicts.

- `COUNT_CONFLICTS_DETECTED`

The number of transactions that have not passed the conflict detection check.

- `COUNT_TRANSACTIONS_ROWS_VALIDATING`

Number of transaction rows which can be used for certification, but have not been garbage collected. Can be thought of as the current size of the conflict detection database against which each transaction is certified.

- `TRANSACTIONS_COMMITTED_ALL_MEMBERS`

The transactions that have been successfully committed on all members of the replication group, shown as [GTID Sets](#). This is updated at a fixed time interval.

- `LAST_CONFLICT_FREE_TRANSACTION`

The transaction identifier of the last conflict free transaction which was checked.

- `COUNT_TRANSACTIONS_REMOTE_IN_APPLIER_QUEUE`

The number of transactions that this member has received from the replication group which are waiting to be applied.

- `COUNT_TRANSACTIONS_REMOTE_APPLIED`

Number of transactions this member has received from the group and applied.

- `COUNT_TRANSACTIONS_LOCAL_PROPOSED`

Number of transactions which originated on this member and were sent to the group.

- `COUNT_TRANSACTIONS_LOCAL_ROLLBACK`

Number of transactions which originated on this member and were rolled back by the group.

The `replication_group_member_stats` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `replication_group_member_stats` table.

### 27.12.11.13 The `replication_group_member_actions` Table

This table lists the member actions that are included in the member actions configuration for replication group members. The table is available only when Group Replication is installed. You can reset the member actions configuration using the `group_replication_reset_member_actions()` function. For more information, see [Section 18.5.1.5, “Configuring Member Actions”](#).

The `replication_group_member_actions` table has these columns:

- `NAME`

The name of the member action.

- `EVENT`

The event that triggers the member action.

- `ENABLED`

Whether the member action is currently enabled. Member actions can be enabled using the `group_replication_enable_member_action()` function and disabled using the `group_replication_disable_member_action()` function.

- `TYPE`

The type of member action. `INTERNAL` is an action that is provided by the Group Replication plugin.

- `PRIORITY`

The priority of the member action. Actions with lower priority values are actioned first.

- `ERROR_HANDLING`

The action that Group Replication takes if an error occurs when the member action is being carried out. `IGNORE` means that an error message is logged to say that the member action failed, but no further action is taken. `CRITICAL` means that the member moves into `ERROR` state, and takes the action specified by the `group_replication_exit_state_action` system variable.

The `replication_group_member_actions` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `replication_group_member_actions` table.

#### 27.12.11.14 The `replication_group_configuration_version` Table

This table displays the version of the member actions configuration for replication group members. The table is available only when Group Replication is installed. Whenever a member action is enabled or disabled using the `group_replication_enable_member_action()` and `group_replication_disable_member_action()` functions, the version number is incremented. You can reset the member actions configuration using the `group_replication_reset_member_actions()` function, which resets the member actions configuration to the default settings, and resets its version number to 1. For more information, see [Section 18.5.1.5, “Configuring Member Actions”](#).

The `replication_group_configuration_version` table has these columns:

- `NAME`

The name of the configuration.

- `VERSION`

The version number of the configuration.

The `replication_group_configuration_version` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `replication_group_configuration_version` table.

#### 27.12.11.15 The `binary_log_transaction_compression_stats` Table

This table shows statistical information for transaction payloads written to the binary log and relay log, and can be used to calculate the effects of enabling binary log transaction compression. For information on binary log transaction compression, see [Section 5.4.4.5, “Binary Log Transaction Compression”](#).

The `binary_log_transaction_compression_stats` table is populated only when the server instance has a binary log, and the system variable `binlog_transaction_compression` is set to `ON`. The statistics cover all transactions written to the binary log and relay log from the time the server was started or the table was truncated. Compressed transactions are grouped by the compression algorithm used, and uncompressed transactions are grouped together with the compression algorithm stated as `NONE`, so the compression ratio can be calculated.

The `binary_log_transaction_compression_stats` table has these columns:

- `LOG_TYPE`

Whether these transactions were written to the binary log or relay log.

- `COMPRESSION_TYPE`

The compression algorithm used to compress the transaction payloads. `NONE` means the payloads for these transactions were not compressed, which is correct in a number of situations (see [Section 5.4.4.5, “Binary Log Transaction Compression”](#)).

- [TRANSACTION\\_COUNTER](#)

The number of transactions written to this log type with this compression type.

- [COMPRESSED\\_BYTES](#)

The total number of bytes that were compressed and then written to this log type with this compression type, counted after compression.

- [UNCOMPRESSED\\_BYTES](#)

The total number of bytes before compression for this log type and this compression type.

- [COMPRESSION\\_PERCENTAGE](#)

The compression ratio for this log type and this compression type, expressed as a percentage.

- [FIRST\\_TRANSACTION\\_ID](#)

The ID of the first transaction that was written to this log type with this compression type.

- [FIRST\\_TRANSACTION\\_COMPRESSED\\_BYTES](#)

The total number of bytes that were compressed and then written to the log for the first transaction, counted after compression.

- [FIRST\\_TRANSACTION\\_UNCOMPRESSED\\_BYTES](#)

The total number of bytes before compression for the first transaction.

- [FIRST\\_TRANSACTION\\_TIMESTAMP](#)

The timestamp when the first transaction was written to the log.

- [LAST\\_TRANSACTION\\_ID](#)

The ID of the most recent transaction that was written to this log type with this compression type.

- [LAST\\_TRANSACTION\\_COMPRESSED\\_BYTES](#)

The total number of bytes that were compressed and then written to the log for the most recent transaction, counted after compression.

- [LAST\\_TRANSACTION\\_UNCOMPRESSED\\_BYTES](#)

The total number of bytes before compression for the most recent transaction.

- [LAST\\_TRANSACTION\\_TIMESTAMP](#)

The timestamp when the most recent transaction was written to the log.

The [binary\\_log\\_transaction\\_compression\\_stats](#) table has no indexes.

[TRUNCATE TABLE](#) is permitted for the [binary\\_log\\_transaction\\_compression\\_stats](#) table.

## 27.12.12 Performance Schema NDB Cluster Tables

The following table shows all Performance Schema tables relating to the [NDBCLUSTER](#) storage engine.

**Table 27.3 Performance Schema NDB Tables**

| Table Name                                | Description                              | Introduced |
|-------------------------------------------|------------------------------------------|------------|
| <a href="#">ndb_sync_excluded_objects</a> | NDB objects which cannot be synchronized | 8.0.21     |

| Table Name                               | Description                             | Introduced |
|------------------------------------------|-----------------------------------------|------------|
| <a href="#">ndb_sync_pending_objects</a> | NDB objects waiting for synchronization | 8.0.21     |

Beginning with NDB 8.0.16, automatic synchronization in [NDB](#) attempts to detect and synchronize automatically all mismatches in metadata between the NDB Cluster's internal dictionary and the MySQL Server's datadictionary. This is done by default in the background at regular intervals as determined by the [ndb\\_metadata\\_check\\_interval](#) system variable, unless disabled using [ndb\\_metadata\\_check](#) or overridden by setting [ndb\\_metadata\\_sync](#). Prior to NDB 8.0.21, the only information readily accessible to users about this process was in the form of logging messages and object counts available (beginning with NDB 8.0.18) as the status variables [Ndb\\_metadata\\_detected\\_count](#), [Ndb\\_metadata\\_synced\\_count](#), and [Ndb\\_metadata\\_excluded\\_count](#) (prior to NDB 8.0.22, this variable was named [Ndb\\_metadata\\_blacklist\\_size](#)). Beginning with NDB 8.0.21, more detailed information about the current state of automatic synchronization is exposed by a MySQL server acting as an SQL node in an NDB Cluster in these two Performance Schema tables:

- [ndb\\_sync\\_pending\\_objects](#): Displays information about [NDB](#) database objects for which mismatches have been detected between the [NDB](#) dictionary and the MySQL data dictionary. When attempting to synchronize such objects, [NDB](#) removes the object from the queue awaiting synchronization, and from this table, and tries to reconcile the mismatch. If synchronization of the object fails due to a temporary error, it is picked up and added back to the queue (and to this table) the next time [NDB](#) performs mismatch detection; if the attempts fails due a permanent error, the object is added to the [ndb\\_sync\\_excluded\\_objects](#) table.
- [ndb\\_sync\\_excluded\\_objects](#): Shows information about [NDB](#) database objects for which automatic synchronization has failed due to permanent errors resulting from mismatches which cannot be reconciled without manual intervention; these objects are blocklisted and not considered again for mismatch detection until this has been done.

The [ndb\\_sync\\_pending\\_objects](#) and [ndb\\_sync\\_excluded\\_objects](#) tables are present only if MySQL has support enabled for the [NDBCLUSTER](#) storage engine.

These tables are described in more detail in the following two sections.

### 27.12.12.1 The [ndb\\_sync\\_pending\\_objects](#) Table

This table provides information about [NDB](#) database objects for which mismatches have been detected and which are waiting to be synchronized between the [NDB](#) dictionary and the MySQL data dictionary.

Example information about [NDB](#) database objects awaiting synchronization:

```
mysql> SELECT * FROM performance_schema.ndb_sync_pending_objects;
```

| SCHEMA_NAME | NAME | TYPE          |
|-------------|------|---------------|
| NULL        | lg1  | LOGFILE GROUP |
| NULL        | ts1  | TABLESPACE    |
| db1         | NULL | SCHEMA        |
| test        | t1   | TABLE         |
| test        | t2   | TABLE         |
| test        | t3   | TABLE         |

The [ndb\\_sync\\_pending\\_objects](#) table has these columns:

- [SCHEMA\\_NAME](#): The name of the schema (database) in which the object awaiting synchronization resides; this is [NULL](#) for tablespaces and log file groups
- [NAME](#): The name of the object awaiting synchronization; this is [NULL](#) if the object is a schema
- [TYPE](#): The type of the object awaiting synchronization; this is one of [LOGFILE GROUP](#), [TABLESPACE](#), [SCHEMA](#), or [TABLE](#)

The `ndb_sync_pending_objects` table was added in NDB 8.0.21.

### 27.12.12.2 The `ndb_sync_excluded_objects` Table

This table provides information about NDB database objects which cannot be automatically synchronized between NDB Cluster's dictionary and the MySQL data dictionary.

Example information about NDB database objects which cannot be synchronized with the MySQL data dictionary:

```
mysql> SELECT * FROM performance_schema.ndb_sync_excluded_objects\G
***** 1. row *****
SCHEMA_NAME: NULL
NAME: lg1
TYPE: LOGFILE GROUP
REASON: Injected failure
***** 2. row *****
SCHEMA_NAME: NULL
NAME: ts1
TYPE: TABLESPACE
REASON: Injected failure
***** 3. row *****
SCHEMA_NAME: db1
NAME: NULL
TYPE: SCHEMA
REASON: Injected failure
***** 4. row *****
SCHEMA_NAME: test
NAME: t1
TYPE: TABLE
REASON: Injected failure
***** 5. row *****
SCHEMA_NAME: test
NAME: t2
TYPE: TABLE
REASON: Injected failure
***** 6. row *****
SCHEMA_NAME: test
NAME: t3
TYPE: TABLE
REASON: Injected failure
```

The `ndb_sync_excluded_objects` table has these columns:

- **SCHEMA\_NAME**: The name of the schema (database) in which the object which has failed to synchronize resides; this is `NULL` for tablespaces and log file groups
- **NAME**: The name of the object which has failed to synchronize; this is `NULL` if the object is a schema
- **TYPE**: The type of the object has failed to synchronize; this is one of `LOGFILE GROUP`, `TABLESPACE`, `SCHEMA`, or `TABLE`
- **REASON**: The reason for exclusion (blocklisting) of the object; that is, the reason for the failure to synchronize this object

Possible reasons include the following:

- `Injected failure`
- `Failed to determine if object existed in NDB`
- `Failed to determine if object existed in DD`
- `Failed to drop object in DD`
- `Failed to get undofiles assigned to logfile group`

- Failed to get object id and version
- Failed to install object in DD
- Failed to get datafiles assigned to tablespace
- Failed to create schema
- Failed to determine if object was a local table
- Failed to invalidate table references
- Failed to set database name of NDB object
- Failed to get extra metadata of table
- Failed to migrate table with extra metadata version 1
- Failed to get object from DD
- Definition of table has changed in NDB Dictionary
- Failed to setup binlogging for table

This list is not necessarily exhaustive, and is subject to change in future [NDB](#) releases.

The `ndb_sync_excluded_objects` table was added in NDB 8.0.21.

## 27.12.13 Performance Schema Lock Tables

The Performance Schema exposes lock information through these tables:

- `data_locks`: Data locks held and requested
- `data_lock_waits`: Relationships between data lock owners and data lock requestors blocked by those owners
- `metadata_locks`: Metadata locks held and requested
- `table_handles`: Table locks held and requested

The following sections describe these tables in more detail.

### 27.12.13.1 The `data_locks` Table

The `data_locks` table shows data locks held and requested. For information about which lock requests are blocked by which held locks, see [Section 27.12.13.2, “The `data\_lock\_waits` Table”](#).

Example data lock information:

```
mysql> SELECT * FROM performance_schema.data_locks\G
***** 1. row *****
ENGINE: INNODB
ENGINE_LOCK_ID: 139664434886512:1059:139664350547912
ENGINE_TRANSACTION_ID: 2569
THREAD_ID: 46
EVENT_ID: 12
OBJECT_SCHEMA: test
OBJECT_NAME: t1
PARTITION_NAME: NULL
SUBPARTITION_NAME: NULL
INDEX_NAME: NULL
OBJECT_INSTANCE_BEGIN: 139664350547912
```

```

 LOCK_TYPE: TABLE
 LOCK_MODE: IX
 LOCK_STATUS: GRANTED
 LOCK_DATA: NULL
***** 2. row *****
 ENGINE: INNODB
 ENGINE_LOCK_ID: 139664434886512:2:4:1:139664350544872
ENGINE_TRANSACTION_ID: 2569
 THREAD_ID: 46
 EVENT_ID: 12
 OBJECT_SCHEMA: test
 OBJECT_NAME: t1
 PARTITION_NAME: NULL
 SUBPARTITION_NAME: NULL
 INDEX_NAME: GEN_CLUST_INDEX
OBJECT_INSTANCE_BEGIN: 139664350544872
 LOCK_TYPE: RECORD
 LOCK_MODE: X
 LOCK_STATUS: GRANTED
 LOCK_DATA: supremum pseudo-record

```

Unlike most Performance Schema data collection, there are no instruments for controlling whether data lock information is collected or system variables for controlling data lock table sizes. The Performance Schema collects information that is already available in the server, so there is no memory or CPU overhead to generate this information or need for parameters that control its collection.

Use the [data\\_locks](#) table to help diagnose performance problems that occur during times of heavy concurrent load. For [InnoDB](#), see the discussion of this topic at [Section 15.15.2, “InnoDB INFORMATION\\_SCHEMA Transaction and Locking Information”](#).

The [data\\_locks](#) table has these columns:

- [ENGINE](#)

The storage engine that holds or requested the lock.

- [ENGINE\\_LOCK\\_ID](#)

The ID of the lock held or requested by the storage engine. Tuples of ([ENGINE\\_LOCK\\_ID](#), [ENGINE](#)) values are unique.

Lock ID formats are internal and subject to change at any time. Applications should not rely on lock IDs having a particular format.

- [ENGINE\\_TRANSACTION\\_ID](#)

The storage engine internal ID of the transaction that requested the lock. This can be considered the owner of the lock, although the lock might still be pending, not actually granted yet ([LOCK\\_STATUS= 'WAITING'](#)).

If the transaction has not yet performed any write operation (is still considered read only), the column contains internal data that users should not try to interpret. Otherwise, the column is the transaction ID.

For [InnoDB](#), to obtain details about the transaction, join this column with the [TRX\\_ID](#) column of the [INFORMATION\\_SCHEMA INNODB\\_TRX](#) table.

- [THREAD\\_ID](#)

The thread ID of the session that created the lock. To obtain details about the thread, join this column with the [THREAD\\_ID](#) column of the Performance Schema [threads](#) table.

[THREAD\\_ID](#) can be used together with [EVENT\\_ID](#) to determine the event during which the lock data structure was created in memory. (This event might have occurred before this particular lock request occurred, if the data structure is used to store multiple locks.)

- `EVENT_ID`

The Performance Schema event that caused the lock. Tuples of (`THREAD_ID`, `EVENT_ID`) values implicitly identify a parent event in other Performance Schema tables:

- The parent wait event in the `events_waits_XXX` tables
- The parent stage event in the `events_stages_XXX` tables
- The parent statement event in the `events_statements_XXX` tables
- The parent transaction event in the `events_transactions_current` table

To obtain details about the parent event, join the `THREAD_ID` and `EVENT_ID` columns with the columns of like name in the appropriate parent event table. See [Section 27.19.2, “Obtaining Parent Event Information”](#).

- `OBJECT_SCHEMA`

The schema that contains the locked table.

- `OBJECT_NAME`

The name of the locked table.

- `PARTITION_NAME`

The name of the locked partition, if any; `NULL` otherwise.

- `SUBPARTITION_NAME`

The name of the locked subpartition, if any; `NULL` otherwise.

- `INDEX_NAME`

The name of the locked index, if any; `NULL` otherwise.

In practice, `InnoDB` always creates an index (`GEN_CLUST_INDEX`), so `INDEX_NAME` is non-`NULL` for `InnoDB` tables.

- `OBJECT_INSTANCE_BEGIN`

The address in memory of the lock.

- `LOCK_TYPE`

The type of lock.

The value is storage engine dependent. For `InnoDB`, permitted values are `RECORD` for a row-level lock, `TABLE` for a table-level lock.

- `LOCK_MODE`

How the lock is requested.

The value is storage engine dependent. For `InnoDB`, permitted values are `S[,GAP]`, `X[,GAP]`, `IS[,GAP]`, `IX[,GAP]`, `AUTO_INC`, and `UNKNOWN`. Lock modes other than `AUTO_INC` and `UNKNOWN` indicate gap locks, if present. For information about `S`, `X`, `IS`, `IX`, and gap locks, refer to [Section 15.7.1, “InnoDB Locking”](#).

- `LOCK_STATUS`

The status of the lock request.

The value is storage engine dependent. For [InnoDB](#), permitted values are [GRANTED](#) (lock is held) and [WAITING](#) (lock is being waited for).

- [LOCK\\_DATA](#)

The data associated with the lock, if any. The value is storage engine dependent. For [InnoDB](#), a value is shown if the [LOCK\\_TYPE](#) is [RECORD](#), otherwise the value is [NULL](#). Primary key values of the locked record are shown for a lock placed on the primary key index. Secondary index values of the locked record are shown with primary key values appended for a lock placed on a secondary index. If there is no primary key, [LOCK\\_DATA](#) shows either the key values of a selected unique index or the unique [InnoDB](#) internal row ID number, according to the rules governing [InnoDB](#) clustered index use (see [Section 15.6.2.1, “Clustered and Secondary Indexes”](#)). [LOCK\\_DATA](#) reports “supremum pseudo-record” for a lock taken on a supremum pseudo-record. If the page containing the locked record is not in the buffer pool because it was written to disk while the lock was held, [InnoDB](#) does not fetch the page from disk. Instead, [LOCK\\_DATA](#) reports [NULL](#).

The [data\\_locks](#) table has these indexes:

- Primary key on ([ENGINE\\_LOCK\\_ID](#), [ENGINE](#))
- Index on ([ENGINE\\_TRANSACTION\\_ID](#), [ENGINE](#))
- Index on ([THREAD\\_ID](#), [EVENT\\_ID](#))
- Index on ([OBJECT\\_SCHEMA](#), [OBJECT\\_NAME](#), [PARTITION\\_NAME](#), [SUBPARTITION\\_NAME](#))

[TRUNCATE TABLE](#) is not permitted for the [data\\_locks](#) table.

#### Note

Prior to MySQL 8.0.1, information similar to that in the Performance Schema [data\\_locks](#) table is available in the [INFORMATION\\_SCHEMA.INNODB\\_LOCKS](#) table, which provides information about each lock that an [InnoDB](#) transaction has requested but not yet acquired, and each lock held by a transaction that is blocking another transaction. [INFORMATION\\_SCHEMA.INNODB\\_LOCKS](#) is deprecated and is removed as of MySQL 8.0.1. [data\\_locks](#) should be used instead.

Differences between [INNODB\\_LOCKS](#) and [data\\_locks](#):

- If a transaction holds a lock, [INNODB\\_LOCKS](#) displays the lock only if another transaction is waiting for it. [data\\_locks](#) displays the lock regardless of whether any transaction is waiting for it.
- The [data\\_locks](#) table has no columns corresponding to [LOCK\\_SPACE](#), [LOCK\\_PAGE](#), or [LOCK\\_REC](#).
- The [INNODB\\_LOCKS](#) table requires the global [PROCESS](#) privilege. The [data\\_locks](#) table requires the usual Performance Schema privilege of [SELECT](#) on the table to be selected from.

The following table shows the mapping from [INNODB\\_LOCKS](#) columns to [data\\_locks](#) columns. Use this information to migrate applications from one table to the other.

**Table 27.4 Mapping from INNODB\_LOCKS to data\_locks Columns**

| INNODB_LOCKS Column                                      | data_locks Column                                                                     |
|----------------------------------------------------------|---------------------------------------------------------------------------------------|
| <a href="#">LOCK_ID</a>                                  | <a href="#">ENGINE_LOCK_ID</a>                                                        |
| <a href="#">LOCK_TRX_ID</a>                              | <a href="#">ENGINE_TRANSACTION_ID</a>                                                 |
| <a href="#">LOCK_MODE</a>                                | <a href="#">LOCK_MODE</a>                                                             |
| <a href="#">LOCK_TYPE</a>                                | <a href="#">LOCK_TYPE</a>                                                             |
| <a href="#">LOCK_TABLE</a> (combined schema/table names) | <a href="#">OBJECT_SCHEMA</a> (schema name), <a href="#">OBJECT_NAME</a> (table name) |

| INNODB_LOCKS Column | data_locks Column |
|---------------------|-------------------|
| LOCK_INDEX          | INDEX_NAME        |
| LOCK_SPACE          | None              |
| LOCK_PAGE           | None              |
| LOCK_REC            | None              |
| LOCK_DATA           | LOCK_DATA         |

### 27.12.13.2 The data\_lock\_waits Table

The `data_lock_waits` table implements a many-to-many relationship showing which data lock requests in the `data_locks` table are blocked by which held data locks in the `data_locks` table. Held locks in `data_locks` appear in `data_lock_waits` only if they block some lock request.

This information enables you to understand data lock dependencies between sessions. The table exposes not only which lock a session or transaction is waiting for, but which session or transaction currently holds that lock.

Example data lock wait information:

```
mysql> SELECT * FROM performance_schema.data_lock_waits\G
***** 1. row *****
ENGINE: INNODB
REQUESTING_ENGINE_LOCK_ID: 140211201964816:2:4:2:140211086465800
REQUESTING_ENGINE_TRANSACTION_ID: 1555
REQUESTING_THREAD_ID: 47
REQUESTING_EVENT_ID: 5
REQUESTING_OBJECT_INSTANCE_BEGIN: 140211086465800
BLOCKING_ENGINE_LOCK_ID: 140211201963888:2:4:2:140211086459880
BLOCKING_ENGINE_TRANSACTION_ID: 1554
BLOCKING_THREAD_ID: 46
BLOCKING_EVENT_ID: 12
BLOCKING_OBJECT_INSTANCE_BEGIN: 140211086459880
```

Unlike most Performance Schema data collection, there are no instruments for controlling whether data lock information is collected or system variables for controlling data lock table sizes. The Performance Schema collects information that is already available in the server, so there is no memory or CPU overhead to generate this information or need for parameters that control its collection.

Use the `data_lock_waits` table to help diagnose performance problems that occur during times of heavy concurrent load. For `InnoDB`, see the discussion of this topic at [Section 15.15.2, “InnoDB INFORMATION\\_SCHEMA Transaction and Locking Information”](#).

Because the columns in the `data_lock_waits` table are similar to those in the `data_locks` table, the column descriptions here are abbreviated. For more detailed column descriptions, see [Section 27.12.13.1, “The data\\_locks Table”](#).

The `data_lock_waits` table has these columns:

- `ENGINE`

The storage engine that requested the lock.

- `REQUESTING_ENGINE_LOCK_ID`

The ID of the lock requested by the storage engine. To obtain details about the lock, join this column with the `ENGINE_LOCK_ID` column of the `data_locks` table.

- `REQUESTING_ENGINE_TRANSACTION_ID`

The storage engine internal ID of the transaction that requested the lock.

- `REQUESTING_THREAD_ID`

The thread ID of the session that requested the lock.

- `REQUESTING_EVENT_ID`

The Performance Schema event that caused the lock request in the session that requested the lock.

- `REQUESTING_OBJECT_INSTANCE_BEGIN`

The address in memory of the requested lock.

- `BLOCKING_ENGINE_LOCK_ID`

The ID of the blocking lock. To obtain details about the lock, join this column with the `ENGINE_LOCK_ID` column of the `data_locks` table.

- `BLOCKING_ENGINE_TRANSACTION_ID`

The storage engine internal ID of the transaction that holds the blocking lock.

- `BLOCKING_THREAD_ID`

The thread ID of the session that holds the blocking lock.

- `BLOCKING_EVENT_ID`

The Performance Schema event that caused the blocking lock in the session that holds it.

- `BLOCKING_OBJECT_INSTANCE_BEGIN`

The address in memory of the blocking lock.

The `data_lock_waits` table has these indexes:

- Index on (`REQUESTING_ENGINE_LOCK_ID`, `ENGINE`)
- Index on (`BLOCKING_ENGINE_LOCK_ID`, `ENGINE`)
- Index on (`REQUESTING_ENGINE_TRANSACTION_ID`, `ENGINE`)
- Index on (`BLOCKING_ENGINE_TRANSACTION_ID`, `ENGINE`)
- Index on (`REQUESTING_THREAD_ID`, `REQUESTING_EVENT_ID`)
- Index on (`BLOCKING_THREAD_ID`, `BLOCKING_EVENT_ID`)

`TRUNCATE TABLE` is not permitted for the `data_lock_waits` table.

#### Note

Prior to MySQL 8.0.1, information similar to that in the Performance Schema `data_lock_waits` table is available in the `INFORMATION_SCHEMA.INNODB_LOCK_WAITS` table, which provides information about each blocked InnoDB transaction, indicating the lock it has requested and any locks that are blocking that request. `INFORMATION_SCHEMA.INNODB_LOCK_WAITS` is deprecated and is removed as of MySQL 8.0.1. `data_lock_waits` should be used instead.

The tables differ in the privileges required: The `INNODB_LOCK_WAITS` table requires the global `PROCESS` privilege. The `data_lock_waits` table requires the usual Performance Schema privilege of `SELECT` on the table to be selected from.

The following table shows the mapping from `INNODB_LOCK_WAITS` columns to `data_lock_waits` columns. Use this information to migrate applications from one table to the other.

**Table 27.5 Mapping from INNODB\_LOCK\_WAITS to data\_lock\_waits Columns**

| INNODB_LOCK_WAITS Column | data_lock_waits Column           |
|--------------------------|----------------------------------|
| REQUESTING_TRX_ID        | REQUESTING_ENGINE_TRANSACTION_ID |
| REQUESTED_LOCK_ID        | REQUESTING_ENGINE_LOCK_ID        |
| BLOCKING_TRX_ID          | BLOCKING_ENGINE_TRANSACTION_ID   |
| BLOCKING_LOCK_ID         | BLOCKING_ENGINE_LOCK_ID          |

### 27.12.13.3 The metadata\_locks Table

MySQL uses metadata locking to manage concurrent access to database objects and to ensure data consistency; see [Section 8.11.4, “Metadata Locking”](#). Metadata locking applies not just to tables, but also to schemas, stored programs (procedures, functions, triggers, scheduled events), tablespaces, user locks acquired with the `GET_LOCK()` function (see [Section 12.15, “Locking Functions”](#)), and locks acquired with the locking service described in [Section 5.6.9.1, “The Locking Service”](#).

The Performance Schema exposes metadata lock information through the `metadata_locks` table:

- Locks that have been granted (shows which sessions own which current metadata locks).
- Locks that have been requested but not yet granted (shows which sessions are waiting for which metadata locks).
- Lock requests that have been killed by the deadlock detector.
- Lock requests that have timed out and are waiting for the requesting session's lock request to be discarded.

This information enables you to understand metadata lock dependencies between sessions. You can see not only which lock a session is waiting for, but which session currently holds that lock.

The `metadata_locks` table is read only and cannot be updated. It is autosized by default; to configure the table size, set the `performance_schema_max_metadata_locks` system variable at server startup.

Metadata lock instrumentation uses the `wait/lock/metadata/sql/mdl` instrument, which is enabled by default.

To control metadata lock instrumentation state at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='wait/lock/metadata/sql/mdl=ON'
```

- Disable:

```
[mysqld]
performance-schema-instrument='wait/lock/metadata/sql/mdl=OFF'
```

To control metadata lock instrumentation state at runtime, update the `setup_instruments` table:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME = 'wait/lock/metadata/sql/mdl';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME = 'wait/lock/metadata/sql/mdl';
```

The Performance Schema maintains `metadata_locks` table content as follows, using the `LOCK_STATUS` column to indicate the status of each lock:

- When a metadata lock is requested and obtained immediately, a row with a status of `GRANTED` is inserted.
- When a metadata lock is requested and not obtained immediately, a row with a status of `PENDING` is inserted.
- When a metadata lock previously requested is granted, its row status is updated to `GRANTED`.
- When a metadata lock is released, its row is deleted.
- When a pending lock request is canceled by the deadlock detector to break a deadlock (`ER_LOCK_DEADLOCK`), its row status is updated from `PENDING` to `VICTIM`.
- When a pending lock request times out (`ER_LOCK_WAIT_TIMEOUT`), its row status is updated from `PENDING` to `TIMEOUT`.
- When granted lock or pending lock request is killed, its row status is updated from `GRANTED` or `PENDING` to `KILLED`.
- The `VICTIM`, `TIMEOUT`, and `KILLED` status values are brief and signify that the lock row is about to be deleted.
- The `PRE_ACQUIRE_NOTIFY` and `POST_RELEASE_NOTIFY` status values are brief and signify that the metadata locking subsystem is notifying interested storage engines while entering lock acquisition operations or leaving lock release operations.

The `metadata_locks` table has these columns:

- `OBJECT_TYPE`

The type of lock used in the metadata lock subsystem. The value is one of `GLOBAL`, `SCHEMA`, `TABLE`, `FUNCTION`, `PROCEDURE`, `TRIGGER` (currently unused), `EVENT`, `COMMIT`, `USER LEVEL LOCK`, `TABLESPACE`, or `LOCKING SERVICE`.

A value of `USER LEVEL LOCK` indicates a lock acquired with `GET_LOCK( )`. A value of `LOCKING SERVICE` indicates a lock acquired with the locking service described in [Section 5.6.9.1, “The Locking Service”](#).

- `OBJECT_SCHEMA`

The schema that contains the object.

- `OBJECT_NAME`

The name of the instrumented object.

- `OBJECT_INSTANCE_BEGIN`

The address in memory of the instrumented object.

- `LOCK_TYPE`

The lock type from the metadata lock subsystem. The value is one of `INTENTION_EXCLUSIVE`, `SHARED`, `SHARED_HIGH_PRIO`, `SHARED_READ`, `SHARED_WRITE`, `SHARED_UPGRADABLE`, `SHARED_NO_WRITE`, `SHARED_NO_READ_WRITE`, or `EXCLUSIVE`.

- `LOCK_DURATION`

The lock duration from the metadata lock subsystem. The value is one of `STATEMENT`, `TRANSACTION`, or `EXPLICIT`. The `STATEMENT` and `TRANSACTION` values signify locks that are

released implicitly at statement or transaction end, respectively. The `EXPLICIT` value signifies locks that survive statement or transaction end and are released by explicit action, such as global locks acquired with `FLUSH TABLES WITH READ LOCK`.

- `LOCK_STATUS`

The lock status from the metadata lock subsystem. The value is one of `PENDING`, `GRANTED`, `VICTIM`, `TIMEOUT`, `KILLED`, `PRE_ACQUIRE_NOTIFY`, or `POST_RELEASE_NOTIFY`. The Performance Schema assigns these values as described previously.

- `SOURCE`

The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved.

- `OWNER_THREAD_ID`

The thread requesting a metadata lock.

- `OWNER_EVENT_ID`

The event requesting a metadata lock.

The `metadata_locks` table has these indexes:

- Primary key on (`OBJECT_INSTANCE_BEGIN`)
- Index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)
- Index on (`OWNER_THREAD_ID`, `OWNER_EVENT_ID`)

`TRUNCATE TABLE` is not permitted for the `metadata_locks` table.

### 27.12.13.4 The `table_handles` Table

The Performance Schema exposes table lock information through the `table_handles` table to show the table locks currently in effect for each opened table handle. `table_handles` reports what is recorded by the table lock instrumentation. This information shows which table handles the server has open, how they are locked, and by which sessions.

The `table_handles` table is read only and cannot be updated. It is autosized by default; to configure the table size, set the `performance_schema_max_table_handles` system variable at server startup.

Table lock instrumentation uses the `wait/lock/table/sql/handler` instrument, which is enabled by default.

To control table lock instrumentation state at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='wait/lock/table/sql/handler=ON'
```

- Disable:

```
[mysqld]
performance-schema-instrument='wait/lock/table/sql/handler=OFF'
```

To control table lock instrumentation state at runtime, update the `setup_instruments` table:

- Enable:

```
UPDATE performance_schema.setup_instruments
```

```
SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME = 'wait/lock/table/sql/handler';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME = 'wait/lock/table/sql/handler';
```

The `table_handles` table has these columns:

- `OBJECT_TYPE`

The table opened by a table handle.

- `OBJECT_SCHEMA`

The schema that contains the object.

- `OBJECT_NAME`

The name of the instrumented object.

- `OBJECT_INSTANCE_BEGIN`

The table handle address in memory.

- `OWNER_THREAD_ID`

The thread owning the table handle.

- `OWNER_EVENT_ID`

The event which caused the table handle to be opened.

- `INTERNAL_LOCK`

The table lock used at the SQL level. The value is one of `READ`, `READ WITH SHARED LOCKS`, `READ HIGH PRIORITY`, `READ NO INSERT`, `WRITE ALLOW WRITE`, `WRITE CONCURRENT INSERT`, `WRITE LOW PRIORITY`, or `WRITE`. For information about these lock types, see the `include/thr_lock.h` source file.

- `EXTERNAL_LOCK`

The table lock used at the storage engine level. The value is one of `READ EXTERNAL` or `WRITE EXTERNAL`.

The `table_handles` table has these indexes:

- Primary key on (`OBJECT_INSTANCE_BEGIN`)
- Index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)
- Index on (`OWNER_THREAD_ID`, `OWNER_EVENT_ID`)

`TRUNCATE TABLE` is not permitted for the `table_handles` table.

## 27.12.14 Performance Schema System Variable Tables

The MySQL server maintains many system variables that indicate how it is configured (see [Section 5.1.8, “Server System Variables”](#)). System variable information is available in these Performance Schema tables:

- `global_variables`: Global system variables. An application that wants only global values should use this table.

- `session_variables`: System variables for the current session. An application that wants all system variable values for its own session should use this table. It includes the session variables for its session, as well as the values of global variables that have no session counterpart.
- `variables_by_thread`: Session system variables for each active session. An application that wants to know the session variable values for specific sessions should use this table. It includes session variables only, identified by thread ID.
- `persisted_variables`: Provides a SQL interface to the `mysqld-auto.cnf` file that stores persisted global system variable settings. See [Section 27.12.14.1, “Performance Schema persisted\\_variables Table”](#).
- `variables_info`: Shows, for each system variable, the source from which it was most recently set, and its range of values. See [Section 27.12.14.2, “Performance Schema variables\\_info Table”](#).

The session variable tables (`session_variables`, `variables_by_thread`) contain information only for active sessions, not terminated sessions.

The `global_variables` and `session_variables` tables have these columns:

- `VARIABLE_NAME`

The system variable name.

- `VARIABLE_VALUE`

The system variable value. For `global_variables`, this column contains the global value. For `session_variables`, this column contains the variable value in effect for the current session.

The `global_variables` and `session_variables` tables have these indexes:

- Primary key on (`VARIABLE_NAME`)

The `variables_by_thread` table has these columns:

- `THREAD_ID`

The thread identifier of the session in which the system variable is defined.

- `VARIABLE_NAME`

The system variable name.

- `VARIABLE_VALUE`

The session variable value for the session named by the `THREAD_ID` column.

The `variables_by_thread` table has these indexes:

- Primary key on (`THREAD_ID`, `VARIABLE_NAME`)

The `variables_by_thread` table contains system variable information only about foreground threads. If not all threads are instrumented by the Performance Schema, this table misses some rows. In this case, the `Performance_schema_thread_instances_lost` status variable is greater than zero.

`TRUNCATE TABLE` is not supported for Performance Schema system variable tables.

### 27.12.14.1 Performance Schema `persisted_variables` Table

The `persisted_variables` table provides an SQL interface to the `mysqld-auto.cnf` file that stores persisted global system variable settings, enabling the file contents to be inspected at

runtime using `SELECT` statements. Variables are persisted using `SET PERSIST` or `PERSIST_ONLY` statements; see [Section 13.7.6.1, “SET Syntax for Variable Assignment”](#). The table contains a row for each persisted system variable in the file. Variables not persisted do not appear in the table.

For information about persisted system variables, see [Section 13.7.6.1, “SET Syntax for Variable Assignment”](#).

Suppose that `mysqld-auto.cnf` looks like this (slightly reformatted):

```
{
 "Version": 1,
 "mysql_server": {
 "max_connections": {
 "Value": "1000",
 "Metadata": {
 "Timestamp": 1.519921706e+15,
 "User": "root",
 "Host": "localhost"
 }
 },
 "autocommit": {
 "Value": "ON",
 "Metadata": {
 "Timestamp": 1.519921707e+15,
 "User": "root",
 "Host": "localhost"
 }
 }
 }
}
```

Then `persisted_variables` has these contents:

```
mysql> SELECT * FROM performance_schema.persisted_variables;
+-----+-----+
| VARIABLE_NAME | VARIABLE_VALUE |
+-----+-----+
| autocommit | ON |
| max_connections | 1000 |
+-----+-----+
```

The `persisted_variables` table has these columns:

- `VARIABLE_NAME`

The variable name listed in `mysqld-auto.cnf`.

- `VARIABLE_VALUE`

The value listed for the variable in `mysqld-auto.cnf`.

`persisted_variables` has these indexes:

- Primary key on (`VARIABLE_NAME`)

`TRUNCATE TABLE` is not permitted for the `persisted_variables` table.

## 27.12.14.2 Performance Schema `variables_info` Table

The `variables_info` table shows, for each system variable, the source from which it was most recently set, and its range of values.

The `variables_info` table has these columns:

- `VARIABLE_NAME`

The variable name.

- `VARIABLE_SOURCE`

The source from which the variable was most recently set:

- `COMMAND_LINE`

The variable was set on the command line.

- `COMPILED`

The variable has its compiled-in default value. `COMPILED` is the value used for variables not set any other way.

- `DYNAMIC`

The variable was set at runtime. This includes variables set within files specified using the `init_file` system variable.

- `EXPLICIT`

The variable was set from an option file named with the `--defaults-file` option.

- `EXTRA`

The variable was set from an option file named with the `--defaults-extra-file` option.

- `GLOBAL`

The variable was set from a global option file. This includes option files not covered by `EXPLICIT`, `EXTRA`, `LOGIN`, `PERSISTED`, `SERVER`, or `USER`.

- `LOGIN`

The variable was set from a user-specific login path file (`~/mylogin.cnf`).

- `PERSISTED`

The variable was set from a server-specific `mysqld-auto.cnf` option file. No row has this value if the server was started with `persisted_globals_load` disabled.

- `SERVER`

The variable was set from a server-specific `$MYSQL_HOME/my.cnf` option file. For details about how `MYSQL_HOME` is set, see [Section 4.2.2.2, “Using Option Files”](#).

- `USER`

The variable was set from a user-specific `~/my.cnf` option file.

- `VARIABLE_PATH`

If the variable was set from an option file, `VARIABLE_PATH` is the path name of that file. Otherwise, the value is the empty string.

- `MIN_VALUE`, `MAX_VALUE`

The minimum and maximum permitted values for the variable. Both are 0 for variables that have no such values (that is, variables that are not numeric).

- `SET_TIME`

The time at which the variable was most recently set. The default is the time at which the server initialized global system variables during startup.

- `SET_USER`, `SET_HOST`

The user name and host name of the client user that most recently set the variable.

If a client connects as `user17` from host `host34.example.com` using the account `'user17'@'%.example.com`, `SET_USER` and `SET_HOST` are `user17` and `host34.example.com`, respectively. For proxy user connections, these values correspond to the external (proxy) user, not the proxied user against which privilege checking is performed. The default for each column is the empty string, indicating that the variable has not been set since server startup.

The `variables_info` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `variables_info` table.

If a variable with a `VARIABLE_SOURCE` value other than `DYNAMIC` is set at runtime, `VARIABLE_SOURCE` becomes `DYNAMIC` and `VARIABLE_PATH` becomes the empty string.

A system variable that has only a session value (such as `debug_sync`) cannot be set at startup or persisted. For session-only system variables, `VARIABLE_SOURCE` can be only `COMPILED` or `DYNAMIC`.

If a system variable has an unexpected `VARIABLE_SOURCE` value, consider your server startup method. For example, `mysqld_safe` reads option files and passes certain options it finds there as part of the command line that it uses to start `mysqld`. Consequently, some system variables that you set in option files might display in `variables_info` as `COMMAND_LINE`, rather than as `GLOBAL` or `SERVER` as you might otherwise expect.

Some sample queries that use the `variables_info` table, with representative output:

- Display variables set on the command line:

```
mysql> SELECT VARIABLE_NAME
FROM performance_schema.variables_info
WHERE VARIABLE_SOURCE = 'COMMAND_LINE'
ORDER BY VARIABLE_NAME;
+-----+
| VARIABLE_NAME |
+-----+
| basedir |
| datadir |
| log_error |
| pid_file |
| plugin_dir |
| port |
+-----+
```

- Display variables set from persistent storage:

```
mysql> SELECT VARIABLE_NAME
FROM performance_schema.variables_info
WHERE VARIABLE_SOURCE = 'PERSISTED'
ORDER BY VARIABLE_NAME;
+-----+
| VARIABLE_NAME |
+-----+
| event_scheduler |
| max_connections |
| validate_password.policy |
+-----+
```

- Join `variables_info` with the `global_variables` table to display the current values of persisted variables, together with their range of values:

```
mysql> SELECT
 VI.VARIABLE_NAME, GV.VARIABLE_VALUE,
 VI.MIN_VALUE, VI.MAX_VALUE
FROM performance_schema.variables_info AS VI
INNER JOIN performance_schema.global_variables AS GV
 USING(VARIABLE_NAME)
```

```
WHERE VI.VARIABLE_SOURCE = 'PERSISTED'
ORDER BY VARIABLE_NAME;
```

| VARIABLE_NAME            | VARIABLE_VALUE | MIN_VALUE | MAX_VALUE |
|--------------------------|----------------|-----------|-----------|
| event_scheduler          | ON             | 0         | 0         |
| max_connections          | 200            | 1         | 100000    |
| validate_password.policy | STRONG         | 0         | 0         |

## 27.12.15 Performance Schema Status Variable Tables

The MySQL server maintains many status variables that provide information about its operation (see [Section 5.1.10, “Server Status Variables”](#)). Status variable information is available in these Performance Schema tables:

- [global\\_status](#): Global status variables. An application that wants only global values should use this table.
- [session\\_status](#): Status variables for the current session. An application that wants all status variable values for its own session should use this table. It includes the session variables for its session, as well as the values of global variables that have no session counterpart.
- [status\\_by\\_thread](#): Session status variables for each active session. An application that wants to know the session variable values for specific sessions should use this table. It includes session variables only, identified by thread ID.

There are also summary tables that provide status variable information aggregated by account, host name, and user name. See [Section 27.12.20.12, “Status Variable Summary Tables”](#).

The session variable tables ([session\\_status](#), [status\\_by\\_thread](#)) contain information only for active sessions, not terminated sessions.

The Performance Schema collects statistics for global status variables only for threads for which the [INSTRUMENTED](#) value is [YES](#) in the [threads](#) table. Statistics for session status variables are always collected, regardless of the [INSTRUMENTED](#) value.

The Performance Schema does not collect statistics for [Com\\_xxx](#) status variables in the status variable tables. To obtain global and per-session statement execution counts, use the [events\\_statements\\_summary\\_global\\_by\\_event\\_name](#) and [events\\_statements\\_summary\\_by\\_thread\\_by\\_event\\_name](#) tables, respectively. For example:

```
SELECT EVENT_NAME, COUNT_STAR
FROM performance_schema.events_statements_summary_global_by_event_name
WHERE EVENT_NAME LIKE 'statement/sql/%';
```

The [global\\_status](#) and [session\\_status](#) tables have these columns:

- [VARIABLE\\_NAME](#)

The status variable name.

- [VARIABLE\\_VALUE](#)

The status variable value. For [global\\_status](#), this column contains the global value. For [session\\_status](#), this column contains the variable value for the current session.

The [global\\_status](#) and [session\\_status](#) tables have these indexes:

- Primary key on ([VARIABLE\\_NAME](#))

The [status\\_by\\_thread](#) table contains the status of each active thread. It has these columns:

- [THREAD\\_ID](#)

The thread identifier of the session in which the status variable is defined.

- `VARIABLE_NAME`

The status variable name.

- `VARIABLE_VALUE`

The session variable value for the session named by the `THREAD_ID` column.

The `status_by_thread` table has these indexes:

- Primary key on (`THREAD_ID`, `VARIABLE_NAME`)

The `status_by_thread` table contains status variable information only about foreground threads. If the `performance_schema_max_thread_instances` system variable is not autoscaled (signified by a value of -1) and the maximum permitted number of instrumented thread objects is not greater than the number of background threads, the table is empty.

The Performance Schema supports `TRUNCATE TABLE` for status variable tables as follows:

- `global_status`: Resets thread, account, host, and user status. Resets global status variables except those that the server never resets.
- `session_status`: Not supported.
- `status_by_thread`: Aggregates status for all threads to the global status and account status, then resets thread status. If account statistics are not collected, the session status is added to host and user status, if host and user status are collected.

Account, host, and user statistics are not collected if the `performance_schema_accounts_size`, `performance_schema_hosts_size`, and `performance_schema_users_size` system variables, respectively, are set to 0.

`FLUSH STATUS` adds the session status from all active sessions to the global status variables, resets the status of all active sessions, and resets account, host, and user status values aggregated from disconnected sessions.

## 27.12.16 Performance Schema Thread Pool Tables

### Note

The Performance Schema tables described here are available as of MySQL 8.0.14. Prior to MySQL 8.0.14, use the corresponding `INFORMATION_SCHEMA` tables instead; see [Section 26.5, “INFORMATION\\_SCHEMA Thread Pool Tables”](#).

The following sections describe the Performance Schema tables associated with the thread pool plugin (see [Section 5.6.3, “MySQL Enterprise Thread Pool”](#)). They provide information about thread pool operation:

- `tp_thread_group_state`: Information about thread pool thread group states.
- `tp_thread_group_stats`: Thread group statistics.
- `tp_thread_state`: Information about thread pool thread states.

Rows in these tables represent snapshots in time. In the case of `tp_thread_state`, all rows for a thread group comprise a snapshot in time. Thus, the MySQL server holds the mutex of the thread group while producing the snapshot. But it does not hold mutexes on all thread groups at the same time, to prevent a statement against `tp_thread_state` from blocking the entire MySQL server.

The Performance Schema thread pool tables are implemented by the thread pool plugin and are loaded and unloaded when that plugin is loaded and unloaded (see [Section 5.6.3.2, “Thread Pool Installation”](#)). No special configuration step for the tables is needed. However, the tables depend on the thread pool plugin being enabled. If the thread pool plugin is loaded but disabled, the tables are not created.

### 27.12.16.1 The `tp_thread_group_state` Table

#### Note

The Performance Schema table described here is available as of MySQL 8.0.14. Prior to MySQL 8.0.14, use the corresponding [INFORMATION\\_SCHEMA](#) table instead; see [Section 26.5.2, “The INFORMATION\\_SCHEMA TP\\_THREAD\\_GROUP\\_STATE Table”](#).

The `tp_thread_group_state` table has one row per thread group in the thread pool. Each row provides information about the current state of a group.

The `tp_thread_group_state` table has these columns:

- `TP_GROUP_ID`

The thread group ID. This is a unique key within the table.

- `CONSUMER_THREADS`

The number of consumer threads. There is at most one thread ready to start executing if the active threads become stalled or blocked.

- `RESERVE_THREADS`

The number of threads in the reserved state. This means that they are not started until there is a need to wake a new thread and there is no consumer thread. This is where most threads end up when the thread group has created more threads than needed for normal operation. Often a thread group needs additional threads for a short while and then does not need them again for a while. In this case, they go into the reserved state and remain until needed again. They take up some extra memory resources, but no extra computing resources.

- `CONNECT_THREAD_COUNT`

The number of threads that are processing or waiting to process connection initialization and authentication. There can be a maximum of four connection threads per thread group; these threads expire after a period of inactivity.

- `CONNECTION_COUNT`

The number of connections using this thread group.

- `QUEUED_QUERIES`

The number of statements waiting in the high-priority queue.

- `QUEUED_TRANSACTIONS`

The number of statements waiting in the low-priority queue. These are the initial statements for transactions that have not started, so they also represent queued transactions.

- `STALL_LIMIT`

The value of the `thread_pool_stall_limit` system variable for the thread group. This is the same value for all thread groups.

- [PRIO\\_KICKUP\\_TIMER](#)

The value of the [thread\\_pool\\_prio\\_kickup\\_timer](#) system variable for the thread group. This is the same value for all thread groups.

- [ALGORITHM](#)

The value of the [thread\\_pool\\_algorithm](#) system variable for the thread group. This is the same value for all thread groups.

- [THREAD\\_COUNT](#)

The number of threads started in the thread pool as part of this thread group.

- [ACTIVE\\_THREAD\\_COUNT](#)

The number of threads active in executing statements.

- [STALLED\\_THREAD\\_COUNT](#)

The number of stalled statements in the thread group. A stalled statement could be executing, but from a thread pool perspective it is stalled and making no progress. A long-running statement quickly ends up in this category.

- [WAITING\\_THREAD\\_NUMBER](#)

If there is a thread handling the polling of statements in the thread group, this specifies the thread number within this thread group. It is possible that this thread could be executing a statement.

- [OLDEST\\_QUEUED](#)

How long in milliseconds the oldest queued statement has been waiting for execution.

- [MAX\\_THREAD\\_IDS\\_IN\\_GROUP](#)

The maximum thread ID of the threads in the group. This is the same as [MAX\(TP\\_THREAD\\_NUMBER\)](#) for the threads when selected from the [tp\\_thread\\_state](#) table. That is, these two queries are equivalent:

```
SELECT TP_GROUP_ID, MAX_THREAD_IDS_IN_GROUP
FROM tp_thread_group_state;

SELECT TP_GROUP_ID, MAX(TP_THREAD_NUMBER)
FROM tp_thread_state GROUP BY TP_GROUP_ID;
```

The [tp\\_thread\\_group\\_state](#) table has these indexes:

- Unique index on ([TP\\_GROUP\\_ID](#))

[TRUNCATE TABLE](#) is not permitted for the [tp\\_thread\\_group\\_state](#) table.

## 27.12.16.2 The [tp\\_thread\\_group\\_stats](#) Table

### Note

The Performance Schema table described here is available as of MySQL 8.0.14. Prior to MySQL 8.0.14, use the corresponding [INFORMATION\\_SCHEMA](#) table instead; see [Section 26.5.3, “The INFORMATION\\_SCHEMA TP\\_THREAD\\_GROUP\\_STATS Table”](#).

The [tp\\_thread\\_group\\_stats](#) table reports statistics per thread group. There is one row per group.

The [tp\\_thread\\_group\\_stats](#) table has these columns:

- [TP\\_GROUP\\_ID](#)

The thread group ID. This is a unique key within the table.

- [CONNECTIONS\\_STARTED](#)

The number of connections started.

- [CONNECTIONS\\_CLOSED](#)

The number of connections closed.

- [QUERIES\\_EXECUTED](#)

The number of statements executed. This number is incremented when a statement starts executing, not when it finishes.

- [QUERIES\\_QUEUED](#)

The number of statements received that were queued for execution. This does not count statements that the thread group was able to begin executing immediately without queuing, which can happen under the conditions described in [Section 5.6.3.3, “Thread Pool Operation”](#).

- [THREADS\\_STARTED](#)

The number of threads started.

- [PRIO\\_KICKUPS](#)

The number of statements that have been moved from low-priority queue to high-priority queue based on the value of the [thread\\_pool\\_prio\\_kickup\\_timer](#) system variable. If this number increases quickly, consider increasing the value of that variable. A quickly increasing counter means that the priority system is not keeping transactions from starting too early. For [InnoDB](#), this most likely means deteriorating performance due to too many concurrent transactions..

- [STALLED\\_QUERIES\\_EXECUTED](#)

The number of statements that have become defined as stalled due to executing for longer than the value of the [thread\\_pool\\_stall\\_limit](#) system variable.

- [BECOME\\_CONSUMER\\_THREAD](#)

The number of times thread have been assigned the consumer thread role.

- [BECOME\\_RESERVE\\_THREAD](#)

The number of times threads have been assigned the reserve thread role.

- [BECOME\\_WAITING\\_THREAD](#)

The number of times threads have been assigned the waiter thread role. When statements are queued, this happens very often, even in normal operation, so rapid increases in this value are normal in the case of a highly loaded system where statements are queued up.

- [WAKE\\_THREAD\\_STALL\\_CHECKER](#)

The number of times the stall check thread decided to wake or create a thread to possibly handle some statements or take care of the waiter thread role.

- [SLEEP\\_WAITS](#)

The number of [THD\\_WAIT\\_SLEEP](#) waits. These occur when threads go to sleep (for example, by calling the [SLEEP \( \)](#) function).

- [DISK\\_IO\\_WAITS](#)

The number of [THD\\_WAIT\\_DISKIO](#) waits. These occur when threads perform disk I/O that is likely to not hit the file system cache. Such waits occur when the buffer pool reads and writes data to disk, not for normal reads from and writes to files.

- [ROW\\_LOCK\\_WAITS](#)

The number of [THD\\_WAIT\\_ROW\\_LOCK](#) waits for release of a row lock by another transaction.

- [GLOBAL\\_LOCK\\_WAITS](#)

The number of [THD\\_WAIT\\_GLOBAL\\_LOCK](#) waits for a global lock to be released.

- [META\\_DATA\\_LOCK\\_WAITS](#)

The number of [THD\\_WAIT\\_META\\_DATA\\_LOCK](#) waits for a metadata lock to be released.

- [TABLE\\_LOCK\\_WAITS](#)

The number of [THD\\_WAIT\\_TABLE\\_LOCK](#) waits for a table to be unlocked that the statement needs to access.

- [USER\\_LOCK\\_WAITS](#)

The number of [THD\\_WAIT\\_USER\\_LOCK](#) waits for a special lock constructed by the user thread.

- [BINLOG\\_WAITS](#)

The number of [THD\\_WAIT\\_BINLOG\\_WAITS](#) waits for the binary log to become free.

- [GROUP\\_COMMIT\\_WAITS](#)

The number of [THD\\_WAIT\\_GROUP\\_COMMIT](#) waits. These occur when a group commit must wait for the other parties to complete their part of a transaction.

- [FSYNC\\_WAITS](#)

The number of [THD\\_WAIT\\_SYNC](#) waits for a file sync operation.

The [tp\\_thread\\_group\\_stats](#) table has these indexes:

- Unique index on ([TP\\_GROUP\\_ID](#))

[TRUNCATE TABLE](#) is not permitted for the [tp\\_thread\\_group\\_stats](#) table.

### 27.12.16.3 The [tp\\_thread\\_state](#) Table

#### Note

The Performance Schema table described here is available as of MySQL 8.0.14. Prior to MySQL 8.0.14, use the corresponding [INFORMATION\\_SCHEMA](#) table instead; see [Section 26.5.4, “The INFORMATION\\_SCHEMA TP\\_THREAD\\_STATE Table”](#).

The [tp\\_thread\\_state](#) table has one row per thread created by the thread pool to handle connections.

The [tp\\_thread\\_state](#) table has these columns:

- [TP\\_GROUP\\_ID](#)

The thread group ID.

- `TP_THREAD_NUMBER`

The ID of the thread within its thread group. `TP_GROUP_ID` and `TP_THREAD_NUMBER` together provide a unique key within the table.

- `PROCESS_COUNT`

The 10ms interval in which the statement that uses this thread is currently executing. 0 means no statement is executing, 1 means it is in the first 10ms, and so forth.

- `WAIT_TYPE`

The type of wait for the thread. `NULL` means the thread is not blocked. Otherwise, the thread is blocked by a call to `thd_wait_begin()` and the value specifies the type of wait. The `xxx_WAIT` columns of the `tp_thread_group_stats` table accumulate counts for each wait type.

The `WAIT_TYPE` value is a string that describes the type of wait, as shown in the following table.

**Table 27.6 `tp_thread_state` Table `WAIT_TYPE` Values**

| Wait Type                            | Meaning                   |
|--------------------------------------|---------------------------|
| <code>THD_WAIT_SLEEP</code>          | Waiting for sleep         |
| <code>THD_WAIT_DISKIO</code>         | Waiting for Disk IO       |
| <code>THD_WAIT_ROW_LOCK</code>       | Waiting for row lock      |
| <code>THD_WAIT_GLOBAL_LOCK</code>    | Waiting for global lock   |
| <code>THD_WAIT_META_DATA_LOCK</code> | Waiting for metadata lock |
| <code>THD_WAIT_TABLE_LOCK</code>     | Waiting for table lock    |
| <code>THD_WAIT_USER_LOCK</code>      | Waiting for user lock     |
| <code>THD_WAIT_BINLOG</code>         | Waiting for binlog        |
| <code>THD_WAIT_GROUP_COMMIT</code>   | Waiting for group commit  |
| <code>THD_WAIT_SYNC</code>           | Waiting for fsync         |

The `tp_thread_state` table has these indexes:

- Unique index on (`TP_GROUP_ID`, `TP_THREAD_NUMBER`)

`TRUNCATE TABLE` is not permitted for the `tp_thread_state` table.

## 27.12.17 Performance Schema Firewall Tables

### Note

The Performance Schema tables described here are available as of MySQL 8.0.23. Prior to MySQL 8.0.23, use the corresponding `INFORMATION_SCHEMA` tables instead; see [MySQL Enterprise Firewall Tables](#).

The following sections describe the Performance Schema tables associated with MySQL Enterprise Firewall (see [Section 6.4.7, “MySQL Enterprise Firewall”](#)). They provide information about firewall operation:

- `firewall_groups`: Information about firewall group profiles.
- `firewall_group_allowlist`: Allowlist rules of registered firewall group profiles.
- `firewall_membership`: Members (accounts) of registered firewall group profiles.

### 27.12.17.1 The `firewall_groups` Table

The `firewall_groups` table provides a view into the in-memory data cache for MySQL Enterprise Firewall. It lists names and operational modes of registered firewall group profiles. It is used in conjunction with the `mysql.firewall_groups` system table that provides persistent storage of firewall data; see [MySQL Enterprise Firewall Tables](#).

The `firewall_groups` table has these columns:

- `NAME`

The group profile name.

- `MODE`

The current operational mode for the profile. Permitted mode values are `OFF`, `DETECTING`, `PROTECTING`, and `RECORDING`. For details about their meanings, see [Firewall Concepts](#).

- `USERHOST`

The training account for the group profile, to be used when the profile is in `RECORDING` mode. The value is `NULL`, or a non-`NULL` account that has the format `user_name@host_name`:

- If the value is `NULL`, the firewall records allowlist rules for statements received from any account that is a member of the group.
- If the value is non-`NULL`, the firewall records allowlist rules only for statements received from the named account (which should be a member of the group).

The `firewall_groups` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `firewall_groups` table.

The `firewall_groups` table was added in MySQL 8.0.23.

### 27.12.17.2 The `firewall_group_allowlist` Table

The `firewall_group_allowlist` table provides a view into the in-memory data cache for MySQL Enterprise Firewall. It lists allowlist rules of registered firewall group profiles. It is used in conjunction with the `mysql.firewall_group_allowlist` system table that provides persistent storage of firewall data; see [MySQL Enterprise Firewall Tables](#).

The `firewall_group_allowlist` table has these columns:

- `NAME`

The group profile name.

- `RULE`

A normalized statement indicating an acceptable statement pattern for the profile. A profile allowlist is the union of its rules.

The `firewall_group_allowlist` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `firewall_group_allowlist` table.

The `firewall_group_allowlist` table was added in MySQL 8.0.23.

### 27.12.17.3 The `firewall_membership` Table

The `firewall_membership` table provides a view into the in-memory data cache for MySQL Enterprise Firewall. It lists the members (accounts) of registered firewall group profiles. It is used in conjunction with the `mysql.firewall_membership` system table that provides persistent storage of firewall data; see [MySQL Enterprise Firewall Tables](#).

The `firewall_membership` table has these columns:

- `GROUP_ID`

The group profile name.

- `MEMBER_ID`

The name of an account that is a member of the profile.

The `firewall_membership` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `firewall_membership` table.

The `firewall_membership` table was added in MySQL 8.0.23.

## 27.12.18 Performance Schema Keyring Tables

The following sections describe the Performance Schema tables associated with the MySQL keyring (see [Section 6.4.4, “The MySQL Keyring”](#)). They provide information about keyring operation:

- `keyring_component_status`: Information about the keyring component in use.
- `keyring_keys`: Metadata for keys in the MySQL keyring.

### 27.12.18.1 The `keyring_component_status` Table

The `keyring_component_status` table (available as of MySQL 8.0.24) provides status information about the properties of the keyring component in use, if one is installed. The table is empty if no keyring component is installed (for example, if the keyring is not being used, or is configured to manage the keystore using a keyring plugin rather than a keyring component).

There is no fixed set of properties. Each keyring component is free to define its own set.

Example `keyring_component_status` contents:

```
mysql> SELECT * FROM performance_schema.keyring_component_status;
```

| STATUS_KEY          | STATUS_VALUE                                    |
|---------------------|-------------------------------------------------|
| Component_name      | component_keyring_file                          |
| Author              | Oracle Corporation                              |
| License             | GPL                                             |
| Implementation_name | component_keyring_file                          |
| Version             | 1.0                                             |
| Component_status    | Active                                          |
| Data_file           | /usr/local/mysql/keyring/component_keyring_file |
| Read_only           | No                                              |

The `keyring_component_status` table has these columns:

- `STATUS_KEY`

The status item name.

- `STATUS_VALUE`

The status item value.

The `keyring_component_status` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `keyring_component_status` table.

### 27.12.18.2 The `keyring_keys` table

MySQL Server supports a keyring that enables internal server components and plugins to securely store sensitive information for later retrieval. See [Section 6.4.4, “The MySQL Keyring”](#).

As of MySQL 8.0.16, the `keyring_keys` table exposes metadata for keys in the keyring. Key metadata includes key IDs, key owners, and backend key IDs. The `keyring_keys` table does *not* expose any sensitive keyring data such as key contents.

The `keyring_keys` table has these columns:

- `KEY_ID`

The key identifier.

- `KEY_OWNER`

The owner of the key.

- `BACKEND_KEY_ID`

The ID used for the key by the keyring backend.

The `keyring_keys` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `keyring_keys` table.

## 27.12.19 Performance Schema Clone Tables

### Note

The Performance Schema tables described here are available as of MySQL 8.0.17.

The following sections describe the Performance Schema tables associated with the clone plugin (see [Section 5.6.7, “The Clone Plugin”](#)). The tables provide information about cloning operations.

- `clone_status`: status information about the current or last executed cloning operation.
- `clone_progress`: progress information about the current or last executed cloning operation.

The Performance Schema clone tables are implemented by the clone plugin and are loaded and unloaded when that plugin is loaded and unloaded (see [Section 5.6.7.1, “Installing the Clone Plugin”](#)). No special configuration step for the tables is needed. However, the tables depend on the clone plugin being enabled. If the clone plugin is loaded but disabled, the tables are not created.

The Performance Schema clone plugin tables are used only on the recipient MySQL server instance. The data is persisted across server shutdown and restart.

### 27.12.19.1 The `clone_status` Table

### Note

The Performance Schema table described here is available as of MySQL 8.0.17.

The `clone_status` table shows the status of the current or last executed cloning operation only. The table only ever contains one row of data, or is empty.

The `clone_status` table has these columns:

- `ID`

A unique cloning operation identifier in the current MySQL server instance.

- `PID`

Process list ID of the session executing the cloning operation.

- `STATE`

Current state of the cloning operation. Values include `Not Started`, `In Progress`, `Completed`, and `Failed`.

- `BEGIN_TIME`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the cloning operation started.

- `END_TIME`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the cloning operation finished. Reports NULL if the operation has not ended.

- `SOURCE`

The donor MySQL server address in '`HOST:PORT`' format. The column displays '`LOCAL INSTANCE`' for a local cloning operation.

- `DESTINATION`

The directory being cloned to.

- `ERROR_NO`

The error number reported for a failed cloning operation.

- `ERROR_MESSAGE`

The error message string for a failed cloning operation.

- `BINLOG_FILE`

The name of the binary log file up to which data is cloned.

- `BINLOG_POSITION`

The binary log file offset up to which data is cloned.

- `GTID_EXECUTED`

The GTID value for the last cloned transaction.

The `clone_status` table is read-only. DDL, including `TRUNCATE TABLE`, is not permitted.

### 27.12.19.2 The `clone_progress` Table

**Note**

The Performance Schema table described here is available as of MySQL 8.0.17.

The `clone_progress` table shows progress information for the current or last executed cloning operation only.

The stages of a cloning operation include `DROP DATA`, `FILE COPY`, `PAGE_COPY`, `REDO_COPY`, `FILE_SYNC`, `RESTART`, and `RECOVERY`. A cloning operation produces a record for each stage. The table therefore only ever contains seven rows of data, or is empty.

The `clone_progress` table has these columns:

- `ID`

A unique cloning operation identifier in the current MySQL server instance.

- `STAGE`

The name of the current cloning stage. Stages include `DROP DATA`, `FILE COPY`, `PAGE_COPY`, `REDO_COPY`, `FILE_SYNC`, `RESTART`, and `RECOVERY`.

- `STATE`

The current state of the cloning stage. States include `Not Started`, `In Progress`, and `Completed`.

- `BEGIN_TIME`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the cloning stage started. Reports NULL if the stage has not started.

- `END_TIME`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the cloning stage finished. Reports NULL if the stage has not ended.

- `THREADS`

The number of concurrent threads used in the stage.

- `ESTIMATE`

The estimated amount of data for the current stage, in bytes.

- `DATA`

The amount of data transferred in current state, in bytes.

- `NETWORK`

The amount of network data transferred in the current state, in bytes.

- `DATA_SPEED`

The current actual speed of data transfer, in bytes per second. This value may differ from the requested maximum data transfer rate defined by `clone_max_data_bandwidth`.

- `NETWORK_SPEED`

The current speed of network transfer in bytes per second.

The `clone_progress` table is read-only. DDL, including `TRUNCATE TABLE`, is not permitted.

## 27.12.20 Performance Schema Summary Tables

Summary tables provide aggregated information for terminated events over time. The tables in this group summarize event data in different ways.

Each summary table has grouping columns that determine how to group the data to be aggregated, and summary columns that contain the aggregated values. Tables that summarize events in similar ways often have similar sets of summary columns and differ only in the grouping columns used to determine how events are aggregated.

Summary tables can be truncated with `TRUNCATE TABLE`. Generally, the effect is to reset the summary columns to 0 or `NULL`, not to remove rows. This enables you to clear collected values and restart aggregation. That might be useful, for example, after you have made a runtime configuration change. Exceptions to this truncation behavior are noted in individual summary table sections.

## Wait Event Summaries

**Table 27.7 Performance Schema Wait Event Summary Tables**

| Table Name                                                 | Description                              |
|------------------------------------------------------------|------------------------------------------|
| <code>events_waits_summary_by_account_by_event_name</code> | Wait events per account and event name   |
| <code>events_waits_summary_by_host_by_event_name</code>    | Wait events per host name and event name |
| <code>events_waits_summary_by_instance</code>              | Wait events per instance                 |
| <code>events_waits_summary_by_thread_by_event_name</code>  | Wait events per thread and event name    |
| <code>events_waits_summary_by_user_by_event_name</code>    | Wait events per user name and event name |
| <code>events_waits_summary_global_by_event_name</code>     | Wait events per event name               |

## Stage Summaries

**Table 27.8 Performance Schema Stage Event Summary Tables**

| Table Name                                                  | Description                               |
|-------------------------------------------------------------|-------------------------------------------|
| <code>events_stages_summary_by_account_by_event_name</code> | Stage events per account and event name   |
| <code>events_stages_summary_by_host_by_event_name</code>    | Stage events per host name and event name |
| <code>events_stages_summary_by_thread_by_event_name</code>  | Stage waits per thread and event name     |
| <code>events_stages_summary_by_user_by_event_name</code>    | Stage events per user name and event name |
| <code>events_stages_summary_global_by_event_name</code>     | Stage waits per event name                |

## Statement Summaries

**Table 27.9 Performance Schema Statement Event Summary Tables**

| Table Name                                                      | Description                                      |
|-----------------------------------------------------------------|--------------------------------------------------|
| <code>events_statements_histogram_by_digest</code>              | Statement histograms per schema and digest value |
| <code>events_statements_histogram_global</code>                 | Statement histogram summarized globally          |
| <code>events_statements_summary_by_account_by_event_name</code> | Statement events per account and event name      |
| <code>events_statements_summary_by_digest</code>                | Statement events per schema and digest value     |
| <code>events_statements_summary_by_host_by_event_name</code>    | Statement events per host name and event name    |
| <code>events_statements_summary_by_program</code>               | Statement events per stored program              |
| <code>events_statements_summary_by_thread_by_event_name</code>  | Statement events per thread and event name       |
| <code>events_statements_summary_by_user_by_event_name</code>    | Statement events per user name and event name    |
| <code>events_statements_summary_global_by_event_name</code>     | Statement events per event name                  |
| <code>prepared_statements_instances</code>                      | Prepared statement instances and statistics      |

## Transaction Summaries

**Table 27.10 Performance Schema Transaction Event Summary Tables**

| Table Name                                                        | Description                                   |
|-------------------------------------------------------------------|-----------------------------------------------|
| <code>events_transactions_summary_by_account_by_event_name</code> | Transaction events per account and event name |

| Table Name                                                       | Description                                     |
|------------------------------------------------------------------|-------------------------------------------------|
| <code>events_transactions_summary_by_host_by_event_name</code>   | Transaction events per host name and event name |
| <code>events_transactions_summary_by_thread_by_event_name</code> | Transaction events per thread and event name    |
| <code>events_transactions_summary_by_user_by_event_name</code>   | Transaction events per user name and event name |
| <code>events_transactions_summary_global_by_event_name</code>    | Transaction events per event name               |

## Object Wait Summaries

**Table 27.11 Performance Schema Object Event Summary Tables**

| Table Name                                  | Description      |
|---------------------------------------------|------------------|
| <code>objects_summary_global_by_type</code> | Object summaries |

## File I/O Summaries

**Table 27.12 Performance Schema File I/O Event Summary Tables**

| Table Name                              | Description                   |
|-----------------------------------------|-------------------------------|
| <code>file_summary_by_event_name</code> | File events per event name    |
| <code>file_summary_by_instance</code>   | File events per file instance |

## Table I/O and Lock Wait Summaries

**Table 27.13 Performance Schema Table I/O and Lock Wait Event Summary Tables**

| Table Name                                         | Description                |
|----------------------------------------------------|----------------------------|
| <code>table_io_waits_summary_by_index_usage</code> | Table I/O waits per index  |
| <code>table_io_waits_summary_by_table</code>       | Table I/O waits per table  |
| <code>table_lock_waits_summary_by_table</code>     | Table lock waits per table |

## Socket Summaries

**Table 27.14 Performance Schema Socket Event Summary Tables**

| Table Name                                | Description                         |
|-------------------------------------------|-------------------------------------|
| <code>socket_summary_by_event_name</code> | Socket waits and I/O per event name |
| <code>socket_summary_by_instance</code>   | Socket waits and I/O per instance   |

## Memory Summaries

**Table 27.15 Performance Schema Memory Operation Summary Tables**

| Table Name                                           | Description                                  |
|------------------------------------------------------|----------------------------------------------|
| <code>memory_summary_by_account_by_event_name</code> | Memory operations per account and event name |
| <code>memory_summary_by_host_by_event_name</code>    | Memory operations per host and event name    |
| <code>memory_summary_by_thread_by_event_name</code>  | Memory operations per thread and event name  |
| <code>memory_summary_by_user_by_event_name</code>    | Memory operations per user and event name    |
| <code>memory_summary_global_by_event_name</code>     | Memory operations globally per event name    |

## Error Summaries

**Table 27.16 Performance Schema Error Summary Tables**

| Table Name                                                     | Description                       |
|----------------------------------------------------------------|-----------------------------------|
| <a href="#">events_errors_summary_by_account_by_error_code</a> | Errors per account and error code |
| <a href="#">events_errors_summary_by_host_by_error_code</a>    | Errors per host and error code    |
| <a href="#">events_errors_summary_by_thread_by_error_code</a>  | Errors per thread and error code  |
| <a href="#">events_errors_summary_by_user_by_error_code</a>    | Errors per user and error code    |
| <a href="#">events_errors_summary_global_by_error_code</a>     | Errors per error code             |

## Status Variable Summaries

**Table 27.17 Performance Schema Error Status Variable Summary Tables**

| Table Name                        | Description                            |
|-----------------------------------|----------------------------------------|
| <a href="#">status_by_account</a> | Session status variables per account   |
| <a href="#">status_by_host</a>    | Session status variables per host name |
| <a href="#">status_by_user</a>    | Session status variables per user name |

### 27.12.20.1 Wait Event Summary Tables

The Performance Schema maintains tables for collecting current and recent wait events, and aggregates that information in summary tables. [Section 27.12.4, “Performance Schema Wait Event Tables”](#) describes the events on which wait summaries are based. See that discussion for information about the content of wait events, the current and recent wait event tables, and how to control wait event collection, which is disabled by default.

Example wait event summary information:

```
mysql> SELECT *
 FROM performance_schema.events_waits_summary_global_by_event_name\G
...
***** 6. row *****
EVENT_NAME: wait/synch/mutex/sql/BINARY_LOG::LOCK_index
COUNT_STAR: 8
SUM_TIMER_WAIT: 2119302
MIN_TIMER_WAIT: 196092
AVG_TIMER_WAIT: 264912
MAX_TIMER_WAIT: 569421
...
***** 9. row *****
EVENT_NAME: wait/synch/mutex/sql/hash_filo::lock
COUNT_STAR: 69
SUM_TIMER_WAIT: 16848828
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 244185
MAX_TIMER_WAIT: 735345
...
```

Each wait event summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the [setup\\_instruments](#) table:

- [events\\_waits\\_summary\\_by\\_account\\_by\\_event\\_name](#) has [EVENT\\_NAME](#), [USER](#), and [HOST](#) columns. Each row summarizes events for a given account (user and host combination) and event name.
- [events\\_waits\\_summary\\_by\\_host\\_by\\_event\\_name](#) has [EVENT\\_NAME](#) and [HOST](#) columns. Each row summarizes events for a given host and event name.

- `events_waits_summary_by_instance` has `EVENT_NAME` and `OBJECT_INSTANCE_BEGIN` columns. Each row summarizes events for a given event name and object. If an instrument is used to create multiple instances, each instance has a unique `OBJECT_INSTANCE_BEGIN` value and is summarized separately in this table.
- `events_waits_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `events_waits_summary_by_user_by_event_name` has `EVENT_NAME` and `USER` columns. Each row summarizes events for a given user and event name.
- `events_waits_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name. An instrument might be used to create multiple instances of the instrumented object. For example, if there is an instrument for a mutex that is created for each connection, there are as many instances as there are connections. The summary row for the instrument summarizes over all these instances.

Each wait event summary table has these summary columns containing aggregated values:

- `COUNT_STAR`  
The number of summarized events. This value includes all events, whether timed or nontimed.
- `SUM_TIMER_WAIT`  
The total wait time of the summarized timed events. This value is calculated only for timed events because nontimed events have a wait time of `NULL`. The same is true for the other `xxx_TIMER_WAIT` values.
- `MIN_TIMER_WAIT`  
The minimum wait time of the summarized timed events.
- `AVG_TIMER_WAIT`  
The average wait time of the summarized timed events.
- `MAX_TIMER_WAIT`  
The maximum wait time of the summarized timed events.

The wait event summary tables have these indexes:

- `events_waits_summary_by_account_by_event_name`:
  - Primary key on (`USER`, `HOST`, `EVENT_NAME`)
- `events_waits_summary_by_host_by_event_name`:
  - Primary key on (`HOST`, `EVENT_NAME`)
- `events_waits_summary_by_instance`:
  - Primary key on (`OBJECT_INSTANCE_BEGIN`)
  - Index on (`EVENT_NAME`)
- `events_waits_summary_by_thread_by_event_name`:
  - Primary key on (`THREAD_ID`, `EVENT_NAME`)
- `events_waits_summary_by_user_by_event_name`:
  - Primary key on (`USER`, `EVENT_NAME`)

- `events_waits_summary_global_by_event_name`:
  - Primary key on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for wait summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each wait summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `events_waits_summary_global_by_event_name`. For details, see [Section 27.12.8, “Performance Schema Connection Tables”](#).

## 27.12.20.2 Stage Summary Tables

The Performance Schema maintains tables for collecting current and recent stage events, and aggregates that information in summary tables. [Section 27.12.5, “Performance Schema Stage Event Tables”](#) describes the events on which stage summaries are based. See that discussion for information about the content of stage events, the current and historical stage event tables, and how to control stage event collection, which is disabled by default.

Example stage event summary information:

```
mysql> SELECT *
 FROM performance_schema.events_stages_summary_global_by_event_name\G
...
***** 5. row *****
 EVENT_NAME: stage/sql/checking permissions
 COUNT_STAR: 57
 SUM_TIMER_WAIT: 26501888880
 MIN_TIMER_WAIT: 7317456
 AVG_TIMER_WAIT: 464945295
 MAX_TIMER_WAIT: 12858936792
...
***** 9. row *****
 EVENT_NAME: stage/sql/closing tables
 COUNT_STAR: 37
 SUM_TIMER_WAIT: 662606568
 MIN_TIMER_WAIT: 1593864
 AVG_TIMER_WAIT: 17907891
 MAX_TIMER_WAIT: 437977248
...
```

Each stage summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `events_stages_summary_by_account_by_event_name` has `EVENT_NAME`, `USER`, and `HOST` columns. Each row summarizes events for a given account (user and host combination) and event name.
- `events_stages_summary_by_host_by_event_name` has `EVENT_NAME` and `HOST` columns. Each row summarizes events for a given host and event name.
- `events_stages_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `events_stages_summary_by_user_by_event_name` has `EVENT_NAME` and `USER` columns. Each row summarizes events for a given user and event name.
- `events_stages_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

Each stage summary table has these summary columns containing aggregated values: `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, and `MAX_TIMER_WAIT`. These columns are analogous to the columns of the same names in the wait event summary tables (see [Section 27.12.20.1, “Wait Event Summary Tables”](#)), except that the stage summary tables aggregate events from `events_stages_current` rather than `events_waits_current`.

The stage summary tables have these indexes:

- `events_stages_summary_by_account_by_event_name`:
  - Primary key on (`USER`, `HOST`, `EVENT_NAME`)
- `events_stages_summary_by_host_by_event_name`:
  - Primary key on (`HOST`, `EVENT_NAME`)
- `events_stages_summary_by_thread_by_event_name`:
  - Primary key on (`THREAD_ID`, `EVENT_NAME`)
- `events_stages_summary_by_user_by_event_name`:
  - Primary key on (`USER`, `EVENT_NAME`)
- `events_stages_summary_global_by_event_name`:
  - Primary key on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for stage summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each stage summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `events_stages_summary_global_by_event_name`. For details, see [Section 27.12.8, “Performance Schema Connection Tables”](#).

### 27.12.20.3 Statement Summary Tables

The Performance Schema maintains tables for collecting current and recent statement events, and aggregates that information in summary tables. [Section 27.12.6, “Performance Schema Statement Event Tables”](#) describes the events on which statement summaries are based. See that discussion for information about the content of statement events, the current and historical statement event tables, and how to control statement event collection, which is partially disabled by default.

Example statement event summary information:

```
mysql> SELECT *
 FROM performance_schema.events_statements_summary_global_by_event_name\G
***** 1. row *****
 EVENT_NAME: statement/sql/select
 COUNT_STAR: 25
 SUM_TIMER_WAIT: 1535983999000
 MIN_TIMER_WAIT: 209823000
 AVG_TIMER_WAIT: 61439359000
 MAX_TIMER_WAIT: 1363397650000
 SUM_LOCK_TIME: 20186000000
 SUM_ERRORS: 0
 SUM_WARNINGS: 0
 SUM_ROWS_AFFECTED: 0
 SUM_ROWS_SENT: 388
```

```

SUM_ROWS_EXAMINED: 370
SUM_CREATED_TMP_DISK_TABLES: 0
SUM_CREATED_TMP_TABLES: 0
SUM_SELECT_FULL_JOIN: 0
SUM_SELECT_FULL_RANGE_JOIN: 0
SUM_SELECT_RANGE: 0
SUM_SELECT_RANGE_CHECK: 0
SUM_SELECT_SCAN: 6
SUM_SORT_MERGE_PASSES: 0
SUM_SORT_RANGE: 0
SUM_SORT_ROWS: 0
SUM_SORT_SCAN: 0
SUM_NO_INDEX_USED: 6
SUM_NO_GOOD_INDEX_USED: 0
...

```

Each statement summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the [setup\\_instruments](#) table:

- [events\\_statements\\_summary\\_by\\_account\\_by\\_event\\_name](#) has [EVENT\\_NAME](#), [USER](#), and [HOST](#) columns. Each row summarizes events for a given account (user and host combination) and event name.
- [events\\_statements\\_summary\\_by\\_digest](#) has [SCHEMA\\_NAME](#) and [DIGEST](#) columns. Each row summarizes events per schema and digest value. (The [DIGEST\\_TEXT](#) column contains the corresponding normalized statement digest text, but is neither a grouping nor a summary column. The [QUERY\\_SAMPLE\\_TEXT](#), [QUERY\\_SAMPLE\\_SEEN](#), and [QUERY\\_SAMPLE\\_TIMER\\_WAIT](#) columns also are neither grouping nor summary columns; they support statement sampling.)

The maximum number of rows in the table is autosized at server startup. To set this maximum explicitly, set the [performance\\_schema\\_digests\\_size](#) system variable at server startup.

- [events\\_statements\\_summary\\_by\\_host\\_by\\_event\\_name](#) has [EVENT\\_NAME](#) and [HOST](#) columns. Each row summarizes events for a given host and event name.
- [events\\_statements\\_summary\\_by\\_program](#) has [OBJECT\\_TYPE](#), [OBJECT\\_SCHEMA](#), and [OBJECT\\_NAME](#) columns. Each row summarizes events for a given stored program (stored procedure or function, trigger, or event).
- [events\\_statements\\_summary\\_by\\_thread\\_by\\_event\\_name](#) has [THREAD\\_ID](#) and [EVENT\\_NAME](#) columns. Each row summarizes events for a given thread and event name.
- [events\\_statements\\_summary\\_by\\_user\\_by\\_event\\_name](#) has [EVENT\\_NAME](#) and [USER](#) columns. Each row summarizes events for a given user and event name.
- [events\\_statements\\_summary\\_global\\_by\\_event\\_name](#) has an [EVENT\\_NAME](#) column. Each row summarizes events for a given event name.
- [prepared\\_statements\\_instances](#) has an [OBJECT\\_INSTANCE\\_BEGIN](#) column. Each row summarizes events for a given prepared statement.

Each statement summary table has these summary columns containing aggregated values (with exceptions as noted):

- [COUNT\\_STAR](#), [SUM\\_TIMER\\_WAIT](#), [MIN\\_TIMER\\_WAIT](#), [AVG\\_TIMER\\_WAIT](#), [MAX\\_TIMER\\_WAIT](#)

These columns are analogous to the columns of the same names in the wait event summary tables (see [Section 27.12.20.1, “Wait Event Summary Tables”](#)), except that the statement summary tables aggregate events from [events\\_statements\\_current](#) rather than [events\\_waits\\_current](#).

The [prepared\\_statements\\_instances](#) table does not have these columns.

- [SUM\\_xxx](#)

The aggregate of the corresponding `xxx` column in the `events_statements_current` table. For example, the `SUM_LOCK_TIME` and `SUM_ERRORS` columns in statement summary tables are the aggregates of the `LOCK_TIME` and `ERRORS` columns in `events_statements_current` table.

The `events_statements_summary_by_digest` table has these additional summary columns:

- `FIRST_SEEN`, `LAST_SEEN`

Timestamps indicating when statements with the given digest value were first seen and most recently seen.

- `QUANTILE_95`: The 95th percentile of the statement latency, in picoseconds. This percentile is a high estimate, computed from the histogram data collected. In other words, for a given digest, 95% of the statements measured have a latency lower than `QUANTILE_95`.

For access to the histogram data, use the tables described in [Section 27.12.20.4, “Statement Histogram Summary Tables”](#).

- `QUANTILE_99`: Similar to `QUANTILE_95`, but for the 99th percentile.
- `QUANTILE_999`: Similar to `QUANTILE_95`, but for the 99.9th percentile.

The `events_statements_summary_by_digest` table contains the following columns. These are neither grouping nor summary columns; they support statement sampling:

- `QUERY_SAMPLE_TEXT`

A sample SQL statement that produces the digest value in the row. This column enables applications to access, for a given digest value, a statement actually seen by the server that produces that digest. One use for this might be to run `EXPLAIN` on the statement to examine the execution plan for a representative statement associated with a frequently occurring digest.

When the `QUERY_SAMPLE_TEXT` column is assigned a value, the `QUERY_SAMPLE_SEEN` and `QUERY_SAMPLE_TIMER_WAIT` columns are assigned values as well.

The maximum space available for statement display is 1024 bytes by default. To change this value, set the `performance_schema_max_sql_text_length` system variable at server startup. (Changing this value affects columns in other Performance Schema tables as well. See [Section 27.10, “Performance Schema Statement Digests and Sampling”](#).)

For information about statement sampling, see [Section 27.10, “Performance Schema Statement Digests and Sampling”](#).

- `QUERY_SAMPLE_SEEN`

A timestamp indicating when the statement in the `QUERY_SAMPLE_TEXT` column was seen.

- `QUERY_SAMPLE_TIMER_WAIT`

The wait time for the sample statement in the `QUERY_SAMPLE_TEXT` column.

The `events_statements_summary_by_program` table has these additional summary columns:

- `COUNT_STATEMENTS`, `SUM_STATEMENTS_WAIT`, `MIN_STATEMENTS_WAIT`, `AVG_STATEMENTS_WAIT`, `MAX_STATEMENTS_WAIT`

Statistics about nested statements invoked during stored program execution.

The `prepared_statements_instances` table has these additional summary columns:

- `COUNT_EXECUTE`, `SUM_TIMER_EXECUTE`, `MIN_TIMER_EXECUTE`, `AVG_TIMER_EXECUTE`, `MAX_TIMER_EXECUTE`

Aggregated statistics for executions of the prepared statement.

The statement summary tables have these indexes:

- `events_transactions_summary_by_account_by_event_name`:
  - Primary key on (`USER`, `HOST`, `EVENT_NAME`)
- `events_statements_summary_by_digest`:
  - Primary key on (`SCHEMA_NAME`, `DIGEST`)
- `events_transactions_summary_by_host_by_event_name`:
  - Primary key on (`HOST`, `EVENT_NAME`)
- `events_statements_summary_by_program`:
  - Primary key on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)
- `events_statements_summary_by_thread_by_event_name`:
  - Primary key on (`THREAD_ID`, `EVENT_NAME`)
- `events_transactions_summary_by_user_by_event_name`:
  - Primary key on (`USER`, `EVENT_NAME`)
- `events_statements_summary_global_by_event_name`:
  - Primary key on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for statement summary tables. It has these effects:

- For `events_statements_summary_by_digest`, it removes the rows.
- For other summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For other summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each statement summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `events_statements_summary_global_by_event_name`. For details, see [Section 27.12.8, “Performance Schema Connection Tables”](#).

In addition, truncating `events_statements_summary_by_digest` implicitly truncates `events_statements_histogram_by_digest`, and truncating `events_statements_summary_global_by_event_name` implicitly truncates `events_statements_histogram_global`.

## Statement Digest Aggregation Rules

If the `statements_digest` consumer is enabled, aggregation into `events_statements_summary_by_digest` occurs as follows when a statement completes. Aggregation is based on the `DIGEST` value computed for the statement.

- If a `events_statements_summary_by_digest` row already exists with the digest value for the statement that just completed, statistics for the statement are aggregated to that row. The `LAST_SEEN` column is updated to the current time.

- If no row has the digest value for the statement that just completed, and the table is not full, a new row is created for the statement. The `FIRST_SEEN` and `LAST_SEEN` columns are initialized with the current time.
- If no row has the statement digest value for the statement that just completed, and the table is full, the statistics for the statement that just completed are added to a special “catch-all” row with `DIGEST = NULL`, which is created if necessary. If the row is created, the `FIRST_SEEN` and `LAST_SEEN` columns are initialized with the current time. Otherwise, the `LAST_SEEN` column is updated with the current time.

The row with `DIGEST = NULL` is maintained because Performance Schema tables have a maximum size due to memory constraints. The `DIGEST = NULL` row permits digests that do not match other rows to be counted even if the summary table is full, using a common “other” bucket. This row helps you estimate whether the digest summary is representative:

- A `DIGEST = NULL` row that has a `COUNT_STAR` value that represents 5% of all digests shows that the digest summary table is very representative; the other rows cover 95% of the statements seen.
- A `DIGEST = NULL` row that has a `COUNT_STAR` value that represents 50% of all digests shows that the digest summary table is not very representative; the other rows cover only half the statements seen. Most likely the DBA should increase the maximum table size so that more of the rows counted in the `DIGEST = NULL` row would be counted using more specific rows instead. By default, the table is autosized, but if this size is too small, set the `performance_schema_digests_size` system variable to a larger value at server startup.

## Stored Program Instrumentation Behavior

For stored program types for which instrumentation is enabled in the `setup_objects` table, `events_statements_summary_by_program` maintains statistics for stored programs as follows:

- A row is added for an object when it is first used in the server.
- The row for an object is removed when the object is dropped.
- Statistics are aggregated in the row for an object as it executes.

See also [Section 27.4.3, “Event Pre-Filtering”](#).

## 27.12.20.4 Statement Histogram Summary Tables

The Performance Schema maintains statement event summary tables that contain information about minimum, maximum, and average statement latency (see [Section 27.12.20.3, “Statement Summary Tables”](#)). Those tables permit high-level assessment of system performance. To permit assessment at a more fine-grained level, the Performance Schema also collects histogram data for statement latencies. These histograms provide additional insight into latency distributions.

[Section 27.12.6, “Performance Schema Statement Event Tables”](#) describes the events on which statement summaries are based. See that discussion for information about the content of statement events, the current and historical statement event tables, and how to control statement event collection, which is partially disabled by default.

Example statement histogram information:

```
mysql> SELECT *
 FROM performance_schema.events_statements_histogram_by_digest
 WHERE SCHEMA_NAME = 'mydb' AND DIGEST = 'bb3f69453119b2d7b3ae40673a9d4c7c'
 AND COUNT_BUCKET > 0 ORDER BY BUCKET_NUMBER\G
***** 1. row *****
 SCHEMA_NAME: mydb
 DIGEST: bb3f69453119b2d7b3ae40673a9d4c7c
 BUCKET_NUMBER: 42
 BUCKET_TIMER_LOW: 66069344
 BUCKET_TIMER_HIGH: 69183097
 COUNT_BUCKET: 1
```

```

COUNT_BUCKET_AND_LOWER: 1
 BUCKET_QUANTILE: 0.058824
***** 2. row *****
 SCHEMA_NAME: mydb
 DIGEST: bb3f69453119b2d7b3ae40673a9d4c7c
 BUCKET_NUMBER: 43
 BUCKET_TIMER_LOW: 69183097
 BUCKET_TIMER_HIGH: 72443596
 COUNT_BUCKET: 1
COUNT_BUCKET_AND_LOWER: 2
 BUCKET_QUANTILE: 0.117647
***** 3. row *****
 SCHEMA_NAME: mydb
 DIGEST: bb3f69453119b2d7b3ae40673a9d4c7c
 BUCKET_NUMBER: 44
 BUCKET_TIMER_LOW: 72443596
 BUCKET_TIMER_HIGH: 75857757
 COUNT_BUCKET: 2
COUNT_BUCKET_AND_LOWER: 4
 BUCKET_QUANTILE: 0.235294
***** 4. row *****
 SCHEMA_NAME: mydb
 DIGEST: bb3f69453119b2d7b3ae40673a9d4c7c
 BUCKET_NUMBER: 45
 BUCKET_TIMER_LOW: 75857757
 BUCKET_TIMER_HIGH: 79432823
 COUNT_BUCKET: 6
COUNT_BUCKET_AND_LOWER: 10
 BUCKET_QUANTILE: 0.625000
...

```

For example, in row 3, these values indicate that 23.52% of queries run in under 75.86 microseconds:

```

BUCKET_TIMER_HIGH: 75857757
BUCKET_QUANTILE: 0.235294

```

In row 4, these values indicate that 62.50% of queries run in under 79.44 microseconds:

```

BUCKET_TIMER_HIGH: 79432823
BUCKET_QUANTILE: 0.625000

```

Each statement histogram summary table has one or more grouping columns to indicate how the table aggregates events:

- `events_statements_histogram_by_digest` has `SCHEMA_NAME`, `DIGEST`, and `BUCKET_NUMBER` columns:
  - The `SCHEMA_NAME` and `DIGEST` columns identify a statement digest row in the `events_statements_summary_by_digest` table.
  - The `events_statements_histogram_by_digest` rows with the same `SCHEMA_NAME` and `DIGEST` values comprise the histogram for that schema/digest combination.
  - Within a given histogram, the `BUCKET_NUMBER` column indicates the bucket number.
- `events_statements_histogram_global` has a `BUCKET_NUMBER` column. This table summarizes latencies globally across schema name and digest values, using a single histogram. The `BUCKET_NUMBER` column indicates the bucket number within this global histogram.

A histogram consists of *N* buckets, where each row represents one bucket, with the bucket number indicated by the `BUCKET_NUMBER` column. Bucket numbers begin with 0.

Each statement histogram summary table has these summary columns containing aggregated values:

- `BUCKET_TIMER_LOW`, `BUCKET_TIMER_HIGH`

A bucket counts statements that have a latency, in picoseconds, measured between `BUCKET_TIMER_LOW` and `BUCKET_TIMER_HIGH`:

- The value of `BUCKET_TIMER_LOW` for the first bucket (`BUCKET_NUMBER = 0`) is 0.
- The value of `BUCKET_TIMER_LOW` for a bucket (`BUCKET_NUMBER = k`) is the same as `BUCKET_TIMER_HIGH` for the previous bucket (`BUCKET_NUMBER = k-1`)
- The last bucket is a catchall for statements that have a latency exceeding previous buckets in the histogram.
- `COUNT_BUCKET`  
The number of statements measured with a latency in the interval from `BUCKET_TIMER_LOW` up to but not including `BUCKET_TIMER_HIGH`.
- `COUNT_BUCKET_AND_LOWER`  
The number of statements measured with a latency in the interval from 0 up to but not including `BUCKET_TIMER_HIGH`.
- `BUCKET_QUANTILE`  
The proportion of statements that fall into this or a lower bucket. This proportion corresponds by definition to `COUNT_BUCKET_AND_LOWER / SUM(COUNT_BUCKET)` and is displayed as a convenience column.

The statement histogram summary tables have these indexes:

- `events_statements_histogram_by_digest`:
  - Unique index on (`SCHEMA_NAME`, `DIGEST`, `BUCKET_NUMBER`)
- `events_statements_histogram_global`:
  - Primary key on (`BUCKET_NUMBER`)

`TRUNCATE TABLE` is permitted for statement histogram summary tables. Truncation sets the `COUNT_BUCKET` and `COUNT_BUCKET_AND_LOWER` columns to 0.

In addition, truncating `events_statements_summary_by_digest` implicitly truncates `events_statements_histogram_by_digest`, and truncating `events_statements_summary_global_by_event_name` implicitly truncates `events_statements_histogram_global`.

## 27.12.20.5 Transaction Summary Tables

The Performance Schema maintains tables for collecting current and recent transaction events, and aggregates that information in summary tables. [Section 27.12.7, “Performance Schema Transaction Tables”](#) describes the events on which transaction summaries are based. See that discussion for information about the content of transaction events, the current and historical transaction event tables, and how to control transaction event collection, which is disabled by default.

Example transaction event summary information:

```
mysql> SELECT *
 FROM performance_schema.events_transactions_summary_global_by_event_name
 LIMIT 1\G
***** 1. row *****
 EVENT_NAME: transaction
 COUNT_STAR: 5
 SUM_TIMER_WAIT: 19550092000
 MIN_TIMER_WAIT: 2954148000
 AVG_TIMER_WAIT: 3910018000
 MAX_TIMER_WAIT: 5486275000
 COUNT_READ_WRITE: 5
```

```

SUM_TIMER_READ_WRITE: 19550092000
MIN_TIMER_READ_WRITE: 2954148000
AVG_TIMER_READ_WRITE: 3910018000
MAX_TIMER_READ_WRITE: 5486275000
COUNT_READ_ONLY: 0
SUM_TIMER_READ_ONLY: 0
MIN_TIMER_READ_ONLY: 0
AVG_TIMER_READ_ONLY: 0
MAX_TIMER_READ_ONLY: 0

```

Each transaction summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the [setup\\_instruments](#) table:

- [events\\_transactions\\_summary\\_by\\_account\\_by\\_event\\_name](#) has [USER](#), [HOST](#), and [EVENT\\_NAME](#) columns. Each row summarizes events for a given account (user and host combination) and event name.
- [events\\_transactions\\_summary\\_by\\_host\\_by\\_event\\_name](#) has [HOST](#) and [EVENT\\_NAME](#) columns. Each row summarizes events for a given host and event name.
- [events\\_transactions\\_summary\\_by\\_thread\\_by\\_event\\_name](#) has [THREAD\\_ID](#) and [EVENT\\_NAME](#) columns. Each row summarizes events for a given thread and event name.
- [events\\_transactions\\_summary\\_by\\_user\\_by\\_event\\_name](#) has [USER](#) and [EVENT\\_NAME](#) columns. Each row summarizes events for a given user and event name.
- [events\\_transactions\\_summary\\_global\\_by\\_event\\_name](#) has an [EVENT\\_NAME](#) column. Each row summarizes events for a given event name.

Each transaction summary table has these summary columns containing aggregated values:

- [COUNT\\_STAR](#), [SUM\\_TIMER\\_WAIT](#), [MIN\\_TIMER\\_WAIT](#), [AVG\\_TIMER\\_WAIT](#), [MAX\\_TIMER\\_WAIT](#)

These columns are analogous to the columns of the same names in the wait event summary tables (see [Section 27.12.20.1, “Wait Event Summary Tables”](#)), except that the transaction summary tables aggregate events from [events\\_transactions\\_current](#) rather than [events\\_waits\\_current](#). These columns summarize read-write and read-only transactions.

- [COUNT\\_READ\\_WRITE](#), [SUM\\_TIMER\\_READ\\_WRITE](#), [MIN\\_TIMER\\_READ\\_WRITE](#), [AVG\\_TIMER\\_READ\\_WRITE](#), [MAX\\_TIMER\\_READ\\_WRITE](#)

These are similar to the [COUNT\\_STAR](#) and [xxx\\_TIMER\\_WAIT](#) columns, but summarize read-write transactions only. The transaction access mode specifies whether transactions operate in read/write or read-only mode.

- [COUNT\\_READ\\_ONLY](#), [SUM\\_TIMER\\_READ\\_ONLY](#), [MIN\\_TIMER\\_READ\\_ONLY](#), [AVG\\_TIMER\\_READ\\_ONLY](#), [MAX\\_TIMER\\_READ\\_ONLY](#)

These are similar to the [COUNT\\_STAR](#) and [xxx\\_TIMER\\_WAIT](#) columns, but summarize read-only transactions only. The transaction access mode specifies whether transactions operate in read/write or read-only mode.

The transaction summary tables have these indexes:

- [events\\_transactions\\_summary\\_by\\_account\\_by\\_event\\_name](#):
  - Primary key on ([USER](#), [HOST](#), [EVENT\\_NAME](#))
- [events\\_transactions\\_summary\\_by\\_host\\_by\\_event\\_name](#):
  - Primary key on ([HOST](#), [EVENT\\_NAME](#))
- [events\\_transactions\\_summary\\_by\\_thread\\_by\\_event\\_name](#):

- Primary key on ([THREAD\\_ID](#), [EVENT\\_NAME](#))
- [events\\_transactions\\_summary\\_by\\_user\\_by\\_event\\_name](#):
  - Primary key on ([USER](#), [EVENT\\_NAME](#))
- [events\\_transactions\\_summary\\_global\\_by\\_event\\_name](#):
  - Primary key on ([EVENT\\_NAME](#))

[TRUNCATE TABLE](#) is permitted for transaction summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each transaction summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of [events\\_transactions\\_summary\\_global\\_by\\_event\\_name](#). For details, see [Section 27.12.8, “Performance Schema Connection Tables”](#).

## Transaction Aggregation Rules

Transaction event collection occurs without regard to isolation level, access mode, or autocommit mode.

Transaction event collection occurs for all non-aborted transactions initiated by the server, including empty transactions.

Read-write transactions are generally more resource intensive than read-only transactions, therefore transaction summary tables include separate aggregate columns for read-write and read-only transactions.

Resource requirements may also vary with transaction isolation level. However, presuming that only one isolation level would be used per server, aggregation by isolation level is not provided.

### 27.12.20.6 Object Wait Summary Table

The Performance Schema maintains the [objects\\_summary\\_global\\_by\\_type](#) table for aggregating object wait events.

Example object wait event summary information:

```
mysql> SELECT * FROM performance_schema.objects_summary_global_by_type\G
...
***** 3. row *****
 OBJECT_TYPE: TABLE
 OBJECT_SCHEMA: test
 OBJECT_NAME: t
 COUNT_STAR: 3
 SUM_TIMER_WAIT: 263126976
 MIN_TIMER_WAIT: 1522272
 AVG_TIMER_WAIT: 87708678
 MAX_TIMER_WAIT: 258428280
...
***** 10. row *****
 OBJECT_TYPE: TABLE
 OBJECT_SCHEMA: mysql
 OBJECT_NAME: user
 COUNT_STAR: 14
 SUM_TIMER_WAIT: 365567592
 MIN_TIMER_WAIT: 1141704
```

```
AVG_TIMER_WAIT: 26111769
MAX_TIMER_WAIT: 334783032
...
```

The `objects_summary_global_by_type` table has these grouping columns to indicate how the table aggregates events: `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME`. Each row summarizes events for the given object.

`objects_summary_global_by_type` has the same summary columns as the `events_waits_summary_by_xxx` tables. See [Section 27.12.20.1, “Wait Event Summary Tables”](#).

The `objects_summary_global_by_type` table has these indexes:

- Primary key on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)

`TRUNCATE TABLE` is permitted for the object summary table. It resets the summary columns to zero rather than removing rows.

## 27.12.20.7 File I/O Summary Tables

The Performance Schema maintains file I/O summary tables that aggregate information about I/O operations.

Example file I/O event summary information:

```
mysql> SELECT * FROM performance_schema.file_summary_by_event_name\G
...
***** 2. row *****
 EVENT_NAME: wait/io/file/sql/binlog
 COUNT_STAR: 31
 SUM_TIMER_WAIT: 8243784888
 MIN_TIMER_WAIT: 0
 AVG_TIMER_WAIT: 265928484
 MAX_TIMER_WAIT: 6490658832
...
mysql> SELECT * FROM performance_schema.file_summary_by_instance\G
...
***** 2. row *****
 FILE_NAME: /var/mysql/share/english/errmsg.sys
 EVENT_NAME: wait/io/file/sql/ERRMSG
 EVENT_NAME: wait/io/file/sql/ERRMSG
 OBJECT_INSTANCE_BEGIN: 4686193384
 COUNT_STAR: 5
 SUM_TIMER_WAIT: 13990154448
 MIN_TIMER_WAIT: 26349624
 AVG_TIMER_WAIT: 2798030607
 MAX_TIMER_WAIT: 8150662536
...
```

Each file I/O summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `file_summary_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.
- `file_summary_by_instance` has `FILE_NAME`, `EVENT_NAME`, and `OBJECT_INSTANCE_BEGIN` columns. Each row summarizes events for a given file and event name.

Each file I/O summary table has the following summary columns containing aggregated values. Some columns are more general and have values that are the same as the sum of the values of more fine-grained columns. In this way, aggregations at higher levels are available directly without the need for user-defined views that sum lower-level columns.

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns aggregate all I/O operations.

- `COUNT_READ`, `SUM_TIMER_READ`, `MIN_TIMER_READ`, `AVG_TIMER_READ`, `MAX_TIMER_READ`, `SUM_NUMBER_OF_BYTES_READ`

These columns aggregate all read operations, including `FGETS`, `FGETC`, `FREAD`, and `READ`.

- `COUNT_WRITE`, `SUM_TIMER_WRITE`, `MIN_TIMER_WRITE`, `AVG_TIMER_WRITE`, `MAX_TIMER_WRITE`, `SUM_NUMBER_OF_BYTES_WRITE`

These columns aggregate all write operations, including `FPUTS`, `FPUTC`, `FPRINTF`, `VFPRINTF`, `FWRITE`, and `PWRITE`.

- `COUNT_MISC`, `SUM_TIMER_MISC`, `MIN_TIMER_MISC`, `AVG_TIMER_MISC`, `MAX_TIMER_MISC`

These columns aggregate all other I/O operations, including `CREATE`, `DELETE`, `OPEN`, `CLOSE`, `STREAM_OPEN`, `STREAM_CLOSE`, `SEEK`, `TELL`, `FLUSH`, `STAT`, `FSTAT`, `CHSIZE`, `RENAME`, and `SYNC`. There are no byte counts for these operations.

The file I/O summary tables have these indexes:

- `file_summary_by_event_name`:
  - Primary key on (`EVENT_NAME`)
- `file_summary_by_instance`:
  - Primary key on (`OBJECT_INSTANCE_BEGIN`)
  - Index on (`FILE_NAME`)
  - Index on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for file I/O summary tables. It resets the summary columns to zero rather than removing rows.

The MySQL server uses several techniques to avoid I/O operations by caching information read from files, so it is possible that statements you might expect to result in I/O events do not do so. You may be able to ensure that I/O does occur by flushing caches or restarting the server to reset its state.

## 27.12.20.8 Table I/O and Lock Wait Summary Tables

The following sections describe the table I/O and lock wait summary tables:

- `table_io_waits_summary_by_index_usage`: Table I/O waits per index
- `table_io_waits_summary_by_table`: Table I/O waits per table
- `table_lock_waits_summary_by_table`: Table lock waits per table

### The `table_io_waits_summary_by_table` Table

The `table_io_waits_summary_by_table` table aggregates all table I/O wait events, as generated by the `wait/io/table/sql/handler` instrument. The grouping is by table.

The `table_io_waits_summary_by_table` table has these grouping columns to indicate how the table aggregates events: `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME`. These columns have the same meaning as in the `events_waits_current` table. They identify the table to which the row applies.

`table_io_waits_summary_by_table` has the following summary columns containing aggregated values. As indicated in the column descriptions, some columns are more general and have values that are the same as the sum of the values of more fine-grained columns. For example, columns that aggregate all writes hold the sum of the corresponding columns that aggregate inserts, updates, and

deletes. In this way, aggregations at higher levels are available directly without the need for user-defined views that sum lower-level columns.

- [COUNT\\_STAR](#), [SUM\\_TIMER\\_WAIT](#), [MIN\\_TIMER\\_WAIT](#), [AVG\\_TIMER\\_WAIT](#), [MAX\\_TIMER\\_WAIT](#)

These columns aggregate all I/O operations. They are the same as the sum of the corresponding [xxx\\_READ](#) and [xxx\\_WRITE](#) columns.

- [COUNT\\_READ](#), [SUM\\_TIMER\\_READ](#), [MIN\\_TIMER\\_READ](#), [AVG\\_TIMER\\_READ](#), [MAX\\_TIMER\\_READ](#)

These columns aggregate all read operations. They are the same as the sum of the corresponding [xxx\\_FETCH](#) columns.

- [COUNT\\_WRITE](#), [SUM\\_TIMER\\_WRITE](#), [MIN\\_TIMER\\_WRITE](#), [AVG\\_TIMER\\_WRITE](#), [MAX\\_TIMER\\_WRITE](#)

These columns aggregate all write operations. They are the same as the sum of the corresponding [xxx\\_INSERT](#), [xxx\\_UPDATE](#), and [xxx\\_DELETE](#) columns.

- [COUNT\\_FETCH](#), [SUM\\_TIMER\\_FETCH](#), [MIN\\_TIMER\\_FETCH](#), [AVG\\_TIMER\\_FETCH](#), [MAX\\_TIMER\\_FETCH](#)

These columns aggregate all fetch operations.

- [COUNT\\_INSERT](#), [SUM\\_TIMER\\_INSERT](#), [MIN\\_TIMER\\_INSERT](#), [AVG\\_TIMER\\_INSERT](#), [MAX\\_TIMER\\_INSERT](#)

These columns aggregate all insert operations.

- [COUNT\\_UPDATE](#), [SUM\\_TIMER\\_UPDATE](#), [MIN\\_TIMER\\_UPDATE](#), [AVG\\_TIMER\\_UPDATE](#), [MAX\\_TIMER\\_UPDATE](#)

These columns aggregate all update operations.

- [COUNT\\_DELETE](#), [SUM\\_TIMER\\_DELETE](#), [MIN\\_TIMER\\_DELETE](#), [AVG\\_TIMER\\_DELETE](#), [MAX\\_TIMER\\_DELETE](#)

These columns aggregate all delete operations.

The [table\\_io\\_waits\\_summary\\_by\\_table](#) table has these indexes:

- Unique index on ([OBJECT\\_TYPE](#), [OBJECT\\_SCHEMA](#), [OBJECT\\_NAME](#))

[TRUNCATE TABLE](#) is permitted for table I/O summary tables. It resets the summary columns to zero rather than removing rows. Truncating this table also truncates the [table\\_io\\_waits\\_summary\\_by\\_index\\_usage](#) table.

### The [table\\_io\\_waits\\_summary\\_by\\_index\\_usage](#) Table

The [table\\_io\\_waits\\_summary\\_by\\_index\\_usage](#) table aggregates all table index I/O wait events, as generated by the [wait/io/table/sql/handler](#) instrument. The grouping is by table index.

The columns of [table\\_io\\_waits\\_summary\\_by\\_index\\_usage](#) are nearly identical to [table\\_io\\_waits\\_summary\\_by\\_table](#). The only difference is the additional group column, [INDEX\\_NAME](#), which corresponds to the name of the index that was used when the table I/O wait event was recorded:

- A value of [PRIMARY](#) indicates that table I/O used the primary index.
- A value of [NULL](#) means that table I/O used no index.
- Inserts are counted against [INDEX\\_NAME](#) = [NULL](#).

The [table\\_io\\_waits\\_summary\\_by\\_index\\_usage](#) table has these indexes:

- Unique index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`, `INDEX_NAME`)

`TRUNCATE TABLE` is permitted for table I/O summary tables. It resets the summary columns to zero rather than removing rows. This table is also truncated by truncation of the `table_io_waits_summary_by_table` table. A DDL operation that changes the index structure of a table may cause the per-index statistics to be reset.

## The `table_lock_waits_summary_by_table` Table

The `table_lock_waits_summary_by_table` table aggregates all table lock wait events, as generated by the `wait/lock/table/sql/handler` instrument. The grouping is by table.

This table contains information about internal and external locks:

- An internal lock corresponds to a lock in the SQL layer. This is currently implemented by a call to `thr_lock()`. In event rows, these locks are distinguished by the `OPERATION` column, which has one of these values:

```
read normal
read with shared locks
read high priority
read no insert
write allow write
write concurrent insert
write delayed
write low priority
write normal
```

- An external lock corresponds to a lock in the storage engine layer. This is currently implemented by a call to `handler::external_lock()`. In event rows, these locks are distinguished by the `OPERATION` column, which has one of these values:

```
read external
write external
```

The `table_lock_waits_summary_by_table` table has these grouping columns to indicate how the table aggregates events: `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME`. These columns have the same meaning as in the `events_waits_current` table. They identify the table to which the row applies.

`table_lock_waits_summary_by_table` has the following summary columns containing aggregated values. As indicated in the column descriptions, some columns are more general and have values that are the same as the sum of the values of more fine-grained columns. For example, columns that aggregate all locks hold the sum of the corresponding columns that aggregate read and write locks. In this way, aggregations at higher levels are available directly without the need for user-defined views that sum lower-level columns.

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns aggregate all lock operations. They are the same as the sum of the corresponding `xxx_READ` and `xxx_WRITE` columns.

- `COUNT_READ`, `SUM_TIMER_READ`, `MIN_TIMER_READ`, `AVG_TIMER_READ`, `MAX_TIMER_READ`

These columns aggregate all read-lock operations. They are the same as the sum of the corresponding `xxx_READ_NORMAL`, `xxx_READ_WITH_SHARED_LOCKS`, `xxx_READ_HIGH_PRIORITY`, and `xxx_READ_NO_INSERT` columns.

- `COUNT_WRITE`, `SUM_TIMER_WRITE`, `MIN_TIMER_WRITE`, `AVG_TIMER_WRITE`, `MAX_TIMER_WRITE`

These columns aggregate all write-lock operations. They are the same as the sum of the corresponding `xxx_WRITE_ALLOW_WRITE`, `xxx_WRITE_CONCURRENT_INSERT`, `xxx_WRITE_LOW_PRIORITY`, and `xxx_WRITE_NORMAL` columns.

- `COUNT_READ_NORMAL`, `SUM_TIMER_READ_NORMAL`, `MIN_TIMER_READ_NORMAL`, `AVG_TIMER_READ_NORMAL`, `MAX_TIMER_READ_NORMAL`

These columns aggregate internal read locks.

- `COUNT_READ_WITH_SHARED_LOCKS`, `SUM_TIMER_READ_WITH_SHARED_LOCKS`, `MIN_TIMER_READ_WITH_SHARED_LOCKS`, `AVG_TIMER_READ_WITH_SHARED_LOCKS`, `MAX_TIMER_READ_WITH_SHARED_LOCKS`

These columns aggregate internal read locks.

- `COUNT_READ_HIGH_PRIORITY`, `SUM_TIMER_READ_HIGH_PRIORITY`, `MIN_TIMER_READ_HIGH_PRIORITY`, `AVG_TIMER_READ_HIGH_PRIORITY`, `MAX_TIMER_READ_HIGH_PRIORITY`

These columns aggregate internal read locks.

- `COUNT_READ_NO_INSERT`, `SUM_TIMER_READ_NO_INSERT`, `MIN_TIMER_READ_NO_INSERT`, `AVG_TIMER_READ_NO_INSERT`, `MAX_TIMER_READ_NO_INSERT`

These columns aggregate internal read locks.

- `COUNT_READ_EXTERNAL`, `SUM_TIMER_READ_EXTERNAL`, `MIN_TIMER_READ_EXTERNAL`, `AVG_TIMER_READ_EXTERNAL`, `MAX_TIMER_READ_EXTERNAL`

These columns aggregate external read locks.

- `COUNT_WRITE_ALLOW_WRITE`, `SUM_TIMER_WRITE_ALLOW_WRITE`, `MIN_TIMER_WRITE_ALLOW_WRITE`, `AVG_TIMER_WRITE_ALLOW_WRITE`, `MAX_TIMER_WRITE_ALLOW_WRITE`

These columns aggregate internal write locks.

- `COUNT_WRITE_CONCURRENT_INSERT`, `SUM_TIMER_WRITE_CONCURRENT_INSERT`, `MIN_TIMER_WRITE_CONCURRENT_INSERT`, `AVG_TIMER_WRITE_CONCURRENT_INSERT`, `MAX_TIMER_WRITE_CONCURRENT_INSERT`

These columns aggregate internal write locks.

- `COUNT_WRITE_LOW_PRIORITY`, `SUM_TIMER_WRITE_LOW_PRIORITY`, `MIN_TIMER_WRITE_LOW_PRIORITY`, `AVG_TIMER_WRITE_LOW_PRIORITY`, `MAX_TIMER_WRITE_LOW_PRIORITY`

These columns aggregate internal write locks.

- `COUNT_WRITE_NORMAL`, `SUM_TIMER_WRITE_NORMAL`, `MIN_TIMER_WRITE_NORMAL`, `AVG_TIMER_WRITE_NORMAL`, `MAX_TIMER_WRITE_NORMAL`

These columns aggregate internal write locks.

- `COUNT_WRITE_EXTERNAL`, `SUM_TIMER_WRITE_EXTERNAL`, `MIN_TIMER_WRITE_EXTERNAL`, `AVG_TIMER_WRITE_EXTERNAL`, `MAX_TIMER_WRITE_EXTERNAL`

These columns aggregate external write locks.

The `table_lock_waits_summary_by_table` table has these indexes:

- Unique index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)

`TRUNCATE TABLE` is permitted for table lock summary tables. It resets the summary columns to zero rather than removing rows.

## 27.12.20.9 Socket Summary Tables

These socket summary tables aggregate timer and byte count information for socket operations:

- `socket_summary_by_event_name`: Aggregate timer and byte count statistics generated by the `wait/io/socket/*` instruments for all socket I/O operations, per socket instrument.
- `socket_summary_by_instance`: Aggregate timer and byte count statistics generated by the `wait/io/socket/*` instruments for all socket I/O operations, per socket instance. When a connection terminates, the row in `socket_summary_by_instance` corresponding to it is deleted.

The socket summary tables do not aggregate waits generated by `idle` events while sockets are waiting for the next request from the client. For `idle` event aggregations, use the wait-event summary tables; see [Section 27.12.20.1, “Wait Event Summary Tables”](#).

Each socket summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `socket_summary_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.
- `socket_summary_by_instance` has an `OBJECT_INSTANCE_BEGIN` column. Each row summarizes events for a given object.

Each socket summary table has these summary columns containing aggregated values:

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns aggregate all operations.

- `COUNT_READ`, `SUM_TIMER_READ`, `MIN_TIMER_READ`, `AVG_TIMER_READ`, `MAX_TIMER_READ`, `SUM_NUMBER_OF_BYTES_READ`

These columns aggregate all receive operations (`RECV`, `RECVFROM`, and `RECVMSG`).

- `COUNT_WRITE`, `SUM_TIMER_WRITE`, `MIN_TIMER_WRITE`, `AVG_TIMER_WRITE`, `MAX_TIMER_WRITE`, `SUM_NUMBER_OF_BYTES_WRITE`

These columns aggregate all send operations (`SEND`, `SENDTO`, and `SENDMSG`).

- `COUNT_MISC`, `SUM_TIMER_MISC`, `MIN_TIMER_MISC`, `AVG_TIMER_MISC`, `MAX_TIMER_MISC`

These columns aggregate all other socket operations, such as `CONNECT`, `LISTEN`, `ACCEPT`, `CLOSE`, and `SHUTDOWN`. There are no byte counts for these operations.

The `socket_summary_by_instance` table also has an `EVENT_NAME` column that indicates the class of the socket: `client_connection`, `server_tcpip_socket`, `server_unix_socket`. This column can be grouped on to isolate, for example, client activity from that of the server listening sockets.

The socket summary tables have these indexes:

- `socket_summary_by_event_name`:
  - Primary key on (`EVENT_NAME`)
- `socket_summary_by_instance`:
  - Primary key on (`OBJECT_INSTANCE_BEGIN`)
  - Index on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for socket summary tables. Except for `events_statements_summary_by_digest`, it resets the summary columns to zero rather than removing rows.

## 27.12.20.10 Memory Summary Tables

The Performance Schema instruments memory usage and aggregates memory usage statistics, detailed by these factors:

- Type of memory used (various caches, internal buffers, and so forth)
- Thread, account, user, host indirectly performing the memory operation

The Performance Schema instruments the following aspects of memory use

- Memory sizes used
- Operation counts
- Low and high water marks

Memory sizes help to understand or tune the memory consumption of the server.

Operation counts help to understand or tune the overall pressure the server is putting on the memory allocator, which has an impact on performance. Allocating a single byte one million times is not the same as allocating one million bytes a single time; tracking both sizes and counts can expose the difference.

Low and high water marks are critical to detect workload spikes, overall workload stability, and possible memory leaks.

Memory summary tables do not contain timing information because memory events are not timed.

For information about collecting memory usage data, see [Memory Instrumentation Behavior](#).

Example memory event summary information:

```
mysql> SELECT *
 FROM performance_schema.memory_summary_global_by_event_name
 WHERE EVENT_NAME = 'memory/sql/TABLE'\G
***** 1. row *****
 EVENT_NAME: memory/sql/TABLE
 COUNT_ALLOC: 1381
 COUNT_FREE: 924
 SUM_NUMBER_OF_BYTES_ALLOC: 2059873
 SUM_NUMBER_OF_BYTES_FREE: 1407432
 LOW_COUNT_USED: 0
 CURRENT_COUNT_USED: 457
 HIGH_COUNT_USED: 461
 LOW_NUMBER_OF_BYTES_USED: 0
 CURRENT_NUMBER_OF_BYTES_USED: 652441
 HIGH_NUMBER_OF_BYTES_USED: 669269
```

Each memory summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the [setup\\_instruments](#) table:

- [memory\\_summary\\_by\\_account\\_by\\_event\\_name](#) has [USER](#), [HOST](#), and [EVENT\\_NAME](#) columns. Each row summarizes events for a given account (user and host combination) and event name.
- [memory\\_summary\\_by\\_host\\_by\\_event\\_name](#) has [HOST](#) and [EVENT\\_NAME](#) columns. Each row summarizes events for a given host and event name.
- [memory\\_summary\\_by\\_thread\\_by\\_event\\_name](#) has [THREAD\\_ID](#) and [EVENT\\_NAME](#) columns. Each row summarizes events for a given thread and event name.
- [memory\\_summary\\_by\\_user\\_by\\_event\\_name](#) has [USER](#) and [EVENT\\_NAME](#) columns. Each row summarizes events for a given user and event name.
- [memory\\_summary\\_global\\_by\\_event\\_name](#) has an [EVENT\\_NAME](#) column. Each row summarizes events for a given event name.

Each memory summary table has these summary columns containing aggregated values:

- `COUNT_ALLOC`, `COUNT_FREE`

The aggregated numbers of calls to memory-allocation and memory-free functions.

- `SUM_NUMBER_OF_BYTES_ALLOC`, `SUM_NUMBER_OF_BYTES_FREE`

The aggregated sizes of allocated and freed memory blocks.

- `CURRENT_COUNT_USED`

The aggregated number of currently allocated blocks that have not been freed yet. This is a convenience column, equal to `COUNT_ALLOC - COUNT_FREE`.

- `CURRENT_NUMBER_OF_BYTES_USED`

The aggregated size of currently allocated memory blocks that have not been freed yet. This is a convenience column, equal to `SUM_NUMBER_OF_BYTES_ALLOC - SUM_NUMBER_OF_BYTES_FREE`.

- `LOW_COUNT_USED`, `HIGH_COUNT_USED`

The low and high water marks corresponding to the `CURRENT_COUNT_USED` column.

- `LOW_NUMBER_OF_BYTES_USED`, `HIGH_NUMBER_OF_BYTES_USED`

The low and high water marks corresponding to the `CURRENT_NUMBER_OF_BYTES_USED` column.

The memory summary tables have these indexes:

- `memory_summary_by_account_by_event_name`:

- Primary key on (`USER`, `HOST`, `EVENT_NAME`)

- `memory_summary_by_host_by_event_name`:

- Primary key on (`HOST`, `EVENT_NAME`)

- `memory_summary_by_thread_by_event_name`:

- Primary key on (`THREAD_ID`, `EVENT_NAME`)

- `memory_summary_by_user_by_event_name`:

- Primary key on (`USER`, `EVENT_NAME`)

- `memory_summary_global_by_event_name`:

- Primary key on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for memory summary tables. It has these effects:

- In general, truncation resets the baseline for statistics, but does not change the server state. That is, truncating a memory table does not free memory.
- `COUNT_ALLOC` and `COUNT_FREE` are reset to a new baseline, by reducing each counter by the same value.
- Likewise, `SUM_NUMBER_OF_BYTES_ALLOC` and `SUM_NUMBER_OF_BYTES_FREE` are reset to a new baseline.
- `LOW_COUNT_USED` and `HIGH_COUNT_USED` are reset to `CURRENT_COUNT_USED`.
- `LOW_NUMBER_OF_BYTES_USED` and `HIGH_NUMBER_OF_BYTES_USED` are reset to `CURRENT_NUMBER_OF_BYTES_USED`.

In addition, each memory summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `memory_summary_global_by_event_name`. For details, see [Section 27.12.8, “Performance Schema Connection Tables”](#).

## Memory Instrumentation Behavior

Memory instruments are listed in the `setup_instruments` table and have names of the form `memory/code_area/instrument_name`. Memory instrumentation is enabled by default.

Instruments named with the prefix `memory/performance_schema/` expose how much memory is allocated for internal buffers in the Performance Schema itself. The `memory/performance_schema/` instruments are built in, always enabled, and cannot be disabled at startup or runtime. Built-in memory instruments are displayed only in the `memory_summary_global_by_event_name` table.

To control memory instrumentation state at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='memory/%=ON'
```

- Disable:

```
[mysqld]
performance-schema-instrument='memory/%=OFF'
```

To control memory instrumentation state at runtime, update the `ENABLED` column of the relevant instruments in the `setup_instruments` table:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES'
WHERE NAME LIKE 'memory/%';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO'
WHERE NAME LIKE 'memory/%';
```

For memory instruments, the `TIMED` column in `setup_instruments` is ignored because memory operations are not timed.

When a thread in the server executes a memory allocation that has been instrumented, these rules apply:

- If the thread is not instrumented or the memory instrument is not enabled, the memory block allocated is not instrumented.
- Otherwise (that is, both the thread and the instrument are enabled), the memory block allocated is instrumented.

For deallocation, these rules apply:

- If a memory allocation operation was instrumented, the corresponding free operation is instrumented, regardless of the current instrument or thread enabled status.
- If a memory allocation operation was not instrumented, the corresponding free operation is not instrumented, regardless of the current instrument or thread enabled status.

For the per-thread statistics, the following rules apply.

When an instrumented memory block of size *N* is allocated, the Performance Schema makes these updates to memory summary table columns:

- `COUNT_ALLOC`: Increased by 1
- `CURRENT_COUNT_USED`: Increased by 1
- `HIGH_COUNT_USED`: Increased if `CURRENT_COUNT_USED` is a new maximum
- `SUM_NUMBER_OF_BYTES_ALLOC`: Increased by *N*
- `CURRENT_NUMBER_OF_BYTES_USED`: Increased by *N*
- `HIGH_NUMBER_OF_BYTES_USED`: Increased if `CURRENT_NUMBER_OF_BYTES_USED` is a new maximum

When an instrumented memory block is deallocated, the Performance Schema makes these updates to memory summary table columns:

- `COUNT_FREE`: Increased by 1
- `CURRENT_COUNT_USED`: Decreased by 1
- `LOW_COUNT_USED`: Decreased if `CURRENT_COUNT_USED` is a new minimum
- `SUM_NUMBER_OF_BYTES_FREE`: Increased by *N*
- `CURRENT_NUMBER_OF_BYTES_USED`: Decreased by *N*
- `LOW_NUMBER_OF_BYTES_USED`: Decreased if `CURRENT_NUMBER_OF_BYTES_USED` is a new minimum

For higher-level aggregates (global, by account, by user, by host), the same rules apply as expected for low and high water marks.

- `LOW_COUNT_USED` and `LOW_NUMBER_OF_BYTES_USED` are lower estimates. The value reported by the Performance Schema is guaranteed to be less than or equal to the lowest count or size of memory effectively used at runtime.
- `HIGH_COUNT_USED` and `HIGH_NUMBER_OF_BYTES_USED` are higher estimates. The value reported by the Performance Schema is guaranteed to be greater than or equal to the highest count or size of memory effectively used at runtime.

For lower estimates in summary tables other than `memory_summary_global_by_event_name`, it is possible for values to go negative if memory ownership is transferred between threads.

Here is an example of estimate computation; but note that estimate implementation is subject to change:

Thread 1 uses memory in the range from 1MB to 2MB during execution, as reported by the `LOW_NUMBER_OF_BYTES_USED` and `HIGH_NUMBER_OF_BYTES_USED` columns of the `memory_summary_by_thread_by_event_name` table.

Thread 2 uses memory in the range from 10MB to 12MB during execution, as reported likewise.

When these two threads belong to the same user account, the per-account summary estimates that this account used memory in the range from 11MB to 14MB. That is, the `LOW_NUMBER_OF_BYTES_USED` for the higher level aggregate is the sum of each `LOW_NUMBER_OF_BYTES_USED` (assuming the worst case). Likewise, the `HIGH_NUMBER_OF_BYTES_USED` for the higher level aggregate is the sum of each `HIGH_NUMBER_OF_BYTES_USED` (assuming the worst case).

11MB is a lower estimate that can occur only if both threads hit the low usage mark at the same time.

14MB is a higher estimate that can occur only if both threads hit the high usage mark at the same time.

The real memory usage for this account could have been in the range from 11.5MB to 13.5MB.

For capacity planning, reporting the worst case is actually the desired behavior, as it shows what can potentially happen when sessions are uncorrelated, which is typically the case.

## 27.12.20.11 Error Summary Tables

The Performance Schema maintains summary tables for aggregating statistical information about server errors (and warnings). For a list of server errors, see [Server Error Message Reference](#).

Collection of error information is controlled by the `error` instrument, which is enabled by default. Timing information is not collected.

Each error summary table has three columns that identify the error:

- `ERROR_NUMBER` is the numeric error value. The value is unique.
- `ERROR_NAME` is the symbolic error name corresponding to the `ERROR_NUMBER` value. The value is unique.
- `SQLSTATE` is the SQLSTATE value corresponding to the `ERROR_NUMBER` value. The value is not necessarily unique.

For example, if `ERROR_NUMBER` is 1050, `ERROR_NAME` is `ER_TABLE_EXISTS_ERROR` and `SQLSTATE` is `42S01`.

Example error event summary information:

```
mysql> SELECT *
 FROM performance_schema.events_errors_summary_global_by_error
 WHERE SUM_ERROR_RAISED <> 0\G
***** 1. row *****
 ERROR_NUMBER: 1064
 ERROR_NAME: ER_PARSE_ERROR
 SQL_STATE: 42000
 SUM_ERROR_RAISED: 1
 SUM_ERROR_HANDLED: 0
 FIRST_SEEN: 2016-06-28 07:34:02
 LAST_SEEN: 2016-06-28 07:34:02
***** 2. row *****
 ERROR_NUMBER: 1146
 ERROR_NAME: ER_NO_SUCH_TABLE
 SQL_STATE: 42S02
 SUM_ERROR_RAISED: 2
 SUM_ERROR_HANDLED: 0
 FIRST_SEEN: 2016-06-28 07:34:05
 LAST_SEEN: 2016-06-28 07:36:18
***** 3. row *****
 ERROR_NUMBER: 1317
 ERROR_NAME: ER_QUERY_INTERRUPTED
 SQL_STATE: 70100
 SUM_ERROR_RAISED: 1
 SUM_ERROR_HANDLED: 0
 FIRST_SEEN: 2016-06-28 11:01:49
 LAST_SEEN: 2016-06-28 11:01:49
```

Each error summary table has one or more grouping columns to indicate how the table aggregates errors:

- `events_errors_summary_by_account_by_error` has `USER`, `HOST`, and `ERROR_NUMBER` columns. Each row summarizes events for a given account (user and host combination) and error.
- `events_errors_summary_by_host_by_error` has `HOST` and `ERROR_NUMBER` columns. Each row summarizes events for a given host and error.

- `events_errors_summary_by_thread_by_error` has `THREAD_ID` and `ERROR_NUMBER` columns. Each row summarizes events for a given thread and error.
- `events_errors_summary_by_user_by_error` has `USER` and `ERROR_NUMBER` columns. Each row summarizes events for a given user and error.
- `events_errors_summary_global_by_error` has an `ERROR_NUMBER` column. Each row summarizes events for a given error.

Each error summary table has these summary columns containing aggregated values:

- `SUM_ERROR_RAISED`

This column aggregates the number of times the error occurred.

- `SUM_ERROR_HANDLED`

This column aggregates the number of times the error was handled by an SQL exception handler.

- `FIRST_SEEN`, `LAST_SEEN`

Timestamp indicating when the error was first seen and most recently seen.

A `NULL` row in each error summary table is used to aggregate statistics for all errors that lie out of range of the instrumented errors. For example, if MySQL Server errors lie in the range from `M` to `N` and an error is raised with number `Q` not in that range, the error is aggregated in the `NULL` row. The `NULL` row is the row with `ERROR_NUMBER=0`, `ERROR_NAME=NULL`, and `SQLSTATE=NULL`.

The error summary tables have these indexes:

- `events_errors_summary_by_account_by_error`:
  - Primary key on (`USER`, `HOST`, `ERROR_NUMBER`)
- `events_errors_summary_by_host_by_error`:
  - Primary key on (`HOST`, `ERROR_NUMBER`)
- `events_errors_summary_by_thread_by_error`:
  - Primary key on (`THREAD_ID`, `ERROR_NUMBER`)
- `events_errors_summary_by_user_by_error`:
  - Primary key on (`USER`, `ERROR_NUMBER`)
- `events_errors_summary_global_by_error`:
  - Primary key on (`ERROR_NUMBER`)

`TRUNCATE TABLE` is permitted for error summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero or `NULL` rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero or `NULL` for the remaining rows.

In addition, each error summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `events_errors_summary_global_by_error`. For details, see [Section 27.12.8, “Performance Schema Connection Tables”](#).

## 27.12.20.12 Status Variable Summary Tables

The Performance Schema makes status variable information available in the tables described in [Section 27.12.15, “Performance Schema Status Variable Tables”](#). It also makes aggregated status variable information available in summary tables, described here. Each status variable summary table has one or more grouping columns to indicate how the table aggregates status values:

- `status_by_account` has `USER`, `HOST`, and `VARIABLE_NAME` columns to summarize status variables by account.
- `status_by_host` has `HOST` and `VARIABLE_NAME` columns to summarize status variables by the host from which clients connected.
- `status_by_user` has `USER` and `VARIABLE_NAME` columns to summarize status variables by client user name.

Each status variable summary table has this summary column containing aggregated values:

- `VARIABLE_VALUE`

The aggregated status variable value for active and terminated sessions.

The status variable summary tables have these indexes:

- `status_by_account`:
  - Primary key on (`USER`, `HOST`, `VARIABLE_NAME`)
- `status_by_host`:
  - Primary key on (`HOST`, `VARIABLE_NAME`)
- `status_by_user`:
  - Primary key on (`USER`, `VARIABLE_NAME`)

The meaning of “account” in these tables is similar to its meaning in the MySQL grant tables in the `mysql` system database, in the sense that the term refers to a combination of user and host values. They differ in that, for grant tables, the host part of an account can be a pattern, whereas for Performance Schema tables, the host value is always a specific nonpattern host name.

Account status is collected when sessions terminate. The session status counters are added to the global status counters and the corresponding account status counters. If account statistics are not collected, the session status is added to host and user status, if host and user status are collected.

Account, host, and user statistics are not collected if the `performance_schema_accounts_size`, `performance_schema_hosts_size`, and `performance_schema_users_size` system variables, respectively, are set to 0.

The Performance Schema supports `TRUNCATE TABLE` for status variable summary tables as follows; in all cases, status for active sessions is unaffected:

- `status_by_account`: Aggregates account status from terminated sessions to user and host status, then resets account status.
- `status_by_host`: Resets aggregated host status from terminated sessions.
- `status_by_user`: Resets aggregated user status from terminated sessions.

`FLUSH STATUS` adds the session status from all active sessions to the global status variables, resets the status of all active sessions, and resets account, host, and user status values aggregated from disconnected sessions.

## 27.12.21 Performance Schema Miscellaneous Tables

The following sections describe tables that do not fall into the table categories discussed in the preceding sections:

- `error_log`: The most recent events written to the error log.
- `host_cache`: Information from the internal host cache.
- `log_status`: Information about server logs for backup purposes.
- `performance_timers`: Which event timers are available.
- `threads`: Information about server threads.
- `tls_channel_status`: TLS context properties for connection interfaces.
- `user_defined_functions`: Loadable functions registered by a component, plugin, or `CREATE FUNCTION` statement.

### 27.12.21.1 The `error_log` Table

Of the logs the MySQL server maintains, one is the error log to which it writes diagnostic messages (see [Section 5.4.2, “The Error Log”](#)). Typically, the server writes diagnostics to a file on the server host or to a system log service. As of MySQL 8.0.22, depending on error log configuration, the server can also write the most recent error events to the Performance Schema `error_log` table. Granting the `SELECT` privilege for the `error_log` table thus gives clients and applications access to error log contents using SQL queries, enabling DBAs to provide access to the log without the need to permit direct file system access on the server host.

The `error_log` table supports focused queries based on its more structured columns. It also includes the full text of error messages to support more free-form analysis.

The table implementation uses a fixed-size, in-memory ring buffer, with old events automatically discarded as necessary to make room for new ones.

Example `error_log` contents:

```
mysql> SELECT * FROM performance_schema.error_log\G
***** 1. row *****
LOGGED: 2020-08-06 09:25:00.338624
THREAD_ID: 0
PRIO: System
ERROR_CODE: MY-010116
SUBSYSTEM: Server
DATA: mysqld (mysqld 8.0.23) starting as process 96344
***** 2. row *****
LOGGED: 2020-08-06 09:25:00.363521
THREAD_ID: 1
PRIO: System
ERROR_CODE: MY-013576
SUBSYSTEM: InnoDB
DATA: InnoDB initialization has started.
...
***** 65. row *****
LOGGED: 2020-08-06 09:25:02.936146
THREAD_ID: 0
PRIO: Warning
ERROR_CODE: MY-010068
SUBSYSTEM: Server
DATA: CA certificate /var/mysql/sslinfo/cacert.pem is self signed.
...
***** 89. row *****
LOGGED: 2020-08-06 09:25:03.112801
THREAD_ID: 0
PRIO: System
```

```
ERROR_CODE: MY-013292
SUBSYSTEM: Server
DATA: Admin interface ready for connections, address: '127.0.0.1' port: 33062
```

The `error_log` table has the following columns. As indicated in the descriptions, all but the `DATA` column correspond to fields of the underlying error event structure, which is described in [Section 5.4.2.3, “Error Event Fields”](#).

- `LOGGED`

The event timestamp, with microsecond precision. `LOGGED` corresponds to the `time` field of error events, although with certain potential differences:

- `time` values in the error log are displayed according to the `log_timestamps` system variable setting; see [Early-Startup Logging Output Format](#).
- The `LOGGED` column stores values using the `TIMESTAMP` data type, for which values are stored in UTC but displayed when retrieved in the current session time zone; see [Section 11.2.2, “The DATE, DATETIME, and TIMESTAMP Types”](#).

To display `LOGGED` values in the same time zone as displayed in the error log file, first set the session time zone as follows:

```
SET @@session.time_zone = @@global.log_timestamps;
```

If the `log_timestamps` value is `UTC` and your system does not have named time zone support installed (see [Section 5.1.15, “MySQL Server Time Zone Support”](#)), set the time zone like this:

```
SET @@session.time_zone = '+00:00';
```

- `THREAD_ID`

The MySQL thread ID. `THREAD_ID` corresponds to the `thread` field of error events.

Within the Performance Schema, the `THREAD_ID` column in the `error_log` table is most similar to the `PROCESSLIST_ID` column of the `threads` table:

- For foreground threads, `THREAD_ID` and `PROCESSLIST_ID` represent a connection identifier. This is the same value displayed in the `ID` column of the `INFORMATION_SCHEMA.PROCESSLIST` table, displayed in the `Id` column of `SHOW PROCESSLIST` output, and returned by the `CONNECTION_ID()` function within the thread.
- For background threads, `THREAD_ID` is 0 and `PROCESSLIST_ID` is `NULL`.

Many Performance Schema tables other than `error_log` has a column named `THREAD_ID`, but in those tables, the `THREAD_ID` column is a value assigned internally by the Performance Schema.

- `PRIO`

The event priority. Permitted values are `System`, `Error`, `Warning`, `Note`. The `PRIO` column is based on the `label` field of error events, which itself is based on the underlying numeric `prio` field value.

- `ERROR_CODE`

The numeric event error code. `ERROR_CODE` corresponds to the `error_code` field of error events.

- `SUBSYSTEM`

The subsystem in which the event occurred. `SUBSYSTEM` corresponds to the `subsystem` field of error events.

- `DATA`

The text representation of the error event. The format of this value depends on the format produced by the log sink component that generates the `error_log` row. For example, if the log sink is `log_sink_internal` or `log_sink_json`, `DATA` values represent error events in traditional or JSON format, respectively. (See [Section 5.4.2.9, “Error Log Output Format”](#).)

Because the error log can be reconfigured to change the log sink component that supplies rows to the `error_log` table, and because different sinks produce different output formats, it is possible for rows written to the `error_log` table at different times to have different `DATA` formats.

The `error_log` table has these indexes:

- Primary key on (`LOGGED`)
- Index on (`THREAD_ID`)
- Index on (`PRIO`)
- Index on (`ERROR_CODE`)
- Index on (`SUBSYSTEM`)

`TRUNCATE TABLE` is not permitted for the `error_log` table.

## Implementation and Configuration of the `error_log` Table

The Performance Schema `error_log` table is populated by error log sink components that write to the table in addition to writing formatted error events to the error log. Performance Schema support by log sinks has two parts:

- A log sink can write new error events to the `error_log` table as they occur.
- A log sink can provide a parser for extraction of previously written error messages. This enables a server instance to read messages written to an error log file by the previous instance and store them in the `error_log` table. Messages written during shutdown by the previous instance may be useful for diagnosing why shutdown occurred.

Currently, the traditional-format `log_sink_internal` and JSON-format `log_sink_json` sinks support writing new events to the `error_log` table and provide a parser for reading previously written error log files.

The `log_error_services` system variable controls which log components to enable for error logging. Its value is a pipeline of log filter and log sink components to be executed in left-to-right order when error events occur. The `log_error_services` value pertains to populating the `error_log` table as follows:

- At startup, the server examines the `log_error_services` value and chooses from it the leftmost log sink that satisfies these conditions:
  - A sink that supports the `error_log` table and provides a parser.
  - If none, a sink that supports the `error_log` table but provides no parser.

If no log sink satisfies those conditions, the `error_log` table remains empty. Otherwise, if the sink provides a parser and log configuration enables a previously written error log file to be found, the server uses the sink parser to read the last part of the file and writes the old events it contains to the table. The sink then writes new error events to the table as they occur.

- At runtime, if the value of `log_error_services` changes, the server again examines it, this time looking for the leftmost enabled log sink that supports the `error_log` table, regardless of whether it provides a parser.

If no such log sink exists, no additional error events are written to the `error_log` table. Otherwise, the newly configured sink writes new error events to the table as they occur.

Any configuration that affects output written to the error log affects `error_log` table contents. This includes settings such as those for verbosity, message suppression, and message filtering. It also applies to information read at startup from a previous log file. For example, messages not written during a previous server instance configured with low verbosity do not become available if the file is read by a current instance configured with higher verbosity.

The `error_log` table is a view on a fixed-size, in-memory ring buffer, with old events automatically discarded as necessary to make room for new ones. As shown in the following table, several status variables provide information about ongoing `error_log` operation.

| Status Variable                        | Meaning                     |
|----------------------------------------|-----------------------------|
| <code>Error_log_buffered_bytes</code>  | Bytes used in table         |
| <code>Error_log_buffered_events</code> | Events present in table     |
| <code>Error_log_expired_events</code>  | Events discarded from table |
| <code>Error_log_latest_write</code>    | Time of last write to table |

### 27.12.21.2 The `host_cache` Table

The MySQL server maintains an in-memory host cache that contains client host name and IP address information and is used to avoid Domain Name System (DNS) lookups. The `host_cache` table exposes the contents of this cache. The `host_cache_size` system variable controls the size of the host cache, as well as the size of the `host_cache` table. For operational and configuration information about the host cache, see [Section 5.1.12.3, “DNS Lookups and the Host Cache”](#).

Because the `host_cache` table exposes the contents of the host cache, it can be examined using `SELECT` statements. This may help you diagnose the causes of connection problems.

The `host_cache` table has these columns:

- `IP`

The IP address of the client that connected to the server, expressed as a string.

- `HOST`

The resolved DNS host name for that client IP, or `NULL` if the name is unknown.

- `HOST_VALIDATED`

Whether the IP-to-host name-to-IP DNS resolution was performed successfully for the client IP. If `HOST_VALIDATED` is `YES`, the `HOST` column is used as the host name corresponding to the IP so that additional calls to DNS can be avoided. While `HOST_VALIDATED` is `NO`, DNS resolution is attempted for each connection attempt, until it eventually completes with either a valid result or a permanent error. This information enables the server to avoid caching bad or missing host names during temporary DNS failures, which would negatively affect clients forever.

- `SUM_CONNECT_ERRORS`

The number of connection errors that are deemed “blocking” (assessed against the `max_connect_errors` system variable). Only protocol handshake errors are counted, and only for hosts that passed validation (`HOST_VALIDATED = YES`).

Once `SUM_CONNECT_ERRORS` for a given host reaches the value of `max_connect_errors`, new connections from that host are blocked. The `SUM_CONNECT_ERRORS` value can exceed the `max_connect_errors` value because multiple connection attempts from a host can occur simultaneously while the host is not blocked. Any or all of them can fail, independently incrementing `SUM_CONNECT_ERRORS`, possibly beyond the value of `max_connect_errors`.

Suppose that `max_connect_errors` is 200 and `SUM_CONNECT_ERRORS` for a given host is 199. If 10 clients attempt to connect from that host simultaneously, none of them are

blocked because `SUM_CONNECT_ERRORS` has not reached 200. If blocking errors occur for five of the clients, `SUM_CONNECT_ERRORS` is increased by one for each client, for a resulting `SUM_CONNECT_ERRORS` value of 204. The other five clients succeed and are not blocked because the value of `SUM_CONNECT_ERRORS` when their connection attempts began had not reached 200. New connections from the host that begin after `SUM_CONNECT_ERRORS` reaches 200 are blocked.

- `COUNT_HOST_BLOCKED_ERRORS`

The number of connections that were blocked because `SUM_CONNECT_ERRORS` exceeded the value of the `max_connect_errors` system variable.

- `COUNT_NAMEINFO_TRANSIENT_ERRORS`

The number of transient errors during IP-to-host name DNS resolution.

- `COUNT_NAMEINFO_PERMANENT_ERRORS`

The number of permanent errors during IP-to-host name DNS resolution.

- `COUNT_FORMAT_ERRORS`

The number of host name format errors. MySQL does not perform matching of `Host` column values in the `mysql.user` system table against host names for which one or more of the initial components of the name are entirely numeric, such as `1.2.example.com`. The client IP address is used instead. For the rationale why this type of matching does not occur, see [Section 6.2.4, “Specifying Account Names”](#).

- `COUNT_ADDRINFO_TRANSIENT_ERRORS`

The number of transient errors during host name-to-IP reverse DNS resolution.

- `COUNT_ADDRINFO_PERMANENT_ERRORS`

The number of permanent errors during host name-to-IP reverse DNS resolution.

- `COUNT_FCRDNS_ERRORS`

The number of forward-confirmed reverse DNS errors. These errors occur when IP-to-host name-to-IP DNS resolution produces an IP address that does not match the client originating IP address.

- `COUNT_HOST_ACL_ERRORS`

The number of errors that occur because no users are permitted to connect from the client host. In such cases, the server returns `ER_HOST_NOT_PRIVILEGED` and does not even ask for a user name or password.

- `COUNT_NO_AUTH_PLUGIN_ERRORS`

The number of errors due to requests for an unavailable authentication plugin. A plugin can be unavailable if, for example, it was never loaded or a load attempt failed.

- `COUNT_AUTH_PLUGIN_ERRORS`

The number of errors reported by authentication plugins.

An authentication plugin can report different error codes to indicate the root cause of a failure. Depending on the type of error, one of these columns is incremented: `COUNT_AUTHENTICATION_ERRORS`, `COUNT_AUTH_PLUGIN_ERRORS`, `COUNT_HANDSHAKE_ERRORS`. New return codes are an optional extension to the existing plugin API. Unknown or unexpected plugin errors are counted in the `COUNT_AUTH_PLUGIN_ERRORS` column.

- `COUNT_HANDSHAKE_ERRORS`

The number of errors detected at the wire protocol level.

- [COUNT\\_PROXY\\_USER\\_ERRORS](#)

The number of errors detected when proxy user A is proxied to another user B who does not exist.

- [COUNT\\_PROXY\\_USER\\_ACL\\_ERRORS](#)

The number of errors detected when proxy user A is proxied to another user B who does exist but for whom A does not have the [PROXY](#) privilege.

- [COUNT\\_AUTHENTICATION\\_ERRORS](#)

The number of errors caused by failed authentication.

- [COUNT\\_SSL\\_ERRORS](#)

The number of errors due to SSL problems.

- [COUNT\\_MAX\\_USER\\_CONNECTIONS\\_ERRORS](#)

The number of errors caused by exceeding per-user connection quotas. See [Section 6.2.20, “Setting Account Resource Limits”](#).

- [COUNT\\_MAX\\_USER\\_CONNECTIONS\\_PER\\_HOUR\\_ERRORS](#)

The number of errors caused by exceeding per-user connections-per-hour quotas. See [Section 6.2.20, “Setting Account Resource Limits”](#).

- [COUNT\\_DEFAULT\\_DATABASE\\_ERRORS](#)

The number of errors related to the default database. For example, the database does not exist or the user has no privileges to access it.

- [COUNT\\_INIT\\_CONNECT\\_ERRORS](#)

The number of errors caused by execution failures of statements in the [init\\_connect](#) system variable value.

- [COUNT\\_LOCAL\\_ERRORS](#)

The number of errors local to the server implementation and not related to the network, authentication, or authorization. For example, out-of-memory conditions fall into this category.

- [COUNT\\_UNKNOWN\\_ERRORS](#)

The number of other, unknown errors not accounted for by other columns in this table. This column is reserved for future use, in case new error conditions must be reported, and if preserving the backward compatibility and structure of the [host\\_cache](#) table is required.

- [FIRST\\_SEEN](#)

The timestamp of the first connection attempt seen from the client in the [IP](#) column.

- [LAST\\_SEEN](#)

The timestamp of the most recent connection attempt seen from the client in the [IP](#) column.

- [FIRST\\_ERROR\\_SEEN](#)

The timestamp of the first error seen from the client in the [IP](#) column.

- [LAST\\_ERROR\\_SEEN](#)

The timestamp of the most recent error seen from the client in the `IP` column.

The `host_cache` table has these indexes:

- Primary key on (`IP`)
- Index on (`HOST`)

`TRUNCATE TABLE` is permitted for the `host_cache` table. It requires the `DROP` privilege for the table. Truncating the table flushes the host cache, which has the effects described in [Flushing the Host Cache](#).

### 27.12.21.3 The `log_status` Table

The `log_status` table provides information that enables an online backup tool to copy the required log files without locking those resources for the duration of the copy process.

When the `log_status` table is queried, the server blocks logging and related administrative changes for just long enough to populate the table, then releases the resources. The `log_status` table informs the online backup which point it should copy up to in the source's binary log and `gtid_executed` record, and the relay log for each replication channel. It also provides relevant information for individual storage engines, such as the last log sequence number (LSN) and the LSN of the last checkpoint taken for the `InnoDB` storage engine.

The `log_status` table has these columns:

- `SERVER_UUID`

The server UUID for this server instance. This is the generated unique value of the read-only system variable `server_uuid`.

- `LOCAL`

The log position state information from the source, provided as a single JSON object with the following keys:

|                                  |                                                                                                                                                                                                                                                        |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>binary_log_file</code>     | The name of the current binary log file.                                                                                                                                                                                                               |
| <code>binary_log_position</code> | The current binary log position at the time the <code>log_status</code> table was accessed.                                                                                                                                                            |
| <code>gtid_executed</code>       | The current value of the global server variable <code>gtid_executed</code> at the time the <code>log_status</code> table was accessed. This information is consistent with the <code>binary_log_file</code> and <code>binary_log_position</code> keys. |

- `REPLICATION`

A JSON array of channels, each with the following information:

|                             |                                                                                                                      |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------|
| <code>channel_name</code>   | The name of the replication channel. The default replication channel's name is the empty string ( <code>""</code> ). |
| <code>relay_log_file</code> | The name of the current relay log file for the replication channel.                                                  |
| <code>relay_log_pos</code>  | The current relay log position at the time the <code>log_status</code> table was accessed.                           |

- `STORAGE_ENGINES`

Relevant information from individual storage engines, provided as a JSON object with one key for each applicable storage engine.

The `log_status` table has no indexes.

The `BACKUP_ADMIN` privilege, as well as the `SELECT` privilege, is required for access to the `log_status` table.

`TRUNCATE TABLE` is not permitted for the `log_status` table.

#### 27.12.21.4 The `performance_timers` Table

The `performance_timers` table shows which event timers are available:

```
mysql> SELECT * FROM performance_schema.performance_timers;
```

| TIMER_NAME  | TIMER_FREQUENCY | TIMER_RESOLUTION | TIMER_OVERHEAD |
|-------------|-----------------|------------------|----------------|
| CYCLE       | 2389029850      | 1                | 72             |
| NANOSECOND  | 1000000000      | 1                | 112            |
| MICROSECOND | 1000000         | 1                | 136            |
| MILLISECOND | 1036            | 1                | 168            |

If the values associated with a given timer name are `NULL`, that timer is not supported on your platform. For an explanation of how event timing occurs, see [Section 27.4.1, “Performance Schema Event Timing”](#).

The `performance_timers` table has these columns:

- `TIMER_NAME`

The timer name.

- `TIMER_FREQUENCY`

The number of timer units per second. For a cycle timer, the frequency is generally related to the CPU speed. For example, on a system with a 2.4GHz processor, the `CYCLE` may be close to 2400000000.

- `TIMER_RESOLUTION`

Indicates the number of timer units by which timer values increase. If a timer has a resolution of 10, its value increases by 10 each time.

- `TIMER_OVERHEAD`

The minimal number of cycles of overhead to obtain one timing with the given timer. The Performance Schema determines this value by invoking the timer 20 times during initialization and picking the smallest value. The total overhead really is twice this amount because the instrumentation invokes the timer at the start and end of each event. The timer code is called only for timed events, so this overhead does not apply for nontimed events.

The `performance_timers` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `performance_timers` table.

#### 27.12.21.5 The `processlist` Table

The MySQL process list indicates the operations currently being performed by the set of threads executing within the server. The `processlist` table is one source of process information. For a comparison of this table with other sources, see [Sources of Process Information](#).

The `processlist` table can be queried directly. If you have the `PROCESS` privilege, you can see all threads, even those belonging to other users. Otherwise (without the `PROCESS` privilege),

nonanonymous users have access to information about their own threads but not threads for other users, and anonymous users have no access to thread information.

#### Note

If the `performance_schema_show_processlist` system variable is enabled, the `processlist` table also serves as the basis for an alternative implementation underlying the `SHOW PROCESSLIST` statement. For details, see later in this section.

The `processlist` table contains a row for each server process:

```
mysql> SELECT * FROM performance_schema.processlist\G
***** 1. row *****
 ID: 5
 USER: event_scheduler
 HOST: localhost
 DB: NULL
COMMAND: Daemon
 TIME: 137
 STATE: Waiting on empty queue
 INFO: NULL
***** 2. row *****
 ID: 9
 USER: me
 HOST: localhost:58812
 DB: NULL
COMMAND: Sleep
 TIME: 95
 STATE:
 INFO: NULL
***** 3. row *****
 ID: 10
 USER: me
 HOST: localhost:58834
 DB: test
COMMAND: Query
 TIME: 0
 STATE: executing
 INFO: SELECT * FROM performance_schema.processlist
...

```

The `processlist` table has these columns:

- **ID**

The connection identifier. This is the same value displayed in the `Id` column of the `SHOW PROCESSLIST` statement, displayed in the `PROCESSLIST_ID` column of the Performance Schema `threads` table, and returned by the `CONNECTION_ID()` function within the thread.

- **USER**

The MySQL user who issued the statement. A value of `system user` refers to a nonclient thread spawned by the server to handle tasks internally, for example, a delayed-row handler thread or an I/O or SQL thread used on replica hosts. For `system user`, there is no host specified in the `Host` column. `unauthenticated user` refers to a thread that has become associated with a client connection but for which authentication of the client user has not yet occurred. `event_scheduler` refers to the thread that monitors scheduled events (see [Section 25.4, “Using the Event Scheduler”](#)).

#### Note

A `USER` value of `system user` is distinct from the `SYSTEM_USER` privilege. The former designates internal threads. The latter distinguishes the system user and regular user account categories (see [Section 6.2.11, “Account Categories”](#)).

- **HOST**

The host name of the client issuing the statement (except for `system user`, for which there is no host). The host name for TCP/IP connections is reported in `host_name:client_port` format to make it easier to determine which client is doing what.

- `DB`

The default database for the thread, or `NULL` if none has been selected.

- `COMMAND`

The type of command the thread is executing on behalf of the client, or `Sleep` if the session is idle. For descriptions of thread commands, see [Section 8.14, “Examining Server Thread \(Process\) Information”](#). The value of this column corresponds to the `COM_xxx` commands of the client/server protocol and `Com_xxx` status variables. See [Section 5.1.10, “Server Status Variables”](#)

- `TIME`

The time in seconds that the thread has been in its current state. For a replica SQL thread, the value is the number of seconds between the timestamp of the last replicated event and the real time of the replica host. See [Section 17.2.3, “Replication Threads”](#).

- `STATE`

An action, event, or state that indicates what the thread is doing. For descriptions of `STATE` values, see [Section 8.14, “Examining Server Thread \(Process\) Information”](#).

Most states correspond to very quick operations. If a thread stays in a given state for many seconds, there might be a problem that needs to be investigated.

- `INFO`

The statement the thread is executing, or `NULL` if it is executing no statement. The statement might be the one sent to the server, or an innermost statement if the statement executes other statements. For example, if a `CALL` statement executes a stored procedure that is executing a `SELECT` statement, the `INFO` value shows the `SELECT` statement.

The `processlist` table has these indexes:

- Primary key on (`ID`)

`TRUNCATE TABLE` is not permitted for the `processlist` table.

As mentioned previously, if the `performance_schema_show_processlist` system variable is enabled, the `processlist` table serves as the basis for an alternative implementation of other process information sources:

- The `SHOW PROCESSLIST` statement.
- The `mysqladmin processlist` command (which uses `SHOW PROCESSLIST` statement).

The default `SHOW PROCESSLIST` implementation iterates across active threads from within the thread manager while holding a global mutex. This has negative performance consequences, particularly on busy systems. The alternative `SHOW PROCESSLIST` implementation is based on the Performance Schema `processlist` table. This implementation queries active thread data from the Performance Schema rather than the thread manager and does not require a mutex.

MySQL configuration affects `processlist` table contents as follows:

- Minimum required configuration:
  - The MySQL server must be configured and built with thread instrumentation enabled. This is true by default; it is controlled using the `DISABLE_PSI_THREAD CMake` option.

- The Performance Schema must be enabled at server startup. This is true by default; it is controlled using the `performance_schema` system variable.

With that configuration satisfied, `performance_schema_show_processlist` enables or disables the alternative `SHOW PROCESSLIST` implementation. If the minimum configuration is not satisfied, the `processlist` table (and thus `SHOW PROCESSLIST`) may not return all data.

- Recommended configuration:
  - To avoid having some threads ignored:
    - Leave the `performance_schema_max_thread_instances` system variable set to its default or set it at least as great as the `max_connections` system variable.
    - Leave the `performance_schema_max_thread_classes` system variable set to its default.
  - To avoid having some `STATE` column values be empty, leave the `performance_schema_max_stage_classes` system variable set to its default.

The default for those configuration parameters is `-1`, which causes the Performance Schema to autosize them at server startup. With the parameters set as indicated, the `processlist` table (and thus `SHOW PROCESSLIST`) produce complete process information.

The preceding configuration parameters affect the contents of the `processlist` table. For a given configuration, however, the `processlist` contents are unaffected by the `performance_schema_show_processlist` setting.

The alternative process list implementation does not apply to the `INFORMATION_SCHEMA.PROCESSLIST` table or the `COM_PROCESS_INFO` command of the MySQL client/server protocol.

## 27.12.21.6 The threads Table

The `threads` table contains a row for each server thread. Each row contains information about a thread and indicates whether monitoring and historical event logging are enabled for it:

```
mysql> SELECT * FROM performance_schema.threads\G
***** 1. row *****
 THREAD_ID: 1
 NAME: thread/sql/main
 TYPE: BACKGROUND
 PROCESSLIST_ID: NULL
 PROCESSLIST_USER: NULL
 PROCESSLIST_HOST: NULL
 PROCESSLIST_DB: NULL
 PROCESSLIST_COMMAND: NULL
 PROCESSLIST_TIME: 80284
 PROCESSLIST_STATE: NULL
 PROCESSLIST_INFO: NULL
 PARENT_THREAD_ID: NULL
 ROLE: NULL
 INSTRUMENTED: YES
 HISTORY: YES
 CONNECTION_TYPE: NULL
 THREAD_OS_ID: 489803
 RESOURCE_GROUP: SYS_default
...
***** 4. row *****
 THREAD_ID: 51
 NAME: thread/sql/one_connection
 TYPE: FOREGROUND
 PROCESSLIST_ID: 34
 PROCESSLIST_USER: isabella
 PROCESSLIST_HOST: localhost
 PROCESSLIST_DB: performance_schema
 PROCESSLIST_COMMAND: Query
```

```

PROCESSLIST_TIME: 0
PROCESSLIST_STATE: Sending data
PROCESSLIST_INFO: SELECT * FROM performance_schema.threads
PARENT_THREAD_ID: 1
 ROLE: NULL
 INSTRUMENTED: YES
 HISTORY: YES
CONNECTION_TYPE: SSL/TLS
 THREAD_OS_ID: 755399
RESOURCE_GROUP: USR_default
...

```

When the Performance Schema initializes, it populates the `threads` table based on the threads in existence then. Thereafter, a new row is added each time the server creates a thread.

The `INSTRUMENTED` and `HISTORY` column values for new threads are determined by the contents of the `setup_actors` table. For information about how to use the `setup_actors` table to control these columns, see [Section 27.4.6, “Pre-Filtering by Thread”](#).

Removal of rows from the `threads` table occurs when threads end. For a thread associated with a client session, removal occurs when the session ends. If a client has auto-reconnect enabled and the session reconnects after a disconnect, the session becomes associated with a new row in the `threads` table that has a different `PROCESSLIST_ID` value. The initial `INSTRUMENTED` and `HISTORY` values for the new thread may be different from those of the original thread: The `setup_actors` table may have changed in the meantime, and if the `INSTRUMENTED` or `HISTORY` value for the original thread was changed after the row was initialized, the change does not carry over to the new thread.

You can enable or disable thread monitoring (that is, whether events executed by the thread are instrumented) and historical event logging. To control the initial `INSTRUMENTED` and `HISTORY` values for new foreground threads, use the `setup_actors` table. To control these aspects of existing threads, set the `INSTRUMENTED` and `HISTORY` columns of `threads` table rows. (For more information about the conditions under which thread monitoring and historical event logging occur, see the descriptions of the `INSTRUMENTED` and `HISTORY` columns.)

For a comparison of the `threads` table columns with names having a prefix of `PROCESSLIST_` to other process information sources, see [Sources of Process Information](#).

### Important

For thread information sources other than the `threads` table, information about threads for other users is shown only if the current user has the `PROCESS` privilege. That is not true of the `threads` table; all rows are shown to any user who has the `SELECT` privilege for the table. Users who should not be able to see threads for other users by accessing the `threads` table should not be given the `SELECT` privilege for it.

The `threads` table has these columns:

- `THREAD_ID`

A unique thread identifier.

- `NAME`

The name associated with the thread instrumentation code in the server. For example, `thread/sql/one_connection` corresponds to the thread function in the code responsible for handling a user connection, and `thread/sql/main` stands for the `main()` function of the server.

- `TYPE`

The thread type, either `FOREGROUND` or `BACKGROUND`. User connection threads are foreground threads. Threads associated with internal server activity are background threads. Examples are

internal [InnoDB](#) threads, “binlog dump” threads sending information to replicas, and replication I/O and SQL threads.

- [PROCESSLIST\\_ID](#)

For a foreground thread (associated with a user connection), this is the connection identifier. This is the same value displayed in the [ID](#) column of the [INFORMATION\\_SCHEMA PROCESSLIST](#) table, displayed in the [Id](#) column of [SHOW PROCESSLIST](#) output, and returned by the [CONNECTION\\_ID\(\)](#) function within the thread.

For a background thread (not associated with a user connection), [PROCESSLIST\\_ID](#) is [NULL](#), so the values are not unique.

- [PROCESSLIST\\_USER](#)

The user associated with a foreground thread, [NULL](#) for a background thread.

- [PROCESSLIST\\_HOST](#)

The host name of the client associated with a foreground thread, [NULL](#) for a background thread.

Unlike the [HOST](#) column of the [INFORMATION\\_SCHEMA PROCESSLIST](#) table or the [Host](#) column of [SHOW PROCESSLIST](#) output, the [PROCESSLIST\\_HOST](#) column does not include the port number for TCP/IP connections. To obtain this information from the Performance Schema, enable the socket instrumentation (which is not enabled by default) and examine the [socket\\_instances](#) table:

```
mysql> SELECT NAME, ENABLED, TIMED
 FROM performance_schema.setup_instruments
 WHERE NAME LIKE 'wait/io/socket%';
+-----+-----+-----+
| NAME | ENABLED | TIMED |
+-----+-----+-----+
wait/io/socket/sql/server_tcpip_socket	NO	NO
wait/io/socket/sql/server_unix_socket	NO	NO
wait/io/socket/sql/client_connection	NO	NO
+-----+-----+-----+
3 rows in set (0.01 sec)

mysql> UPDATE performance_schema.setup_instruments
 SET ENABLED='YES'
 WHERE NAME LIKE 'wait/io/socket%';
Query OK, 3 rows affected (0.00 sec)
Rows matched: 3 Changed: 3 Warnings: 0

mysql> SELECT * FROM performance_schema.socket_instances\G
***** 1. row *****
 EVENT_NAME: wait/io/socket/sql/client_connection
OBJECT_INSTANCE_BEGIN: 140612577298432
 THREAD_ID: 31
 SOCKET_ID: 53
 IP: ::ffff:127.0.0.1
 PORT: 55642
 STATE: ACTIVE
...

```

- [PROCESSLIST\\_DB](#)

The default database for the thread, or [NULL](#) if none has been selected.

- [PROCESSLIST\\_COMMAND](#)

For foreground threads, the type of command the thread is executing on behalf of the client, or [Sleep](#) if the session is idle. For descriptions of thread commands, see [Section 8.14, “Examining Server Thread \(Process\) Information”](#). The value of this column corresponds to the [COM\\_XXX](#) commands of the client/server protocol and [Com\\_XXX](#) status variables. See [Section 5.1.10, “Server Status Variables”](#)

Background threads do not execute commands on behalf of clients, so this column may be [NULL](#).

- [PROCESSLIST\\_TIME](#)

The time in seconds that the thread has been in its current state. For a replica SQL thread, the value is the number of seconds between the timestamp of the last replicated event and the real time of the replica host. See [Section 17.2.3, “Replication Threads”](#).

- [PROCESSLIST\\_STATE](#)

An action, event, or state that indicates what the thread is doing. For descriptions of [PROCESSLIST\\_STATE](#) values, see [Section 8.14, “Examining Server Thread \(Process\) Information”](#). If the value is [NULL](#), the thread may correspond to an idle client session or the work it is doing is not instrumented with stages.

Most states correspond to very quick operations. If a thread stays in a given state for many seconds, there might be a problem that bears investigation.

- [PROCESSLIST\\_INFO](#)

The statement the thread is executing, or [NULL](#) if it is executing no statement. The statement might be the one sent to the server, or an innermost statement if the statement executes other statements. For example, if a [CALL](#) statement executes a stored procedure that is executing a [SELECT](#) statement, the [PROCESSLIST\\_INFO](#) value shows the [SELECT](#) statement.

- [PARENT\\_THREAD\\_ID](#)

If this thread is a subthread (spawned by another thread), this is the [THREAD\\_ID](#) value of the spawning thread.

- [ROLE](#)

Unused.

- [INSTRUMENTED](#)

Whether events executed by the thread are instrumented. The value is [YES](#) or [NO](#).

- For foreground threads, the initial [INSTRUMENTED](#) value is determined by whether the user account associated with the thread matches any row in the [setup\\_actors](#) table. Matching is based on the values of the [PROCESSLIST\\_USER](#) and [PROCESSLIST\\_HOST](#) columns.

If the thread spawns a subthread, matching occurs again for the [threads](#) table row created for the subthread.

- For background threads, [INSTRUMENTED](#) is [YES](#) by default. [setup\\_actors](#) is not consulted because there is no associated user for background threads.
- For any thread, its [INSTRUMENTED](#) value can be changed during the lifetime of the thread.

For monitoring of events executed by the thread to occur, these things must be true:

- The [thread\\_instrumentation](#) consumer in the [setup\\_consumers](#) table must be [YES](#).
  - The [threads.INSTRUMENTED](#) column must be [YES](#).
  - Monitoring occurs only for those thread events produced from instruments that have the [ENABLED](#) column set to [YES](#) in the [setup\\_instruments](#) table.
- [HISTORY](#)

Whether to log historical events for the thread. The value is [YES](#) or [NO](#).

- For foreground threads, the initial `HISTORY` value is determined by whether the user account associated with the thread matches any row in the `setup_actors` table. Matching is based on the values of the `PROCESSLIST_USER` and `PROCESSLIST_HOST` columns.

If the thread spawns a subthread, matching occurs again for the `threads` table row created for the subthread.

- For background threads, `HISTORY` is `YES` by default. `setup_actors` is not consulted because there is no associated user for background threads.
- For any thread, its `HISTORY` value can be changed during the lifetime of the thread.

For historical event logging for the thread to occur, these things must be true:

- The appropriate history-related consumers in the `setup_consumers` table must be enabled. For example, wait event logging in the `events_waits_history` and `events_waits_history_long` tables requires the corresponding `events_waits_history` and `events_waits_history_long` consumers to be `YES`.
- The `threads.HISTORY` column must be `YES`.
- Logging occurs only for those thread events produced from instruments that have the `ENABLED` column set to `YES` in the `setup_instruments` table.

- `CONNECTION_TYPE`

The protocol used to establish the connection, or `NULL` for background threads. Permitted values are `TCP/IP` (TCP/IP connection established without encryption), `SSL/TLS` (TCP/IP connection established with encryption), `Socket` (Unix socket file connection), `Named Pipe` (Windows named pipe connection), and `Shared Memory` (Windows shared memory connection).

- `THREAD_OS_ID`

The thread or task identifier as defined by the underlying operating system, if there is one:

- When a MySQL thread is associated with the same operating system thread for its lifetime, `THREAD_OS_ID` contains the operating system thread ID.
- When a MySQL thread is not associated with the same operating system thread for its lifetime, `THREAD_OS_ID` contains `NULL`. This is typical for user sessions when the thread pool plugin is used (see [Section 5.6.3, “MySQL Enterprise Thread Pool”](#)).

For Windows, `THREAD_OS_ID` corresponds to the thread ID visible in Process Explorer (<https://technet.microsoft.com/en-us/sysinternals/bb896653.aspx>).

For Linux, `THREAD_OS_ID` corresponds to the value of the `gettid()` function. This value is exposed, for example, using the `perf` or `ps -L` commands, or in the `proc` file system (`/proc/[pid]/task/[tid]`). For more information, see the `perf-stat(1)`, `ps(1)`, and `proc(5)` man pages.

- `RESOURCE_GROUP`

The resource group label. This value is `NULL` if resource groups are not supported on the current platform or server configuration (see [Resource Group Restrictions](#)).

The `threads` table has these indexes:

- Primary key on (`THREAD_ID`)
- Index on (`NAME`)

- Index on ([PROCESSLIST\\_ID](#))
- Index on ([PROCESSLIST\\_USER](#), [PROCESSLIST\\_HOST](#))
- Index on ([PROCESSLIST\\_HOST](#))
- Index on ([THREAD\\_OS\\_ID](#))
- Index on ([RESOURCE\\_GROUP](#))

[TRUNCATE TABLE](#) is not permitted for the [threads](#) table.

### 27.12.21.7 The [tls\\_channel\\_status](#) Table

Connection interface TLS properties are set at server startup, and can be updated at runtime using the [ALTER INSTANCE RELOAD TLS](#) statement. See [Server-Side Runtime Configuration and Monitoring for Encrypted Connections](#).

The [tls\\_channel\\_status](#) table (available as of MySQL 8.0.21) provides information about connection interface TLS properties:

```
mysql> SELECT * FROM performance_schema.tls_channel_status\G
***** 1. row *****
CHANNEL: mysql_main
PROPERTY: Enabled
VALUE: Yes
***** 2. row *****
CHANNEL: mysql_main
PROPERTY: ssl_accept_renegotiates
VALUE: 0
***** 3. row *****
CHANNEL: mysql_main
PROPERTY: Ssl_accepts
VALUE: 2
...
***** 29. row *****
CHANNEL: mysql_admin
PROPERTY: Enabled
VALUE: No
***** 30. row *****
CHANNEL: mysql_admin
PROPERTY: ssl_accept_renegotiates
VALUE: 0
***** 31. row *****
CHANNEL: mysql_admin
PROPERTY: Ssl_accepts
VALUE: 0
...
```

The [tls\\_channel\\_status](#) table has these columns:

- [CHANNEL](#)

The name of the connection interface to which the TLS property row applies. [mysql\\_main](#) and [mysql\\_admin](#) are the channel names for the main and administrative connection interfaces, respectively. For information about the different interfaces, see [Section 5.1.12.1, “Connection Interfaces”](#).

- [PROPERTY](#)

The TLS property name. The row for the [Enabled](#) property indicates overall interface status, where the interface and its status are named in the [CHANNEL](#) and [VALUE](#) columns, respectively. Other property names indicate particular TLS properties. These often correspond to the names of TLS-related status variables.

- [VALUE](#)

The TLS property value.

The properties exposed by this table are not fixed and depend on the instrumentation implemented by each channel.

For each channel, the row with a `PROPERTY` value of `Enabled` indicates whether the channel supports encrypted connections, and other channel rows indicate TLS context properties:

- For `mysql_main`, the `Enabled` property is `yes` or `no` to indicate whether the main interface supports encrypted connections. Other channel rows display TLS context properties for the main interface.

For the main interface, similar status information can be obtained using these statements:

```
SHOW GLOBAL STATUS LIKE 'current_tls%';
SHOW GLOBAL STATUS LIKE 'ssl%';
```

- For `mysql_admin`, the `Enabled` property is `no` if the administrative interface is not enabled or it is enabled but does not support encrypted connections. `Enabled` is `yes` if the interface is enabled and supports encrypted connections.

When `Enabled` is `yes`, the other `mysql_admin` rows indicate channel properties for the administrative interface TLS context only if some nondefault TLS parameter value is configured for that interface. (This is the case if any `admin_tls_xxx` or `admin_ssl_xxx` system variable is set to a value different from its default.) Otherwise, the administrative interface uses the same TLS context as the main interface.

The `tls_channel_status` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `tls_channel_status` table.

## 27.12.21.8 The `user_defined_functions` Table

The `user_defined_functions` table contains a row for each loadable function registered automatically by a component or plugin, or manually by a `CREATE FUNCTION` statement. For information about operations that add or remove table rows, see [Section 5.7.1, “Installing and Uninstalling Loadable Functions”](#).

### Note

The name of the `user_defined_functions` table stems from the terminology used at its inception for the type of function now known as a loadable function (that is, user-defined function, or UDF).

The `user_defined_functions` table has these columns:

- `UDF_NAME`

The function name as referred to in SQL statements. The value is `NULL` if the function was registered by a `CREATE FUNCTION` statement and is in the process of unloading.

- `UDF_RETURN_TYPE`

The function return value type. The value is one of `int`, `decimal`, `real`, `char`, or `row`.

- `UDF_TYPE`

The function type. The value is one of `function` (scalar) or `aggregate`.

- `UDF_LIBRARY`

The name of the library file containing the executable function code. The file is located in the directory named by the `plugin_dir` system variable. The value is `NULL` if the function was registered by a component or plugin rather than by a `CREATE FUNCTION` statement.

- `UDF_USAGE_COUNT`

The current function usage count. This is used to tell whether statements currently are accessing the function.

The `user_defined_functions` table has these indexes:

- Primary key on (`UDF_NAME`)

`TRUNCATE TABLE` is not permitted for the `user_defined_functions` table.

The `mysql.func` system table also lists installed loadable functions, but only those installed using `CREATE FUNCTION`. The `user_defined_functions` table lists loadable functions installed using `CREATE FUNCTION` as well as loadable functions installed automatically by components or plugins. This difference makes `user_defined_functions` preferable to `mysql.func` for checking which loadable functions are installed.

## 27.13 Performance Schema Option and Variable Reference

Table 27.18 Performance Schema Variable Reference

| Name                                                                | Cmd-Line | Option File | System Var | Status Var | Var Scope | Dynamic |
|---------------------------------------------------------------------|----------|-------------|------------|------------|-----------|---------|
| <code>performance_schema</code>                                     | Yes      | Yes         | Yes        |            | Global    | No      |
| <code>Performance_schema_accounts_lost</code>                       |          |             |            | Yes        | Global    | No      |

## 27.14 Performance Schema Command Options

Performance Schema parameters can be specified at server startup on the command line or in option files to configure Performance Schema instruments and consumers. Runtime configuration is also possible in many cases (see [Section 27.4, “Performance Schema Runtime Configuration”](#)), but startup configuration must be used when runtime configuration is too late to affect instruments that have already been initialized during the startup process.

Performance Schema consumers and instruments can be configured at startup using the following syntax. For additional details, see [Section 27.3, “Performance Schema Startup Configuration”](#).

- `--performance-schema-consumer=consumer_name=value`

Configure a Performance Schema consumer. Consumer names in the `setup_consumers` table use underscores, but for consumers set at startup, dashes and underscores within the name are equivalent. Options for configuring individual consumers are detailed later in this section.

- `--performance-schema-instrument=instrument_name=value`

Configure a Performance Schema instrument. The name may be given as a pattern to configure instruments that match the pattern.

The following items configure individual consumers:

- `--performance-schema-consumer-events-stages-current=value`  
Configure the `events-stages-current` consumer.
- `--performance-schema-consumer-events-stages-history=value`  
Configure the `events-stages-history` consumer.
- `--performance-schema-consumer-events-stages-history-long=value`  
Configure the `events-stages-history-long` consumer.
- `--performance-schema-consumer-events-statements-current=value`  
Configure the `events-statements-current` consumer.
- `--performance-schema-consumer-events-statements-history=value`  
Configure the `events-statements-history` consumer.
- `--performance-schema-consumer-events-statements-history-long=value`  
Configure the `events-statements-history-long` consumer.
- `--performance-schema-consumer-events-transactions-current=value`  
Configure the Performance Schema `events-transactions-current` consumer.
- `--performance-schema-consumer-events-transactions-history=value`  
Configure the Performance Schema `events-transactions-history` consumer.
- `--performance-schema-consumer-events-transactions-history-long=value`  
Configure the Performance Schema `events-transactions-history-long` consumer.
- `--performance-schema-consumer-events-waits-current=value`  
Configure the `events-waits-current` consumer.
- `--performance-schema-consumer-events-waits-history=value`  
Configure the `events-waits-history` consumer.
- `--performance-schema-consumer-events-waits-history-long=value`  
Configure the `events-waits-history-long` consumer.
- `--performance-schema-consumer-global-instrumentation=value`  
Configure the `global-instrumentation` consumer.
- `--performance-schema-consumer-statements-digest=value`  
Configure the `statements-digest` consumer.
- `--performance-schema-consumer-thread-instrumentation=value`  
Configure the `thread-instrumentation` consumer.

## 27.15 Performance Schema System Variables

The Performance Schema implements several system variables that provide configuration information:

```
mysql> SHOW VARIABLES LIKE 'perf%';
```

| Variable_name                                            | Value |
|----------------------------------------------------------|-------|
| performance_schema                                       | ON    |
| performance_schema_accounts_size                         | -1    |
| performance_schema_digests_size                          | 10000 |
| performance_schema_events_stages_history_long_size       | 10000 |
| performance_schema_events_stages_history_size            | 10    |
| performance_schema_events_statements_history_long_size   | 10000 |
| performance_schema_events_statements_history_size        | 10    |
| performance_schema_events_transactions_history_long_size | 10000 |
| performance_schema_events_transactions_history_size      | 10    |
| performance_schema_events_waits_history_long_size        | 10000 |
| performance_schema_events_waits_history_size             | 10    |
| performance_schema_hosts_size                            | -1    |
| performance_schema_max_cond_classes                      | 80    |
| performance_schema_max_cond_instances                    | -1    |
| performance_schema_max_digest_length                     | 1024  |
| performance_schema_max_file_classes                      | 50    |
| performance_schema_max_file_handles                      | 32768 |
| performance_schema_max_file_instances                    | -1    |
| performance_schema_max_index_stat                        | -1    |
| performance_schema_max_memory_classes                    | 320   |
| performance_schema_max_metadata_locks                    | -1    |
| performance_schema_max_mutex_classes                     | 220   |
| performance_schema_max_mutex_instances                   | -1    |
| performance_schema_max_prepared_statements_instances     | -1    |
| performance_schema_max_program_instances                 | -1    |
| performance_schema_max_rwlock_classes                    | 40    |
| performance_schema_max_rwlock_instances                  | -1    |
| performance_schema_max_socket_classes                    | 10    |
| performance_schema_max_socket_instances                  | -1    |
| performance_schema_max_sql_text_length                   | 1024  |
| performance_schema_max_stage_classes                     | 150   |
| performance_schema_max_statement_classes                 | 192   |
| performance_schema_max_statement_stack                   | 10    |
| performance_schema_max_table_handles                     | -1    |
| performance_schema_max_table_instances                   | -1    |
| performance_schema_max_table_lock_stat                   | -1    |
| performance_schema_max_thread_classes                    | 50    |
| performance_schema_max_thread_instances                  | -1    |
| performance_schema_session_connect_attrs_size            | 512   |
| performance_schema_setup_actors_size                     | -1    |
| performance_schema_setup_objects_size                    | -1    |
| performance_schema_users_size                            | -1    |

Performance Schema system variables can be set at server startup on the command line or in option files, and many can be set at runtime. See [Section 27.13, “Performance Schema Option and Variable Reference”](#).

The Performance Schema automatically sizes the values of several of its parameters at server startup if they are not set explicitly. For more information, see [Section 27.3, “Performance Schema Startup Configuration”](#).

Performance Schema system variables have the following meanings:

- [performance\\_schema](#)

|                                      |                                              |
|--------------------------------------|----------------------------------------------|
| Command-Line Format                  | <code>--performance-schema[={OFF ON}]</code> |
| System Variable                      | <a href="#">performance_schema</a>           |
| Scope                                | Global                                       |
| Dynamic                              | No                                           |
| <a href="#">SET_VAR</a> Hint Applies | No                                           |
| Type                                 | Boolean                                      |
| Default Value                        | ON                                           |

The value of this variable is [ON](#) or [OFF](#) to indicate whether the Performance Schema is enabled. By default, the value is [ON](#). At server startup, you can specify this variable with no value or a value of [ON](#) or 1 to enable it, or with a value of [OFF](#) or 0 to disable it.

Even when the Performance Schema is disabled, it continues to populate the [global\\_variables](#), [session\\_variables](#), [global\\_status](#), and [session\\_status](#) tables. This occurs as necessary to permit the results for the [SHOW VARIABLES](#) and [SHOW STATUS](#) statements to be drawn from those tables. The Performance Schema also populates some of the replication tables when disabled.

- [performance\\_schema\\_accounts\\_size](#)

|                                      |                                                              |
|--------------------------------------|--------------------------------------------------------------|
| Command-Line Format                  | <code>--performance-schema-accounts-size=#</code>            |
| System Variable                      | <a href="#">performance_schema_accounts_size</a>             |
| Scope                                | Global                                                       |
| Dynamic                              | No                                                           |
| <a href="#">SET_VAR</a> Hint Applies | No                                                           |
| Type                                 | Integer                                                      |
| Default Value                        | -1 (signifies autoscaling; do not assign this literal value) |
| Minimum Value                        | -1 (signifies autoscaling; do not assign this literal value) |
| Maximum Value                        | 1048576                                                      |

The number of rows in the [accounts](#) table. If this variable is 0, the Performance Schema does not maintain connection statistics in the [accounts](#) table or status variable information in the [status\\_by\\_account](#) table.

- [performance\\_schema\\_digests\\_size](#)

|                                      |                                                             |
|--------------------------------------|-------------------------------------------------------------|
| Command-Line Format                  | <code>--performance-schema-digests-size=#</code>            |
| System Variable                      | <a href="#">performance_schema_digests_size</a>             |
| Scope                                | Global                                                      |
| Dynamic                              | No                                                          |
| <a href="#">SET_VAR</a> Hint Applies | No                                                          |
| Type                                 | Integer                                                     |
| Default Value                        | -1 (signifies autosizing; do not assign this literal value) |
| Minimum Value                        | -1                                                          |
| Maximum Value                        | 1048576                                                     |

The maximum number of rows in the [events\\_statements\\_summary\\_by\\_digest](#) table. If this maximum is exceeded such that a digest cannot be instrumented, the Performance Schema increments the [Performance\\_schema\\_digest\\_lost](#) status variable.

For more information about statement digesting, see [Section 27.10, “Performance Schema Statement Digests and Sampling”](#).

- [performance\\_schema\\_error\\_size](#)

|                     |                                                |
|---------------------|------------------------------------------------|
| Command-Line Format | <code>--performance-schema-error-size=#</code> |
| System Variable     | <a href="#">performance_schema_error_size</a>  |

|                                      |                                              |
|--------------------------------------|----------------------------------------------|
| Scope                                | Global                                       |
| Dynamic                              | No                                           |
| <a href="#">SET_VAR</a> Hint Applies | No                                           |
| Type                                 | Integer                                      |
| Default Value                        | <a href="#">number of server error codes</a> |
| Minimum Value                        | 0                                            |
| Maximum Value                        | 1048576                                      |

The number of instrumented server error codes. The default value is the actual number of server error codes. Although the value can be set anywhere from 0 to its maximum, the intended use is to set it to either its default (to instrument all errors) or 0 (to instrument no errors).

Error information is aggregated in summary tables; see [Section 27.12.20.11, “Error Summary Tables”](#). If an error occurs that is not instrumented, information for the occurrence is aggregated to the [NULL](#) row in each summary table; that is, to the row with [ERROR\\_NUMBER=0](#), [ERROR\\_NAME=NULL](#), and [SQLSTATE=NULL](#).

- [performance\\_schema\\_events\\_stages\\_history\\_long\\_size](#)

|                                      |                                                                        |
|--------------------------------------|------------------------------------------------------------------------|
| Command-Line Format                  | <a href="#">--performance-schema-events-stages-history-long-size=#</a> |
| System Variable                      | <a href="#">performance_schema_events_stages_history_long_size</a>     |
| Scope                                | Global                                                                 |
| Dynamic                              | No                                                                     |
| <a href="#">SET_VAR</a> Hint Applies | No                                                                     |
| Type                                 | Integer                                                                |
| Default Value                        | -1 (signifies autosizing; do not assign this literal value)            |

The number of rows in the [events\\_stages\\_history\\_long](#) table.

- [performance\\_schema\\_events\\_stages\\_history\\_size](#)

|                                      |                                                                   |
|--------------------------------------|-------------------------------------------------------------------|
| Command-Line Format                  | <a href="#">--performance-schema-events-stages-history-size=#</a> |
| System Variable                      | <a href="#">performance_schema_events_stages_history_size</a>     |
| Scope                                | Global                                                            |
| Dynamic                              | No                                                                |
| <a href="#">SET_VAR</a> Hint Applies | No                                                                |
| Type                                 | Integer                                                           |
| Default Value                        | -1 (signifies autosizing; do not assign this literal value)       |

The number of rows per thread in the [events\\_stages\\_history](#) table.

- [performance\\_schema\\_events\\_statements\\_history\\_long\\_size](#)

|                     |                                                                            |
|---------------------|----------------------------------------------------------------------------|
| Command-Line Format | <a href="#">--performance-schema-events-statements-history-long-size=#</a> |
| System Variable     | <a href="#">performance_schema_events_statements_history_long_size</a>     |
| Scope               | Global                                                                     |

|                                      |                                                             |
|--------------------------------------|-------------------------------------------------------------|
| Dynamic                              | No                                                          |
| <a href="#">SET_VAR</a> Hint Applies | No                                                          |
| Type                                 | Integer                                                     |
| Default Value                        | -1 (signifies autosizing; do not assign this literal value) |

The number of rows in the `events_statements_history_long` table.

- [performance\\_schema\\_events\\_statements\\_history\\_size](#)

|                                      |                                                                    |
|--------------------------------------|--------------------------------------------------------------------|
| Command-Line Format                  | <code>--performance-schema-events-statements-history-size=#</code> |

| Type                                 | Integer                                                   |
| Default Value                        | 60                                                        |
| Minimum Value                        | 0                                                         |
| Maximum Value                        | 1048576                                                   |

This variable affects statement sampling for the [events\\_statements\\_summary\\_by\\_digest](#) table. When a new table row is inserted, the statement that produced the row digest value is stored as the current sample statement associated with the digest. Thereafter, when the server sees other statements with the same digest value, it determines whether to use the new statement to replace the current sample statement (that is, whether to resample). Resampling policy is based on the comparative wait times of the current sample statement and new statement and, optionally, the age of the current sample statement:

- Resampling based on wait times: If the new statement wait time has a wait time greater than that of the current sample statement, it becomes the current sample statement.
- Resampling based on age: If the [performance\\_schema\\_max\\_digest\\_sample\\_age](#) system variable has a value greater than zero and the current sample statement is more than that many seconds old, the current statement is considered “too old” and the new statement replaces it. This occurs even if the new statement wait time is less than that of the current sample statement.

For information about statement sampling, see [Section 27.10, “Performance Schema Statement Digests and Sampling”](#).

The maximum number of file instruments. For information about how to set and use this variable, see [Section 27.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_file_handles`

|                      |                                                      |
|----------------------|------------------------------------------------------|
| Command-Line Format  | <code>--performance-schema-max-file-handles=#</code> |
| System Variable      | <code>performance_schema_max_file_handles</code>     |
| Scope                | Global                                               |
| Dynamic              | No                                                   |
| SET_VAR Hint Applies | No                                                   |
| Type                 | Integer                                              |
| Default Value        | 32768                                                |

The maximum number of opened file objects. For information about how to set and use this variable, see [Section 27.7, “Performance Schema Status Monitoring”](#).

The value of `performance_schema_max_file_handles` should be greater than the value of `open_files_limit`: `open_files_limit` affects the maximum number of open file handles the server can support and `performance_schema_max_file_handles` affects how many of these file handles can be instrumented.

- `performance_schema_max_file_instances`

|                      |                                                              |
|----------------------|--------------------------------------------------------------|
| Command-Line Format  | <code>--performance-schema-max-file-instances=#</code>       |
| System Variable      | <code>performance_schema_max_file_instances</code>           |
| Scope                | Global                                                       |
| Dynamic              | No                                                           |
| SET_VAR Hint Applies | No                                                           |
| Type                 | Integer                                                      |
| Default Value        | -1 (signifies autoscaling; do not assign this literal value) |

The maximum number of instrumented file objects. For information about how to set and use this variable, see [Section 27.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_index_stat`

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| Command-Line Format  | <code>--performance-schema-max-index-stat=#</code>          |
| System Variable      | <code>performance_schema_max_index_stat</code>              |
| Scope                | Global                                                      |
| Dynamic              | No                                                          |
| SET_VAR Hint Applies | No                                                          |
| Type                 | Integer                                                     |
| Default Value        | -1 (signifies autosizing; do not assign this literal value) |

The maximum number of indexes for which the Performance Schema maintains statistics. If this maximum is exceeded such that index statistics are lost, the Performance Schema increments the `Performance_schema_index_stat_lost` status variable. The default value is autosized using the value of `performance_schema_max_table_instances`.

- `performance_schema_max_memory_classes`

|                                   |                                                        |
|-----------------------------------|--------------------------------------------------------|
| Command-Line Format               | <code>--performance-schema-max-memory-classes=#</code> |
| System Variable                   | <code>performance_schema_max_memory_classes</code>     |
| Scope                             | Global                                                 |
| Dynamic                           | No                                                     |
| <code>SET_VAR</code> Hint Applies | No                                                     |
| Type                              | Integer                                                |
| Default Value                     | 450                                                    |

The maximum number of memory instruments. For information about how to set and use this variable, see [Section 27.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_metadata_locks`

|                                   |                                                              |
|-----------------------------------|--------------------------------------------------------------|
| Command-Line Format               | <code>--performance-schema-max-metadata-locks=#</code>       |
| System Variable                   | <code>performance_schema_max_metadata_locks</code>           |
| Scope                             | Global                                                       |
| Dynamic                           | No                                                           |
| <code>SET_VAR</code> Hint Applies | No                                                           |
| Type                              | Integer                                                      |
| Default Value                     | -1 (signifies autoscaling; do not assign this literal value) |

The maximum number of metadata lock instruments. This value controls the size of the `metadata_locks` table. If this maximum is exceeded such that a metadata lock cannot be instrumented, the Performance Schema increments the `performance_schema_metadata_lock_lost` status variable.

- `performance_schema_max_mutex_classes`

|                                   |                                                       |
|-----------------------------------|-------------------------------------------------------|
| Command-Line Format               | <code>--performance-schema-max-mutex-classes=#</code> |
| System Variable                   | <code>performance_schema_max_mutex_classes</code>     |
| Scope                             | Global                                                |
| Dynamic                           | No                                                    |
| <code>SET_VAR</code> Hint Applies | No                                                    |
| Type                              | Integer                                               |
| Default Value (≥ 8.0.12)          | 300                                                   |
| Default Value (8.0.11)            | 250                                                   |
| Minimum Value                     | 0                                                     |
| Maximum Value (≥ 8.0.12)          | 1024                                                  |
| Maximum Value (8.0.11)            | 256                                                   |

The maximum number of mutex instruments. For information about how to set and use this variable, see [Section 27.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_mutex_instances`

|                                   |                                                              |
|-----------------------------------|--------------------------------------------------------------|
| Command-Line Format               | <code>--performance-schema-max-mutex-instances=#</code>      |
| System Variable                   | <code>performance_schema_max_mutex_instances</code>          |
| Scope                             | Global                                                       |
| Dynamic                           | No                                                           |
| <code>SET_VAR</code> Hint Applies | No                                                           |
| Type                              | Integer                                                      |
| Default Value                     | -1 (signifies autoscaling; do not assign this literal value) |

The maximum number of instrumented mutex objects. For information about how to set and use this variable, see [Section 27.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_prepared_statements_instances`

|                                   |                                                                       |
|-----------------------------------|-----------------------------------------------------------------------|
| Command-Line Format               | <code>--performance-schema-max-prepared-statements-instances=#</code> |
| System Variable                   | <code>performance_schema_max_prepared_statements_instances</code>     |
| Scope                             | Global                                                                |
| Dynamic                           | No                                                                    |
| <code>SET_VAR</code> Hint Applies | No                                                                    |
| Type                              | Integer                                                               |
| Default Value                     | -1 (signifies autoscaling; do not assign this literal value)          |

The maximum number of rows in the `prepared_statements_instances` table. If this maximum is exceeded such that a prepared statement cannot be instrumented, the Performance Schema increments the `performance_schema_prepared_statements_lost` status variable. For information about how to set and use this variable, see [Section 27.7, “Performance Schema Status Monitoring”](#).

The default value of this variable is autosized based on the value of the `max_prepared_stmt_count` system variable.

- `performance_schema_max_rwlock_classes`

|                                   |                                                        |
|-----------------------------------|--------------------------------------------------------|
| Command-Line Format               | <code>--performance-schema-max-rwlock-classes=#</code> |
| System Variable                   | <code>performance_schema_max_rwlock_classes</code>     |
| Scope                             | Global                                                 |
| Dynamic                           | No                                                     |
| <code>SET_VAR</code> Hint Applies | No                                                     |
| Type                              | Integer                                                |
| Default Value                     | 60                                                     |
| Minimum Value                     | 0                                                      |
| Maximum Value ( $\geq 8.0.12$ )   | 1024                                                   |

|                        |     |
|------------------------|-----|
| Maximum Value (8.0.11) | 256 |
|------------------------|-----|

The maximum number of rwlock instruments. For information about how to set and use this variable, see [Section 27.7, “Performance Schema Status Monitoring”](#).

- [performance\\_schema\\_max\\_program\\_instances](#)

|                                      |                                                              |
|--------------------------------------|--------------------------------------------------------------|
| Command-Line Format                  | <code>--performance-schema-max-program-instances=#</code>    |
| System Variable                      | <a href="#">performance_schema_max_program_instances</a>     |
| Scope                                | Global                                                       |
| Dynamic                              | No                                                           |
| <a href="#">SET_VAR</a> Hint Applies | No                                                           |
| Type                                 | Integer                                                      |
| Default Value                        | -1 (signifies autoscaling; do not assign this literal value) |

The maximum number of stored programs for which the Performance Schema maintains statistics. If this maximum is exceeded, the Performance Schema increments the [performance\\_schema\\_program\\_lost](#) status variable. For information about how to set and use this variable, see [Section 27.7, “Performance Schema Status Monitoring”](#).

- [performance\\_schema\\_max\\_rwlock\\_instances](#)

|                                      |                                                              |
|--------------------------------------|--------------------------------------------------------------|
| Command-Line Format                  | <code>--performance-schema-max-rwlock-instances=#</code>     |
| System Variable                      | <a href="#">performance_schema_max_rwlock_instances</a>      |
| Scope                                | Global                                                       |
| Dynamic                              | No                                                           |
| <a href="#">SET_VAR</a> Hint Applies | No                                                           |
| Type                                 | Integer                                                      |
| Default Value                        | -1 (signifies autoscaling; do not assign this literal value) |

The maximum number of instrumented rwlock objects. For information about how to set and use this variable, see [Section 27.7, “Performance Schema Status Monitoring”](#).

- [performance\\_schema\\_max\\_socket\\_classes](#)

|                                      |                                                        |
|--------------------------------------|--------------------------------------------------------|
| Command-Line Format                  | <code>--performance-schema-max-socket-classes=#</code> |
| System Variable                      | <a href="#">performance_schema_max_socket_classes</a>  |
| Scope                                | Global                                                 |
| Dynamic                              | No                                                     |
| <a href="#">SET_VAR</a> Hint Applies | No                                                     |
| Type                                 | Integer                                                |
| Default Value                        | 10                                                     |
| Minimum Value                        | 0                                                      |
| Maximum Value (≥ 8.0.12)             | 1024                                                   |

|                        |     |
|------------------------|-----|
| Maximum Value (8.0.11) | 256 |
|------------------------|-----|

The maximum number of socket instruments. For information about how to set and use this variable, see [Section 27.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_socket_instances`

|                                   |                                                              |
|-----------------------------------|--------------------------------------------------------------|
| Command-Line Format               | <code>--performance-schema-max-socket-instances=#</code>     |
| System Variable                   | <code>performance_schema_max_socket_instances</code>         |
| Scope                             | Global                                                       |
| Dynamic                           | No                                                           |
| <code>SET_VAR</code> Hint Applies | No                                                           |
| Type                              | Integer                                                      |
| Default Value                     | -1 (signifies autoscaling; do not assign this literal value) |

The maximum number of instrumented socket objects. For information about how to set and use this variable, see [Section 27.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_sql_text_length`

|                                   |                                                         |
|-----------------------------------|---------------------------------------------------------|
| Command-Line Format               | <code>--performance-schema-max-sql-text-length=#</code> |
| System Variable                   | <code>performance_schema_max_sql_text_length</code>     |
| Scope                             | Global                                                  |
| Dynamic                           | No                                                      |
| <code>SET_VAR</code> Hint Applies | No                                                      |
| Type                              | Integer                                                 |
| Default Value                     | 1024                                                    |
| Minimum Value                     | 0                                                       |
| Maximum Value                     | 1048576                                                 |

The maximum number of bytes used to store SQL statements. The value applies to storage required for these columns:

- The `SQL_TEXT` column of the `events_statements_current`, `events_statements_history`, and `events_statements_history_long` statement event tables.
- The `QUERY_SAMPLE_TEXT` column of the `events_statements_summary_by_digest` summary table.

Any bytes in excess of `performance_schema_max_sql_text_length` are discarded and do not appear in the column. Statements differing only after that many initial bytes are indistinguishable in the column.

Decreasing the `performance_schema_max_sql_text_length` value reduces memory use but causes more statements to become indistinguishable if they differ only at the end. Increasing the value increases memory use but permits longer statements to be distinguished.

- `performance_schema_max_stage_classes`

|                                   |                                                       |
|-----------------------------------|-------------------------------------------------------|
| Command-Line Format               | <code>--performance-schema-max-stage-classes=#</code> |
| System Variable                   | <code>performance_schema_max_stage_classes</code>     |
| Scope                             | Global                                                |
| Dynamic                           | No                                                    |
| <code>SET_VAR</code> Hint Applies | No                                                    |
| Type                              | Integer                                               |
| Default Value ( $\geq$ 8.0.13)    | 175                                                   |
| Default Value ( $\leq$ 8.0.12)    | 150                                                   |
| Minimum Value                     | 0                                                     |
| Maximum Value ( $\geq$ 8.0.12)    | 1024                                                  |
| Maximum Value (8.0.11)            | 256                                                   |

The maximum number of stage instruments. For information about how to set and use this variable, see [Section 27.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_statement_classes`

|                                   |                                                             |
|-----------------------------------|-------------------------------------------------------------|
| Command-Line Format               | <code>--performance-schema-max-statement-classes=#</code>   |
| System Variable                   | <code>performance_schema_max_statement_classes</code>       |
| Scope                             | Global                                                      |
| Dynamic                           | No                                                          |
| <code>SET_VAR</code> Hint Applies | No                                                          |
| Type                              | Integer                                                     |
| Default Value                     | -1 (signifies autosizing; do not assign this literal value) |

The maximum number of statement instruments. For information about how to set and use this variable, see [Section 27.7, “Performance Schema Status Monitoring”](#).

The default value is calculated at server build time based on the number of commands in the client/server protocol and the number of SQL statement types supported by the server.

This variable should not be changed, unless to set it to 0 to disable all statement instrumentation and save all memory associated with it. Setting the variable to nonzero values other than the default has no benefit; in particular, values larger than the default cause more memory to be allocated than is needed.

- `performance_schema_max_statement_stack`

|                                   |                                                         |
|-----------------------------------|---------------------------------------------------------|
| Command-Line Format               | <code>--performance-schema-max-statement-stack=#</code> |
| System Variable                   | <code>performance_schema_max_statement_stack</code>     |
| Scope                             | Global                                                  |
| Dynamic                           | No                                                      |
| <code>SET_VAR</code> Hint Applies | No                                                      |
| Type                              | Integer                                                 |

|               |    |
|---------------|----|
| Default Value | 10 |
|---------------|----|

The maximum depth of nested stored program calls for which the Performance Schema maintains statistics. When this maximum is exceeded, the Performance Schema increments the [Performance\\_schema\\_nested\\_statement\\_lost](#) status variable for each stored program statement executed.

- [performance\\_schema\\_max\\_table\\_handles](#)

|                                      |                                                              |
|--------------------------------------|--------------------------------------------------------------|
| Command-Line Format                  | <code>--performance-schema-max-table-handles=#</code>        |
| System Variable                      | <a href="#">performance_schema_max_table_handles</a>         |
| Scope                                | Global                                                       |
| Dynamic                              | No                                                           |
| <a href="#">SET_VAR</a> Hint Applies | No                                                           |
| Type                                 | Integer                                                      |
| Default Value                        | -1 (signifies autoscaling; do not assign this literal value) |

The maximum number of opened table objects. This value controls the size of the [table\\_handles](#) table. If this maximum is exceeded such that a table handle cannot be instrumented, the Performance Schema increments the [Performance\\_schema\\_table\\_handles\\_lost](#) status variable. For information about how to set and use this variable, see [Section 27.7, “Performance Schema Status Monitoring”](#).

- [performance\\_schema\\_max\\_table\\_instances](#)

|                                      |                                                              |
|--------------------------------------|--------------------------------------------------------------|
| Command-Line Format                  | <code>--performance-schema-max-table-instances=#</code>      |
| System Variable                      | <a href="#">performance_schema_max_table_instances</a>       |
| Scope                                | Global                                                       |
| Dynamic                              | No                                                           |
| <a href="#">SET_VAR</a> Hint Applies | No                                                           |
| Type                                 | Integer                                                      |
| Default Value                        | -1 (signifies autoscaling; do not assign this literal value) |

The maximum number of instrumented table objects. For information about how to set and use this variable, see [Section 27.7, “Performance Schema Status Monitoring”](#).

- [performance\\_schema\\_max\\_table\\_lock\\_stat](#)

|                                      |                                                         |
|--------------------------------------|---------------------------------------------------------|
| Command-Line Format                  | <code>--performance-schema-max-table-lock-stat=#</code> |
| System Variable                      | <a href="#">performance_schema_max_table_lock_stat</a>  |
| Scope                                | Global                                                  |
| Dynamic                              | No                                                      |
| <a href="#">SET_VAR</a> Hint Applies | No                                                      |
| Type                                 | Integer                                                 |

|               |                                                             |
|---------------|-------------------------------------------------------------|
| Default Value | -1 (signifies autosizing; do not assign this literal value) |
|---------------|-------------------------------------------------------------|

The maximum number of tables for which the Performance Schema maintains lock statistics. If this maximum is exceeded such that table lock statistics are lost, the Performance Schema increments the `Performance_schema_table_lock_stat_lost` status variable.

- `performance_schema_max_thread_classes`

|                                   |                                                        |
|-----------------------------------|--------------------------------------------------------|
| Command-Line Format               | <code>--performance-schema-max-thread-classes=#</code> |
| System Variable                   | <code>performance_schema_max_thread_classes</code>     |
| Scope                             | Global                                                 |
| Dynamic                           | No                                                     |
| <code>SET_VAR</code> Hint Applies | No                                                     |
| Type                              | Integer                                                |
| Default Value                     | 100                                                    |
| Minimum Value                     | 0                                                      |
| Maximum Value (≥ 8.0.12)          | 1024                                                   |
| Maximum Value (8.0.11)            | 256                                                    |

The maximum number of thread instruments. For information about how to set and use this variable, see [Section 27.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_thread_instances`

|                                   |                                                              |
|-----------------------------------|--------------------------------------------------------------|
| Command-Line Format               | <code>--performance-schema-max-thread-instances=#</code>     |
| System Variable                   | <code>performance_schema_max_thread_instances</code>         |
| Scope                             | Global                                                       |
| Dynamic                           | No                                                           |
| <code>SET_VAR</code> Hint Applies | No                                                           |
| Type                              | Integer                                                      |
| Default Value                     | -1 (signifies autoscaling; do not assign this literal value) |

The maximum number of instrumented thread objects. The value controls the size of the `threads` table. If this maximum is exceeded such that a thread cannot be instrumented, the Performance Schema increments the `Performance_schema_thread_instances_lost` status variable. For information about how to set and use this variable, see [Section 27.7, “Performance Schema Status Monitoring”](#).

The `max_connections` system variable affects how many threads can run in the server. `performance_schema_max_thread_instances` affects how many of these running threads can be instrumented.

The `variables_by_thread` and `status_by_thread` tables contain system and status variable information only about foreground threads. If not all threads are instrumented by the Performance Schema, this table misses some rows. In this case, the `Performance_schema_thread_instances_lost` status variable is greater than zero.

- `performance_schema_session_connect_attrs_size`

|                      |                                                                |
|----------------------|----------------------------------------------------------------|
| Command-Line Format  | <code>--performance-schema-session-connect-attrs-size=#</code> |
| System Variable      | <code>performance_schema_session_connect_attrs_size</code>     |
| Scope                | Global                                                         |
| Dynamic              | No                                                             |
| SET_VAR Hint Applies | No                                                             |
| Type                 | Integer                                                        |
| Default Value        | -1 (signifies autosizing; do not assign this literal value)    |
| Minimum Value        | -1                                                             |
| Maximum Value        | 1048576                                                        |

The amount of preallocated memory per thread reserved to hold connection attribute key-value pairs. If the aggregate size of connection attribute data sent by a client is larger than this amount, the Performance Schema truncates the attribute data, increments the `performance_schema_session_connect_attrs_lost` status variable, and writes a message to the error log indicating that truncation occurred if the `log_error_verbosity` system variable is greater than 1. A `_truncated` attribute is also added to the session attributes with a value indicating how many bytes were lost, if the attribute buffer has sufficient space. This enables the Performance Schema to expose per-connection truncation information in the connection attribute tables. This information can be examined without having to check the error log.

The default value of `performance_schema_session_connect_attrs_size` is autosized at server startup. This value may be small, so if truncation occurs (`performance_schema_session_connect_attrs_lost` becomes nonzero), you may wish to set `performance_schema_session_connect_attrs_size` explicitly to a larger value.

Although the maximum permitted `performance_schema_session_connect_attrs_size` value is 1MB, the effective maximum is 64KB because the server imposes a limit of 64KB on the aggregate size of connection attribute data it accepts. If a client attempts to send more than 64KB of attribute data, the server rejects the connection. For more information, see [Section 27.12.9, “Performance Schema Connection Attribute Tables”](#).

- `performance_schema_setup_actors_size`

|                      |                                                              |
|----------------------|--------------------------------------------------------------|
| Command-Line Format  | <code>--performance-schema-setup-actors-size=#</code>        |
| System Variable      | <code>performance_schema_setup_actors_size</code>            |
| Scope                | Global                                                       |
| Dynamic              | No                                                           |
| SET_VAR Hint Applies | No                                                           |
| Type                 | Integer                                                      |
| Default Value        | -1 (signifies autoscaling; do not assign this literal value) |

The number of rows in the `setup_actors` table.

- `performance_schema_setup_objects_size`

|                     |                                                        |
|---------------------|--------------------------------------------------------|
| Command-Line Format | <code>--performance-schema-setup-objects-size=#</code> |
|                     | 4871                                                   |

|                                      |                                                              |
|--------------------------------------|--------------------------------------------------------------|
| System Variable                      | <a href="#">performance_schema_setup_objects_size</a>        |
| Scope                                | Global                                                       |
| Dynamic                              | No                                                           |
| <a href="#">SET_VAR</a> Hint Applies | No                                                           |
| Type                                 | Integer                                                      |
| Default Value                        | -1 (signifies autoscaling; do not assign this literal value) |

The number of rows in the [setup\\_objects](#) table.

- [performance\\_schema\\_show\\_processlist](#)

|                                      |                                                               |
|--------------------------------------|---------------------------------------------------------------|
| Command-Line Format                  | <code>--performance-schema-show-processlist[={OFF ON}]</code> |
| Introduced                           | 8.0.22                                                        |
| System Variable                      | <a href="#">performance_schema_show_processlist</a>           |
| Scope                                | Global                                                        |
| Dynamic                              | Yes                                                           |
| <a href="#">SET_VAR</a> Hint Applies | No                                                            |
| Type                                 | Boolean                                                       |
| Default Value                        | <a href="#">OFF</a>                                           |

The [SHOW PROCESSLIST](#) statement provides process information by collecting thread data from all active threads. The [performance\\_schema\\_show\\_processlist](#) variable determines which [SHOW PROCESSLIST](#) implementation to use:

- The default implementation iterates across active threads from within the thread manager while holding a global mutex. This has negative performance consequences, particularly on busy systems.
- The alternative [SHOW PROCESSLIST](#) implementation is based on the Performance Schema [processlist](#) table. This implementation queries active thread data from the Performance Schema rather than the thread manager and does not require a mutex.

To enable the alternative implementation, enable the [performance\\_schema\\_show\\_processlist](#) system variable. To ensure that the default and alternative implementations yield the same information, certain configuration requirements must be met; see [Section 27.12.21.5, “The processlist Table”](#).

- [performance\\_schema\\_users\\_size](#)

|                                      |                                                              |
|--------------------------------------|--------------------------------------------------------------|
| Command-Line Format                  | <code>--performance-schema-users-size=#</code>               |
| System Variable                      | <a href="#">performance_schema_users_size</a>                |
| Scope                                | Global                                                       |
| Dynamic                              | No                                                           |
| <a href="#">SET_VAR</a> Hint Applies | No                                                           |
| Type                                 | Integer                                                      |
| Default Value                        | -1 (signifies autoscaling; do not assign this literal value) |
| Minimum Value                        | -1 (signifies autoscaling; do not assign this literal value) |

|               |         |
|---------------|---------|
| Maximum Value | 1048576 |
|---------------|---------|

The number of rows in the `users` table. If this variable is 0, the Performance Schema does not maintain connection statistics in the `users` table or status variable information in the `status_by_user` table.

## 27.16 Performance Schema Status Variables

The Performance Schema implements several status variables that provide information about instrumentation that could not be loaded or created due to memory constraints:

```
mysql> SHOW STATUS LIKE 'perf%';
```

| Variable_name                             | Value |
|-------------------------------------------|-------|
| Performance_schema_accounts_lost          | 0     |
| Performance_schema_cond_classes_lost      | 0     |
| Performance_schema_cond_instances_lost    | 0     |
| Performance_schema_file_classes_lost      | 0     |
| Performance_schema_file_handles_lost      | 0     |
| Performance_schema_file_instances_lost    | 0     |
| Performance_schema_hosts_lost             | 0     |
| Performance_schema_locker_lost            | 0     |
| Performance_schema_mutex_classes_lost     | 0     |
| Performance_schema_mutex_instances_lost   | 0     |
| Performance_schema_rwlock_classes_lost    | 0     |
| Performance_schema_rwlock_instances_lost  | 0     |
| Performance_schema_socket_classes_lost    | 0     |
| Performance_schema_socket_instances_lost  | 0     |
| Performance_schema_stage_classes_lost     | 0     |
| Performance_schema_statement_classes_lost | 0     |
| Performance_schema_table_handles_lost     | 0     |
| Performance_schema_table_instances_lost   | 0     |
| Performance_schema_thread_classes_lost    | 0     |
| Performance_schema_thread_instances_lost  | 0     |
| Performance_schema_users_lost             | 0     |

For information on using these variables to check Performance Schema status, see [Section 27.7, “Performance Schema Status Monitoring”](#).

Performance Schema status variables have the following meanings:

- `Performance_schema_accounts_lost`

The number of times a row could not be added to the `accounts` table because it was full.

- `Performance_schema_cond_classes_lost`

How many condition instruments could not be loaded.

- `Performance_schema_cond_instances_lost`

How many condition instrument instances could not be created.

- `Performance_schema_digest_lost`

The number of digest instances that could not be instrumented in the `events_statements_summary_by_digest` table. This can be nonzero if the value of `performance_schema_digests_size` is too small.

- `Performance_schema_file_classes_lost`

How many file instruments could not be loaded.

- `Performance_schema_file_handles_lost`

How many file instrument instances could not be opened.

- [Performance\\_schema\\_file\\_instances\\_lost](#)

How many file instrument instances could not be created.

- [Performance\\_schema\\_hosts\\_lost](#)

The number of times a row could not be added to the [hosts](#) table because it was full.

- [Performance\\_schema\\_index\\_stat\\_lost](#)

The number of indexes for which statistics were lost. This can be nonzero if the value of [performance\\_schema\\_max\\_index\\_stat](#) is too small.

- [Performance\\_schema\\_locker\\_lost](#)

How many events are “lost” or not recorded, due to the following conditions:

- Events are recursive (for example, waiting for A caused a wait on B, which caused a wait on C).
- The depth of the nested events stack is greater than the limit imposed by the implementation.

Events recorded by the Performance Schema are not recursive, so this variable should always be 0.

- [Performance\\_schema\\_memory\\_classes\\_lost](#)

The number of times a memory instrument could not be loaded.

- [Performance\\_schema\\_metadata\\_lock\\_lost](#)

The number of metadata locks that could not be instrumented in the [metadata\\_locks](#) table. This can be nonzero if the value of [performance\\_schema\\_max\\_metadata\\_locks](#) is too small.

- [Performance\\_schema\\_mutex\\_classes\\_lost](#)

How many mutex instruments could not be loaded.

- [Performance\\_schema\\_mutex\\_instances\\_lost](#)

How many mutex instrument instances could not be created.

- [Performance\\_schema\\_nested\\_statement\\_lost](#)

The number of stored program statements for which statistics were lost. This can be nonzero if the value of [performance\\_schema\\_max\\_statement\\_stack](#) is too small.

- [Performance\\_schema\\_prepared\\_statements\\_lost](#)

The number of prepared statements that could not be instrumented in the [prepared\\_statements\\_instances](#) table. This can be nonzero if the value of [performance\\_schema\\_max\\_prepared\\_statements\\_instances](#) is too small.

- [Performance\\_schema\\_program\\_lost](#)

The number of stored programs for which statistics were lost. This can be nonzero if the value of [performance\\_schema\\_max\\_program\\_instances](#) is too small.

- [Performance\\_schema\\_rwlock\\_classes\\_lost](#)

How many rwlock instruments could not be loaded.

- [Performance\\_schema\\_rwlock\\_instances\\_lost](#)

How many rwlock instrument instances could not be created.

- [Performance\\_schema\\_session\\_connect\\_attrs\\_longest\\_seen](#)

In addition to the connection attribute size-limit check performed by the Performance Schema against the value of the [performance\\_schema\\_session\\_connect\\_attrs\\_size](#) system variable, the server performs a preliminary check, imposing a limit of 64KB on the aggregate size of connection attribute data it accepts. If a client attempts to send more than 64KB of attribute data, the server rejects the connection. Otherwise, the server considers the attribute buffer valid and tracks the size of the longest such buffer in the [Performance\\_schema\\_session\\_connect\\_attrs\\_longest\\_seen](#) status variable. If this value is larger than [performance\\_schema\\_session\\_connect\\_attrs\\_size](#), DBAs may wish to increase the latter value, or, alternatively, investigate which clients are sending large amounts of attribute data.

For more information about connection attributes, see [Section 27.12.9, “Performance Schema Connection Attribute Tables”](#).

- [Performance\\_schema\\_session\\_connect\\_attrs\\_lost](#)

The number of connections for which connection attribute truncation has occurred. For a given connection, if the client sends connection attribute key-value pairs for which the aggregate size is larger than the reserved storage permitted by the value of the [performance\\_schema\\_session\\_connect\\_attrs\\_size](#) system variable, the Performance Schema truncates the attribute data and increments [Performance\\_schema\\_session\\_connect\\_attrs\\_lost](#). If this value is nonzero, you may wish to set [performance\\_schema\\_session\\_connect\\_attrs\\_size](#) to a larger value.

For more information about connection attributes, see [Section 27.12.9, “Performance Schema Connection Attribute Tables”](#).

- [Performance\\_schema\\_socket\\_classes\\_lost](#)

How many socket instruments could not be loaded.

- [Performance\\_schema\\_socket\\_instances\\_lost](#)

How many socket instrument instances could not be created.

- [Performance\\_schema\\_stage\\_classes\\_lost](#)

How many stage instruments could not be loaded.

- [Performance\\_schema\\_statement\\_classes\\_lost](#)

How many statement instruments could not be loaded.

- [Performance\\_schema\\_table\\_handles\\_lost](#)

How many table instrument instances could not be opened. This can be nonzero if the value of [performance\\_schema\\_max\\_table\\_handles](#) is too small.

- [Performance\\_schema\\_table\\_instances\\_lost](#)

How many table instrument instances could not be created.

- [Performance\\_schema\\_table\\_lock\\_stat\\_lost](#)

The number of tables for which lock statistics were lost. This can be nonzero if the value of [performance\\_schema\\_max\\_table\\_lock\\_stat](#) is too small.

- [Performance\\_schema\\_thread\\_classes\\_lost](#)

How many thread instruments could not be loaded.

- `Performance_schema_thread_instances_lost`

The number of thread instances that could not be instrumented in the `threads` table. This can be nonzero if the value of `performance_schema_max_thread_instances` is too small.

- `Performance_schema_users_lost`

The number of times a row could not be added to the `users` table because it was full.

## 27.17 The Performance Schema Memory-Allocation Model

The Performance Schema uses this memory allocation model:

- May allocate memory at server startup
- May allocate additional memory during server operation
- Never free memory during server operation (although it might be recycled)
- Free all memory used at shutdown

The result is to relax memory constraints so that the Performance Schema can be used with less configuration, and to decrease the memory footprint so that consumption scales with server load. Memory used depends on the load actually seen, not the load estimated or explicitly configured for.

Several Performance Schema sizing parameters are autoscaled and need not be configured explicitly unless you want to establish an explicit limit on memory allocation:

```
performance_schema_accounts_size
performance_schema_hosts_size
performance_schema_max_cond_instances
performance_schema_max_file_instances
performance_schema_max_index_stat
performance_schema_max_metadata_locks
performance_schema_max_mutex_instances
performance_schema_max_prepared_statements_instances
performance_schema_max_program_instances
performance_schema_max_rwlock_instances
performance_schema_max_socket_instances
performance_schema_max_table_handles
performance_schema_max_table_instances
performance_schema_max_table_lock_stat
performance_schema_max_thread_instances
performance_schema_users_size
```

For an autoscaled parameter, configuration works like this:

- With the value set to -1 (the default), the parameter is autoscaled:
  - The corresponding internal buffer is empty initially and no memory is allocated.
  - As the Performance Schema collects data, memory is allocated in the corresponding buffer. The buffer size is unbounded, and may grow with the load.
- With the value set to 0:
  - The corresponding internal buffer is empty initially and no memory is allocated.
- With the value set to `N > 0`:
  - The corresponding internal buffer is empty initially and no memory is allocated.

- As the Performance Schema collects data, memory is allocated in the corresponding buffer, until the buffer size reaches *N*.
- Once the buffer size reaches *N*, no more memory is allocated. Data collected by the Performance Schema for this buffer is lost, and any corresponding “lost instance” counters are incremented.

To see how much memory the Performance Schema is using, check the instruments designed for that purpose. The Performance Schema allocates memory internally and associates each buffer with a dedicated instrument so that memory consumption can be traced to individual buffers. Instruments named with the prefix `memory/performance_schema/` expose how much memory is allocated for these internal buffers. The buffers are global to the server, so the instruments are displayed only in the `memory_summary_global_by_event_name` table, and not in other `memory_summary_by_XXX_by_event_name` tables.

This query shows the information associated with the memory instruments:

```
SELECT * FROM performance_schema.memory_summary_global_by_event_name
WHERE EVENT_NAME LIKE 'memory/performance_schema/%';
```

## 27.18 Performance Schema and Plugins

Removing a plugin with `UNINSTALL PLUGIN` does not affect information already collected for code in that plugin. Time spent executing the code while the plugin was loaded was still spent even if the plugin is unloaded later. The associated event information, including aggregate information, remains readable in `performance_schema` database tables. For additional information about the effect of plugin installation and removal, see [Section 27.7, “Performance Schema Status Monitoring”](#).

A plugin implementor who instruments plugin code should document its instrumentation characteristics to enable those who load the plugin to account for its requirements. For example, a third-party storage engine should include in its documentation how much memory the engine needs for mutex and other instruments.

## 27.19 Using the Performance Schema to Diagnose Problems

The Performance Schema is a tool to help a DBA do performance tuning by taking real measurements instead of “wild guesses.” This section demonstrates some ways to use the Performance Schema for this purpose. The discussion here relies on the use of event filtering, which is described in [Section 27.4.2, “Performance Schema Event Filtering”](#).

The following example provides one methodology that you can use to analyze a repeatable problem, such as investigating a performance bottleneck. To begin, you should have a repeatable use case where performance is deemed “too slow” and needs optimization, and you should enable all instrumentation (no pre-filtering at all).

1. Run the use case.
2. Using the Performance Schema tables, analyze the root cause of the performance problem. This analysis relies heavily on post-filtering.
3. For problem areas that are ruled out, disable the corresponding instruments. For example, if analysis shows that the issue is not related to file I/O in a particular storage engine, disable the file I/O instruments for that engine. Then truncate the history and summary tables to remove previously collected events.
4. Repeat the process at step 1.

With each iteration, the Performance Schema output, particularly the `events_waits_history_long` table, contains less and less “noise” caused by nonsignificant instruments, and given that this table has a fixed size, contains more and more data relevant to the analysis of the problem at hand.

With each iteration, investigation should lead closer and closer to the root cause of the problem, as the “signal/noise” ratio improves, making analysis easier.

5. Once a root cause of performance bottleneck is identified, take the appropriate corrective action, such as:
  - Tune the server parameters (cache sizes, memory, and so forth).
  - Tune a query by writing it differently,
  - Tune the database schema (tables, indexes, and so forth).
  - Tune the code (this applies to storage engine or server developers only).
6. Start again at step 1, to see the effects of the changes on performance.

The `mutex_instances.LOCKED_BY_THREAD_ID` and `rwlock_instances.WRITE_LOCKED_BY_THREAD_ID` columns are extremely important for investigating performance bottlenecks or deadlocks. This is made possible by Performance Schema instrumentation as follows:

1. Suppose that thread 1 is stuck waiting for a mutex.
2. You can determine what the thread is waiting for:

```
SELECT * FROM performance_schema.events_waits_current
WHERE THREAD_ID = thread_1;
```

Say the query result identifies that the thread is waiting for mutex A, found in `events_waits_current.OBJECT_INSTANCE_BEGIN`.

3. You can determine which thread is holding mutex A:

```
SELECT * FROM performance_schema.mutex_instances
WHERE OBJECT_INSTANCE_BEGIN = mutex_A;
```

Say the query result identifies that it is thread 2 holding mutex A, as found in `mutex_instances.LOCKED_BY_THREAD_ID`.

4. You can see what thread 2 is doing:

```
SELECT * FROM performance_schema.events_waits_current
WHERE THREAD_ID = thread_2;
```

## 27.19.1 Query Profiling Using Performance Schema

The following example demonstrates how to use Performance Schema statement events and stage events to retrieve data comparable to profiling information provided by `SHOW PROFILES` and `SHOW PROFILE` statements.

The `setup_actors` table can be used to limit the collection of historical events by host, user, or account to reduce runtime overhead and the amount of data collected in history tables. The first step of the example shows how to limit collection of historical events to a specific user.

Performance Schema displays event timer information in picoseconds (trillionths of a second) to normalize timing data to a standard unit. In the following example, `TIMER_WAIT` values are divided by 1000000000000 to show data in units of seconds. Values are also truncated to 6 decimal places to display data in the same format as `SHOW PROFILES` and `SHOW PROFILE` statements.

1. Limit the collection of historical events to the user that runs the query. By default, `setup_actors` is configured to allow monitoring and historical event collection for all foreground threads:

```
mysql> SELECT * FROM performance_schema.setup_actors;
+-----+-----+-----+-----+-----+
| HOST | USER | ROLE | ENABLED | HISTORY |
+-----+-----+-----+-----+-----+
| % | % | % | YES | YES |
+-----+-----+-----+-----+-----+
```

Update the default row in the `setup_actors` table to disable historical event collection and monitoring for all foreground threads, and insert a new row that enables monitoring and historical event collection for the user that runs the query:

```
mysql> UPDATE performance_schema.setup_actors
 SET ENABLED = 'NO', HISTORY = 'NO'
 WHERE HOST = '%' AND USER = '%';

mysql> INSERT INTO performance_schema.setup_actors
 (HOST,USER,ROLE,ENABLED,HISTORY)
 VALUES('localhost','test_user','%','YES','YES');
```

Data in the `setup_actors` table should now appear similar to the following:

```
mysql> SELECT * FROM performance_schema.setup_actors;
+-----+-----+-----+-----+-----+
| HOST | USER | ROLE | ENABLED | HISTORY |
+-----+-----+-----+-----+-----+
| % | % | % | NO | NO |
| localhost | test_user | % | YES | YES |
+-----+-----+-----+-----+-----+
```

2. Ensure that statement and stage instrumentation is enabled by updating the `setup_instruments` table. Some instruments may already be enabled by default.

```
mysql> UPDATE performance_schema.setup_instruments
 SET ENABLED = 'YES', TIMED = 'YES'
 WHERE NAME LIKE '%statement/%';

mysql> UPDATE performance_schema.setup_instruments
 SET ENABLED = 'YES', TIMED = 'YES'
 WHERE NAME LIKE '%stage/%';
```

3. Ensure that `events_statements_*` and `events_stages_*` consumers are enabled. Some consumers may already be enabled by default.

```
mysql> UPDATE performance_schema.setup_consumers
 SET ENABLED = 'YES'
 WHERE NAME LIKE '%events_statements_%';

mysql> UPDATE performance_schema.setup_consumers
 SET ENABLED = 'YES'
 WHERE NAME LIKE '%events_stages_%';
```

4. Under the user account you are monitoring, run the statement that you want to profile. For example:

```
mysql> SELECT * FROM employees.employees WHERE emp_no = 10001;
+-----+-----+-----+-----+-----+
| emp_no | birth_date | first_name | last_name | gender | hire_date |
+-----+-----+-----+-----+-----+
| 10001 | 1953-09-02 | Georgi | Facello | M | 1986-06-26 |
+-----+-----+-----+-----+-----+
```

5. Identify the `EVENT_ID` of the statement by querying the `events_statements_history_long` table. This step is similar to running `SHOW PROFILES` to identify the `Query_ID`. The following query produces output similar to `SHOW PROFILES`:

```
mysql> SELECT EVENT_ID, TRUNCATE(TIMER_WAIT/1000000000000,6) as Duration, SQL_TEXT
 FROM performance_schema.events_statements_history_long WHERE SQL_TEXT like '%10001%';
+-----+-----+-----+
| event_id | duration | sql_text |
+-----+-----+-----+
```

```
| 31 | 0.028310 | SELECT * FROM employees.employees WHERE emp_no = 10001 |
+-----+-----+-----+
```

6. Query the `events_stages_history_long` table to retrieve the statement's stage events. Stages are linked to statements using event nesting. Each stage event record has a `NESTING_EVENT_ID` column that contains the `EVENT_ID` of the parent statement.

```
mysql> SELECT event_name AS Stage, TRUNCATE(TIMER_WAIT/1000000000000,6) AS Duration
FROM performance_schema.events_stages_history_long WHERE NESTING_EVENT_ID=31;
```

| Stage                          | Duration |
|--------------------------------|----------|
| stage/sql/starting             | 0.000080 |
| stage/sql/checking permissions | 0.000005 |
| stage/sql/Opening tables       | 0.027759 |
| stage/sql/init                 | 0.000052 |
| stage/sql/System lock          | 0.000009 |
| stage/sql/optimizing           | 0.000006 |
| stage/sql/statistics           | 0.000082 |
| stage/sql/preparing            | 0.000008 |
| stage/sql/executing            | 0.000000 |
| stage/sql/Sending data         | 0.000017 |
| stage/sql/end                  | 0.000001 |
| stage/sql/query end            | 0.000004 |
| stage/sql/closing tables       | 0.000006 |
| stage/sql/freeing items        | 0.000272 |
| stage/sql/cleaning up          | 0.000001 |

## 27.19.2 Obtaining Parent Event Information

The `data_locks` table shows data locks held and requested. Rows of this table have a `THREAD_ID` column indicating the thread ID of the session that owns the lock, and an `EVENT_ID` column indicating the Performance Schema event that caused the lock. Tuples of (`THREAD_ID`, `EVENT_ID`) values implicitly identify a parent event in other Performance Schema tables:

- The parent wait event in the `events_waits_XXX` tables
- The parent stage event in the `events_stages_XXX` tables
- The parent statement event in the `events_statements_XXX` tables
- The parent transaction event in the `events_transactions_current` table

To obtain details about the parent event, join the `THREAD_ID` and `EVENT_ID` columns with the columns of like name in the appropriate parent event table. The relation is based on a nested set data model, so the join has several clauses. Given parent and child tables represented by `parent` and `child`, respectively, the join looks like this:

```
WHERE
 parent.THREAD_ID = child.THREAD_ID /* 1 */
 AND parent.EVENT_ID < child.EVENT_ID /* 2 */
 AND (
 child.EVENT_ID <= parent.END_EVENT_ID /* 3a */
 OR parent.END_EVENT_ID IS NULL /* 3b */
)
```

The conditions for the join are:

1. The parent and child events are in the same thread.
2. The child event begins after the parent event, so its `EVENT_ID` value is greater than that of the parent.
3. The parent event has either completed or is still running.

To find lock information, `data_locks` is the table containing child events.

The `data_locks` table shows only existing locks, so these considerations apply regarding which table contains the parent event:

- For transactions, the only choice is `events_transactions_current`. If a transaction is completed, it may be in the transaction history tables, but the locks are gone already.
- For statements, it all depends on whether the statement that took a lock is a statement in a transaction that has already completed (use `events_statements_history`) or the statement is still running (use `events_statements_current`).
- For stages, the logic is similar to that for statements; use `events_stages_history` or `events_stages_current`.
- For waits, the logic is similar to that for statements; use `events_waits_history` or `events_waits_current`. However, so many waits are recorded that the wait that caused a lock is most likely gone from the history tables already.

Wait, stage, and statement events disappear quickly from the history. If a statement that executed a long time ago took a lock but is in a still-open transaction, it might not be possible to find the statement, but it is possible to find the transaction.

This is why the nested set data model works better for locating parent events. Following links in a parent/child relationship (data lock -> parent wait -> parent stage -> parent transaction) does not work well when intermediate nodes are already gone from the history tables.

The following scenario illustrates how to find the parent transaction of a statement in which a lock was taken:

Session A:

```
[1] START TRANSACTION;
[2] SELECT * FROM t1 WHERE pk = 1;
[3] SELECT 'Hello, world';
```

Session B:

```
SELECT ...
FROM performance_schema.events_transactions_current AS parent
 INNER JOIN performance_schema.data_locks AS child
WHERE
 parent.THREAD_ID = child.THREAD_ID
 AND parent.EVENT_ID < child.EVENT_ID
 AND (
 child.EVENT_ID <= parent.END_EVENT_ID
 OR parent.END_EVENT_ID IS NULL
);
```

The query for session B should show statement [2] as owning a data lock on the record with `pk=1`.

If session A executes more statements, [2] fades out of the history table.

The query should show the transaction that started in [1], regardless of how many statements, stages, or waits were executed.

To see more data, you can also use the `events_xxx_history_long` tables, except for transactions, assuming no other query runs in the server (so that history is preserved).

## 27.20 Restrictions on Performance Schema

The Performance Schema avoids using mutexes to collect or produce data, so there are no guarantees of consistency and results can sometimes be incorrect. Event values in `performance_schema` tables are nondeterministic and nonrepeatable.

If you save event information in another table, you should not assume that the original events remain available later. For example, if you select events from a `performance_schema` table into a temporary table, intending to join that table with the original table later, there might be no matches.

`mysqldump` and `BACKUP DATABASE` ignore tables in the `performance_schema` database.

Tables in the `performance_schema` database cannot be locked with `LOCK TABLES`, except the `setup_XXX` tables.

Tables in the `performance_schema` database cannot be indexed.

Tables in the `performance_schema` database are not replicated.

The types of timers might vary per platform. The `performance_timers` table shows which event timers are available. If the values in this table for a given timer name are `NULL`, that timer is not supported on your platform.

Instruments that apply to storage engines might not be implemented for all storage engines. Instrumentation of each third-party engine is the responsibility of the engine maintainer.

| 28.4.5 sys Schema Stored Functions .....          | 4951 |

MySQL 8.0 includes the `sys` schema, a set of objects that helps DBAs and developers interpret data collected by the Performance Schema. `sys` schema objects can be used for typical tuning and diagnosis use cases. Objects in this schema include:

- Views that summarize Performance Schema data into more easily understandable form.
- Stored procedures that perform operations such as Performance Schema configuration and generating diagnostic reports.
- Stored functions that query Performance Schema configuration and provide formatting services.

For new installations, the `sys` schema is installed by default during data directory initialization if you use `mysqld` with the `--initialize` or `--initialize-insecure` option. If this is not desired, you can drop the `sys` schema manually after initialization if it is unneeded.

The MySQL upgrade procedure produces an error if a `sys` schema exists but has no `version` view, on the assumption that absence of this view indicates a user-created `sys` schema. To upgrade in this case, remove or rename the existing `sys` schema first.

`sys` schema objects have a `DEFINER` of `'mysql.sys'@'localhost'`. Use of the dedicated `mysql.sys` account avoids problems that occur if a DBA renames or removes the `root` account.

### 28.1 Prerequisites for Using the sys Schema

Before using the `sys` schema, the prerequisites described in this section must be satisfied.

Because the `sys` schema provides an alternative means of accessing the Performance Schema, the Performance Schema must be enabled for the `sys` schema to work. See [Section 27.3, “Performance Schema Startup Configuration”](#).

For full access to the `sys` schema, a user must have these privileges:

- `SELECT` on all `sys` tables and views
- `EXECUTE` on all `sys` stored procedures and functions
- `INSERT` and `UPDATE` for the `sys_config` table, if changes are to be made to it
- Additional privileges for certain `sys` schema stored procedures and functions, as noted in their descriptions (for example, the `ps_setup_save()` procedure)

It is also necessary to have privileges for the objects underlying the `sys` schema objects:

- `SELECT` on any Performance Schema tables accessed by `sys` schema objects, and `UPDATE` for any tables to be updated using `sys` schema objects
- `PROCESS` for the `INFORMATION_SCHEMA INNODB_BUFFER_PAGE` table

Certain Performance Schema instruments and consumers must be enabled and (for instruments) timed to take full advantage of `sys` schema capabilities:

- All `wait` instruments
- All `stage` instruments
- All `statement` instruments
- `xxx_current` and `xxx_history_long` consumers for all events

You can use the `sys` schema itself to enable all of the additional instruments and consumers:

```
CALL sys.ps_setup_enable_instrument('wait');
CALL sys.ps_setup_enable_instrument('stage');
CALL sys.ps_setup_enable_instrument('statement');
CALL sys.ps_setup_enable_consumer('current');
CALL sys.ps_setup_enable_consumer('history_long');
```

#### Note

For many uses of the `sys` schema, the default Performance Schema is sufficient for data collection. Enabling all the instruments and consumers just mentioned has a performance impact, so it is preferable to enable only the additional configuration you need. Also, remember that if you enable additional configuration, you can easily restore the default configuration like this:

```
CALL sys.ps_setup_reset_to_default(TRUE);
```

## 28.2 Using the sys Schema

You can make the `sys` schema the default schema so that references to its objects need not be qualified with the schema name:

```
mysql> USE sys;
Database changed
mysql> SELECT * FROM version;
+-----+-----+
| sys_version | mysql_version |
+-----+-----+
| 2.1.1 | 8.0.26-debug |
+-----+-----+
```

(The `version` view shows the `sys` schema and MySQL server versions.)

To access `sys` schema objects while a different schema is the default (or simply to be explicit), qualify object references with the schema name:

```
mysql> SELECT * FROM sys.version;
+-----+-----+
| sys_version | mysql_version |
+-----+-----+
| 2.1.1 | 8.0.26-debug |
+-----+-----+
```

The `sys` schema contains many views that summarize Performance Schema tables in various ways. Most of these views come in pairs, such that one member of the pair has the same name as the other member, plus a `x$` prefix. For example, the `host_summary_by_file_io` view summarizes file I/O grouped by host and displays latencies converted from picoseconds to more readable values (with units);

```
mysql> SELECT * FROM sys.host_summary_by_file_io;
+-----+-----+-----+
| host | ios | io_latency |
+-----+-----+-----+
| localhost | 67570 | 5.38 s |
| background | 3468 | 4.18 s |
+-----+-----+-----+
```

The `x$host_summary_by_file_io` view summarizes the same data but displays unformatted picosecond latencies:

```
mysql> SELECT * FROM sys.x$host_summary_by_file_io;
+-----+-----+-----+
| host | ios | io_latency |
+-----+-----+-----+
| localhost | 67574 | 5380678125144 |
| background | 3474 | 4758696829416 |
+-----+-----+-----+
```

The view without the `x$` prefix is intended to provide output that is more user friendly and easier for humans to read. The view with the `x$` prefix that displays the same values in raw form is intended more for use with other tools that perform their own processing on the data. For additional information about the differences between non-`x$` and `x$` views, see [Section 28.4.3, “sys Schema Views”](#).

To examine `sys` schema object definitions, use the appropriate `SHOW` statement or `INFORMATION_SCHEMA` query. For example, to examine the definitions of the `session` view and `format_bytes()` function, use these statements:

```
mysql> SHOW CREATE VIEW sys.session;
mysql> SHOW CREATE FUNCTION sys.format_bytes;
```

However, those statements display the definitions in relatively unformatted form. To view object definitions with more readable formatting, access the individual `.sql` files found under the `scripts/sys_schema` in MySQL source distributions. Prior to MySQL 8.0.18, the sources are maintained in a separate distribution available from the `sys` schema development website at <https://github.com/mysql/mysql-sys>.

Neither `mysqldump` nor `mysqlpump` dump the `sys` schema by default. To generate a dump file, name the `sys` schema explicitly on the command line using either of these commands:

```
mysqldump --databases --routines sys > sys_dump.sql
mysqlpump sys > sys_dump.sql
```

To reinstall the schema from the dump file, use this command:

```
mysql < sys_dump.sql
```

## 28.3 sys Schema Progress Reporting

The following `sys` schema views provide progress reporting for long-running transactions:

```
processlist
session
x$processlist
x$session
```

Assuming that the required instruments and consumers are enabled, the `progress` column of these views shows the percentage of work completed for stages that support progress reporting.

Stage progress reporting requires that the `events_stages_current` consumer be enabled, as well as the instruments for which progress information is desired. Instruments for these stages currently support progress reporting:

```
stage/sql/Copying to tmp table
stage/innodb/alter table (end)
stage/innodb/alter table (flush)
stage/innodb/alter table (insert)
stage/innodb/alter table (log apply index)
stage/innodb/alter table (log apply table)
stage/innodb/alter table (merge sort)
stage/innodb/alter table (read PK and internal sort)
stage/innodb/buffer pool load
```

For stages that do not support estimated and completed work reporting, or if the required instruments or consumers are not enabled, the `progress` column is `NULL`.

## 28.4 sys Schema Object Reference

The `sys` schema includes tables and triggers, views, and stored procedures and functions. The following sections provide details for each of these objects.

### 28.4.1 sys Schema Object Index

The following tables list `sys` schema objects and provide a short description of each one.

**Table 28.1 sys Schema Tables and Triggers**

| Table or Trigger Name                   | Description                            |
|-----------------------------------------|----------------------------------------|
| <code>sys_config</code>                 | sys schema configuration options table |
| <code>sys_config_insert_set_user</code> | sys_config insert trigger              |
| <code>sys_config_update_set_user</code> | sys_config update trigger              |

**Table 28.2 sys Schema Views**

| View Name                                                                                       | Description                                                    | Deprecated |
|-------------------------------------------------------------------------------------------------|----------------------------------------------------------------|------------|
| <code>host_summary, x</code><br><code>\$host_summary</code>                                     | Statement activity, file I/O, and connections, grouped by host |            |
| <code>host_summary_by_file_io, x</code><br><code>\$host_summary_by_file_io</code>               | File I/O, grouped by host                                      |            |
| <code>host_summary_by_file_io_type, x</code><br><code>\$host_summary_by_file_io_type</code>     | File I/O, grouped by host and event type                       |            |
| <code>host_summary_by_stages, x</code><br><code>\$host_summary_by_stages</code>                 | Statement stages, grouped by host                              |            |
| <code>host_summary_by_statement, x</code><br><code>\$host_summary_by_statement</code>           | Statement statistics, grouped by host                          |            |
| <code>host_summary_by_statement_type, x</code><br><code>\$host_summary_by_statement_type</code> | Statements executed, grouped by host and statement type        |            |
| <code>innodb_buffer_stats_by_schema, x</code><br><code>\$innodb_buffer_stats_by_schema</code>   | InnoDB buffer information, grouped by schema                   |            |
| <code>innodb_buffer_stats_by_table, x</code><br><code>\$innodb_buffer_stats_by_table</code>     | InnoDB buffer information, grouped by schema and table         |            |
| <code>innodb_lock_waits, x</code><br><code>\$innodb_lock_waits</code>                           | InnoDB lock information                                        |            |
| <code>io_by_thread_by_latency, x</code><br><code>\$io_by_thread_by_latency</code>               | I/O consumers, grouped by thread                               |            |
| <code>io_global_by_file_by_bytes, x</code><br><code>\$io_global_by_file_by_bytes</code>         | Global I/O consumers, grouped by file and bytes                |            |
| <code>io_global_by_file_by_latency, x</code><br><code>\$io_global_by_file_by_latency</code>     | Global I/O consumers, grouped by file and latency              |            |

| View Name                                                                                                                  | Description                                               | Deprecated |
|----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|------------|
| <code>io_global_by_wait_by_bytes</code> ,<br><code>x</code><br><code>\$io_global_by_wait_by_bytes</code>                   | Global I/O consumers, grouped by bytes                    |            |
| <code>io_global_by_wait_by_latency</code> ,<br><code>x</code><br><code>\$io_global_by_wait_by_latency</code>               | Global I/O consumers, grouped by latency                  |            |
| <code>latest_file_io</code> ,<br><code>x</code><br><code>\$latest_file_io</code>                                           | Most recent I/O, grouped by file and thread               |            |
| <code>memory_by_host_by_current_bytes</code> ,<br><code>x</code><br><code>\$memory_by_host_by_current_bytes</code>         | Memory use, grouped by host                               |            |
| <code>memory_by_thread_by_current_bytes</code> ,<br><code>x</code><br><code>\$memory_by_thread_by_current_bytes</code>     | Memory use, grouped by thread                             |            |
| <code>memory_by_user_by_current_bytes</code> ,<br><code>x</code><br><code>\$memory_by_user_by_current_bytes</code>         | Memory use, grouped by user                               |            |
| <code>memory_global_by_current_bytes</code> ,<br><code>x</code><br><code>\$memory_global_by_current_bytes</code>           | Memory use, grouped by allocation type                    |            |
| <code>memory_global_total</code> ,<br><code>x</code><br><code>\$memory_global_total</code>                                 | Total memory use                                          |            |
| <code>metrics</code>                                                                                                       | Server metrics                                            |            |

## 28.4.2 sys Schema Tables and Triggers

The following sections describe `sys` schema tables and triggers.

### 28.4.2.1 The `sys_config` Table

This table contains `sys` schema configuration options, one row per option. Configuration changes made by updating this table persist across client sessions and server restarts.

The `sys_config` table has these columns:

- `variable`

The configuration option name.

- `value`

The configuration option value.

- `set_time`

The timestamp of the most recent modification to the row.

- `set_by`

The account that made the most recent modification to the row. The value is `NULL` if the row has not been changed since the `sys` schema was installed.

As an efficiency measure to minimize the number of direct reads from the `sys_config` table, `sys` schema functions that use a value from this table check for a user-defined variable with a corresponding name, which is the user-defined variable having the same name plus a `@sys.` prefix. (For example, the variable corresponding to the `diagnostics.include_raw` option is `@sys.diagnostics.include_raw`.) If the user-defined variable exists in the current session and is non-`NULL`, the function uses its value in preference to the value in the `sys_config` table. Otherwise, the function reads and uses the value from the table. In the latter case, the calling function conventionally also sets the corresponding user-defined variable to the table value so that further references to the configuration option within the same session use the variable and need not read the table again.

For example, the `statement_truncate_len` option controls the maximum length of statements returned by the `format_statement()` function. The default is 64. To temporarily change the value to 32 for your current session, set the corresponding `@sys.statement_truncate_len` user-defined variable:

```
mysql> SET @stmt = 'SELECT variable, value, set_time, set_by FROM sys_config';
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
| SELECT variable, value, set_time, set_by FROM sys_config |
+-----+
mysql> SET @sys.statement_truncate_len = 32;
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
```

```
| SELECT variabl ... ROM sys_config |
+-----+

```

Subsequent invocations of `format_statement()` within the session continue to use the user-defined variable value (32), rather than the value stored in the table (64).

To stop using the user-defined variable and revert to using the value in the table, set the variable to `NULL` within your session:

```
mysql> SET @sys.statement_truncate_len = NULL;
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
| SELECT variable, value, set_time, set_by FROM sys_config |
+-----+

```

Alternatively, end your current session (causing the user-defined variable to no longer exist) and begin a new session.

The conventional relationship just described between options in the `sys_config` table and user-defined variables can be exploited to make temporary configuration changes that end when your session ends. However, if you set a user-defined variable and then subsequently change the corresponding table value within the same session, the changed table value is not used in that session as long as the user-defined variable exists with a non-`NULL` value. (The changed table value *is* used in other sessions in which the user-defined variable is not assigned.)

The following list describes the options in the `sys_config` table and the corresponding user-defined variables:

- `diagnostics.allow_i_s_tables, @sys.diagnostics.allow_i_s_tables`

If this option is `ON`, the `diagnostics()` procedure is permitted to perform table scans on the `INFORMATION_SCHEMA.TABLES` table. This can be expensive if there are many tables. The default is `OFF`.

- `diagnostics.include_raw, @sys.diagnostics.include_raw`

If this option is `ON`, the `diagnostics()` procedure includes the raw output from querying the `metrics` view. The default is `OFF`.

- `ps_thread_trx_info.max_length, @sys.ps_thread_trx_info.max_length`

The maximum length for JSON output produced by the `ps_thread_trx_info()` function. The default is 65535.

- `statement_performance_analyzer.limit, @sys.statement_performance_analyzer.limit`

The maximum number of rows to return for views that have no built-in limit. (For example, the `statements_with_runtimes_in_95th_percentile` view has a built-in limit in the sense that it returns only statements with average execution time in the 95th percentile.) The default is 100.

- `statement_performance_analyzer.view, @sys.statement_performance_analyzer.view`

The custom query or view to be used by the `statement_performance_analyzer()` procedure (which is itself invoked by the `diagnostics()` procedure). If the option value contains a space, it is interpreted as a query. Otherwise, it must be the name of an existing view that queries the Performance Schema `events_statements_summary_by_digest` table. There cannot be any `LIMIT` clause in the query or view definition if the `statement_performance_analyzer.limit` configuration option is greater than 0. The default is `NULL` (no custom view defined).

- `statement_truncate_len, @sys.statement_truncate_len`

The maximum length of statements returned by the `format_statement()` function. Longer statements are truncated to this length. The default is 64.

Other options can be added to the `sys_config` table. For example, the `diagnostics()` and `execute_prepared_stmt()` procedures use the `debug` option if it exists, but this option is not part of the `sys_config` table by default because debug output normally is enabled only temporarily, by setting the corresponding `@sys.debug` user-defined variable. To enable debug output without having to set that variable in individual sessions, add the option to the table:

```
mysql> INSERT INTO sys.sys_config (variable, value) VALUES('debug', 'ON');
```

To change the debug setting in the table, do two things. First, modify the value in the table itself:

```
mysql> UPDATE sys.sys_config
 SET value = 'OFF'
 WHERE variable = 'debug';
```

Second, to also ensure that procedure invocations within the current session use the changed value from the table, set the corresponding user-defined variable to `NULL`:

```
mysql> SET @sys.debug = NULL;
```

### 28.4.2.2 The sys\_config\_insert\_set\_user Trigger

For rows added to the `sys_config` table by `INSERT` statements, the `sys_config_insert_set_user` trigger sets the `set_by` column to the current user.

### 28.4.2.3 The sys\_config\_update\_set\_user Trigger

The `sys_config_update_set_user` trigger for the `sys_config` table is similar to the `sys_config_insert_set_user` trigger, but for `UPDATE` statements.

## 28.4.3 sys Schema Views

The following sections describe `sys` schema views.

The `sys` schema contains many views that summarize Performance Schema tables in various ways. Most of these views come in pairs, such that one member of the pair has the same name as the other member, plus a `x$` prefix. For example, the `host_summary_by_file_io` view summarizes file I/O grouped by host and displays latencies converted from picoseconds to more readable values (with units);

```
mysql> SELECT * FROM sys.host_summary_by_file_io;
+-----+-----+-----+
| host | ios | io_latency |
+-----+-----+-----+
| localhost | 67570 | 5.38 s |
| background | 3468 | 4.18 s |
+-----+-----+-----+
```

The `x$host_summary_by_file_io` view summarizes the same data but displays unformatted picosecond latencies:

```
mysql> SELECT * FROM sys.x$host_summary_by_file_io;
+-----+-----+-----+
| host | ios | io_latency |
+-----+-----+-----+
| localhost | 67574 | 5380678125144 |
| background | 3474 | 4758696829416 |
+-----+-----+-----+
```

The view without the `x$` prefix is intended to provide output that is more user friendly and easier to read. The view with the `x$` prefix that displays the same values in raw form is intended more for use with other tools that perform their own processing on the data.

Views without the `x$` prefix differ from the corresponding `x$` views in these ways:

- Byte counts are formatted with size units using `format_bytes()`.
- Time values are formatted with temporal units using `format_time()`.
- SQL statements are truncated to a maximum display width using `format_statement()`.
- Path name are shortened using `format_path()`.

### 28.4.3.1 The `host_summary` and `x$host_summary` Views

These views summarize statement activity, file I/O, and connections, grouped by host.

The `host_summary` and `x$host_summary` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statements`

The total number of statements for the host.

- `statement_latency`

The total wait time of timed statements for the host.

- `statement_avg_latency`

The average wait time per timed statement for the host.

- `table_scans`

The total number of table scans for the host.

- `file_ios`

The total number of file I/O events for the host.

- `file_io_latency`

The total wait time of timed file I/O events for the host.

- `current_connections`

The current number of connections for the host.

- `total_connections`

The total number of connections for the host.

- `unique_users`

The number of distinct users for the host.

- `current_memory`

The current amount of allocated memory for the host.

- `total_memory_allocated`

The total amount of allocated memory for the host.

### 28.4.3.2 The `host_summary_by_file_io` and `x$host_summary_by_file_io` Views

These views summarize file I/O, grouped by host. By default, rows are sorted by descending total file I/O latency.

The `host_summary_by_file_io` and `x$host_summary_by_file_io` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `ios`

The total number of file I/O events for the host.

- `io_latency`

The total wait time of timed file I/O events for the host.

### 28.4.3.3 The `host_summary_by_file_io_type` and `x$host_summary_by_file_io_type` Views

These views summarize file I/O, grouped by host and event type. By default, rows are sorted by host and descending total I/O latency.

The `host_summary_by_file_io_type` and `x$host_summary_by_file_io_type` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

The file I/O event name.

- `total`

The total number of occurrences of the file I/O event for the host.

- `total_latency`

The total wait time of timed occurrences of the file I/O event for the host.

- `max_latency`

The maximum single wait time of timed occurrences of the file I/O event for the host.

### 28.4.3.4 The `host_summary_by_stages` and `x$host_summary_by_stages` Views

These views summarize statement stages, grouped by host. By default, rows are sorted by host and descending total latency.

The `host_summary_by_stages` and `x$host_summary_by_stages` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

The stage event name.

- `total`

The total number of occurrences of the stage event for the host.

- `total_latency`

The total wait time of timed occurrences of the stage event for the host.

- `avg_latency`

The average wait time per timed occurrence of the stage event for the host.

#### 28.4.3.5 The `host_summary_by_statement_latency` and `x$host_summary_by_statement_latency` Views

These views summarize overall statement statistics, grouped by host. By default, rows are sorted by descending total latency.

The `host_summary_by_statement_latency` and `x$host_summary_by_statement_latency` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `total`

The total number of statements for the host.

- `total_latency`

The total wait time of timed statements for the host.

- `max_latency`

The maximum single wait time of timed statements for the host.

- `lock_latency`

The total time waiting for locks by timed statements for the host.

- `rows_sent`

The total number of rows returned by statements for the host.

- `rows_examined`

The total number of rows read from storage engines by statements for the host.

- `rows_affected`

The total number of rows affected by statements for the host.

- `full_scans`

The total number of full table scans by statements for the host.

#### 28.4.3.6 The `host_summary_by_statement_type` and `x$host_summary_by_statement_type` Views

These views summarize information about statements executed, grouped by host and statement type. By default, rows are sorted by host and descending total latency.

The `host_summary_by_statement_type` and `x$host_summary_by_statement_type` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statement`

The final component of the statement event name.

- `total`

The total number of occurrences of the statement event for the host.

- `total_latency`

The total wait time of timed occurrences of the statement event for the host.

- `max_latency`

The maximum single wait time of timed occurrences of the statement event for the host.

- `lock_latency`

The total time waiting for locks by timed occurrences of the statement event for the host.

- `rows_sent`

The total number of rows returned by occurrences of the statement event for the host.

- `rows_examined`

The total number of rows read from storage engines by occurrences of the statement event for the host.

- `rows_affected`

The total number of rows affected by occurrences of the statement event for the host.

- `full_scans`

The total number of full table scans by occurrences of the statement event for the host.

#### 28.4.3.7 The `innodb_buffer_stats_by_schema` and `x$innodb_buffer_stats_by_schema` Views

These views summarize the information in the [INFORMATION\\_SCHEMA INNODB\\_BUFFER\\_PAGE](#) table, grouped by schema. By default, rows are sorted by descending buffer size.

### Warning

Querying views that access the [INNODB\\_BUFFER\\_PAGE](#) table can affect performance. Do not query these views on a production system unless you are aware of the performance impact and have determined it to be acceptable. To avoid impacting performance on a production system, reproduce the issue you want to investigate and query buffer pool statistics on a test instance.

The [innodb\\_buffer\\_stats\\_by\\_schema](#) and [x\\$innodb\\_buffer\\_stats\\_by\\_schema](#) views have these columns:

- [object\\_schema](#)

The schema name for the object, or [InnoDB System](#) if the table belongs to the [InnoDB](#) storage engine.

- [allocated](#)

The total number of bytes allocated for the schema.

- [data](#)

The total number of data bytes allocated for the schema.

- [pages](#)

The total number of pages allocated for the schema.

- [pages\\_hashed](#)

The total number of hashed pages allocated for the schema.

- [pages\\_old](#)

The total number of old pages allocated for the schema.

- [rows\\_cached](#)

The total number of cached rows for the schema.

### 28.4.3.8 The [innodb\\_buffer\\_stats\\_by\\_table](#) and [x\\$innodb\\_buffer\\_stats\\_by\\_table](#) Views

These views summarize the information in the [INFORMATION\\_SCHEMA INNODB\\_BUFFER\\_PAGE](#) table, grouped by schema and table. By default, rows are sorted by descending buffer size.

### Warning

Querying views that access the [INNODB\\_BUFFER\\_PAGE](#) table can affect performance. Do not query these views on a production system unless you are aware of the performance impact and have determined it to be acceptable. To avoid impacting performance on a production system, reproduce the issue you want to investigate and query buffer pool statistics on a test instance.

The [innodb\\_buffer\\_stats\\_by\\_table](#) and [x\\$innodb\\_buffer\\_stats\\_by\\_table](#) views have these columns:

- [object\\_schema](#)

The schema name for the object, or [InnoDB System](#) if the table belongs to the [InnoDB](#) storage engine.

- `object_name`  
The table name.
- `allocated`  
The total number of bytes allocated for the table.
- `data`  
The number of data bytes allocated for the table.
- `pages`  
The total number of pages allocated for the table.
- `pages_hashed`  
The number of hashed pages allocated for the table.
- `pages_old`  
The number of old pages allocated for the table.
- `rows_cached`  
The number of cached rows for the table.

#### 28.4.3.9 The `innodb_lock_waits` and `x$innodb_lock_waits` Views

These views summarize the `InnoDB` locks that transactions are waiting for. By default, rows are sorted by descending lock age.

The `innodb_lock_waits` and `x$innodb_lock_waits` views have these columns:

- `wait_started`  
The time at which the lock wait started.
- `wait_age`  
How long the lock has been waited for, as a `TIME` value.
- `wait_age_secs`  
How long the lock has been waited for, in seconds.
- `locked_table_schema`  
The schema that contains the locked table.
- `locked_table_name`  
The name of the locked table.
- `locked_table_partition`  
The name of the locked partition, if any; `NULL` otherwise.
- `locked_table_subpartition`  
The name of the locked subpartition, if any; `NULL` otherwise.
- `locked_index`

The name of the locked index.

- `locked_type`

The type of the waiting lock.

- `waiting_trx_id`

The ID of the waiting transaction.

- `waiting_trx_started`

The time at which the waiting transaction started.

- `waiting_trx_age`

How long the waiting transaction has been waiting, as a `TIME` value.

- `waiting_trx_rows_locked`

The number of rows locked by the waiting transaction.

- `waiting_trx_rows_modified`

The number of rows modified by the waiting transaction.

- `waiting_pid`

The processlist ID of the waiting transaction.

- `waiting_query`

The statement that is waiting for the lock.

- `waiting_lock_id`

The ID of the waiting lock.

- `waiting_lock_mode`

The mode of the waiting lock.

- `blocking_trx_id`

The ID of the transaction that is blocking the waiting lock.

- `blocking_pid`

The processlist ID of the blocking transaction.

- `blocking_query`

The statement the blocking transaction is executing. This field reports NULL if the session that issued the blocking query becomes idle. For more information, see [Identifying a Blocking Query After the Issuing Session Becomes Idle](#).

- `blocking_lock_id`

The ID of the lock that is blocking the waiting lock.

- `blocking_lock_mode`

The mode of the lock that is blocking the waiting lock.

- `blocking_trx_started`

The time at which the blocking transaction started.

- `blocking_trx_age`

How long the blocking transaction has been executing, as a `TIME` value.

- `blocking_trx_rows_locked`

The number of rows locked by the blocking transaction.

- `blocking_trx_rows_modified`

The number of rows modified by the blocking transaction.

- `sql_kill_blocking_query`

The `KILL` statement to execute to kill the blocking statement.

- `sql_kill_blocking_connection`

The `KILL` statement to execute to kill the session running the blocking statement.

#### 28.4.3.10 The `io_by_thread_by_latency` and `x$io_by_thread_by_latency` Views

These views summarize I/O consumers to display time waiting for I/O, grouped by thread. By default, rows are sorted by descending total I/O latency.

The `io_by_thread_by_latency` and `x$io_by_thread_by_latency` views have these columns:

- `user`

For foreground threads, the account associated with the thread. For background threads, the thread name.

- `total`

The total number of I/O events for the thread.

- `total_latency`

The total wait time of timed I/O events for the thread.

- `min_latency`

The minimum single wait time of timed I/O events for the thread.

- `avg_latency`

The average wait time per timed I/O event for the thread.

- `max_latency`

The maximum single wait time of timed I/O events for the thread.

- `thread_id`

The thread ID.

- `processlist_id`

For foreground threads, the processlist ID of the thread. For background threads, `NULL`.

### 28.4.3.11 The `io_global_by_file_by_bytes` and `x$io_global_by_file_by_bytes` Views

These views summarize global I/O consumers to display amount of I/O, grouped by file. By default, rows are sorted by descending total I/O (bytes read and written).

The `io_global_by_file_by_bytes` and `x$io_global_by_file_by_bytes` views have these columns:

- `file`  
The file path name.
- `count_read`  
The total number of read events for the file.
- `total_read`  
The total number of bytes read from the file.
- `avg_read`  
The average number of bytes per read from the file.
- `count_write`  
The total number of write events for the file.
- `total_written`  
The total number of bytes written to the file.
- `avg_write`  
The average number of bytes per write to the file.
- `total`  
The total number of bytes read and written for the file.
- `write_pct`  
The percentage of total bytes of I/O that were writes.

### 28.4.3.12 The `io_global_by_file_by_latency` and `x$io_global_by_file_by_latency` Views

These views summarize global I/O consumers to display time waiting for I/O, grouped by file. By default, rows are sorted by descending total latency.

The `io_global_by_file_by_latency` and `x$io_global_by_file_by_latency` views have these columns:

- `file`  
The file path name.
- `total`  
The total number of I/O events for the file.
- `total_latency`  
The total wait time of timed I/O events for the file.

- `count_read`

The total number of read I/O events for the file.

- `read_latency`

The total wait time of timed read I/O events for the file.

- `count_write`

The total number of write I/O events for the file.

- `write_latency`

The total wait time of timed write I/O events for the file.

- `count_misc`

The total number of other I/O events for the file.

- `misc_latency`

The total wait time of timed other I/O events for the file.

#### 28.4.3.13 The `io_global_by_wait_by_bytes` and `x$io_global_by_wait_by_bytes` Views

These views summarize global I/O consumers to display amount of I/O and time waiting for I/O, grouped by event. By default, rows are sorted by descending total I/O (bytes read and written).

The `io_global_by_wait_by_bytes` and `x$io_global_by_wait_by_bytes` views have these columns:

- `event_name`

The I/O event name, with the `wait/io/file/` prefix stripped.

- `total`

The total number of occurrences of the I/O event.

- `total_latency`

The total wait time of timed occurrences of the I/O event.

- `min_latency`

The minimum single wait time of timed occurrences of the I/O event.

- `avg_latency`

The average wait time per timed occurrence of the I/O event.

- `max_latency`

The maximum single wait time of timed occurrences of the I/O event.

- `count_read`

The number of read requests for the I/O event.

- `total_read`

The number of bytes read for the I/O event.

- `avg_read`

The average number of bytes per read for the I/O event.

- `count_write`

The number of write requests for the I/O event.

- `total_written`

The number of bytes written for the I/O event.

- `avg_written`

The average number of bytes per write for the I/O event.

- `total_requested`

The total number of bytes read and written for the I/O event.

#### 28.4.3.14 The `io_global_by_wait_by_latency` and `x$io_global_by_wait_by_latency` Views

These views summarize global I/O consumers to display amount of I/O and time waiting for I/O, grouped by event. By default, rows are sorted by descending total latency.

The `io_global_by_wait_by_latency` and `x$io_global_by_wait_by_latency` views have these columns:

- `event_name`

The I/O event name, with the `wait/io/file/` prefix stripped.

- `total`

The total number of occurrences of the I/O event.

- `total_latency`

The total wait time of timed occurrences of the I/O event.

- `avg_latency`

The average wait time per timed occurrence of the I/O event.

- `max_latency`

The maximum single wait time of timed occurrences of the I/O event.

- `read_latency`

The total wait time of timed read occurrences of the I/O event.

- `write_latency`

The total wait time of timed write occurrences of the I/O event.

- `misc_latency`

The total wait time of timed other occurrences of the I/O event.

- `count_read`

The number of read requests for the I/O event.

- `total_read`

The number of bytes read for the I/O event.

- `avg_read`

The average number of bytes per read for the I/O event.

- `count_write`

The number of write requests for the I/O event.

- `total_written`

The number of bytes written for the I/O event.

- `avg_written`

The average number of bytes per write for the I/O event.

#### 28.4.3.15 The `latest_file_io` and `x$latest_file_io` Views

These views summarize file I/O activity, grouped by file and thread. By default, rows are sorted with most recent I/O first.

The `latest_file_io` and `x$latest_file_io` views have these columns:

- `thread`

For foreground threads, the account associated with the thread (and port number for TCP/IP connections). For background threads, the thread name and thread ID

- `file`

The file path name.

- `latency`

The wait time of the file I/O event.

- `operation`

The type of operation.

- `requested`

The number of data bytes requested for the file I/O event.

#### 28.4.3.16 The `memory_by_host_by_current_bytes` and `x$memory_by_host_by_current_bytes` Views

These views summarize memory use, grouped by host. By default, rows are sorted by descending amount of memory used.

The `memory_by_host_by_current_bytes` and `x$memory_by_host_by_current_bytes` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `current_count_used`

The current number of allocated memory blocks that have not been freed yet for the host.

- `current_allocated`

The current number of allocated bytes that have not been freed yet for the host.

- `current_avg_alloc`

The current number of allocated bytes per memory block for the host.

- `current_max_alloc`

The largest single current memory allocation in bytes for the host.

- `total_allocated`

The total memory allocation in bytes for the host.

#### **28.4.3.17 The `memory_by_thread_by_current_bytes` and `x$memory_by_thread_by_current_bytes` Views**

These views summarize memory use, grouped by thread. By default, rows are sorted by descending amount of memory used.

The `memory_by_thread_by_current_bytes` and `x$memory_by_thread_by_current_bytes` views have these columns:

- `thread_id`

The thread ID.

- `user`

The thread user or thread name.

- `current_count_used`

The current number of allocated memory blocks that have not been freed yet for the thread.

- `current_allocated`

The current number of allocated bytes that have not been freed yet for the thread.

- `current_avg_alloc`

The current number of allocated bytes per memory block for the thread.

- `current_max_alloc`

The largest single current memory allocation in bytes for the thread.

- `total_allocated`

The total memory allocation in bytes for the thread.

#### **28.4.3.18 The `memory_by_user_by_current_bytes` and `x$memory_by_user_by_current_bytes` Views**

These views summarize memory use, grouped by user. By default, rows are sorted by descending amount of memory used.

The `memory_by_user_by_current_bytes` and `x$memory_by_user_by_current_bytes` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `current_count_used`

The current number of allocated memory blocks that have not been freed yet for the user.

- `current_allocated`

The current number of allocated bytes that have not been freed yet for the user.

- `current_avg_alloc`

The current number of allocated bytes per memory block for the user.

- `current_max_alloc`

The largest single current memory allocation in bytes for the user.

- `total_allocated`

The total memory allocation in bytes for the user.

#### **28.4.3.19 The `memory_global_by_current_bytes` and `x$memory_global_by_current_bytes` Views**

These views summarize memory use, grouped by allocation type (that is, by event). By default, rows are sorted by descending amount of memory used.

The `memory_global_by_current_bytes` and `x$memory_global_by_current_bytes` views have these columns:

- `event_name`

The memory event name.

- `current_count`

The total number of occurrences of the event.

- `current_alloc`

The current number of allocated bytes that have not been freed yet for the event.

- `current_avg_alloc`

The current number of allocated bytes per memory block for the event.

- `high_count`

The high-water mark for number of memory blocks allocated for the event.

- `high_alloc`

The high-water mark for number of bytes allocated for the event.

- `high_avg_alloc`

The high-water mark for average number of bytes per memory block allocated for the event.

### 28.4.3.20 The `memory_global_total` and `x$memory_global_total` Views

These views summarize total memory use within the server.

The `memory_global_total` and `x$memory_global_total` views have these columns:

- `total_allocated`

The total bytes of memory allocated within the server.

### 28.4.3.21 The `metrics` View

This view summarizes MySQL server metrics to show variable names, values, types, and whether they are enabled. By default, rows are sorted by variable type and name.

The `metrics` view includes this information:

- Global status variables from the Performance Schema `global_status` table
- InnoDB metrics from the `INFORMATION_SCHEMA INNODB_METRICS` table
- Current and total memory allocation, based on the Performance Schema memory instrumentation
- The current time (human readable and Unix timestamp formats)

There is some duplication of information between the `global_status` and `INNODB_METRICS` tables, which the `metrics` view eliminates.

The `metrics` view has these columns:

- `Variable_name`

The metric name. The metric type determines the source from which the name is taken:

- For global status variables: The `VARIABLE_NAME` column of the `global_status` table
- For InnoDB metrics: The `NAME` column of the `INNODB_METRICS` table
- For other metrics: A view-provided descriptive string

- `Variable_value`

The metric value. The metric type determines the source from which the value is taken:

- For global status variables: The `VARIABLE_VALUE` column of the `global_status` table
- For InnoDB metrics: The `COUNT` column of the `INNODB_METRICS` table
- For memory metrics: The relevant column from the Performance Schema `memory_summary_global_by_event_name` table
- For the current time: The value of `NOW(3)` or `UNIX_TIMESTAMP(NOW(3))`

- `Type`

The metric type:

- For global status variables: `Global Status`
- For InnoDB metrics: `InnoDB Metrics - %`, where `%` is replaced by the value of the `SUBSYSTEM` column of the `INNODB_METRICS` table

- For memory metrics: [Performance Schema](#)
- For the current time: [System Time](#)
- [Enabled](#)

Whether the metric is enabled:

- For global status variables: [YES](#)
- For [InnoDB](#) metrics: [YES](#) if the [STATUS](#) column of the [INNODB\\_METRICS](#) table is [enabled](#), [NO](#) otherwise
- For memory metrics: [NO](#), [YES](#), or [PARTIAL](#) (currently, [PARTIAL](#) occurs only for memory metrics and indicates that not all [memory/%](#) instruments are enabled; Performance Schema memory instruments are always enabled)
- For the current time: [YES](#)

### 28.4.3.22 The processlist and x\$processlist Views

The MySQL process list indicates the operations currently being performed by the set of threads executing within the server. The [processlist](#) and [x\\$processlist](#) views summarize process information. They provide more complete information than the [SHOW PROCESSLIST](#) statement and the [INFORMATION\\_SCHEMA.PROCESSLIST](#) table, and are also nonblocking. By default, rows are sorted by descending process time and descending wait time. For a comparison of process information sources, see [Sources of Process Information](#).

The column descriptions here are brief. For additional information, see the description of the Performance Schema [threads](#) table at [Section 27.12.21.6, “The threads Table”](#).

The [processlist](#) and [x\\$processlist](#) views have these columns:

- [thd\\_id](#)

The thread ID.

- [conn\\_id](#)

The connection ID.

- [user](#)

The thread user or thread name.

- [db](#)

The default database for the thread, or [NULL](#) if there is none.

- [command](#)

For foreground threads, the type of command the thread is executing on behalf of the client, or [Sleep](#) if the session is idle.

- [state](#)

An action, event, or state that indicates what the thread is doing.

- [time](#)

The time in seconds that the thread has been in its current state.

- `current_statement`

The statement the thread is executing, or `NULL` if it is not executing any statement.

- `statement_latency`

How long the statement has been executing.

- `progress`

The percentage of work completed for stages that support progress reporting. See [Section 28.3, “sys Schema Progress Reporting”](#).

- `lock_latency`

The time spent waiting for locks by the current statement.

- `rows_examined`

The number of rows read from storage engines by the current statement.

- `rows_sent`

The number of rows returned by the current statement.

- `rows_affected`

The number of rows affected by the current statement.

- `tmp_tables`

The number of internal in-memory temporary tables created by the current statement.

- `tmp_disk_tables`

The number of internal on-disk temporary tables created by the current statement.

- `full_scan`

The number of full table scans performed by the current statement.

- `last_statement`

The last statement executed by the thread, if there is no currently executing statement or wait.

- `last_statement_latency`

How long the last statement executed.

- `current_memory`

The number of bytes allocated by the thread.

- `last_wait`

The name of the most recent wait event for the thread.

- `last_wait_latency`

The wait time of the most recent wait event for the thread.

- `source`

The source file and line number containing the instrumented code that produced the event.

- `trx_latency`

The wait time of the current transaction for the thread.

- `trx_state`

The state for the current transaction for the thread.

- `trx_autocommit`

Whether autocommit mode was enabled when the current transaction started.

- `pid`

The client process ID.

- `program_name`

The client program name.

#### 28.4.3.23 The `ps_check_lost_instrumentation` View

This view returns information about lost Performance Schema instruments, to indicate whether the Performance Schema is unable to monitor all runtime data.

The `ps_check_lost_instrumentation` view has these columns:

- `variable_name`

The Performance Schema status variable name indicating which type of instrument was lost.

- `variable_value`

The number of instruments lost.

#### 28.4.3.24 The `schema_auto_increment_columns` View

This view indicates which tables have `AUTO_INCREMENT` columns and provides information about those columns, such as the current and maximum column values and the usage ratio (ratio of used to possible values). By default, rows are sorted by descending usage ratio and maximum column value.

Tables in these schemas are excluded from view output: `mysql`, `sys`, `INFORMATION_SCHEMA`, `performance_schema`.

The `schema_auto_increment_columns` view has these columns:

- `table_schema`

The schema that contains the table.

- `table_name`

The table that contains the `AUTO_INCREMENT` column.

- `column_name`

The name of the `AUTO_INCREMENT` column.

- `data_type`

The data type of the column.

- `column_type`

The column type of the column, which is the data type plus possibly other information. For example, for a column with a `bigint(20) unsigned` column type, the data type is just `bigint`.

- `is_signed`

Whether the column type is signed.

- `is_unsigned`

Whether the column type is unsigned.

- `max_value`

The maximum permitted value for the column.

- `auto_increment`

The current `AUTO_INCREMENT` value for the column.

- `auto_increment_ratio`

The ratio of used to permitted values for the column. This indicates how much of the sequence of values is “used up.”

#### 28.4.3.25 The `schema_index_statistics` and `x$schema_index_statistics` Views

These views provide index statistics. By default, rows are sorted by descending total index latency.

The `schema_index_statistics` and `x$schema_index_statistics` views have these columns:

- `table_schema`

The schema that contains the table.

- `table_name`

The table that contains the index.

- `index_name`

The name of the index.

- `rows_selected`

The total number of rows read using the index.

- `select_latency`

The total wait time of timed reads using the index.

- `rows_inserted`

The total number of rows inserted into the index.

- `insert_latency`

The total wait time of timed inserts into the index.

- `rows_updated`

The total number of rows updated in the index.

- `update_latency`

The total wait time of timed updates in the index.

- `rows_deleted`

The total number of rows deleted from the index.

- `delete_latency`

The total wait time of timed deletes from the index.

#### 28.4.3.26 The `schema_object_overview` View

This view summarizes the types of objects within each schema. By default, rows are sorted by schema and object type.

##### Note

For MySQL instances with a large number of objects, this view might take a long time to execute.

The `schema_object_overview` view has these columns:

- `db`

The schema name.

- `object_type`

The object type: `BASE TABLE`, `INDEX (index_type)`, `EVENT`, `FUNCTION`, `PROCEDURE`, `TRIGGER`, `VIEW`.

- `count`

The number of objects in the schema of the given type.

#### 28.4.3.27 The `schema_redundant_indexes` and `x$schema_flattened_keys` Views

The `schema_redundant_indexes` view displays indexes that duplicate other indexes or are made redundant by them. The `x$schema_flattened_keys` view is a helper view for `schema_redundant_indexes`.

In the following column descriptions, the dominant index is the one that makes the redundant index redundant.

The `schema_redundant_indexes` view has these columns:

- `table_schema`

The schema that contains the table.

- `table_name`

The table that contains the index.

- `redundant_index_name`

The name of the redundant index.

- `redundant_index_columns`

The names of the columns in the redundant index.

- `redundant_index_non_unique`

The number of nonunique columns in the redundant index.

- `dominant_index_name`

The name of the dominant index.

- `dominant_index_columns`

The names of the columns in the dominant index.

- `dominant_index_non_unique`

The number of nonunique columns in the dominant index.

- `subpart_exists`

Whether the index indexes only part of a column.

- `sql_drop_index`

The statement to execute to drop the redundant index.

The `x$schema_flattened_keys` view has these columns:

- `table_schema`

The schema that contains the table.

- `table_name`

The table that contains the index.

- `index_name`

An index name.

- `non_unique`

The number of nonunique columns in the index.

- `subpart_exists`

Whether the index indexes only part of a column.

- `index_columns`

The name of the columns in the index.

#### 28.4.3.28 The `schema_table_lock_waits` and `x$schema_table_lock_waits` Views

These views display which sessions are blocked waiting on metadata locks, and what is blocking them.

The column descriptions here are brief. For additional information, see the description of the Performance Schema `metadata_locks` table at [Section 27.12.13.3, “The metadata\\_locks Table”](#).

The `schema_table_lock_waits` and `x$schema_table_lock_waits` views have these columns:

- `object_schema`

The schema containing the object to be locked.

- `object_name`

The name of the instrumented object.

- `waiting_thread_id`

The thread ID of the thread that is waiting for the lock.

- `waiting_pid`

The processlist ID of the thread that is waiting for the lock.

- `waiting_account`

The account associated with the session that is waiting for the lock.

- `waiting_lock_type`

The type of the waiting lock.

- `waiting_lock_duration`

How long the waiting lock has been waiting.

- `waiting_query`

The statement that is waiting for the lock.

- `waiting_query_secs`

How long the statement has been waiting, in seconds.

- `waiting_query_rows_affected`

The number of rows affected by the statement.

- `waiting_query_rows_examined`

The number of rows read from storage engines by the statement.

- `blocking_thread_id`

The thread ID of the thread that is blocking the waiting lock.

- `blocking_pid`

The processlist ID of the thread that is blocking the waiting lock.

- `blocking_account`

The account associated with the thread that is blocking the waiting lock.

- `blocking_lock_type`

The type of lock that is blocking the waiting lock.

- `blocking_lock_duration`

How long the blocking lock has been held.

- `sql_kill_blocking_query`

The `KILL` statement to execute to kill the blocking statement.

- `sql_kill_blocking_connection`

The `KILL` statement to execute to kill the session running the blocking statement.

### 28.4.3.29 The `schema_table_statistics` and `x$schema_table_statistics` Views

These views summarize table statistics. By default, rows are sorted by descending total wait time (tables with most contention first).

These views user a helper view, `x$ps_schema_table_statistics_io`.

The `schema_table_statistics` and `x$schema_table_statistics` views have these columns:

- `table_schema`

The schema that contains the table.

- `table_name`

The table name.

- `total_latency`

The total wait time of timed I/O events for the table.

- `rows_fetched`

The total number of rows read from the table.

- `fetch_latency`

The total wait time of timed read I/O events for the table.

- `rows_inserted`

The total number of rows inserted into the table.

- `insert_latency`

The total wait time of timed insert I/O events for the table.

- `rows_updated`

The total number of rows updated in the table.

- `update_latency`

The total wait time of timed update I/O events for the table.

- `rows_deleted`

The total number of rows deleted from the table.

- `delete_latency`

The total wait time of timed delete I/O events for the table.

- `io_read_requests`

The total number of read requests for the table.

- `io_read`

The total number of bytes read from the table.

- `io_read_latency`

The total wait time of reads from the table.

- `io_write_requests`

The total number of write requests for the table.

- `io_write`

The total number of bytes written to the table.

- `io_write_latency`

The total wait time of writes to the table.

- `io_misc_requests`

The total number of miscellaneous I/O requests for the table.

- `io_misc_latency`

The total wait time of miscellaneous I/O requests for the table.

#### **28.4.3.30 The `schema_table_statistics_with_buffer` and `x$ps_schema_table_statistics_with_buffer` Views**

These views summarize table statistics, including InnoDB buffer pool statistics. By default, rows are sorted by descending total wait time (tables with most contention first).

These views use a helper view, `x$ps_schema_table_statistics_io`.

The `schema_table_statistics_with_buffer` and `x$ps_schema_table_statistics_with_buffer` views have these columns:

- `table_schema`

The schema that contains the table.

- `table_name`

The table name.

- `rows_fetched`

The total number of rows read from the table.

- `fetch_latency`

The total wait time of timed read I/O events for the table.

- `rows_inserted`

The total number of rows inserted into the table.

- `insert_latency`

The total wait time of timed insert I/O events for the table.

- `rows_updated`

The total number of rows updated in the table.

- `update_latency`

The total wait time of timed update I/O events for the table.

- `rows_deleted`

The total number of rows deleted from the table.

- `delete_latency`

The total wait time of timed delete I/O events for the table.

- `io_read_requests`

The total number of read requests for the table.

- `io_read`

The total number of bytes read from the table.

- `io_read_latency`

The total wait time of reads from the table.

- `io_write_requests`

The total number of write requests for the table.

- `io_write`

The total number of bytes written to the table.

- `io_write_latency`

The total wait time of writes to the table.

- `io_misc_requests`

The total number of miscellaneous I/O requests for the table.

- `io_misc_latency`

The total wait time of miscellaneous I/O requests for the table.

- `innodb_buffer_allocated`

The total number of InnoDB buffer bytes allocated for the table.

- `innodb_buffer_data`

The total number of InnoDB data bytes allocated for the table.

- `innodb_buffer_free`

The total number of InnoDB nondata bytes allocated for the table (`innodb_buffer_allocated - innodb_buffer_data`).

- `innodb_buffer_pages`

The total number of InnoDB pages allocated for the table.

- `innodb_buffer_pages_hashed`

The total number of InnoDB hashed pages allocated for the table.

- `innodb_buffer_pages_old`

The total number of [InnoDB](#) old pages allocated for the table.

- [innodb\\_buffer\\_rows\\_cached](#)

The total number of [InnoDB](#) cached rows for the table.

#### **28.4.3.31 The `schema_tables_with_full_table_scans` and `x$schema_tables_with_full_table_scans` Views**

These views display which tables are being accessed with full table scans. By default, rows are sorted by descending rows scanned.

The [schema\\_tables\\_with\\_full\\_table\\_scans](#) and [x\\$schema\\_tables\\_with\\_full\\_table\\_scans](#) views have these columns:

- [object\\_schema](#)

The schema name.

- [object\\_name](#)

The table name.

- [rows\\_full\\_scanned](#)

The total number of rows scanned by full scans of the table.

- [latency](#)

The total wait time of full scans of the table.

#### **28.4.3.32 The `schema_unused_indexes` View**

These views display indexes for which there are no events, which indicates that they are not being used. By default, rows are sorted by schema and table.

This view is most useful when the server has been up and processing long enough that its workload is representative. Otherwise, presence of an index in this view may not be meaningful.

The [schema\\_unused\\_indexes](#) view has these columns:

- [object\\_schema](#)

The schema name.

- [object\\_name](#)

The table name.

- [index\\_name](#)

The unused index name.

#### **28.4.3.33 The `session` and `x$session` Views**

These views are similar to [processlist](#) and [x\\$processlist](#), but they filter out background processes to display only user sessions. For descriptions of the columns, see [Section 28.4.3.22, “The `processlist` and `x\$processlist` Views”](#).

#### **28.4.3.34 The `session_ssl_status` View**

For each connection, this view displays the SSL version, cipher, and count of reused SSL sessions.

The `session_ssl_status` view has these columns:

- `thread_id`

The thread ID for the connection.

- `ssl_version`

The version of SSL used for the connection.

- `ssl_cipher`

The SSL cipher used for the connection.

- `ssl_sessions_reused`

The number of reused SSL sessions for the connection.

### 28.4.3.35 The `statement_analysis` and `x$statement_analysis` Views

These views list normalized statements with aggregated statistics. The content mimics the MySQL Enterprise Monitor Query Analysis view. By default, rows are sorted by descending total latency.

The `statement_analysis` and `x$statement_analysis` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `full_scan`

The total number of full table scans performed by occurrences of the statement.

- `exec_count`

The total number of times the statement has executed.

- `err_count`

The total number of errors produced by occurrences of the statement.

- `warn_count`

The total number of warnings produced by occurrences of the statement.

- `total_latency`

The total wait time of timed occurrences of the statement.

- `max_latency`

The maximum single wait time of timed occurrences of the statement.

- `avg_latency`

The average wait time per timed occurrence of the statement.

- `lock_latency`

The total time waiting for locks by timed occurrences of the statement.

- `rows_sent`

The total number of rows returned by occurrences of the statement.

- `rows_sent_avg`

The average number of rows returned per occurrence of the statement.

- `rows_examined`

The total number of rows read from storage engines by occurrences of the statement.

- `rows_examined_avg`

The average number of rows read from storage engines per occurrence of the statement.

- `rows_affected`

The total number of rows affected by occurrences of the statement.

- `rows_affected_avg`

The average number of rows affected per occurrence of the statement.

- `tmp_tables`

The total number of internal in-memory temporary tables created by occurrences of the statement.

- `tmp_disk_tables`

The total number of internal on-disk temporary tables created by occurrences of the statement.

- `rows_sorted`

The total number of rows sorted by occurrences of the statement.

- `sort_merge_passes`

The total number of sort merge passes by occurrences of the statement.

- `digest`

The statement digest.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

#### **28.4.3.36 The `statements_with_errors_or_warnings` and `x$statements_with_errors_or_warnings` Views**

These views display normalized statements that have produced errors or warnings. By default, rows are sorted by descending error and warning counts.

The `statements_with_errors_or_warnings` and `x$statements_with_errors_or_warnings` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `exec_count`

The total number of times the statement has executed.

- `errors`

The total number of errors produced by occurrences of the statement.

- `error_pct`

The percentage of statement occurrences that produced errors.

- `warnings`

The total number of warnings produced by occurrences of the statement.

- `warning_pct`

The percentage of statement occurrences that produced warnings.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

#### **28.4.3.37 The `statements_with_full_table_scans` and `x$statements_with_full_table_scans` Views**

These views display normalized statements that have done full table scans. By default, rows are sorted by descending percentage of time a full scan was done and descending total latency.

The `statements_with_full_table_scans` and `x$statements_with_full_table_scans` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `exec_count`

The total number of times the statement has executed.

- `total_latency`

The total wait time of timed statement events for the statement.

- `no_index_used_count`

The total number of times no index was used to scan the table.

- `no_good_index_used_count`

The total number of times no good index was used to scan the table.

- `no_index_used_pct`

The percentage of the time no index was used to scan the table.

- `rows_sent`

The total number of rows returned from the table.

- `rows_examined`

The total number of rows read from the storage engine for the table.

- `rows_sent_avg`

The average number of rows returned from the table.

- `rows_examined_avg`

The average number of rows read from the storage engine for the table.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

#### **28.4.3.38 The statements\_with\_runtimes\_in\_95th\_percentile and x\$statements\_with\_runtimes\_in\_95th\_percentile Views**

These views list statements with runtimes in the 95th percentile. By default, rows are sorted by descending average latency.

Both views use two helper views, `x$ps_digest_avg_latency_distribution` and `x$ps_digest_95th_percentile_by_avg_us`.

The `statements_with_runtimes_in_95th_percentile` and `x$statements_with_runtimes_in_95th_percentile` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `full_scan`

The total number of full table scans performed by occurrences of the statement.

- `exec_count`  
The total number of times the statement has executed.
- `err_count`  
The total number of errors produced by occurrences of the statement.
- `warn_count`  
The total number of warnings produced by occurrences of the statement.
- `total_latency`  
The total wait time of timed occurrences of the statement.
- `max_latency`  
The maximum single wait time of timed occurrences of the statement.
- `avg_latency`  
The average wait time per timed occurrence of the statement.
- `rows_sent`  
The total number of rows returned by occurrences of the statement.
- `rows_sent_avg`  
The average number of rows returned per occurrence of the statement.
- `rows_examined`  
The total number of rows read from storage engines by occurrences of the statement.
- `rows_examined_avg`  
The average number of rows read from storage engines per occurrence of the statement.
- `first_seen`  
The time at which the statement was first seen.
- `last_seen`  
The time at which the statement was most recently seen.
- `digest`  
The statement digest.

#### 28.4.3.39 The `statements_with_sorting` and `x$statements_with_sorting` Views

These views list normalized statements that have performed sorts. By default, rows are sorted by descending total latency.

The `statements_with_sorting` and `x$statements_with_sorting` views have these columns:

- `query`  
The normalized statement string.
- `db`

The default database for the statement, or `NULL` if there is none.

- `exec_count`

The total number of times the statement has executed.

- `total_latency`

The total wait time of timed occurrences of the statement.

- `sort_merge_passes`

The total number of sort merge passes by occurrences of the statement.

- `avg_sort_merges`

The average number of sort merge passes per occurrence of the statement.

- `sorts_using_scans`

The total number of sorts using table scans by occurrences of the statement.

- `sort_using_range`

The total number of sorts using range accesses by occurrences of the statement.

- `rows_sorted`

The total number of rows sorted by occurrences of the statement.

- `avg_rows_sorted`

The average number of rows sorted per occurrence of the statement.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

#### **28.4.3.40 The `statements_with_temp_tables` and `x$statements_with_temp_tables` Views**

These views list normalized statements that have used temporary tables. By default, rows are sorted by descending number of on-disk temporary tables used and descending number of in-memory temporary tables used.

The `statements_with_temp_tables` and `x$statements_with_temp_tables` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `exec_count`

The total number of times the statement has executed.

- `total_latency`

The total wait time of timed occurrences of the statement.

- `memory_tmp_tables`

The total number of internal in-memory temporary tables created by occurrences of the statement.

- `disk_tmp_tables`

The total number of internal on-disk temporary tables created by occurrences of the statement.

- `avg_tmp_tables_per_query`

The average number of internal temporary tables created per occurrence of the statement.

- `tmp_tables_to_disk_pct`

The percentage of internal in-memory temporary tables that were converted to on-disk tables.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

#### 28.4.3.41 The `user_summary` and `x$user_summary` Views

These views summarize statement activity, file I/O, and connections, grouped by user. By default, rows are sorted by descending total latency.

The `user_summary` and `x$user_summary` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statements`

The total number of statements for the user.

- `statement_latency`

The total wait time of timed statements for the user.

- `statement_avg_latency`

The average wait time per timed statement for the user.

- `table_scans`

The total number of table scans for the user.

- `file_ios`

The total number of file I/O events for the user.

- `file_io_latency`

The total wait time of timed file I/O events for the user.

- `current_connections`

The current number of connections for the user.

- `total_connections`

The total number of connections for the user.

- `unique_hosts`

The number of distinct hosts from which connections for the user have originated.

- `current_memory`

The current amount of allocated memory for the user.

- `total_memory_allocated`

The total amount of allocated memory for the user.

#### 28.4.3.42 The `user_summary_by_file_io` and `x$user_summary_by_file_io` Views

These views summarize file I/O, grouped by user. By default, rows are sorted by descending total file I/O latency.

The `user_summary_by_file_io` and `x$user_summary_by_file_io` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `ios`

The total number of file I/O events for the user.

- `io_latency`

The total wait time of timed file I/O events for the user.

#### 28.4.3.43 The `user_summary_by_file_io_type` and `x$user_summary_by_file_io_type` Views

These views summarize file I/O, grouped by user and event type. By default, rows are sorted by user and descending total latency.

The `user_summary_by_file_io_type` and `x$user_summary_by_file_io_type` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

The file I/O event name.

- `total`

The total number of occurrences of the file I/O event for the user.

- `latency`

The total wait time of timed occurrences of the file I/O event for the user.

- `max_latency`

The maximum single wait time of timed occurrences of the file I/O event for the user.

#### 28.4.3.44 The `user_summary_by_stages` and `x$user_summary_by_stages` Views

These views summarize stages, grouped by user. By default, rows are sorted by user and descending total stage latency.

The `user_summary_by_stages` and `x$user_summary_by_stages` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

The stage event name.

- `total`

The total number of occurrences of the stage event for the user.

- `total_latency`

The total wait time of timed occurrences of the stage event for the user.

- `avg_latency`

The average wait time per timed occurrence of the stage event for the user.

#### 28.4.3.45 The `user_summary_by_statement_latency` and `x$user_summary_by_statement_latency` Views

These views summarize overall statement statistics, grouped by user. By default, rows are sorted by descending total latency.

The `user_summary_by_statement_latency` and `x$user_summary_by_statement_latency` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `total`

The total number of statements for the user.

- `total_latency`

The total wait time of timed statements for the user.

- `max_latency`

The maximum single wait time of timed statements for the user.

- `lock_latency`

The total time waiting for locks by timed statements for the user.

- `rows_sent`

The total number of rows returned by statements for the user.

- `rows_examined`

The total number of rows read from storage engines by statements for the user.

- `rows_affected`

The total number of rows affected by statements for the user.

- `full_scans`

The total number of full table scans by statements for the user.

#### 28.4.3.46 The `user_summary_by_statement_type` and `xx$user_summary_by_statement_type` Views

These views summarize information about statements executed, grouped by user and statement type. By default, rows are sorted by user and descending total latency.

The `user_summary_by_statement_type` and `xx$user_summary_by_statement_type` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statement`

The final component of the statement event name.

- `total`

The total number of occurrences of the statement event for the user.

- `total_latency`

The total wait time of timed occurrences of the statement event for the user.

- `max_latency`

The maximum single wait time of timed occurrences of the statement event for the user.

- `lock_latency`

The total time waiting for locks by timed occurrences of the statement event for the user.

- `rows_sent`

The total number of rows returned by occurrences of the statement event for the user.

- `rows_examined`

The total number of rows read from storage engines by occurrences of the statement event for the user.

- `rows_affected`

The total number of rows affected by occurrences of the statement event for the user.

- `full_scans`

The total number of full table scans by occurrences of the statement event for the user.

#### 28.4.3.47 The version View

This view provides the current `sys` schema and MySQL server versions.

##### Note

As of MySQL 8.0.18, this view is deprecated and subject to removal in a future MySQL version. Applications that use it should be migrated to use an alternative instead. For example, use the `VERSION()` function to retrieve the MySQL server version.

The `version` view has these columns:

- `sys_version`

The `sys` schema version.

- `mysql_version`

The MySQL server version.

#### 28.4.3.48 The `wait_classes_global_by_avg_latency` and `x$wait_classes_global_by_avg_latency` Views

These views summarize wait class average latencies, grouped by event class. By default, rows are sorted by descending average latency. Idle events are ignored.

An event class is determined by stripping from the event name everything after the first three components. For example, the class for `wait/io/file/sql/slow_log` is `wait/io/file`.

The `wait_classes_global_by_avg_latency` and `x$wait_classes_global_by_avg_latency` views have these columns:

- `event_class`

The event class.

- `total`

The total number of occurrences of events in the class.

- `total_latency`

The total wait time of timed occurrences of events in the class.

- `min_latency`

The minimum single wait time of timed occurrences of events in the class.

- `avg_latency`

The average wait time per timed occurrence of events in the class.

- `max_latency`

The maximum single wait time of timed occurrences of events in the class.

#### 28.4.3.49 The `wait_classes_global_by_latency` and `x$wait_classes_global_by_latency` Views

These views summarize wait class total latencies, grouped by event class. By default, rows are sorted by descending total latency. Idle events are ignored.

An event class is determined by stripping from the event name everything after the first three components. For example, the class for `wait/io/file/sql/slow_log` is `wait/io/file`.

The `wait_classes_global_by_latency` and `x$wait_classes_global_by_latency` views have these columns:

- `event_class`

The event class.

- `total`

The total number of occurrences of events in the class.

- `total_latency`

The total wait time of timed occurrences of events in the class.

- `min_latency`

The minimum single wait time of timed occurrences of events in the class.

- `avg_latency`

The average wait time per timed occurrence of events in the class.

- `max_latency`

The maximum single wait time of timed occurrences of events in the class.

#### 28.4.3.50 The `waits_by_host_by_latency` and `x$waits_by_host_by_latency` Views

These views summarize wait events, grouped by host and event. By default, rows are sorted by host and descending total latency. Idle events are ignored.

The `waits_by_host_by_latency` and `x$waits_by_host_by_latency` views have these columns:

- `host`

The host from which the connection originated.

- `event`

The event name.

- `total`

The total number of occurrences of the event for the host.

- `total_latency`

The total wait time of timed occurrences of the event for the host.

- `avg_latency`

The average wait time per timed occurrence of the event for the host.

- `max_latency`

The maximum single wait time of timed occurrences of the event for the host.

#### 28.4.3.51 The `waits_by_user_by_latency` and `x$waits_by_user_by_latency` Views

These views summarize wait events, grouped by user and event. By default, rows are sorted by user and descending total latency. Idle events are ignored.

The `waits_by_user_by_latency` and `x$waits_by_user_by_latency` views have these columns:

- `user`

The user associated with the connection.

- `event`

The event name.

- `total`

The total number of occurrences of the event for the user.

- `total_latency`

The total wait time of timed occurrences of the event for the user.

- `avg_latency`

The average wait time per timed occurrence of the event for the user.

- `max_latency`

The maximum single wait time of timed occurrences of the event for the user.

#### 28.4.3.52 The `waits_global_by_latency` and `x$waits_global_by_latency` Views

These views summarize wait events, grouped by event. By default, rows are sorted by descending total latency. Idle events are ignored.

The `waits_global_by_latency` and `x$waits_global_by_latency` views have these columns:

- `events`

The event name.

- `total`

The total number of occurrences of the event.

- `total_latency`

The total wait time of timed occurrences of the event.

- `avg_latency`

The average wait time per timed occurrence of the event.

- `max_latency`

The maximum single wait time of timed occurrences of the event.

## 28.4.4 sys Schema Stored Procedures

The following sections describe `sys` schema stored procedures.

### 28.4.4.1 The `create_synonym_db()` Procedure

Given a schema name, this procedure creates a synonym schema containing views that refer to all the tables and views in the original schema. This can be used, for example, to create a shorter name by which to refer to a schema with a long name (such as `info` rather than `INFORMATION_SCHEMA`).

#### Parameters

- `in_db_name VARCHAR(64)`: The name of the schema for which to create the synonym.
- `in_synonym VARCHAR(64)`: The name to use for the synonym schema. This schema must not already exist.

#### Example

```
mysql> SHOW DATABASES;
+-----+
| Database |
+-----+
| information_schema |
| mysql |
| performance_schema |
| sys |
| world |
+-----+
mysql> CALL sys.create_synonym_db('INFORMATION_SCHEMA', 'info');
+-----+
| summary |
+-----+
| Created 63 views in the info database |
+-----+
mysql> SHOW DATABASES;
+-----+
| Database |
+-----+
| information_schema |
| info |
| mysql |
| performance_schema |
| sys |
| world |
+-----+
mysql> SHOW FULL TABLES FROM info;
+-----+-----+
| Tables_in_info | Table_type |
+-----+-----+
character_sets	VIEW
collation_character_set_applicability	VIEW
collations	VIEW
column_privileges	VIEW
columns	VIEW
```

...

### 28.4.4.2 The `diagnostics()` Procedure

Creates a report of the current server status for diagnostic purposes.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 5.1.9.1, “System Variable Privileges”](#).

Data collected for `diagnostics()` includes this information:

- Information from the `metrics` view (see [Section 28.4.3.21, “The metrics View”](#))
- Information from other relevant `sys` schema views, such as the one that determines queries in the 95th percentile
- Information from the `ndbinfo` schema, if the MySQL server is part of NDB Cluster
- Replication status (both source and replica)

Some of the `sys` schema views are calculated as initial (optional), overall, and delta values:

- The initial view is the content of the view at the start of the `diagnostics()` procedure. This output is the same as the start values used for the delta view. The initial view is included if the `diagnostics.include_raw` configuration option is `ON`.
- The overall view is the content of the view at the end of the `diagnostics()` procedure. This output is the same as the end values used for the delta view. The overall view is always included.
- The delta view is the difference from the beginning to the end of procedure execution. The minimum and maximum values are the minimum and maximum values from the end view, respectively. They do not necessarily reflect the minimum and maximum values in the monitored period. Except for the `metrics` view, the delta is calculated only between the first and last outputs.

#### Parameters

- `in_max_runtime` `INT UNSIGNED`: The maximum data collection time in seconds. Use `NULL` to collect data for the default of 60 seconds. Otherwise, use a value greater than 0.
- `in_interval` `INT UNSIGNED`: The sleep time between data collections in seconds. Use `NULL` to sleep for the default of 30 seconds. Otherwise, use a value greater than 0.
- `in_auto_config` `ENUM('current', 'medium', 'full')`: The Performance Schema configuration to use. Permitted values are:
  - `current`: Use the current instrument and consumer settings.
  - `medium`: Enable some instruments and consumers.
  - `full`: Enable all instruments and consumers.

#### Note

The more instruments and consumers enabled, the more impact on MySQL server performance. Be careful with the `medium` setting and especially the `full` setting, which has a large performance impact.

Use of the `medium` or `full` setting requires the `SUPER` privilege.

If a setting other than `current` is chosen, the current settings are restored at the end of the procedure.

## Configuration Options

`diagnostics()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 28.4.2.1, “The sys\\_config Table”](#)):

- `debug`, `@sys.debug`

If this option is `ON`, produce debugging output. The default is `OFF`.

- `diagnostics.allow_i_s_tables`, `@sys.diagnostics.allow_i_s_tables`

If this option is `ON`, the `diagnostics()` procedure is permitted to perform table scans on the `INFORMATION_SCHEMA.TABLES` table. This can be expensive if there are many tables. The default is `OFF`.

- `diagnostics.include_raw`, `@sys.diagnostics.include_raw`

If this option is `ON`, the `diagnostics()` procedure output includes the raw output from querying the `metrics` view. The default is `OFF`.

- `statement_truncate_len`, `@sys.statement_truncate_len`

The maximum length of statements returned by the `format_statement()` function. Longer statements are truncated to this length. The default is 64.

## Example

Create a diagnostics report that starts an iteration every 30 seconds and runs for at most 120 seconds using the current Performance Schema settings:

```
mysql> CALL sys.diagnostics(120, 30, 'current');
```

To capture the output from the `diagnostics()` procedure in a file as it runs, use the `mysql` client `tee filename` and `notee` commands (see [Section 4.5.1.2, “mysql Client Commands”](#)):

```
mysql> tee diag.out;
mysql> CALL sys.diagnostics(120, 30, 'current');
mysql> notee;
```

### 28.4.4.3 The `execute_prepared_stmt()` Procedure

Given an SQL statement as a string, executes it as a prepared statement. The prepared statement is deallocated after execution, so it is not subject to reuse. Thus, this procedure is useful primarily for executing dynamic statements on a one-time basis.

This procedure uses `sys_execute_prepared_stmt` as the prepared statement name. If that statement name exists when the procedure is called, its previous content is destroyed.

## Parameters

- `in_query` `LONGTEXT CHARACTER SET utf8`: The statement string to execute.

## Configuration Options

`execute_prepared_stmt()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 28.4.2.1, “The sys\\_config Table”](#)):

- `debug`, `@sys.debug`

If this option is `ON`, produce debugging output. The default is `OFF`.

## Example

```
mysql> CALL sys.execute_prepared_stmt('SELECT COUNT(*) FROM mysql.user');
```

```

+-----+
| COUNT(*) |
+-----+
| 15 |
+-----+

```

#### 28.4.4.4 The `ps_setup_disable_background_threads()` Procedure

Disables Performance Schema instrumentation for all background threads. Produces a result set indicating how many background threads were disabled. Already disabled threads do not count.

##### Parameters

None.

##### Example

```

mysql> CALL sys.ps_setup_disable_background_threads();
+-----+
| summary |
+-----+
| Disabled 24 background threads |
+-----+

```

#### 28.4.4.5 The `ps_setup_disable_consumer()` Procedure

Disables Performance Schema consumers with names that contain the argument. Produces a result set indicating how many consumers were disabled. Already disabled consumers do not count.

##### Parameters

- `consumer VARCHAR(128)`: The value used to match consumer names, which are identified by using `%consumer%` as an operand for a `LIKE` pattern match.

A value of `' '` matches all consumers.

##### Example

Disable all statement consumers:

```

mysql> CALL sys.ps_setup_disable_consumer('statement');
+-----+
| summary |
+-----+
| Disabled 4 consumers |
+-----+

```

#### 28.4.4.6 The `ps_setup_disable_instrument()` Procedure

Disables Performance Schema instruments with names that contain the argument. Produces a result set indicating how many instruments were disabled. Already disabled instruments do not count.

##### Parameters

- `in_pattern VARCHAR(128)`: The value used to match instrument names, which are identified by using `%in_pattern%` as an operand for a `LIKE` pattern match.

A value of `' '` matches all instruments.

##### Example

Disable a specific instrument:

```
mysql> CALL sys.ps_setup_disable_instrument('wait/lock/metadata/sql/mdl');
+-----+
| summary |
+-----+
| Disabled 1 instrument |
+-----+
```

Disable all mutex instruments:

```
mysql> CALL sys.ps_setup_disable_instrument('mutex');
+-----+
| summary |
+-----+
| Disabled 177 instruments |
+-----+
```

#### 28.4.4.7 The `ps_setup_disable_thread()` Procedure

Given a connection ID, disables Performance Schema instrumentation for the thread. Produces a result set indicating how many threads were disabled. Already disabled threads do not count.

##### Parameters

- `in_connection_id` **BIGINT**: The connection ID. This is a value of the type given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

##### Example

Disable a specific connection by its connection ID:

```
mysql> CALL sys.ps_setup_disable_thread(225);
+-----+
| summary |
+-----+
| Disabled 1 thread |
+-----+
```

Disable the current connection:

```
mysql> CALL sys.ps_setup_disable_thread(CONNECTION_ID());
+-----+
| summary |
+-----+
| Disabled 1 thread |
+-----+
```

#### 28.4.4.8 The `ps_setup_enable_background_threads()` Procedure

Enables Performance Schema instrumentation for all background threads. Produces a result set indicating how many background threads were enabled. Already enabled threads do not count.

##### Parameters

None.

##### Example

```
mysql> CALL sys.ps_setup_enable_background_threads();
+-----+
```

```
| summary |
+-----+
| Enabled 24 background threads |
+-----+
```

#### 28.4.4.9 The `ps_setup_enable_consumer()` Procedure

Enables Performance Schema consumers with names that contain the argument. Produces a result set indicating how many consumers were enabled. Already enabled consumers do not count.

##### Parameters

- `consumer VARCHAR(128)`: The value used to match consumer names, which are identified by using `%consumer%` as an operand for a `LIKE` pattern match.

A value of `' '` matches all consumers.

##### Example

Enable all statement consumers:

```
mysql> CALL sys.ps_setup_enable_consumer('statement');
+-----+
| summary |
+-----+
| Enabled 4 consumers |
+-----+
```

#### 28.4.4.10 The `ps_setup_enable_instrument()` Procedure

Enables Performance Schema instruments with names that contain the argument. Produces a result set indicating how many instruments were enabled. Already enabled instruments do not count.

##### Parameters

- `in_pattern VARCHAR(128)`: The value used to match instrument names, which are identified by using `%in_pattern%` as an operand for a `LIKE` pattern match.

A value of `' '` matches all instruments.

##### Example

Enable a specific instrument:

```
mysql> CALL sys.ps_setup_enable_instrument('wait/lock/metadata/sql/mdl');
+-----+
| summary |
+-----+
| Enabled 1 instrument |
+-----+
```

Enable all mutex instruments:

```
mysql> CALL sys.ps_setup_enable_instrument('mutex');
+-----+
| summary |
+-----+
| Enabled 177 instruments |
+-----+
```

#### 28.4.4.11 The `ps_setup_enable_thread()` Procedure

Given a connection ID, enables Performance Schema instrumentation for the thread. Produces a result set indicating how many threads were enabled. Already enabled threads do not count.

### Parameters

- `in_connection_id` **BIGINT**: The connection ID. This is a value of the type given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

### Example

Enable a specific connection by its connection ID:

```
mysql> CALL sys.ps_setup_enable_thread(225);
+-----+
| summary |
+-----+
| Enabled 1 thread |
+-----+
```

Enable the current connection:

```
mysql> CALL sys.ps_setup_enable_thread(CONNECTION_ID());
+-----+
| summary |
+-----+
| Enabled 1 thread |
+-----+
```

#### 28.4.4.12 The `ps_setup_reload_saved()` Procedure

Reloads a Performance Schema configuration saved earlier within the same session using `ps_setup_save()`. For more information, see the description of `ps_setup_save()`.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 5.1.9.1, “System Variable Privileges”](#).

### Parameters

None.

#### 28.4.4.13 The `ps_setup_reset_to_default()` Procedure

Resets the Performance Schema configuration to its default settings.

### Parameters

- `in_verbose` **BOOLEAN**: Whether to display information about each setup stage during procedure execution. This includes the SQL statements executed.

### Example

```
mysql> CALL sys.ps_setup_reset_to_default(TRUE)\G
***** 1. row *****
status: Resetting: setup_actors
DELETE
FROM performance_schema.setup_actors
WHERE NOT (HOST = '%' AND USER = '%' AND ROLE = '%')

***** 1. row *****
status: Resetting: setup_actors
```

```
INSERT IGNORE INTO performance_schema.setup_actors
VALUES ('%', '%', '%')
...
```

#### 28.4.4.14 The `ps_setup_save()` Procedure

Saves the current Performance Schema configuration. This enables you to alter the configuration temporarily for debugging or other purposes, then restore it to the previous state by invoking the `ps_setup_reload_saved()` procedure.

To prevent other simultaneous calls to save the configuration, `ps_setup_save()` acquires an advisory lock named `sys.ps_setup_save` by calling the `GET_LOCK()` function. `ps_setup_save()` takes a timeout parameter to indicate how many seconds to wait if the lock already exists (which indicates that some other session has a saved configuration outstanding). If the timeout expires without obtaining the lock, `ps_setup_save()` fails.

It is intended you call `ps_setup_reload_saved()` later within the *same* session as `ps_setup_save()` because the configuration is saved in `TEMPORARY` tables. `ps_setup_save()` drops the temporary tables and releases the lock. If you end your session without invoking `ps_setup_save()`, the tables and lock disappear automatically.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 5.1.9.1, “System Variable Privileges”](#).

#### Parameters

- `in_timeout` `INT`: How many seconds to wait to obtain the `sys.ps_setup_save` lock. A negative timeout value means infinite timeout.

#### Example

```
mysql> CALL sys.ps_setup_save(10);
... make Performance Schema configuration changes ...
mysql> CALL sys.ps_setup_reload_saved();
```

#### 28.4.4.15 The `ps_setup_show_disabled()` Procedure

Displays all currently disabled Performance Schema configuration.

#### Parameters

- `in_show_instruments` `BOOLEAN`: Whether to display disabled instruments. This might be a long list.
- `in_show_threads` `BOOLEAN`: Whether to display disabled threads.

#### Example

```
mysql> CALL sys.ps_setup_show_disabled(TRUE, TRUE);
+-----+
| performance_schema_enabled |
+-----+
| 1 |
+-----+

+-----+
| enabled_users |
+-----+
| '%@'%' |
+-----+
```

| object_type | objects              | enabled | timed |
|-------------|----------------------|---------|-------|
| EVENT       | mysql.%              | NO      | NO    |
| EVENT       | performance_schema.% | NO      | NO    |
| EVENT       | information_schema.% | NO      | NO    |
| FUNCTION    | mysql.%              | NO      | NO    |
| FUNCTION    | performance_schema.% | NO      | NO    |
| FUNCTION    | information_schema.% | NO      | NO    |
| PROCEDURE   | mysql.%              | NO      | NO    |
| PROCEDURE   | performance_schema.% | NO      | NO    |
| PROCEDURE   | information_schema.% | NO      | NO    |
| TABLE       | mysql.%              | NO      | NO    |
| TABLE       | performance_schema.% | NO      | NO    |
| TABLE       | information_schema.% | NO      | NO    |
| TRIGGER     | mysql.%              | NO      | NO    |
| TRIGGER     | performance_schema.% | NO      | NO    |
| TRIGGER     | information_schema.% | NO      | NO    |

...

#### 28.4.4.16 The `ps_setup_show_disabled_consumers()` Procedure

Displays all currently disabled Performance Schema consumers.

##### Parameters

None.

##### Example

```
mysql> CALL sys.ps_setup_show_disabled_consumers();
```

| disabled_consumers               |
|----------------------------------|
| events_stages_current            |
| events_stages_history            |
| events_stages_history_long       |
| events_statements_history        |
| events_statements_history_long   |
| events_transactions_history      |
| events_transactions_history_long |
| events_waits_current             |
| events_waits_history             |
| events_waits_history_long        |

#### 28.4.4.17 The `ps_setup_show_disabled_instruments()` Procedure

Displays all currently disabled Performance Schema instruments. This might be a long list.

##### Parameters

None.

##### Example

```
mysql> CALL sys.ps_setup_show_disabled_instruments()\G
***** 1. row *****
disabled_instruments: wait/synch/mutex/sql/TC_LOG_MMAP::LOCK_tc
timed: NO
***** 2. row *****
disabled_instruments: wait/synch/mutex/sql/THD::LOCK_query_plan
timed: NO
***** 3. row *****
disabled_instruments: wait/synch/mutex/sql/MYSQL_BIN_LOG::LOCK_commit
```

```
... timed: NO
```

#### 28.4.4.18 The `ps_setup_show_enabled()` Procedure

Displays all currently enabled Performance Schema configuration.

##### Parameters

- `in_show_instruments` `BOOLEAN`: Whether to display enabled instruments. This might be a long list.
- `in_show_threads` `BOOLEAN`: Whether to display enabled threads.

##### Example

```
mysql> CALL sys.ps_setup_show_enabled(FALSE, FALSE);
+-----+
| performance_schema_enabled |
+-----+
| 1 |
+-----+
1 row in set (0.01 sec)

+-----+
| enabled_users |
+-----+
| '%'@'%' |
+-----+
1 row in set (0.01 sec)

+-----+-----+-----+-----+
| object_type | objects | enabled | timed |
+-----+-----+-----+-----+
EVENT	%.%	YES	YES
FUNCTION	%.%	YES	YES
PROCEDURE	%.%	YES	YES
TABLE	%.%	YES	YES
TRIGGER	%.%	YES	YES
+-----+-----+-----+-----+
5 rows in set (0.02 sec)

+-----+
| enabled_consumers |
+-----+
| events_statements_current |
| events_statements_history |
| events_transactions_current |
| events_transactions_history |
| global_instrumentation |
| statements_digest |
| thread_instrumentation |
+-----+
```

#### 28.4.4.19 The `ps_setup_show_enabled_consumers()` Procedure

Displays all currently enabled Performance Schema consumers.

##### Parameters

None.

##### Example

```
mysql> CALL sys.ps_setup_show_enabled_consumers();
+-----+
| enabled_consumers |

#### 28.4.4.20 The `ps_setup_show_enabled_instruments()` Procedure

Displays all currently enabled Performance Schema instruments. This might be a long list.

##### Parameters

None.

##### Example

```

mysql> CALL sys.ps_setup_show_enabled_instruments()\G
***** 1. row *****
enabled_instruments: wait/io/file/sql/map
 timed: YES
***** 2. row *****
enabled_instruments: wait/io/file/sql/binlog
 timed: YES
***** 3. row *****
enabled_instruments: wait/io/file/sql/binlog_cache
 timed: YES
...

```

#### 28.4.4.21 The `ps_statement_avg_latency_histogram()` Procedure

Displays a textual histogram graph of the average latency values across all normalized statements tracked within the Performance Schema `events_statements_summary_by_digest` table.

This procedure can be used to display a very high-level picture of the latency distribution of statements running within this MySQL instance.

##### Parameters

None.

##### Example

The histogram output in statement units. For example, `* = 2 units` in the histogram legend means that each `*` character represents 2 statements.

```

mysql> CALL sys.ps_statement_avg_latency_histogram()\G
***** 1. row *****
Performance Schema Statement Digest Average Latency Histogram:

. = 1 unit
* = 2 units
= 3 units

(0 - 66ms) 88 | #####

(863 - 929ms) 0 |
(929 - 995ms) 0 |
(995 - 1062ms) 0 |
```

```
Total Statements: 114; Buckets: 16; Bucket Size: 66 ms;
```

### 28.4.4.22 The `ps_trace_statement_digest()` Procedure

Traces all Performance Schema instrumentation for a specific statement digest.

If you find a statement of interest within the Performance Schema `events_statements_summary_by_digest` table, specify its `DIGEST` column MD5 value to this procedure and indicate the polling duration and interval. The result is a report of all statistics tracked within Performance Schema for that digest for the interval.

The procedure also attempts to execute `EXPLAIN` for the longest running example of the digest during the interval. This attempt might fail because the Performance Schema truncates long `SQL_TEXT` values. Consequently, `EXPLAIN` fails, due to parse errors.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 5.1.9.1, “System Variable Privileges”](#).

#### Parameters

- `in_digest` `VARCHAR(32)`: The statement digest identifier to analyze.
- `in_runtime` `INT`: How long to run the analysis in seconds.
- `in_interval` `DECIMAL(2,2)`: The analysis interval in seconds (which can be fractional) at which to try to take snapshots.
- `in_start_fresh` `BOOLEAN`: Whether to truncate the Performance Schema `events_statements_history_long` and `events_stages_history_long` tables before starting.
- `in_auto_enable` `BOOLEAN`: Whether to automatically enable required consumers.

#### Example

```
mysql> CALL sys.ps_trace_statement_digest('891ec6860f98ba46d89dd20b0c03652c', 10, 0.1, TRUE, TRUE);
```

```

#### 28.4.4.23 The `ps_trace_thread()` Procedure

Dumps all Performance Schema data for an instrumented thread to a `.dot` formatted graph file (for the DOT graph description language). Each result set returned from the procedure should be used for a complete graph.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 5.1.9.1, “System Variable Privileges”](#).

#### Parameters

- `in_thread_id` `INT`: The thread to trace.
- `in_outfile` `VARCHAR(255)`: The name to use for the `.dot` output file.
- `in_max_runtime` `DECIMAL(20,2)`: The maximum number of seconds (which can be fractional) to collect data. Use `NULL` to collect data for the default of 60 seconds.
- `in_interval` `DECIMAL(20,2)`: The number of seconds (which can be fractional) to sleep between data collections. Use `NULL` to sleep for the default of 1 second.
- `in_start_fresh` `BOOLEAN`: Whether to reset all Performance Schema data before tracing.

- `in_auto_setup` `BOOLEAN`: Whether to disable all other threads and enable all instruments and consumers. This also resets the settings at the end of the run.
- `in_debug` `BOOLEAN`: Whether to include `file:lineno` information in the graph.

### Example

```
mysql> CALL sys.ps_trace_thread(25, CONCAT('/tmp/stack-', REPLACE(NOW(), ' ', '-'), '.dot'), NULL, NULL, TR
+-----+
| summary |
+-----+
| Disabled 1 thread |

```

#### 28.4.4.24 The `ps_truncate_all_tables()` Procedure

Truncates all Performance Schema summary tables, resetting all aggregated instrumentation as a snapshot. Produces a result set indicating how many tables were truncated.

#### Parameters

- `in_verbose` `BOOLEAN`: Whether to display each `TRUNCATE TABLE` statement before executing it.

### Example

```
mysql> CALL sys.ps_truncate_all_tables(FALSE);
+-----+
| summary |
+-----+
| Truncated 49 tables |
+-----+
```

#### 28.4.4.25 The `statement_performance_analyzer()` Procedure

Creates a report of the statements running on the server. The views are calculated based on the overall and/or delta activity.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 5.1.9.1, “System Variable Privileges”](#).

## Parameters

- `in_action` ENUM('snapshot', 'overall', 'delta', 'create\_tmp', 'create\_table', 'save', 'cleanup'): The action to take. These values are permitted:
  - `snapshot`: Store a snapshot. The default is to make a snapshot of the current content of the Performance Schema `events_statements_summary_by_digest` table. By setting `in_table`, this can be overwritten to copy the content of the specified table. The snapshot is stored in the `sys` schema `tmp_digests` temporary table.
  - `overall`: Generate an analysis based on the content of the table specified by `in_table`. For the overall analysis, `in_table` can be `NOW()` to use a fresh snapshot. This overwrites an existing snapshot. Use `NULL` for `in_table` to use the existing snapshot. If `in_table` is `NULL` and no snapshot exists, a new snapshot is created. The `in_views` parameter and the `statement_performance_analyzer.limit` configuration option affect the operation of this procedure.
  - `delta`: Generate a delta analysis. The delta is calculated between the reference table specified by `in_table` and the snapshot, which must exist. This action uses the `sys` schema `tmp_digests_delta` temporary table. The `in_views` parameter and the `statement_performance_analyzer.limit` configuration option affect the operation of this procedure.
  - `create_table`: Create a regular table suitable for storing the snapshot for later use (for example, for calculating deltas).
  - `create_tmp`: Create a temporary table suitable for storing the snapshot for later use (for example, for calculating deltas).
  - `save`: Save the snapshot in the table specified by `in_table`. The table must exist and have the correct structure. If no snapshot exists, a new snapshot is created.
  - `cleanup`: Remove the temporary tables used for the snapshot and delta.
- `in_table` VARCHAR(129): The table parameter used for some of the actions specified by the `in_action` parameter. Use the format `db_name.tbl_name` or `tbl_name` without using any backtick (``) identifier-quoting characters. Periods (.) are not supported in database and table names.

The meaning of the `in_table` value for each `in_action` value is detailed in the individual `in_action` value descriptions.

- `in_views` SET ('with\_runtimes\_in\_95th\_percentile', 'analysis', 'with\_errors\_or\_warnings', 'with\_full\_table\_scans', 'with\_sorting', 'with\_temp\_tables', 'custom'): Which views to include. This parameter is a `SET` value, so it can contain multiple view names, separated by commas. The default is to include all views except `custom`. The following values are permitted:
  - `with_runtimes_in_95th_percentile`: Use the `statements_with_runtimes_in_95th_percentile` view.
  - `analysis`: Use the `statement_analysis` view.
  - `with_errors_or_warnings`: Use the `statements_with_errors_or_warnings` view.

- `with_full_table_scans`: Use the `statements_with_full_table_scans` view.
- `with_sorting`: Use the `statements_with_sorting` view.
- `with_temp_tables`: Use the `statements_with_temp_tables` view.
- `custom`: Use a custom view. This view must be specified using the `statement_performance_analyzer.view` configuration option to name a query or an existing view.

## Configuration Options

`statement_performance_analyzer()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 28.4.2.1, “The sys\\_config Table”](#)):

- `debug`, `@sys.debug`

If this option is `ON`, produce debugging output. The default is `OFF`.

- `statement_performance_analyzer.limit`,  
`@sys.statement_performance_analyzer.limit`

The maximum number of rows to return for views that have no built-in limit. The default is 100.

- `statement_performance_analyzer.view`,  
`@sys.statement_performance_analyzer.view`

The custom query or view to be used. If the option value contains a space, it is interpreted as a query. Otherwise, it must be the name of an existing view that queries the Performance Schema `events_statements_summary_by_digest` table. There cannot be any `LIMIT` clause in the query or view definition if the `statement_performance_analyzer.limit` configuration option is greater than 0. If specifying a view, use the same format as for the `in_table` parameter. The default is `NULL` (no custom view defined).

## Example

To create a report with the queries in the 95th percentile since the last truncation of `events_statements_summary_by_digest` and with a one-minute delta period:

1. Create a temporary table to store the initial snapshot.
2. Create the initial snapshot.
3. Save the initial snapshot in the temporary table.
4. Wait one minute.
5. Create a new snapshot.
6. Perform analysis based on the new snapshot.
7. Perform analysis based on the delta between the initial and new snapshots.

```
mysql> CALL sys.statement_performance_analyzer('create_tmp', 'mydb.tmp_digests_ini', NULL);
Query OK, 0 rows affected (0.08 sec)

mysql> CALL sys.statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.02 sec)

mysql> CALL sys.statement_performance_analyzer('save', 'mydb.tmp_digests_ini', NULL);
Query OK, 0 rows affected (0.00 sec)

mysql> DO SLEEP(60);
```

```

Query OK, 0 rows affected (1 min 0.00 sec)

mysql> CALL sys.statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.02 sec)

mysql> CALL sys.statement_performance_analyzer('overall', NULL, 'with_runtimes_in_95th_percentile');
+-----+
| Next Output |
+-----+
| Queries with Runtime in 95th Percentile |
+-----+
1 row in set (0.05 sec)

...

mysql> CALL sys.statement_performance_analyzer('delta', 'mydb.tmp_digests_ini', 'with_runtimes_in_95th_percentile');
+-----+
| Next Output |
+-----+
| Queries with Runtime in 95th Percentile |
+-----+
1 row in set (0.03 sec)

...

```

Create an overall report of the 95th percentile queries and the top 10 queries with full table scans:

```

mysql> CALL sys.statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.01 sec)

mysql> SET @sys.statement_performance_analyzer.limit = 10;
Query OK, 0 rows affected (0.00 sec)

mysql> CALL sys.statement_performance_analyzer('overall', NULL, 'with_runtimes_in_95th_percentile,with_full_table_scans');
+-----+
| Next Output |
+-----+
| Queries with Runtime in 95th Percentile |
+-----+
1 row in set (0.01 sec)

...

+-----+
| Next Output |
+-----+
| Top 10 Queries with Full Table Scan |
+-----+
1 row in set (0.09 sec)

...

```

Use a custom view showing the top 10 queries sorted by total execution time, refreshing the view every minute using the `watch` command in Linux:

```

mysql> CREATE OR REPLACE VIEW mydb.my_statements AS
 SELECT sys.format_statement(DIGEST_TEXT) AS query,
 SCHEMA_NAME AS db,
 COUNT_STAR AS exec_count,
 sys.format_time(SUM_TIMER_WAIT) AS total_latency,
 sys.format_time(AVG_TIMER_WAIT) AS avg_latency,
 ROUND(IFNULL(SUM_ROWS_SENT / NULLIF(COUNT_STAR, 0), 0)) AS rows_sent_avg,
 ROUND(IFNULL(SUM_ROWS_EXAMINED / NULLIF(COUNT_STAR, 0), 0)) AS rows_examined_avg,
 ROUND(IFNULL(SUM_ROWS_AFFECTED / NULLIF(COUNT_STAR, 0), 0)) AS rows_affected_avg,
 DIGEST AS digest
 FROM performance_schema.events_statements_summary_by_digest
 ORDER BY SUM_TIMER_WAIT DESC;
Query OK, 0 rows affected (0.10 sec)

mysql> CALL sys.statement_performance_analyzer('create_table', 'mydb.digests_prev', NULL);
Query OK, 0 rows affected (0.10 sec)

```

```

shell> watch -n 60 "mysql sys --table -e \"
> SET @sys.statement_performance_analyzer.view = 'mydb.my_statements';
> SET @sys.statement_performance_analyzer.limit = 10;
> CALL statement_performance_analyzer('snapshot', NULL, NULL);
> CALL statement_performance_analyzer('delta', 'mydb.digests_prev', 'custom');
> CALL statement_performance_analyzer('save', 'mydb.digests_prev', NULL);
> \\""

Every 60.0s: mysql sys --table -e " ... Mon Dec 22 10:58:51 2014

+-----+
| Next Output |
+-----+
| Top 10 Queries Using Custom View |
+-----+
+-----+-----+-----+-----+-----+-----+
| query | db | exec_count | total_latency | avg_latency | rows_sent_avg | rows_examined_avg |
+-----+-----+-----+-----+-----+-----+
...
```

#### 28.4.4.26 The table\_exists() Procedure

Tests whether a given table exists as a regular table, a [TEMPORARY](#) table, or a view. The procedure returns the table type in an [OUT](#) parameter. If both a temporary and a permanent table exist with the given name, [TEMPORARY](#) is returned.

##### Parameters

- `in_db VARCHAR(64)`: The name of the database in which to check for table existence.
- `in_table VARCHAR(64)`: The name of the table to check the existence of.
- `out_exists ENUM('', 'BASE TABLE', 'VIEW', 'TEMPORARY')`: The return value. This is an [OUT](#) parameter, so it must be a variable into which the table type can be stored. When the procedure returns, the variable has one of the following values to indicate whether the table exists:
  - `''`: The table name does not exist as a base table, [TEMPORARY](#) table, or view.
  - `BASE TABLE`: The table name exists as a base (permanent) table.
  - `VIEW`: The table name exists as a view.
  - `TEMPORARY`: The table name exists as a [TEMPORARY](#) table.

##### Example

```

mysql> CREATE DATABASE db1;
Query OK, 1 row affected (0.01 sec)

mysql> USE db1;
Database changed

mysql> CREATE TABLE t1 (id INT PRIMARY KEY);
Query OK, 0 rows affected (0.03 sec)

mysql> CREATE TABLE t2 (id INT PRIMARY KEY);
Query OK, 0 rows affected (0.20 sec)

mysql> CREATE view v_t1 AS SELECT * FROM t1;
Query OK, 0 rows affected (0.02 sec)

mysql> CREATE TEMPORARY TABLE t1 (id INT PRIMARY KEY);
Query OK, 0 rows affected (0.00 sec)

mysql> CALL sys.table_exists('db1', 't1', @exists); SELECT @exists;
Query OK, 0 rows affected (0.01 sec)
```

```

+-----+
| @exists |
+-----+
| TEMPORARY |
+-----+
1 row in set (0.00 sec)

mysql> CALL sys.table_exists('db1', 't2', @exists); SELECT @exists;
Query OK, 0 rows affected (0.02 sec)

+-----+
| @exists |
+-----+
| BASE TABLE |
+-----+
1 row in set (0.00 sec)

mysql> CALL sys.table_exists('db1', 'v_t1', @exists); SELECT @exists;
Query OK, 0 rows affected (0.02 sec)

+-----+
| @exists |
+-----+
| VIEW |
+-----+
1 row in set (0.00 sec)

mysql> CALL sys.table_exists('db1', 't3', @exists); SELECT @exists;
Query OK, 0 rows affected (0.00 sec)

+-----+
| @exists |
+-----+
| |
+-----+
1 row in set (0.00 sec)

```

## 28.4.5 sys Schema Stored Functions

The following sections describe `sys` schema stored functions.

### 28.4.5.1 The `extract_schema_from_file_name()` Function

Given a file path name, returns the path component that represents the schema name. This function assumes that the file name lies within the schema directory. For this reason, it does not work with partitions or tables defined using their own `DATA_DIRECTORY` table option.

This function is useful when extracting file I/O information from the Performance Schema that includes file path names. It provides a convenient way to display schema names, which can be more easily understood than full path names, and can be used in joins against object schema names.

#### Parameters

- `path VARCHAR(512)`: The full path to a data file from which to extract the schema name.

#### Return Value

A `VARCHAR(64)` value.

#### Example

```

mysql> SELECT sys.extract_schema_from_file_name('/usr/local/mysql/data/world/City.ibd');
+-----+
| sys.extract_schema_from_file_name('/usr/local/mysql/data/world/City.ibd') |
+-----+
| world |
+-----+

```

### 28.4.5.2 The `extract_table_from_file_name()` Function

Given a file path name, returns the path component that represents the table name.

This function is useful when extracting file I/O information from the Performance Schema that includes file path names. It provides a convenient way to display table names, which can be more easily understood than full path names, and can be used in joins against object table names.

#### Parameters

- `path VARCHAR(512)`: The full path to a data file from which to extract the table name.

#### Return Value

A `VARCHAR(64)` value.

#### Example

```
mysql> SELECT sys.extract_table_from_file_name('/usr/local/mysql/data/world/City.ibd');
+-----+
| sys.extract_table_from_file_name('/usr/local/mysql/data/world/City.ibd') |
+-----+
| City |
+-----+
```

### 28.4.5.3 The `format_bytes()` Function

#### Note

As of MySQL 8.0.16, `format_bytes()` is deprecated and subject to removal in a future MySQL version. Applications that use it should be migrated to use the built-in `FORMAT_BYTES()` function instead. See [Section 12.22](#), “Performance Schema Functions”

Given a byte count, converts it to human-readable format and returns a string consisting of a value and a units indicator. Depending on the size of the value, the units part is `bytes`, `KiB` (kibibytes), `MiB` (mebibytes), `GiB` (gibibytes), `TiB` (tebibytes), or `PiB` (pebibytes).

#### Parameters

- `bytes TEXT`: The byte count to format.

#### Return Value

A `TEXT` value.

#### Example

```
mysql> SELECT sys.format_bytes(512), sys.format_bytes(18446644073709551615);
+-----+-----+
| sys.format_bytes(512) | sys.format_bytes(18446644073709551615) |
+-----+-----+
| 512 bytes | 16383.91 PiB |
+-----+-----+
```

### 28.4.5.4 The `format_path()` Function

Given a path name, returns the modified path name after replacing subpaths that match the values of the following system variables, in order:

```
datadir
tmpdir
slave_load_tmpdir
innodb_data_home_dir
innodb_log_group_home_dir
```

```
innodb_undo_directory
basedir
```

A value that matches the value of system variable `sysvar` is replaced with the string `@@GLOBAL.sysvar`.

## Parameters

- `path VARCHAR(512)`: The path name to format.

## Return Value

A `VARCHAR(512) CHARACTER SET utf8` value.

## Example

```
mysql> SELECT sys.format_path('/usr/local/mysql/data/world/City.ibd');
+-----+
| sys.format_path('/usr/local/mysql/data/world/City.ibd') |
+-----+
| @@datadir/world/City.ibd |
+-----+
```

### 28.4.5.5 The `format_statement()` Function

Given a string (normally representing an SQL statement), reduces it to the length given by the `statement_truncate_len` configuration option, and returns the result. No truncation occurs if the string is shorter than `statement_truncate_len`. Otherwise, the middle part of the string is replaced by an ellipsis (`...`).

This function is useful for formatting possibly lengthy statements retrieved from Performance Schema tables to a known fixed maximum length.

## Parameters

- `statement LONGTEXT`: The statement to format.

## Configuration Options

`format_statement()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 28.4.2.1, “The sys\\_config Table”](#)):

- `statement_truncate_len, @sys.statement_truncate_len`

The maximum length of statements returned by the `format_statement()` function. Longer statements are truncated to this length. The default is 64.

## Return Value

A `LONGTEXT` value.

## Example

By default, `format_statement()` truncates statements to be no more than 64 characters. Setting `@sys.statement_truncate_len` changes the truncation length for the current session:

```
mysql> SET @stmt = 'SELECT variable, value, set_time, set_by FROM sys_config';
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
| SELECT variable, value, set_time, set_by FROM sys_config |
+-----+
mysql> SET @sys.statement_truncate_len = 32;
mysql> SELECT sys.format_statement(@stmt);
```

```

+-----+
| sys.format_statement(@stmt) |
+-----+
| SELECT variabl ... ROM sys_config |
+-----+

```

### 28.4.5.6 The `format_time()` Function

#### Note

As of MySQL 8.0.16, `format_time()` is deprecated and subject to removal in a future MySQL version. Applications that use it should be migrated to use the built-in `FORMAT_PICO_TIME()` function instead. See [Section 12.22](#), “Performance Schema Functions”

Given a Performance Schema latency or wait time in picoseconds, converts it to human-readable format and returns a string consisting of a value and a units indicator. Depending on the size of the value, the units part is `ps` (picoseconds), `ns` (nanoseconds), `us` (microseconds), `ms` (milliseconds), `s` (seconds), `m` (minutes), `h` (hours), `d` (days), or `w` (weeks).

#### Parameters

- `picoseconds TEXT`: The picoseconds value to format.

#### Return Value

A `TEXT` value.

#### Example

```

mysql> SELECT sys.format_time(3501), sys.format_time(188732396662000);
+-----+
| sys.format_time(3501) | sys.format_time(188732396662000) |
+-----+
| 3.50 ns | 3.15 m |
+-----+

```

### 28.4.5.7 The `list_add()` Function

Adds a value to a comma-separated list of values and returns the result.

This function and `list_drop()` can be useful for manipulating the value of system variables such as `sql_mode` and `optimizer_switch` that take a comma-separated list of values.

#### Parameters

- `in_list TEXT`: The list to be modified.
- `in_add_value TEXT`: The value to add to the list.

#### Return Value

A `TEXT` value.

#### Example

```

mysql> SELECT @@sql_mode;
+-----+
| @@sql_mode |
+-----+
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES |
+-----+
mysql> SET @@sql_mode = sys.list_add(@@sql_mode, 'NO_ENGINE_SUBSTITUTION');
mysql> SELECT @@sql_mode;

```

```

+-----+
| @@sql_mode |
+-----+
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ENGINE_SUBSTITUTION |
+-----+
mysql> SET @@sql_mode = sys.list_drop(@@sql_mode, 'ONLY_FULL_GROUP_BY');
mysql> SELECT @@sql_mode;
+-----+
| @@sql_mode |
+-----+
| STRICT_TRANS_TABLES,NO_ENGINE_SUBSTITUTION |
+-----+

```

### 28.4.5.8 The list\_drop() Function

Removes a value from a comma-separated list of values and returns the result. For more information, see the description of [list\\_add\(\)](#)

#### Parameters

- `in_list` `TEXT`: The list to be modified.
- `in_drop_value` `TEXT`: The value to drop from the list.

#### Return Value

A `TEXT` value.

### 28.4.5.9 The ps\_is\_account\_enabled() Function

Returns `YES` or `NO` to indicate whether Performance Schema instrumentation for a given account is enabled.

#### Parameters

- `in_host` `VARCHAR(60)`: The host name of the account to check.
- `in_user` `VARCHAR(32)`: The user name of the account to check.

#### Return Value

An `ENUM('YES','NO')` value.

#### Example

```

mysql> SELECT sys.ps_is_account_enabled('localhost', 'root');
+-----+
| sys.ps_is_account_enabled('localhost', 'root') |
+-----+
| YES |
+-----+

```

### 28.4.5.10 The ps\_is\_consumer\_enabled() Function

Returns `YES` or `NO` to indicate whether a given Performance Schema consumer is enabled, or `NULL` if the argument is `NULL`. If the argument is not a valid consumer name, an error occurs. (Prior to MySQL 8.0.18, the function returns `NULL` if the argument is not a valid consumer name.)

This function accounts for the consumer hierarchy, so a consumer is not considered enabled unless all consumers on which depends are also enabled. For information about the consumer hierarchy, see [Section 27.4.7, “Pre-Filtering by Consumer”](#).

#### Parameters

- `in_consumer` `VARCHAR(64)`: The name of the consumer to check.

## Return Value

An `ENUM( 'YES' , 'NO' )` value.

## Example

```
mysql> SELECT sys.ps_is_consumer_enabled('thread_instrumentation');
+-----+
| sys.ps_is_consumer_enabled('thread_instrumentation') |
+-----+
| YES |
+-----+
```

### 28.4.5.11 The `ps_is_instrument_default_enabled()` Function

Returns `YES` or `NO` to indicate whether a given Performance Schema instrument is enabled by default.

## Parameters

- `in_instrument VARCHAR(128)`: The name of the instrument to check.

## Return Value

An `ENUM( 'YES' , 'NO' )` value.

## Example

```
mysql> SELECT sys.ps_is_instrument_default_enabled('memory/innodb/row_log_buf');
+-----+
| sys.ps_is_instrument_default_enabled('memory/innodb/row_log_buf') |
+-----+
| NO |
+-----+
mysql> SELECT sys.ps_is_instrument_default_enabled('statement/sql/alter_user');
+-----+
| sys.ps_is_instrument_default_enabled('statement/sql/alter_user') |
+-----+
| YES |
+-----+
```

### 28.4.5.12 The `ps_is_instrument_default_timed()` Function

Returns `YES` or `NO` to indicate whether a given Performance Schema instrument is timed by default.

## Parameters

- `in_instrument VARCHAR(128)`: The name of the instrument to check.

## Return Value

An `ENUM( 'YES' , 'NO' )` value.

## Example

```
mysql> SELECT sys.ps_is_instrument_default_timed('memory/innodb/row_log_buf');
+-----+
| sys.ps_is_instrument_default_timed('memory/innodb/row_log_buf') |
+-----+
| NO |
+-----+
mysql> SELECT sys.ps_is_instrument_default_timed('statement/sql/alter_user');
+-----+
| sys.ps_is_instrument_default_timed('statement/sql/alter_user') |
+-----+
| YES |
+-----+
```

### 28.4.5.13 The `ps_is_thread_instrumented()` Function

Returns `YES` or `NO` to indicate whether Performance Schema instrumentation for a given connection ID is enabled, `UNKNOWN` if the ID is unknown, or `NULL` if the ID is `NULL`.

#### Parameters

- `in_connection_id` `BIGINT UNSIGNED`: The connection ID. This is a value of the type given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

#### Return Value

An `ENUM('YES', 'NO', 'UNKNOWN')` value.

#### Example

```
mysql> SELECT sys.ps_is_thread_instrumented(43);
+-----+
| sys.ps_is_thread_instrumented(43) |
+-----+
| UNKNOWN |
+-----+
mysql> SELECT sys.ps_is_thread_instrumented(CONNECTION_ID());
+-----+
| sys.ps_is_thread_instrumented(CONNECTION_ID()) |
+-----+
| YES |
+-----+
```

### 28.4.5.14 The `ps_thread_account()` Function

Given a Performance Schema thread ID, returns the `user_name@host_name` account associated with the thread.

#### Parameters

- `in_thread_id` `BIGINT UNSIGNED`: The thread ID for which to return the account. The value should match the `THREAD_ID` column from some Performance Schema `threads` table row.

#### Return Value

A `TEXT` value.

#### Example

```
mysql> SELECT sys.ps_thread_account(sys.ps_thread_id(CONNECTION_ID()));
+-----+
| sys.ps_thread_account(sys.ps_thread_id(CONNECTION_ID())) |
+-----+
| root@localhost |
+-----+
```

### 28.4.5.15 The `ps_thread_id()` Function

#### Note

As of MySQL 8.0.16, `ps_thread_id()` is deprecated and subject to removal in a future MySQL version. Applications that use it should be migrated to use the built-in `PS_THREAD_ID()` and `PS_CURRENT_THREAD_ID()` functions instead. See [Section 12.22, “Performance Schema Functions”](#)

Returns the Performance Schema thread ID assigned to a given connection ID, or the thread ID for the current connection if the connection ID is `NULL`.

## Parameters

- `in_connection_id` **BIGINT UNSIGNED**: The ID of the connection for which to return the thread ID. This is a value of the type given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

## Return Value

A **BIGINT UNSIGNED** value.

## Example

```
mysql> SELECT sys.ps_thread_id(260);
+-----+
| sys.ps_thread_id(260) |
+-----+
| 285 |
+-----+
```

### 28.4.5.16 The `ps_thread_stack()` Function

Returns a JSON formatted stack of all statements, stages, and events within the Performance Schema for a given thread ID.

## Parameters

- `in_thread_id` **BIGINT**: The ID of the thread to trace. The value should match the `THREAD_ID` column from some Performance Schema `threads` table row.
- `in_verbose` **BOOLEAN**: Whether to include `file:lineno` information in the events.

## Return Value

A **LONGTEXT CHARACTER SET latin1** value.

## Example

```
mysql> SELECT sys.ps_thread_stack(37, FALSE) AS thread_stack\G
***** 1. row *****
thread_stack: {"rankdir": "LR", "nodesep": "0.10",
"stack_created": "2014-02-19 13:39:03", "mysql_version": "8.0.2-dmr-debug-log",
"mysql_user": "root@localhost", "events": [{"nesting_event_id": "0",
"event_id": "10", "timer_wait": 256.35, "event_info": "sql/select",
"wait_info": "select @@version_comment limit 1\nerrors: 0\nwarnings: 0\nlock time:
...

```

### 28.4.5.17 The `ps_thread_trx_info()` Function

Returns a JSON object containing information about a given thread. The information includes the current transaction, and the statements it has already executed, derived from the Performance Schema `events_transactions_current` and `events_statements_history` tables. (The consumers for those tables must be enabled to obtain full data in the JSON object.)

If the output exceeds the truncation length (65535 by default), a JSON error object is returned, such as:

```
{ "error": "Trx info truncated: Row 6 was cut by GROUP_CONCAT()" }
```

Similar error objects are returned for other warnings and exceptions raised during function execution.

## Parameters

- `in_thread_id` **BIGINT UNSIGNED**: The thread ID for which to return transaction information. The value should match the `THREAD_ID` column from some Performance Schema `threads` table row.

## Configuration Options

`ps_thread_trx_info()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 28.4.2.1](#), “The `sys_config` Table”):

- `ps_thread_trx_info.max_length`, `@sys.ps_thread_trx_info.max_length`

The maximum length of the output. The default is 65535.

## Return Value

A `LONGTEXT` value.

## Example

```
mysql> SELECT sys.ps_thread_trx_info(48)\G
***** 1. row *****
sys.ps_thread_trx_info(48): [
 {
 "time": "790.70 us",
 "state": "COMMITTED",
 "mode": "READ WRITE",
 "autocommitted": "NO",
 "gtid": "AUTOMATIC",
 "isolation": "REPEATABLE READ",
 "statements_executed": [
 {
 "sql_text": "INSERT INTO info VALUES (1, \'foo\')",
 "time": "471.02 us",
 "schema": "trx",
 "rows_examined": 0,
 "rows_affected": 1,
 "rows_sent": 0,
 "tmp_tables": 0,
 "tmp_disk_tables": 0,
 "sort_rows": 0,
 "sort_merge_passes": 0
 },
 {
 "sql_text": "COMMIT",
 "time": "254.42 us",
 "schema": "trx",
 "rows_examined": 0,
 "rows_affected": 0,
 "rows_sent": 0,
 "tmp_tables": 0,
 "tmp_disk_tables": 0,
 "sort_rows": 0,
 "sort_merge_passes": 0
 }
]
 },
 {
 "time": "426.20 us",
 "state": "COMMITTED",
 "mode": "READ WRITE",
 "autocommitted": "NO",
 "gtid": "AUTOMATIC",
 "isolation": "REPEATABLE READ",
 "statements_executed": [
 {
 "sql_text": "INSERT INTO info VALUES (2, \'bar\')",
 "time": "107.33 us",
 "schema": "trx",
 "rows_examined": 0,
 "rows_affected": 1,
 "rows_sent": 0,
 "tmp_tables": 0,
 "tmp_disk_tables": 0,
 "sort_rows": 0,
```

```

 "sort_merge_passes": 0
 },
 {
 "sql_text": "COMMIT",
 "time": "213.23 us",
 "schema": "trx",
 "rows_examined": 0,
 "rows_affected": 0,
 "rows_sent": 0,
 "tmp_tables": 0,
 "tmp_disk_tables": 0,
 "sort_rows": 0,
 "sort_merge_passes": 0
 }
]
 }
}

```

### 28.4.5.18 The `quote_identifier()` Function

Given a string argument, this function produces a quoted identifier suitable for inclusion in SQL statements. This is useful when a value to be used as an identifier is a reserved word or contains backtick (``) characters.

#### Parameters

`in_identifier TEXT`: The identifier to quote.

#### Return Value

A `TEXT` value.

#### Example

```

mysql> SELECT sys.quote_identifier('plain');
+-----+
| sys.quote_identifier('plain') |
+-----+
| `plain` |
+-----+
mysql> SELECT sys.quote_identifier('trick`ier');
+-----+
| sys.quote_identifier('trick`ier') |
+-----+
| `trick`ier` |
+-----+
mysql> SELECT sys.quote_identifier('integer');
+-----+
| sys.quote_identifier('integer') |
+-----+
| `integer` |
+-----+

```

### 28.4.5.19 The `sys_get_config()` Function

Given a configuration option name, returns the option value from the `sys_config` table, or the provided default value (which may be `NULL`) if the option does not exist in the table.

If `sys_get_config()` returns the default value and that value is `NULL`, it is expected that the caller is able to handle `NULL` for the given configuration option.

By convention, routines that call `sys_get_config()` first check whether the corresponding user-defined variable exists and is non-`NULL`. If so, the routine uses the variable value without reading the `sys_config` table. If the variable does not exist or is `NULL`, the routine reads the option value from the table and sets the user-defined variable to that value. For more information about the relationship between configuration options and their corresponding user-defined variables, see [Section 28.4.2.1, "The `sys\_config` Table"](#).

If you want to check whether the configuration option has already been set and, if not, use the return value of `sys_get_config()`, you can use `IFNULL(...)` (see example later). However, this should not be done inside a loop (for example, for each row in a result set) because for repeated calls where the assignment is needed only in the first iteration, using `IFNULL(...)` is expected to be significantly slower than using an `IF (...) THEN ... END IF;` block (see example later).

## Parameters

- `in_variable_name VARCHAR(128)`: The name of the configuration option for which to return the value.
- `in_default_value VARCHAR(128)`: The default value to return if the configuration option is not found in the `sys_config` table.

## Return Value

A `VARCHAR(128)` value.

## Example

Get a configuration value from the `sys_config` table, falling back to 128 as the default if the option is not present in the table:

```
mysql> SELECT sys.sys_get_config('statement_truncate_len', 128) AS Value;
+-----+
| Value |
+-----+
| 64 |
+-----+
```

One-liner example: Check whether the option is already set; if not, assign the `IFNULL(...)` result (using the value from the `sys_config` table):

```
mysql> SET @sys.statement_truncate_len =
 IFNULL(@sys.statement_truncate_len,
 sys.sys_get_config('statement_truncate_len', 64));
```

`IF (...) THEN ... END IF;` block example: Check whether the option is already set; if not, assign the value from the `sys_config` table:

```
IF (@sys.statement_truncate_len IS NULL) THEN
 SET @sys.statement_truncate_len = sys.sys_get_config('statement_truncate_len', 64);
END IF;
```

### 28.4.5.20 The version\_major() Function

This function returns the major version of the MySQL server.

## Parameters

None.

## Return Value

A `TINYINT UNSIGNED` value.

## Example

```
mysql> SELECT VERSION(), sys.version_major();
+-----+-----+
| VERSION() | sys.version_major() |
+-----+-----+
| 8.0.26-debug | 8 |
+-----+-----+
```

### 28.4.5.21 The version\_minor() Function

This function returns the minor version of the MySQL server.

#### Parameters

None.

#### Return Value

A `TINYINT UNSIGNED` value.

#### Example

```
mysql> SELECT VERSION(), sys.version_minor();
+-----+-----+
| VERSION() | sys.version_minor() |
+-----+-----+
| 8.0.26-debug | 0 |
+-----+-----+
```

### 28.4.5.22 The version\_patch() Function

This function returns the patch release version of the MySQL server.

#### Parameters

None.

#### Return Value

A `TINYINT UNSIGNED` value.

#### Example

```
mysql> SELECT VERSION(), sys.version_patch();
+-----+-----+
| VERSION() | sys.version_patch() |
+-----+-----+
| 8.0.26-debug | 26 |
+-----+-----+
```

---

## Chapter 29 Connectors and APIs

### Table of Contents

|                                    |      |

| 29.12 MySQL Tcl API .....          | 4968 |
| 29.13 MySQL Eiffel Wrapper .....   | 4968 |

MySQL Connectors provide connectivity to the MySQL server for client programs. APIs provide low-level access to MySQL resources using either the classic MySQL protocol or X Protocol. Both Connectors and the APIs enable you to connect and execute MySQL statements from another language or environment, including ODBC, Java (JDBC), C++, Python, Node.js, PHP, Perl, Ruby, and C.

### MySQL Connectors

Oracle develops a number of connectors:

- [Connector/C++](#) enables C++ applications to connect to MySQL.
- [Connector/J](#) provides driver support for connecting to MySQL from Java applications using the standard Java Database Connectivity (JDBC) API.
- [Connector/NET](#) enables developers to create .NET applications that connect to MySQL. Connector/NET implements a fully functional ADO.NET interface and provides support for use with ADO.NET aware tools. Applications that use Connector/NET can be written in any supported .NET language.

[MySQL for Visual Studio](#) works with Connector/NET and Microsoft Visual Studio 2012, 2013, 2015, and 2017. MySQL for Visual Studio provides access to MySQL objects and data from Visual Studio. As a Visual Studio package, it integrates directly into Server Explorer providing the ability to create new connections and work with MySQL database objects.

- [Connector/ODBC](#) provides driver support for connecting to MySQL using the Open Database Connectivity (ODBC) API. Support is available for ODBC connectivity from Windows, Unix, and macOS platforms.
- [Connector/Python](#) provides driver support for connecting to MySQL from Python applications using an API that is compliant with the [Python DB API version 2.0](#). No additional Python modules or MySQL client libraries are required.
- [Connector/Node.js](#) provides an asynchronous API for connecting to MySQL from Node.js applications using X Protocol. Connector/Node.js supports managing database sessions and schemas, working with MySQL Document Store collections and using raw SQL statements.

## The MySQL C API

For direct access to using MySQL natively within a C application, the [C API](#) provides low-level access to the MySQL client/server protocol through the `libmysqlclient` client library. This is the primary method used to connect to an instance of the MySQL server, and is used both by MySQL command-line clients and many of the MySQL Connectors and third-party APIs detailed here.

`libmysqlclient` is included in MySQL distributions distributions.

See also [MySQL C API Implementations](#).

To access MySQL from a C application, or to build an interface to MySQL for a language not supported by the Connectors or APIs in this chapter, the [C API](#) is where to start. A number of programmer's utilities are available to help with the process; see [Section 4.7, "Program Development Utilities"](#).

## Third-Party MySQL APIs

The remaining APIs described in this chapter provide an interface to MySQL from specific application languages. These third-party solutions are not developed or supported by Oracle. Basic information on their usage and abilities is provided here for reference purposes only.

All the third-party language APIs are developed using one of two methods, using `libmysqlclient` or by implementing a *native driver*. The two solutions offer different benefits:

- Using `libmysqlclient` offers complete compatibility with MySQL because it uses the same libraries as the MySQL client applications. However, the feature set is limited to the implementation and interfaces exposed through `libmysqlclient` and the performance may be lower as data is copied between the native language, and the MySQL API components.
- *Native drivers* are an implementation of the MySQL network protocol entirely within the host language or environment. Native drivers are fast, as there is less copying of data between components, and they can offer advanced functionality not available through the standard MySQL API. Native drivers are also easier for end users to build and deploy because no copy of the MySQL client libraries is needed to build the native driver components.

[Table 29.1, "MySQL APIs and Interfaces"](#) lists many of the libraries and interfaces available for MySQL.

**Table 29.1 MySQL APIs and Interfaces**

| Environment | API                    | Type                        | Notes                                                                                                                                        |
|-------------|------------------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Ada         | GNU Ada MySQL Bindings | <code>libmysqlclient</code> | See <a href="#">MySQL Bindings for GNU Ada</a>                                                                                               |
| C           | C API                  | <code>libmysqlclient</code> | See <a href="#">MySQL 8.0 C API Developer Guide</a> .                                                                                        |
| C++         | Connector/C++          | <code>libmysqlclient</code> | See <a href="#">MySQL Connector/C++ 8.0 Developer Guide</a> .                                                                                |
|             | MySQL++                | <code>libmysqlclient</code> | See <a href="#">MySQL++ website</a> .                                                                                                        |
|             | MySQL wrapped          | <code>libmysqlclient</code> | See <a href="#">MySQL wrapped</a> .                                                                                                          |
| Cocoa       | MySQL-Cocoa            | <code>libmysqlclient</code> | Compatible with the Objective-C Cocoa environment. See <a href="http://mysql-cocoa.sourceforge.net/">http://mysql-cocoa.sourceforge.net/</a> |
| D           | MySQL for D            | <code>libmysqlclient</code> | See <a href="#">MySQL for D</a> .                                                                                                            |

## 29.1 MySQL Connector/C++

The MySQL Connector/C++ manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/C++ 8.0 Developer Guide](#)
- Release notes: [MySQL Connector/C++ Release Notes](#)

## 29.2 MySQL Connector/J

The MySQL Connector/J manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/J Developer Guide](#)
- Release notes: [MySQL Connector/J Release Notes](#)

## 29.3 MySQL Connector/NET

The MySQL Connector/NET manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/NET Developer Guide](#)
- Release notes: [MySQL Connector/NET Release Notes](#)

## 29.4 MySQL Connector/ODBC

The MySQL Connector/ODBC manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/ODBC Developer Guide](#)
- Release notes: [MySQL Connector/ODBC Release Notes](#)

## 29.5 MySQL Connector/Python

The MySQL Connector/Python manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/Python Developer Guide](#)
- Release notes: [MySQL Connector/Python Release Notes](#)

## 29.6 MySQL Connector/Node.js

The MySQL Connector/Node.js manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Release notes: [MySQL Connector/Node.js Release Notes](#)

## 29.7 MySQL C API

The MySQL C API Developer Guide is published in standalone form, not as part of the MySQL Reference Manual. See [MySQL 8.0 C API Developer Guide](#).

## 29.8 MySQL PHP API

The MySQL PHP API manual is now published in standalone form, not as part of the MySQL Reference Manual. See [MySQL and PHP](#).

## 29.9 MySQL Perl API

The Perl `DBI` module provides a generic interface for database access. You can write a DBI script that works with many different database engines without change. To use DBI with MySQL, install the following:

1. The `DBI` module.
2. The `DBD::mysql` module. This is the DataBase Driver (DBD) module for Perl.
3. Optionally, the DBD module for any other type of database server you want to access.

Perl DBI is the recommended Perl interface. It replaces an older interface called `mysqlperl`, which should be considered obsolete.

These sections contain information about using Perl with MySQL and writing MySQL applications in Perl:

- For installation instructions for Perl DBI support, see [Section 2.13, “Perl Installation Notes”](#).
- For an example of reading options from option files, see [Section 5.8.4, “Using Client Programs in a Multiple-Server Environment”](#).
- For secure coding tips, see [Section 6.1.1, “Security Guidelines”](#).
- For debugging tips, see [Section 5.9.1.4, “Debugging mysqld under gdb”](#).
- For some Perl-specific environment variables, see [Section 4.9, “Environment Variables”](#).
- For considerations for running on macOS, see [Section 2.4, “Installing MySQL on macOS”](#).
- For ways to quote string literals, see [Section 9.1.1, “String Literals”](#).

DBI information is available at the command line, online, or in printed form:

- Once you have the `DBI` and `DBD::mysql` modules installed, you can get information about them at the command line with the `perldoc` command:

```
shell> perldoc DBI
shell> perldoc DBI:FAQ
shell> perldoc DBD:mysql
```

You can also use `pod2man`, `pod2html`, and so on to translate this information into other formats.

- For online information about Perl DBI, visit the DBI website, <http://dbi.perl.org/>. That site hosts a general DBI mailing list.
- For printed information, the official DBI book is *Programming the Perl DBI* (Alligator Descartes and Tim Bunce, O'Reilly & Associates, 2000). Information about the book is available at the DBI website, <http://dbi.perl.org/>.

## 29.10 MySQL Python API

`MySQLdb` is a third-party driver that provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at <http://sourceforge.net/projects/mysql-python/>.

The new MySQL Connector/Python component provides an interface to the same Python API, and is built into the MySQL Server and supported by Oracle. See [MySQL Connector/Python Developer Guide](#) for details on the Connector, as well as coding guidelines for Python applications and sample Python code.

## 29.11 MySQL Ruby APIs

Two APIs are available for Ruby programmers developing MySQL applications:

- The MySQL/Ruby API is based on the `libmysqlclient` API library. For information on installing and using the MySQL/Ruby API, see [Section 29.11.1, “The MySQL/Ruby API”](#).
- The Ruby/MySQL API is written to use the native MySQL network protocol (a native driver). For information on installing and using the Ruby/MySQL API, see [Section 29.11.2, “The Ruby/MySQL API”](#).

For background and syntax information about the Ruby language, see [Ruby Programming Language](#).

### 29.11.1 The MySQL/Ruby API

The MySQL/Ruby module provides access to MySQL databases using Ruby through `libmysqlclient`.

For information on installing the module, and the functions exposed, see [MySQL/Ruby](#).

### 29.11.2 The Ruby/MySQL API

The Ruby/MySQL module provides access to MySQL databases using Ruby through a native driver interface using the MySQL network protocol.

For information on installing the module, and the functions exposed, see [Ruby/MySQL](#).

## 29.12 MySQL Tcl API

`MySQLtcl` is a simple API for accessing a MySQL database server from the [Tcl programming language](#). It can be found at <http://www.xdobry.de/mysqltcl/>.

## 29.13 MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the [Eiffel programming language](#), written by Michael Ravits. It can be found at <http://efsa.sourceforge.net/archive/ravits/mysql.htm>.

MySQL Enterprise Edition is a commercial product. Like MySQL Community Edition, MySQL Enterprise Edition includes MySQL Server, a fully integrated transaction-safe, ACID-compliant database with full commit, rollback, crash-recovery, and row-level locking capabilities. In addition, MySQL Enterprise Edition includes the following components designed to provide monitoring and online backup, as well as improved security and scalability:

The following sections briefly discuss each of these components and indicate where to find more detailed information. To learn more about commercial products, see <https://www.mysql.com/products/>.

- [MySQL Enterprise Monitor](#)
- [MySQL Enterprise Backup](#)
- [MySQL Enterprise Security](#)
- [MySQL Enterprise Encryption](#)
- [MySQL Enterprise Audit](#)
- [MySQL Enterprise Firewall](#)
- [MySQL Enterprise Thread Pool](#)
- [MySQL Enterprise Data Masking and De-Identification](#)

### 30.1 MySQL Enterprise Monitor Overview

MySQL Enterprise Monitor is an enterprise monitoring system for MySQL that keeps an eye on your MySQL servers, notifies you of potential issues and problems, and advises you how to fix the issues. MySQL Enterprise Monitor can monitor all kinds of configurations, from a single MySQL server that is important to your business, all the way up to a huge farm of MySQL servers powering a busy website.

The following discussion briefly summarizes the basic components that make up the MySQL Enterprise Monitor product. For more information, see the MySQL Enterprise Monitor manual, available at <https://dev.mysql.com/doc/mysql-monitor/en/>.

MySQL Enterprise Monitor components can be installed in various configurations depending on your database and network topology, to give you the best combination of reliable and responsive monitoring data, with minimal overhead on the database server machines. A typical MySQL Enterprise Monitor installation consists of:

- One or more MySQL servers to monitor. MySQL Enterprise Monitor can monitor both Community and Enterprise MySQL server releases.
- A MySQL Enterprise Monitor Agent for each monitored host.

- A single MySQL Enterprise Service Manager, which collates information from the agents and provides the user interface to the collected data.

MySQL Enterprise Monitor is designed to monitor one or more MySQL servers. The monitoring information is collected by using an agent, *MySQL Enterprise Monitor Agent*. The agent communicates with the hosts and MySQL servers that it monitors, collecting variables, status and health information, and sending this information to the MySQL Enterprise Service Manager.

The information collected by the agent about each MySQL server and host you are monitoring is sent to the *MySQL Enterprise Service Manager*. This server collates all of the information from the agents. As it collates the information sent by the agents, the MySQL Enterprise Service Manager continually tests the collected data, comparing the status of the server to reasonable values. When thresholds are reached, the server can trigger an event (including an alarm and notification) to highlight a potential issue, such as low memory, high CPU usage, or more complex conditions such as insufficient buffer sizes and status information. We call each test, with its associated threshold value, a *rule*.

These rules, and the alarms and notifications, are each known as a *MySQL Enterprise Advisors*. Advisors form a critical part of the MySQL Enterprise Service Manager, as they provide warning information and troubleshooting advice about potential problems.

The MySQL Enterprise Service Manager includes a web server, and you interact with it through any web browser. This interface, the MySQL Enterprise Monitor User Interface, displays all of the information collected by the agents, and lets you view all of your servers and their current status as a group or individually. You control and configure all aspects of the service using the MySQL Enterprise Monitor User Interface.

The information supplied by the MySQL Enterprise Monitor Agent processes also includes statistical and query information, which you can view in the form of graphs. For example, you can view aspects such as server load, query numbers, or index usage information as a graph over time. The graph lets you pinpoint problems or potential issues on your server, and can help diagnose the impact from database or external problems (such as external system or network failure) by examining the data from a specific time interval.

The MySQL Enterprise Monitor Agent can also be configured to collect detailed information about the queries executed on your server, including the row counts and performance times for executing each query. You can correlate the detailed query data with the graphical information to identify which queries were executing when you experienced a particularly high load, index or other issue. The query data is supported by a system called Query Analyzer, and the data can be presented in different ways depending on your needs.

## 30.2 MySQL Enterprise Backup Overview

MySQL Enterprise Backup performs hot backup operations for MySQL databases. The product is architected for efficient and reliable backups of tables created by the InnoDB storage engine. For completeness, it can also back up tables from MyISAM and other storage engines.

The following discussion briefly summarizes MySQL Enterprise Backup. For more information, see the MySQL Enterprise Backup manual, available at <https://dev.mysql.com/doc/mysql-enterprise-backup/en/>.

Hot backups are performed while the database is running and applications are reading and writing to it. This type of backup does not block normal database operations, and it captures even changes that occur while the backup is happening. For these reasons, hot backups are desirable when your database “grows up” -- when the data is large enough that the backup takes significant time, and when your data is important enough to your business that you must capture every last change, without taking your application, website, or web service offline.

MySQL Enterprise Backup does a hot backup of all tables that use the InnoDB storage engine. For tables using MyISAM or other non-InnoDB storage engines, it does a “warm” backup, where the database continues to run, but those tables cannot be modified while being backed up. For efficient

backup operations, you can designate InnoDB as the default storage engine for new tables, or convert existing tables to use the InnoDB storage engine.

## 30.3 MySQL Enterprise Security Overview

MySQL Enterprise Edition provides plugins that implement security features using external services:

- MySQL Enterprise Edition includes an authentication plugin that enables MySQL Server to use PAM (Pluggable Authentication Modules) to authenticate MySQL users. PAM enables a system to use a standard interface to access various kinds of authentication methods, such as Unix passwords or an LDAP directory. For more information, see [Section 6.4.1.5, “PAM Pluggable Authentication”](#).
- MySQL Enterprise Edition includes an authentication plugin that performs external authentication on Windows, enabling MySQL Server to use native Windows services to authenticate client connections. Users who have logged in to Windows can connect from MySQL client programs to the server based on the information in their environment without specifying an additional password. For more information, see [Section 6.4.1.6, “Windows Pluggable Authentication”](#).
- MySQL Enterprise Edition includes a set of encryption functions based on the OpenSSL library that expose OpenSSL capabilities at the SQL level. These functions enable masking existing data using several methods such as obfuscation (removing identifying characteristics), generation of formatted random data, and data replacement or substitution. For more information, see [Section 30.4, “MySQL Enterprise Encryption Overview”](#).
- MySQL Enterprise Edition 5.7 and higher includes a keyring plugin that uses Oracle Key Vault as a back end for keyring storage. For more information, see [Section 6.4.4, “The MySQL Keyring”](#).

For other related Enterprise security features, see [Section 30.4, “MySQL Enterprise Encryption Overview”](#).

## 30.4 MySQL Enterprise Encryption Overview

MySQL Enterprise Edition includes a set of encryption functions based on the OpenSSL library that expose OpenSSL capabilities at the SQL level. These functions enable Enterprise applications to perform the following operations:

- Implement added data protection using public-key asymmetric cryptography
- Create public and private keys and digital signatures
- Perform asymmetric encryption and decryption
- Use cryptographic hashing for digital signing and data verification and validation

For more information, see [Section 6.6, “MySQL Enterprise Encryption”](#).

For other related Enterprise security features, see [Section 30.3, “MySQL Enterprise Security Overview”](#).

## 30.5 MySQL Enterprise Audit Overview

MySQL Enterprise Edition includes MySQL Enterprise Audit, implemented using a server plugin. MySQL Enterprise Audit uses the open MySQL Audit API to enable standard, policy-based monitoring and logging of connection and query activity executed on specific MySQL servers. Designed to meet the Oracle audit specification, MySQL Enterprise Audit provides an out of box, easy to use auditing and compliance solution for applications that are governed by both internal and external regulatory guidelines.

When installed, the audit plugin enables MySQL Server to produce a log file containing an audit record of server activity. The log contents include when clients connect and disconnect, and what actions they perform while connected, such as which databases and tables they access.

For more information, see [Section 6.4.5, “MySQL Enterprise Audit”](#).

## 30.6 MySQL Enterprise Firewall Overview

MySQL Enterprise Edition includes MySQL Enterprise Firewall, an application-level firewall that enables database administrators to permit or deny SQL statement execution based on matching against allowlists of accepted statement patterns. This helps harden MySQL Server against attacks such as SQL injection or attempts to exploit applications by using them outside of their legitimate query workload characteristics.

Each MySQL account registered with the firewall has its own statement allowlist, enabling protection to be tailored per account. For a given account, the firewall can operate in recording or protecting mode, for training in the accepted statement patterns or protection against unacceptable statements.

For more information, see [Section 6.4.7, “MySQL Enterprise Firewall”](#).

## 30.7 MySQL Enterprise Thread Pool Overview

MySQL Enterprise Edition includes MySQL Enterprise Thread Pool, implemented using a server plugin. The default thread-handling model in MySQL Server executes statements using one thread per client connection. As more clients connect to the server and execute statements, overall performance degrades. In MySQL Enterprise Edition, a thread pool plugin provides an alternative thread-handling model designed to reduce overhead and improve performance. The plugin implements a thread pool that increases server performance by efficiently managing statement execution threads for large numbers of client connections.

For more information, see [Section 5.6.3, “MySQL Enterprise Thread Pool”](#).

## 30.8 MySQL Enterprise Data Masking and De-Identification Overview

MySQL Enterprise Edition 5.7 and higher includes MySQL Enterprise Data Masking and De-Identification, implemented as a plugin library containing a plugin and several loadable functions. Data masking hides sensitive information by replacing real values with substitutes. MySQL Enterprise Data Masking and De-Identification functions enable masking existing data using several methods such as obfuscation (removing identifying characteristics), generation of formatted random data, and data replacement or substitution.

For more information, see [Section 6.5, “MySQL Enterprise Data Masking and De-Identification”](#).

---

## Chapter 31 MySQL Workbench

MySQL Workbench provides a graphical tool for working with MySQL servers and databases. MySQL Workbench fully supports MySQL versions 5.5 and higher.

The following discussion briefly describes MySQL Workbench capabilities. For more information, see the MySQL Workbench manual, available at <https://dev.mysql.com/doc/workbench/en/>.

MySQL Workbench provides five main areas of functionality:

- **SQL Development:** Enables you to create and manage connections to database servers. As well as enabling you to configure connection parameters, MySQL Workbench provides the capability to execute SQL queries on the database connections using the built-in SQL Editor. This functionality replaces that previously provided by the Query Browser standalone application.
- **Data Modeling:** Enables you to create models of your database schema graphically, reverse and forward engineer between a schema and a live database, and edit all aspects of your database using the comprehensive Table Editor. The Table Editor provides easy-to-use facilities for editing Tables, Columns, Indexes, Triggers, Partitioning, Options, Inserts and Privileges, Routines and Views.
- **Server Administration:** Enables you to create and administer server instances.
- **Data Migration:** Allows you to migrate from Microsoft SQL Server, Sybase ASE, SQLite, SQL Anywhere, PostgreSQL, and other RDBMS tables, objects and data to MySQL. Migration also supports migrating from earlier versions of MySQL to the latest releases.
- **MySQL Enterprise Support:** Support for Enterprise products such as MySQL Enterprise Backup and MySQL Audit.

MySQL Workbench is available in two editions, the Community Edition and the Commercial Edition. The Community Edition is available free of charge. The Commercial Edition provides additional Enterprise features, such as database documentation generation, at low cost.

| 32.5 Maintenance .....                                                        | 4978 |

This chapter describes how to deploy MySQL Enterprise Edition as an Oracle Cloud Infrastructure (OCI) Marketplace Application. This is a BYOL product.

#### Note

For more information on OCI marketplace, see [Overview of Marketplace](#).

The MySQL Enterprise Edition Marketplace Application is an OCI compute instance, running Oracle Linux 7.7, with MySQL EE 8.0. The MySQL EE installation on the deployed image is similar to the RPM installation, as described in [Section 2.5.4, “Installing MySQL on Linux Using RPM Packages from Oracle”](#).

For more information on MySQL Enterprise Edition, see [Chapter 30, MySQL Enterprise Edition](#).

For more information on MySQL advanced configuration, see [Secure Deployment Guide](#).

For more information on Oracle Linux 7, see [Oracle Linux Documentation](#)

This product is user-managed, meaning you are responsible for upgrades and maintenance.

### 32.1 Prerequisites to Deploying MySQL EE on Oracle Cloud Infrastructure

The following assumptions are made:

- You are familiar with OCI terminology. If you are new to OCI, see [Getting Started](#).
- You have access to a properly configured Virtual Cloud Network (VCN) and subnet. For more information, see [Virtual Networking](#).
- You have the permissions required to deploy OCI Marketplace applications in a compartment of your tenancy. For more information, see [How Policies Work](#).

### 32.2 Deploying MySQL EE on Oracle Cloud Infrastructure

To deploy MySQL EE on Oracle Cloud Infrastructure, do the following:

1. Open the OCI Marketplace and select **MySQL**.

The **MySQL** listing is displayed.

2. Click **Launch Instance** to begin the application launch process.

The **Create Compute Instance** dialog is displayed.

See [To create a Linux instance](#) for information on how to complete the fields.

By default, the MySQL server listens on port 3306 and is configured with a single user, root.

**Important**

When the deployment is complete, the MySQL server is started, and you must connect to the compute instance, and retrieve the default root password which was written to the MySQL log file.

See [Connecting with SSH](#) for more information.

The following MySQL software is installed:

- MySQL Server EE
- MySQL Enterprise Backup
- MySQL Shell
- MySQL Router

## MySQL Configuration

For security, the following are enabled:

- SELinux: for more information, see [Configuring and Using SELinux](#)
- `firewalld`: for more information, see [Current Status and Settings of firewalld](#)

The following MySQL plugins are enabled:

- `thread_pool`
- `validate_password`

On startup, the following occurs:

- MySQL Server reads `/etc/my.cnf` and all files named `*.cnf` in `/etc/my.cnf.d/`.
- `/etc/my.cnf.d/perf-tuning.cnf` is created by `/usr/bin/mkcnf` based on the selected OCI shape.

**Note**

To disable this mechanism, remove `/etc/systemd/system/mysqld.service.d/perf-tuning.conf`.

Performance tuning is configured for the following shapes:

- VM.Standard2.1
- VM.Standard2.2
- VM.Standard2.4
- VM.Standard2.8
- VM.Standard2.16
- VM.Standard2.24
- VM.Standard.E2.1
- VM.Standard.E2.2
- VM.Standard.E2.4

- VM.Standard.E2.8
- BM.Standard2.52

For all other shapes, the tuning for VM.Standard2.1 is used.

## 32.3 Configuring Network Access

For information on OCI Security Rules, see [Security Rules](#).

### Important

You must enable ingress on ports 22 (SSH) and 3306 (MySQL), and optionally 33060, if you intend to use MySQL X Protocol.

## 32.4 Connecting

This section describes the various connection methods for connecting to the deployed MySQL server on the OCI Compute Instance.

### Connecting with SSH

This section gives some detail on connecting from a UNIX-like platform to the OCI Compute. For more information on connecting with SSH, see [Accessing an Oracle Linux Instance Using SSH](#) and [Connecting to Your Instance](#).

To connect to the Oracle Linux running on the Compute Instance with SSH, run the following command:

```
ssh opc@computeIP
```

where `opc` is the compute user and `computeIP` is the IP address of your Compute Instance.

To find the temporary root password created for the root user, run the following command:

```
sudo grep 'temporary password' /var/log/mysqld.log
```

To change your default password, log in to the server using the generated, temporary password, using the following command: `mysql -uroot -p`. Then run the following:

```
ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass4!';
```

### Connecting with MySQL Client

### Note

To connect from your local MySQL client, you must first create on the MySQL server a user which allows remote login.

To connect to the MySQL Server from your local MySQL client, run the following command from your shell session:

```
mysql -uroot -p -hcomputeIP
```

where `computeIP` is the IP address of your Compute Instance.

### Connecting with MySQL Shell

To connect to the MySQL Server from your local MySQL Shell, run the following command to start your shell session:

```
mysqlsh \connect root@computeIP
```

where *computeIP* is the IP address of your Compute Instance.

For more information on MySQL Shell connections, see [MySQL Shell Connections](#).

## Connecting with Workbench

To connect to the MySQL Server from MySQL Workbench, see [Connections in MySQL Workbench](#).

## 32.5 Maintenance

This product is user-managed, meaning you are responsible for upgrades and maintenance.

### Upgrading MySQL

The existing installation is RPM-based, to upgrade the MySQL server, see [Section 2.11.6, “Upgrading MySQL Binary or Package-based Installations on Unix/Linux”](#).

You can use `scp` to copy the required RPM to the OCI Compute Instance, or copy it from OCI Object Storage, if you have configured access to it. File Storage is also an option. For more information, see [File Storage and NFS](#).

### Backup and Restore

MySQL Enterprise Backup is the preferred backup and restore solution. For more information, see [Backing Up to Cloud Storage](#).

For information on MySQL Enterprise Backup, see [Getting Started with MySQL Enterprise Backup](#).

For information on the default MySQL backup and restore, see [Chapter 7, Backup and Recovery](#).

| A.1.3 Can MySQL 8.0 do subqueries? .....                                                  | 4980 |
| A.1.4 Can MySQL 8.0 perform multiple-table inserts, updates, and deletes? .....           | 4980 |
| A.1.5 Does MySQL 8.0 have Sequences? .....                                                | 4980 |
| A.1.6 Does MySQL 8.0 have a <code>NOW( )</code> function with fractions of seconds? ..... | 4980 |
| A.1.7 Does MySQL 8.0 work with multi-core processors? .....                               | 4980 |
| A.1.8 Why do I see multiple processes for <code>mysqld</code> ? .....                     | 4980 |
| A.1.9 Can MySQL 8.0 perform ACID transactions? .....                                      | 4980 |

### A.1.1. Which version of MySQL is production-ready (GA)?

MySQL 8.0, 5.7, and MySQL 5.6 are supported for production use.

MySQL 8.0 achieved General Availability (GA) status with MySQL 8.0.11, which was released for production use on 19 April 2018.

MySQL 5.7 achieved General Availability (GA) status with MySQL 5.7.9, which was released for production use on 21 October 2015.

MySQL 5.6 achieved General Availability (GA) status with MySQL 5.6.10, which was released for production use on 5 February 2013.

MySQL 5.5 achieved General Availability (GA) status with MySQL 5.5.8, which was released for production use on 3 December 2010. Active development for MySQL 5.5 has ended.

MySQL 5.1 achieved General Availability (GA) status with MySQL 5.1.30, which was released for production use on 14 November 2008. Active development for MySQL 5.1 has ended.

MySQL 5.0 achieved General Availability (GA) status with MySQL 5.0.15, which was released for production use on 19 October 2005. Active development for MySQL 5.0 has ended.

### A.1.2. Why did MySQL version numbering skip versions 6 and 7 and go straight to 8.0?

Due to the many new and important features we were introducing in this MySQL version, we decided to start a fresh new series. As the series numbers 6 and 7 had actually been used before by MySQL, we went to 8.0.

**A.1.3.** Can MySQL 8.0 do subqueries?

Yes. See [Section 13.2.11, “Subqueries”](#).

**A.1.4.** Can MySQL 8.0 perform multiple-table inserts, updates, and deletes?

Yes. For the syntax required to perform multiple-table updates, see [Section 13.2.13, “UPDATE Statement”](#); for that required to perform multiple-table deletes, see [Section 13.2.2, “DELETE Statement”](#).

A multiple-table insert can be accomplished using a trigger whose `FOR EACH ROW` clause contains multiple `INSERT` statements within a `BEGIN ... END` block. See [Section 25.3, “Using Triggers”](#).

**A.1.5.** Does MySQL 8.0 have Sequences?

No. However, MySQL has an `AUTO_INCREMENT` system, which in MySQL 8.0 can also handle inserts in a multi-source replication setup. With the `auto_increment_increment` and `auto_increment_offset` system variables, you can set each server to generate auto-increment values that don't conflict with other servers. The `auto_increment_increment` value should be greater than the number of servers, and each server should have a unique offset.

**A.1.6.** Does MySQL 8.0 have a `NOW( )` function with fractions of seconds?

Yes, see [Section 11.2.6, “Fractional Seconds in Time Values”](#).

**A.1.7.** Does MySQL 8.0 work with multi-core processors?

Yes. MySQL is fully multithreaded, and makes use of all CPUs made available to it. Not all CPUs may be available; modern operating systems should be able to utilize all underlying CPUs, but also make it possible to restrict a process to a specific CPU or sets of CPUs.

On Windows, there is currently a limit to the number of (logical) processors that `mysqld` can use: a single processor group, which is limited to a maximum of 64 logical processors.

Use of multiple cores may be seen in these ways:

- A single core is usually used to service the commands issued from one session.
- A few background threads make limited use of extra cores; for example, to keep background I/O tasks moving.
- If the database is I/O-bound (indicated by CPU consumption less than capacity), adding more CPUs is futile. If the database is partitioned into an I/O-bound part and a CPU-bound part, adding CPUs may still be useful.

**A.1.8.** Why do I see multiple processes for `mysqld`?

`mysqld` is a single-process program, not a multi-process program, and does not fork or launch other processes. However, `mysqld` is multithreaded and some process-reporting system utilities display separate entries for each thread of multithreaded processes, which may lead to the appearance of multiple `mysqld` processes when in fact there is only one.

**A.1.9.** Can MySQL 8.0 perform ACID transactions?

Yes. All current MySQL versions support transactions. The `InnoDB` storage engine offers full ACID transactions with row-level locking, multi-versioning, nonlocking repeatable reads, and all four SQL standard isolation levels.

The [NDB](#) storage engine supports the [READ COMMITTED](#) transaction isolation level only.

## A.2 MySQL 8.0 FAQ: Storage Engines

|                                                                                                                                                                                                          |      |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|
| A.2.1 Where can I obtain complete documentation for MySQL storage engines? .....                                                                                                                         | 4981 |
| A.2.2 Are there any new storage engines in MySQL 8.0? .....                                                                                                                                              | 4981 |
| A.2.3 Have any storage engines been removed in MySQL 8.0? .....                                                                                                                                          | 4981 |
| A.2.4 Can I prevent the use of a particular storage engine? .....                                                                                                                                        | 4981 |
| A.2.5 Is there an advantage to using the <a href="#">InnoDB</a> storage engine exclusively, as opposed to a combination of <a href="#">InnoDB</a> and non- <a href="#">InnoDB</a> storage engines? ..... | 4981 |
| A.2.6 What are the unique benefits of the <a href="#">ARCHIVE</a> storage engine? .....                                                                                                                  | 4981 |

### A.2.1. Where can I obtain complete documentation for MySQL storage engines?

See [Chapter 16, \*Alternative Storage Engines\*](#). That chapter contains information about all MySQL storage engines except for the [InnoDB](#) storage engine and the [NDB](#) storage engine (used for MySQL Cluster). [InnoDB](#) is covered in [Chapter 15, \*The InnoDB Storage Engine\*](#). [NDB](#) is covered in [Chapter 23, \*MySQL NDB Cluster 8.0\*](#).

### A.2.2. Are there any new storage engines in MySQL 8.0?

No. [InnoDB](#) is the default storage engine for new tables. See [Section 15.1, “Introduction to InnoDB”](#) for details.

### A.2.3. Have any storage engines been removed in MySQL 8.0?

The [PARTITION](#) storage engine plugin which provided partitioning support is replaced by a native partitioning handler. As part of this change, the server can no longer be built using `-DWITH_PARTITION_STORAGE_ENGINE`. `partition` is also no longer displayed in the output of `SHOW PLUGINS`, or shown in the `INFORMATION_SCHEMA.PLUGINS` table.

In order to support partitioning of a given table, the storage engine used for the table must now provide its own (“native”) partitioning handler. [InnoDB](#) is the only storage engine supported in MySQL 8.0 that includes a native partitioning handler. An attempt to create partitioned tables in MySQL 8.0 using any other storage engine fails. (The [NDB](#) storage engine used by MySQL Cluster also provides its own partitioning handler, but is currently not supported by MySQL 8.0.)

### A.2.4. Can I prevent the use of a particular storage engine?

Yes. The `disabled_storage_engines` configuration option defines which storage engines cannot be used to create tables or tablespaces. By default, `disabled_storage_engines` is empty (no engines disabled), but it can be set to a comma-separated list of one or more engines.

### A.2.5. Is there an advantage to using the [InnoDB](#) storage engine exclusively, as opposed to a combination of [InnoDB](#) and non-[InnoDB](#) storage engines?

Yes. Using [InnoDB](#) tables exclusively can simplify backup and recovery operations. MySQL Enterprise Backup does a [hot backup](#) of all tables that use the [InnoDB](#) storage engine. For tables using [MyISAM](#) or other non-[InnoDB](#) storage engines, it does a “warm” backup, where the database continues to run, but those tables cannot be modified while being backed up. See [Section 30.2, “MySQL Enterprise Backup Overview”](#).

### A.2.6. What are the unique benefits of the [ARCHIVE](#) storage engine?

The [ARCHIVE](#) storage engine stores large amounts of data without indexes; it has a small footprint, and performs selects using table scans. See [Section 16.5, “The ARCHIVE Storage Engine”](#), for details.

## A.3 MySQL 8.0 FAQ: Server SQL Mode

|                                        |      |
|----------------------------------------|------|
| A.3.1 What are server SQL modes? ..... | 4982 |
|----------------------------------------|------|

|                                                                              |      |
|------------------------------------------------------------------------------|------|
| A.3.2 How many server SQL modes are there? .....                             | 4982 |
| A.3.3 How do you determine the server SQL mode? .....                        | 4982 |
| A.3.4 Is the mode dependent on the database or connection? .....             | 4982 |
| A.3.5 Can the rules for strict mode be extended? .....                       | 4982 |
| A.3.6 Does strict mode impact performance? .....                             | 4982 |
| A.3.7 What is the default server SQL mode when MySQL 8.0 is installed? ..... | 4982 |

#### A.3.1. What are server SQL modes?

Server SQL modes define what SQL syntax MySQL should support and what kind of data validation checks it should perform. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers. The MySQL Server apply these modes individually to different clients. For more information, see [Section 5.1.11, “Server SQL Modes”](#).

#### A.3.2. How many server SQL modes are there?

Each mode can be independently switched on and off. See [Section 5.1.11, “Server SQL Modes”](#), for a complete list of available modes.

#### A.3.3. How do you determine the server SQL mode?

You can set the default SQL mode (for `mysqld` startup) with the `--sql-mode` option. Using the statement `SET [GLOBAL|SESSION] sql_mode='modes'`, you can change the settings from within a connection, either locally to the connection, or to take effect globally. You can retrieve the current mode by issuing a `SELECT @@sql_mode` statement.

#### A.3.4. Is the mode dependent on the database or connection?

A mode is not linked to a particular database. Modes can be set locally to the session (connection), or globally for the server. you can change these settings using `SET [GLOBAL|SESSION] sql_mode='modes'`.

#### A.3.5. Can the rules for strict mode be extended?

When we refer to *strict mode*, we mean a mode where at least one of the modes `TRADITIONAL`, `STRICT_TRANS_TABLES`, or `STRICT_ALL_TABLES` is enabled. Options can be combined, so you can add restrictions to a mode. See [Section 5.1.11, “Server SQL Modes”](#), for more information.

#### A.3.6. Does strict mode impact performance?

The intensive validation of input data that some settings requires more time than if the validation is not done. While the performance impact is not that great, if you do not require such validation (perhaps your application already handles all of this), then MySQL gives you the option of leaving strict mode disabled. However, if you do require it, strict mode can provide such validation.

#### A.3.7. What is the default server SQL mode when MySQL 8.0 is installed?

The default SQL mode in MySQL 8.0 includes these modes: `ONLY_FULL_GROUP_BY`, `STRICT_TRANS_TABLES`, `NO_ZERO_IN_DATE`, `NO_ZERO_DATE`, `ERROR_FOR_DIVISION_BY_ZERO`, and `NO_ENGINE_SUBSTITUTION`.

For information about all available modes and default MySQL behavior, see [Section 5.1.11, “Server SQL Modes”](#).

## A.4 MySQL 8.0 FAQ: Stored Procedures and Functions

|                                                                                              |      |
|----------------------------------------------------------------------------------------------|------|
| A.4.1 Does MySQL 8.0 support stored procedures and functions? .....                          | 4983 |
| A.4.2 Where can I find documentation for MySQL stored procedures and stored functions? ..... | 4983 |
| A.4.3 Is there a discussion forum for MySQL stored procedures? .....                         | 4983 |

|                                                                                                                                                         |      |
|---------------------------------------------------------------------------------------------------------------------------------------------------------|------|
| A.4.4 Where can I find the ANSI SQL 2003 specification for stored procedures? .....                                                                     | 4983 |
| A.4.5 How do you manage stored routines? .....                                                                                                          | 4983 |
| A.4.6 Is there a way to view all stored procedures and stored functions in a given database? .....                                                      | 4983 |
| A.4.7 Where are stored procedures stored? .....                                                                                                         | 4984 |
| A.4.8 Is it possible to group stored procedures or stored functions into packages? .....                                                                | 4984 |
| A.4.9 Can a stored procedure call another stored procedure? .....                                                                                       | 4984 |
| A.4.10 Can a stored procedure call a trigger? .....                                                                                                     | 4984 |
| A.4.11 Can a stored procedure access tables? .....                                                                                                      | 4984 |
| A.4.12 Do stored procedures have a statement for raising application errors? .....                                                                      | 4984 |
| A.4.13 Do stored procedures provide exception handling? .....                                                                                           | 4984 |
| A.4.14 Can MySQL 8.0 stored routines return result sets? .....                                                                                          | 4984 |
| A.4.15 Is <code>WITH RECOMPILE</code> supported for stored procedures? .....                                                                            | 4984 |
| A.4.16 Is there a MySQL equivalent to using <code>mod_plsql</code> as a gateway on Apache to talk directly to a stored procedure in the database? ..... | 4984 |
| A.4.17 Can I pass an array as input to a stored procedure? .....                                                                                        | 4985 |
| A.4.18 Can I pass a cursor as an <code>IN</code> parameter to a stored procedure? .....                                                                 | 4985 |
| A.4.19 Can I return a cursor as an <code>OUT</code> parameter from a stored procedure? .....                                                            | 4985 |
| A.4.20 Can I print out a variable's value within a stored routine for debugging purposes? .....                                                         | 4985 |
| A.4.21 Can I commit or roll back transactions inside a stored procedure? .....                                                                          | 4985 |
| A.4.22 Do MySQL 8.0 stored procedures and functions work with replication? .....                                                                        | 4985 |
| A.4.23 Are stored procedures and functions created on a replication source server replicated to a replica? .....                                        | 4985 |
| A.4.24 How are actions that take place inside stored procedures and functions replicated? .....                                                         | 4985 |
| A.4.25 Are there special security requirements for using stored procedures and functions together with replication? .....                               | 4985 |
| A.4.26 What limitations exist for replicating stored procedure and function actions? .....                                                              | 4986 |
| A.4.27 Do the preceding limitations affect the ability of MySQL to do point-in-time recovery? .....                                                     | 4986 |
| A.4.28 What is being done to correct the aforementioned limitations? .....                                                                              | 4986 |

**A.4.1. Does MySQL 8.0 support stored procedures and functions?**

Yes. MySQL 8.0 supports two types of stored routines, stored procedures and stored functions.

**A.4.2. Where can I find documentation for MySQL stored procedures and stored functions?**

See [Section 25.2, "Using Stored Routines"](#).

**A.4.3. Is there a discussion forum for MySQL stored procedures?**

Yes. See <https://forums.mysql.com/list.php?98>.

**A.4.4. Where can I find the ANSI SQL 2003 specification for stored procedures?**

Unfortunately, the official specifications are not freely available (ANSI makes them available for purchase). However, there are books, such as *SQL-99 Complete, Really* by Peter Gultzan and Trudy Pelzer, that provide a comprehensive overview of the standard, including coverage of stored procedures.

**A.4.5. How do you manage stored routines?**

It is always good practice to use a clear naming scheme for your stored routines. You can manage stored procedures with `CREATE [FUNCTION|PROCEDURE]`, `ALTER [FUNCTION|PROCEDURE]`, `DROP [FUNCTION|PROCEDURE]`, and `SHOW CREATE [FUNCTION|PROCEDURE]`. You can obtain information about existing stored procedures using the `ROUTINES` table in the `INFORMATION_SCHEMA` database (see [Section 26.3.30, "The INFORMATION\\_SCHEMA ROUTINES Table"](#)).

**A.4.6. Is there a way to view all stored procedures and stored functions in a given database?**

Yes. For a database named `dbname`, use this query on the `INFORMATION_SCHEMA.ROUTINES` table:

```
SELECT ROUTINE_TYPE, ROUTINE_NAME
FROM INFORMATION_SCHEMA.ROUTINES
WHERE ROUTINE_SCHEMA='dbname' ;
```

For more information, see [Section 26.3.30, “The INFORMATION\\_SCHEMA ROUTINES Table”](#).

The body of a stored routine can be viewed using `SHOW CREATE FUNCTION` (for a stored function) or `SHOW CREATE PROCEDURE` (for a stored procedure). See [Section 13.7.7.9, “SHOW CREATE PROCEDURE Statement”](#), for more information.

**A.4.7.** Where are stored procedures stored?

Stored procedures are stored in the `mysql.routines` and `mysql.parameters` tables, which are part of the data dictionary. You cannot access these tables directly. Instead, query the `INFORMATION_SCHEMA.ROUTINES` and `PARAMETERS` tables. See [Section 26.3.30, “The INFORMATION\\_SCHEMA ROUTINES Table”](#), and [Section 26.3.20, “The INFORMATION\\_SCHEMA PARAMETERS Table”](#).

You can also use `SHOW CREATE FUNCTION` to obtain information about stored functions, and `SHOW CREATE PROCEDURE` to obtain information about stored procedures. See [Section 13.7.7.9, “SHOW CREATE PROCEDURE Statement”](#).

**A.4.8.** Is it possible to group stored procedures or stored functions into packages?

No. This is not supported in MySQL 8.0.

**A.4.9.** Can a stored procedure call another stored procedure?

Yes.

**A.4.10** Can a stored procedure call a trigger?

A stored procedure can execute an SQL statement, such as an `UPDATE`, that causes a trigger to activate.

**A.4.11** Can a stored procedure access tables?

Yes. A stored procedure can access one or more tables as required.

**A.4.12** Do stored procedures have a statement for raising application errors?

Yes. MySQL 8.0 implements the SQL standard `SIGNAL` and `RESIGNAL` statements. See [Section 13.6.7, “Condition Handling”](#).

**A.4.13** Do stored procedures provide exception handling?

MySQL implements `HANDLER` definitions according to the SQL standard. See [Section 13.6.7.2, “DECLARE ... HANDLER Statement”](#), for details.

**A.4.14** Can MySQL 8.0 stored routines return result sets?

*Stored procedures* can, but *stored functions* cannot. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You need to use the MySQL 4.1 (or higher) client/server protocol for this to work. This means that, for example, in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

**A.4.15** Is `WITH RECOMPILE` supported for stored procedures?

Not in MySQL 8.0.

**A.4.16** Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?

There is no equivalent in MySQL 8.0.

**A.4.17** Can I pass an array as input to a stored procedure?

Not in MySQL 8.0.

**A.4.18** Can I pass a cursor as an `IN` parameter to a stored procedure?

In MySQL 8.0, cursors are available inside stored procedures only.

**A.4.19** Can I return a cursor as an `OUT` parameter from a stored procedure?

In MySQL 8.0, cursors are available inside stored procedures only. However, if you do not open a cursor on a `SELECT`, the result is sent directly to the client. You can also `SELECT INTO` variables. See [Section 13.2.10, “SELECT Statement”](#).

**A.4.20** Can I print out a variable's value within a stored routine for debugging purposes?

Yes, you can do this in a *stored procedure*, but not in a stored function. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You must use the MySQL 4.1 (or above) client/server protocol for this to work. This means that, for example, in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

**A.4.21** Can I commit or roll back transactions inside a stored procedure?

Yes. However, you cannot perform transactional operations within a stored function.

**A.4.22** Do MySQL 8.0 stored procedures and functions work with replication?

Yes, standard actions carried out in stored procedures and functions are replicated from a replication source server to a replica. There are a few limitations that are described in detail in [Section 25.7, “Stored Program Binary Logging”](#).

**A.4.23** Are stored procedures and functions created on a replication source server replicated to a replica?

Yes, creation of stored procedures and functions carried out through normal DDL statements on a replication source server are replicated to a replica, so that the objects exist on both servers. `ALTER` and `DROP` statements for stored procedures and functions are also replicated.

**A.4.24** How are actions that take place inside stored procedures and functions replicated?

MySQL records each DML event that occurs in a stored procedure and replicates those individual actions to a replica. The actual calls made to execute stored procedures are not replicated.

Stored functions that change data are logged as function invocations, not as the DML events that occur inside each function.

**A.4.25** Are there special security requirements for using stored procedures and functions together with replication?

Yes. Because a replica has authority to execute any statement read from a source's binary log, special security constraints exist for using stored functions with replication. If replication or binary logging in general (for the purpose of point-in-time recovery) is active, then MySQL DBAs have two security options open to them:

1. Any user wishing to create stored functions must be granted the `SUPER` privilege.
2. Alternatively, a DBA can set the `log_bin_trust_function_creators` system variable to 1, which enables anyone with the standard `CREATE ROUTINE` privilege to create stored functions.

**A.4.26** What limitations exist for replicating stored procedure and function actions?

Nondeterministic (random) or time-based actions embedded in stored procedures may not replicate properly. By their very nature, randomly produced results are not predictable and cannot be exactly reproduced; therefore, random actions replicated to a replica do not mirror those performed on a source. Declaring stored functions to be `DETERMINISTIC` or setting the `log_bin_trust_function_creators` system variable to 0 keeps random operations producing random values from being invoked.

In addition, time-based actions cannot be reproduced on a replica because the timing of such actions in a stored procedure is not reproducible through the binary log used for replication. It records only DML events and does not factor in timing constraints.

Finally, nontransactional tables for which errors occur during large DML actions (such as bulk inserts) may experience replication issues in that a source may be partially updated from DML activity, but no updates are done to the replica because of the errors that occurred. A workaround is for a function's DML actions to be carried out with the `IGNORE` keyword so that updates on the source that cause errors are ignored and updates that do not cause errors are replicated to the replica.

**A.4.27** Do the preceding limitations affect the ability of MySQL to do point-in-time recovery?

The same limitations that affect replication do affect point-in-time recovery.

**A.4.28** What is being done to correct the aforementioned limitations?

You can choose either statement-based replication or row-based replication. The original replication implementation is based on statement-based binary logging. Row-based binary logging resolves the limitations mentioned earlier.

*Mixed* replication is also available (by starting the server with `--binlog-format=mixed`). This hybrid form of replication “knows” whether statement-level replication can safely be used, or row-level replication is required.

For additional information, see [Section 17.2.1, “Replication Formats”](#).

## A.5 MySQL 8.0 FAQ: Triggers

|                                                                                                |      |
|------------------------------------------------------------------------------------------------|------|
| A.5.1 Where can I find the documentation for MySQL 8.0 triggers? .....                         | 4986 |
| A.5.2 Is there a discussion forum for MySQL Triggers? .....                                    | 4986 |
| A.5.3 Does MySQL 8.0 have statement-level or row-level triggers? .....                         | 4986 |
| A.5.4 Are there any default triggers? .....                                                    | 4987 |
| A.5.5 How are triggers managed in MySQL? .....                                                 | 4987 |
| A.5.6 Is there a way to view all triggers in a given database? .....                           | 4987 |
| A.5.7 Where are triggers stored? .....                                                         | 4987 |
| A.5.8 Can a trigger call a stored procedure? .....                                             | 4987 |
| A.5.9 Can triggers access tables? .....                                                        | 4987 |
| A.5.10 Can a table have multiple triggers with the same trigger event and action time? .....   | 4987 |
| A.5.11 Is it possible for a trigger to update tables on a remote server? .....                 | 4987 |
| A.5.12 Do triggers work with replication? .....                                                | 4987 |
| A.5.13 How are actions carried out through triggers on a source replicated to a replica? ..... | 4988 |

**A.5.1.** Where can I find the documentation for MySQL 8.0 triggers?

See [Section 25.3, “Using Triggers”](#).

**A.5.2.** Is there a discussion forum for MySQL Triggers?

Yes. It is available at <https://forums.mysql.com/list.php?99>.

**A.5.3.** Does MySQL 8.0 have statement-level or row-level triggers?

In MySQL 8.0, all triggers are `FOR EACH ROW`; that is, the trigger is activated for each row that is inserted, updated, or deleted. MySQL 8.0 does not support triggers using `FOR EACH STATEMENT`.

**A.5.4.** Are there any default triggers?

Not explicitly. MySQL does have specific special behavior for some `TIMESTAMP` columns, as well as for columns which are defined using `AUTO_INCREMENT`.

**A.5.5.** How are triggers managed in MySQL?

In MySQL 8.0, triggers can be created using the `CREATE TRIGGER` statement, and dropped using `DROP TRIGGER`. See [Section 13.1.22, “CREATE TRIGGER Statement”](#), and [Section 13.1.34, “DROP TRIGGER Statement”](#), for more about these statements.

Information about triggers can be obtained by querying the `INFORMATION_SCHEMA.TRIGGERS` table. See [Section 26.3.45, “The INFORMATION\\_SCHEMA TRIGGERS Table”](#).

**A.5.6.** Is there a way to view all triggers in a given database?

Yes. You can obtain a listing of all triggers defined on database `dbname` using a query on the `INFORMATION_SCHEMA.TRIGGERS` table such as the one shown here:

```
SELECT TRIGGER_NAME, EVENT_MANIPULATION, EVENT_OBJECT_TABLE, ACTION_STATEMENT
FROM INFORMATION_SCHEMA.TRIGGERS
WHERE TRIGGER_SCHEMA= 'dbname' ;
```

For more information about this table, see [Section 26.3.45, “The INFORMATION\\_SCHEMA TRIGGERS Table”](#).

You can also use the `SHOW TRIGGERS` statement, which is specific to MySQL. See [Section 13.7.7.40, “SHOW TRIGGERS Statement”](#).

**A.5.7.** Where are triggers stored?

Triggers are stored in the `mysql.triggers` system table, which is part of the data dictionary.

**A.5.8.** Can a trigger call a stored procedure?

Yes.

**A.5.9.** Can triggers access tables?

A trigger can access both old and new data in its own table. A trigger can also affect other tables, but it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.

**A.5.10** Can a table have multiple triggers with the same trigger event and action time?

In MySQL 8.0, it is possible to define multiple triggers for a given table that have the same trigger event and action time. For example, you can have two `BEFORE UPDATE` triggers for a table. By default, triggers that have the same trigger event and action time activate in the order they were created. To affect trigger order, specify a clause after `FOR EACH ROW` that indicates `FOLLOWS` or `PRECEDES` and the name of an existing trigger that also has the same trigger event and action time. With `FOLLOWS`, the new trigger activates after the existing trigger. With `PRECEDES`, the new trigger activates before the existing trigger.

**A.5.11** Is it possible for a trigger to update tables on a remote server?

Yes. A table on a remote server could be updated using the `FEDERATED` storage engine. (See [Section 16.8, “The FEDERATED Storage Engine”](#)).

**A.5.12** Do triggers work with replication?

Yes. However, the way in which they work depends whether you are using MySQL's "classic" statement-based or row-based replication format.

When using statement-based replication, triggers on the replica are executed by statements that are executed on the source (and replicated to the replica).

When using row-based replication, triggers are not executed on the replica due to statements that were run on the source and then replicated to the replica. Instead, when using row-based replication, the changes caused by executing the trigger on the source are applied on the replica.

For more information, see [Section 17.5.1.36, "Replication and Triggers"](#).

#### **A.5.13**How are actions carried out through triggers on a source replicated to a replica?

Again, this depends on whether you are using statement-based or row-based replication.

**Statement-based replication.** First, the triggers that exist on a source must be re-created on the replica server. Once this is done, the replication flow works as any other standard DML statement that participates in replication. For example, consider a table `EMP` that has an `AFTER` insert trigger, which exists on a replication source server. The same `EMP` table and `AFTER` insert trigger exist on the replica server as well. The replication flow would be:

1. An `INSERT` statement is made to `EMP`.
2. The `AFTER` trigger on `EMP` activates.
3. The `INSERT` statement is written to the binary log.
4. The replica picks up the `INSERT` statement to `EMP` and executes it.
5. The `AFTER` trigger on `EMP` that exists on the replica activates.

**Row-based replication.** When you use row-based replication, the changes caused by executing the trigger on the source are applied on the replica. However, the triggers themselves are not actually executed on the replica under row-based replication. This is because, if both the source and the replica applied the changes from the source and, in addition, the trigger causing these changes were applied on the replica, the changes would in effect be applied twice on the replica, leading to different data on the source and the replica.

In most cases, the outcome is the same for both row-based and statement-based replication. However, if you use different triggers on the source and replica, you cannot use row-based replication. (This is because the row-based format replicates the changes made by triggers executing on the source to the replicas, rather than the statements that caused the triggers to execute, and the corresponding triggers on the replica are not executed.) Instead, any statements causing such triggers to be executed must be replicated using statement-based replication.

For more information, see [Section 17.5.1.36, "Replication and Triggers"](#).

## **A.6 MySQL 8.0 FAQ: Views**

|                                                                                  |      |
|----------------------------------------------------------------------------------|------|
| A.6.1 Where can I find documentation covering MySQL Views? .....                 | 4988 |
| A.6.2 Is there a discussion forum for MySQL Views? .....                         | 4989 |
| A.6.3 What happens to a view if an underlying table is dropped or renamed? ..... | 4989 |
| A.6.4 Does MySQL 8.0 have table snapshots? .....                                 | 4989 |
| A.6.5 Does MySQL 8.0 have materialized views? .....                              | 4989 |
| A.6.6 Can you insert into views that are based on joins? .....                   | 4989 |

### **A.6.1.** Where can I find documentation covering MySQL Views?

See [Section 25.5, "Using Views"](#).

**A.6.2.** Is there a discussion forum for MySQL Views?

Yes. See <https://forums.mysql.com/list.php?100>

**A.6.3.** What happens to a view if an underlying table is dropped or renamed?

After a view has been created, it is possible to drop or alter a table or view to which the definition refers. To check a view definition for problems of this kind, use the [CHECK TABLE](#) statement. (See [Section 13.7.3.2, "CHECK TABLE Statement"](#).)

**A.6.4.** Does MySQL 8.0 have table snapshots?

No.

**A.6.5.** Does MySQL 8.0 have materialized views?

No.

**A.6.6.** Can you insert into views that are based on joins?

It is possible, provided that your [INSERT](#) statement has a column list that makes it clear there is only one table involved.

You *cannot* insert into multiple tables with a single insert on a view.

## A.7 MySQL 8.0 FAQ: INFORMATION\_SCHEMA

A.7.1 Where can I find documentation for the MySQL [INFORMATION\\_SCHEMA](#) database? ..... 4989

A.7.2 Is there a discussion forum for [INFORMATION\\_SCHEMA](#)? ..... 4989

A.7.3 Where can I find the ANSI SQL 2003 specification for [INFORMATION\\_SCHEMA](#)? ..... 4989

A.7.4 What is the difference between the Oracle Data Dictionary and MySQL [INFORMATION\\_SCHEMA](#)? ..... 4989

A.7.5 Can I add to or otherwise modify the tables found in the [INFORMATION\\_SCHEMA](#) database? 4989

**A.7.1.** Where can I find documentation for the MySQL [INFORMATION\\_SCHEMA](#) database?

See [Chapter 26, INFORMATION\\_SCHEMA Tables](#)

**A.7.2.** Is there a discussion forum for [INFORMATION\\_SCHEMA](#)?

See <https://forums.mysql.com/list.php?101>.

**A.7.3.** Where can I find the ANSI SQL 2003 specification for [INFORMATION\\_SCHEMA](#)?

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available, such as *SQL-99 Complete, Really* by Peter Gultzan and Trudy Pelzer, that provide a comprehensive overview of the standard, including [INFORMATION\\_SCHEMA](#).

**A.7.4.** What is the difference between the Oracle Data Dictionary and MySQL [INFORMATION\\_SCHEMA](#)?

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names. The MySQL implementation is more similar to those found in DB2 and SQL Server, which also support [INFORMATION\\_SCHEMA](#) as defined in the SQL standard.

**A.7.5.** Can I add to or otherwise modify the tables found in the [INFORMATION\\_SCHEMA](#) database?

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, *we cannot support bugs or other issues which result from modifying [INFORMATION\\_SCHEMA](#) tables or data.*

## A.8 MySQL 8.0 FAQ: Migration

|                                                                                                      |      |
|------------------------------------------------------------------------------------------------------|------|
| A.8.1 Where can I find information on how to migrate from MySQL 5.7 to MySQL 8.0? .....              | 4990 |
| A.8.2 How has storage engine (table type) support changed in MySQL 8.0 from previous versions? ..... | 4990 |

### A.8.1. Where can I find information on how to migrate from MySQL 5.7 to MySQL 8.0?

For detailed upgrade information, see [Section 2.11, “Upgrading MySQL”](#). Do not skip a major version when upgrading, but rather complete the process in steps, upgrading from one major version to the next in each step. This may seem more complicated, but ultimately saves time and trouble. If you encounter problems during the upgrade, their origin is easier to identify, either by you or, if you have a MySQL Enterprise subscription, by MySQL support.

### A.8.2. How has storage engine (table type) support changed in MySQL 8.0 from previous versions?

Storage engine support has changed as follows:

- Support for [ISAM](#) tables was removed in MySQL 5.0 and you should now use the [MyISAM](#) storage engine in place of [ISAM](#). To convert a table [tblname](#) from [ISAM](#) to [MyISAM](#), simply issue a statement such as this one:

```
ALTER TABLE tblname ENGINE=MYISAM;
```

- Internal [RAID](#) for [MyISAM](#) tables was also removed in MySQL 5.0. This was formerly used to allow large tables in file systems that did not support file sizes greater than 2GB. All modern file systems allow for larger tables; in addition, there are now other solutions such as [MERGE](#) tables and views.
- The [VARCHAR](#) column type now retains trailing spaces in all storage engines.
- [MEMORY](#) tables (formerly known as [HEAP](#) tables) can also contain [VARCHAR](#) columns.

## A.9 MySQL 8.0 FAQ: Security

|                                                                                                           |      |
|-----------------------------------------------------------------------------------------------------------|------|
| A.9.1 Where can I find documentation that addresses security issues for MySQL? .....                      | 4990 |
| A.9.2 What is the default authentication plugin in MySQL 8.0? .....                                       | 4991 |
| A.9.3 Does MySQL 8.0 have native support for SSL? .....                                                   | 4991 |
| A.9.4 Is SSL support built into MySQL binaries, or must I recompile the binary myself to enable it? ..... | 4991 |
| A.9.5 Does MySQL 8.0 have built-in authentication against LDAP directories? .....                         | 4991 |
| A.9.6 Does MySQL 8.0 include support for Roles Based Access Control (RBAC)? .....                         | 4991 |

### A.9.1. Where can I find documentation that addresses security issues for MySQL?

The best place to start is [Chapter 6, Security](#).

Other portions of the MySQL Documentation which you may find useful with regard to specific security concerns include the following:

- [Section 6.1.1, “Security Guidelines”](#).
- [Section 6.1.3, “Making MySQL Secure Against Attackers”](#).
- [Section B.3.3.2, “How to Reset the Root Password”](#).
- [Section 6.1.5, “How to Run MySQL as a Normal User”](#).
- [Section 6.1.4, “Security-Related mysqld Options and Variables”](#).
- [Section 6.1.6, “Security Considerations for LOAD DATA LOCAL”](#).

- [Section 2.10, “Postinstallation Setup and Testing”](#).
- [Section 6.3, “Using Encrypted Connections”](#).
- [Loadable Function Security Precautions](#).

There is also the [Secure Deployment Guide](#), which provides procedures for deploying a generic binary distribution of MySQL Enterprise Edition Server with features for managing the security of your MySQL installation.

**A.9.2.** What is the default authentication plugin in MySQL 8.0?

The default authentication plugin in MySQL 8.0 is `caching_sha2_password`. For information about this plugin, see [Section 6.4.1.2, “Caching SHA-2 Pluggable Authentication”](#).

The `caching_sha2_password` plugin provides more secure password encryption than the `mysql_native_password` plugin (the default plugin in previous MySQL series). For information about the implications of this change of default plugin for server operation and compatibility of the server with clients and connectors, see [caching\\_sha2\\_password as the Preferred Authentication Plugin](#).

For general information about pluggable authentication and other available authentication plugins, see [Section 6.2.17, “Pluggable Authentication”](#), and [Section 6.4.1, “Authentication Plugins”](#).

**A.9.3.** Does MySQL 8.0 have native support for SSL?

Most 8.0 binaries have support for SSL connections between the client and server. See [Section 6.3, “Using Encrypted Connections”](#).

You can also tunnel a connection using SSH, if (for example) the client application does not support SSL connections. For an example, see [Section 6.3.4, “Connecting to MySQL Remotely from Windows with SSH”](#).

**A.9.4.** Is SSL support built into MySQL binaries, or must I recompile the binary myself to enable it?

Most 8.0 binaries have SSL enabled for client/server connections that are secured, authenticated, or both. See [Section 6.3, “Using Encrypted Connections”](#).

**A.9.5.** Does MySQL 8.0 have built-in authentication against LDAP directories?

The Enterprise edition includes a [PAM Authentication Plugin](#) that supports authentication against an LDAP directory.

**A.9.6.** Does MySQL 8.0 include support for Roles Based Access Control (RBAC)?

Not at this time.

## A.10 MySQL 8.0 FAQ: NDB Cluster

In the following section, we answer questions that are frequently asked about MySQL NDB Cluster and the [NDB](#) storage engine.

|                                                                                                              |      |
|--------------------------------------------------------------------------------------------------------------|------|
| A.10.1 Which versions of the MySQL software support NDB Cluster? Do I have to compile from source? .....     | 4992 |
| A.10.2 What do “NDB” and “NDBCLUSTER” mean? .....                                                            | 4993 |
| A.10.3 What is the difference between using NDB Cluster versus using MySQL Replication? .....                | 4993 |
| A.10.4 Do I need any special networking to run NDB Cluster? How do computers in a cluster communicate? ..... | 4994 |

|                                                                                                                                                        |      |
|--------------------------------------------------------------------------------------------------------------------------------------------------------|------|
| A.10.5 How many computers do I need to run an NDB Cluster, and why? .....                                                                              | 4994 |
| A.10.6 What do the different computers do in an NDB Cluster? .....                                                                                     | 4994 |
| A.10.7 When I run the <code>SHOW</code> command in the NDB Cluster management client, I see a line of<br>output that looks like this: .....            | 4995 |
| A.10.8 With which operating systems can I use NDB Cluster? .....                                                                                       | 4995 |
| A.10.9 What are the hardware requirements for running NDB Cluster? .....                                                                               | 4995 |
| A.10.10 How much RAM do I need to use NDB Cluster? Is it possible to use disk memory at all? ..                                                        | 4996 |
| A.10.11 What file systems can I use with NDB Cluster? What about network file systems or<br>network shares? .....                                      | 4996 |
| A.10.12 Can I run NDB Cluster nodes inside virtual machines (such as those created by VMWare,<br>VirtualBox, Parallels, or Xen)? .....                 | 4997 |
| A.10.13 I am trying to populate an NDB Cluster database. The loading process terminates<br>prematurely and I get an error message like this one: ..... | 4997 |
| A.10.14 NDB Cluster uses TCP/IP. Does this mean that I can run it over the Internet, with one or<br>more nodes in remote locations? .....              | 4997 |
| A.10.15 Do I have to learn a new programming or query language to use NDB Cluster? .....                                                               | 4998 |
| A.10.16 What programming languages and APIs are supported by NDB Cluster? .....                                                                        | 4998 |
| A.10.17 Does NDB Cluster include any management tools? .....                                                                                           | 4998 |
| A.10.18 How do I find out what an error or warning message means when using NDB Cluster? ...                                                           | 4999 |
| A.10.19 Is NDB Cluster transaction-safe? What isolation levels are supported? .....                                                                    | 4999 |
| A.10.20 What storage engines are supported by NDB Cluster? .....                                                                                       | 4999 |
| A.10.21 In the event of a catastrophic failure—for example, the whole city loses power <i>and</i> my<br>UPS fails—would I lose all my data? .....      | 4999 |
| A.10.22 Is it possible to use <code>FULLTEXT</code> indexes with NDB Cluster? .....                                                                    | 4999 |
| A.10.23 Can I run multiple nodes on a single computer? .....                                                                                           | 4999 |
| A.10.24 Can I add data nodes to an NDB Cluster without restarting it? .....                                                                            | 5000 |
| A.10.25 Are there any limitations that I should be aware of when using NDB Cluster? .....                                                              | 5000 |
| A.10.26 Does NDB Cluster support foreign keys? .....                                                                                                   | 5000 |
| A.10.27 How do I import an existing MySQL database into an NDB Cluster? .....                                                                          | 5001 |
| A.10.28 How do NDB Cluster nodes communicate with one another? .....                                                                                   | 5001 |
| A.10.29 What is an <i>arbitrator</i> ? .....                                                                                                           | 5001 |
| A.10.30 What data types are supported by NDB Cluster? .....                                                                                            | 5001 |
| A.10.31 How do I start and stop NDB Cluster? .....                                                                                                     | 5002 |
| A.10.32 What happens to NDB Cluster data when the NDB Cluster is shut down? .....                                                                      | 5003 |
| A.10.33 Is it a good idea to have more than one management node for an NDB Cluster? .....                                                              | 5003 |
| A.10.34 Can I mix different kinds of hardware and operating systems in one NDB Cluster? .....                                                          | 5003 |
| A.10.35 Can I run two data nodes on a single host? Two SQL nodes? .....                                                                                | 5003 |
| A.10.36 Can I use host names with NDB Cluster? .....                                                                                                   | 5003 |
| A.10.37 Does NDB Cluster support IPv6? .....                                                                                                           | 5003 |
| A.10.38 How do I handle MySQL users in an NDB Cluster having multiple MySQL servers? .....                                                             | 5003 |
| A.10.39 How do I continue to send queries in the event that one of the SQL nodes fails? .....                                                          | 5003 |
| A.10.40 How do I back up and restore an NDB Cluster? .....                                                                                             | 5004 |
| A.10.41 What is an “angel process”? .....                                                                                                              | 5004 |

**A.10.1** Which versions of the MySQL software support NDB Cluster? Do I have to compile from source?

NDB Cluster is not supported in standard MySQL Server 8.0 releases. Instead, MySQL NDB Cluster is provided as a separate product. Available NDB Cluster release series include the following:

- **NDB Cluster 7.2.** This series is no longer supported for new deployments or maintained. Users of NDB Cluster 7.2 should upgrade to a newer release series as soon as possible. We recommend that new deployments use the latest NDB Cluster 8.0 release.
- **NDB Cluster 7.3.** This series is a previous General Availability (GA) version of NDB Cluster, still available for production use, although we recommend that new deployments use the latest NDB Cluster 8.0 release. The most recent NDB Cluster 7.3 release can be obtained from <https://dev.mysql.com/downloads/cluster/>.

- **NDB Cluster 7.4.** This series is a previous General Availability (GA) version of NDB Cluster, still available for production use, although we recommend that new deployments use the latest NDB Cluster 8.0 release. The most recent NDB Cluster 7.4 release can be obtained from <https://dev.mysql.com/downloads/cluster/>.
- **NDB Cluster 7.5.** This series is a previous General Availability (GA) version of NDB Cluster, still available for production use, although we recommend that new deployments use the latest NDB Cluster 7.6 release. The latest NDB Cluster 7.5 releases can be obtained from <https://dev.mysql.com/downloads/cluster/>.
- **NDB Cluster 7.6.** This series is a previous General Availability (GA) version of NDB Cluster, still available for production use, although we recommend that new deployments use the latest NDB Cluster 8.0 release. The latest NDB Cluster 7.6 releases can be obtained from <https://dev.mysql.com/downloads/cluster/>.
- **NDB Cluster 8.0.** This series is the most recent General Availability (GA) version of NDB Cluster, based on version 8.0 of the [NDB](#) storage engine and MySQL Server 8.0. NDB Cluster 8.0 is available for production use; new deployments intended for production should use the latest GA release in this series, which is currently NDB Cluster 8.0.26. You can obtain the most recent NDB Cluster 8.0 release from <https://dev.mysql.com/downloads/cluster/>. For information about new features and other important changes in this series, see [Section 23.1.4, “What is New in NDB Cluster”](#).

You can obtain and compile NDB Cluster from source (see [Section 23.2.1.4, “Building NDB Cluster from Source on Linux”](#), and [Section 23.2.2.2, “Compiling and Installing NDB Cluster from Source on Windows”](#)), but for all but the most specialized cases, we recommend using one of the following installers provided by Oracle that is appropriate to your operating platform and circumstances:

- The web-based [NDB Cluster Auto-Installer](#) (works on all platforms supported by [NDB](#))
- Linux [binary release](#) ([tar.gz](#) file)
- Linux [RPM package](#)
- Linux [.deb file](#)
- Windows [binary “no-install” release](#)
- Windows [MSI Installer](#)

Installation packages may also be available from your platform's package management system.

You can determine whether your MySQL Server has [NDB](#) support using one of the statements `SHOW VARIABLES LIKE 'have_%'`, `SHOW ENGINES`, or `SHOW PLUGINS`.

#### **A.10.2**What do “NDB” and “NDBCLUSTER” mean?

“NDB” stands for “**N**etwork **D**atabase”. [NDB](#) and [NDBCLUSTER](#) are both names for the storage engine that enables clustering support with MySQL. [NDB](#) is preferred, but either name is correct.

#### **A.10.3**What is the difference between using NDB Cluster versus using MySQL Replication?

In traditional MySQL replication, a source MySQL server updates one or more replicas. Transactions are committed sequentially, and a slow transaction can cause the replica to lag behind the source. This means that if the source fails, it is possible that the replica might not have recorded the last few transactions. If a transaction-safe engine such as [InnoDB](#) is being used, a transaction is either completed on the replica or not applied at all, but replication does not guarantee that all data on the source and the replica remains consistent at all times. In NDB Cluster, all data nodes are kept in synchrony, and a transaction committed by any one data

node is committed for all data nodes. In the event of a data node failure, all remaining data nodes remain in a consistent state.

In short, whereas standard MySQL replication is *asynchronous*, NDB Cluster is *synchronous*.

Asynchronous replication is also available in NDB Cluster. *NDB Cluster Replication* (also sometimes known as “geo-replication”) includes the capability to replicate both between two NDB Clusters, and from an NDB Cluster to a non-Cluster MySQL server. See [Section 23.6, “NDB Cluster Replication”](#).

**A.10.4** Do I need any special networking to run NDB Cluster? How do computers in a cluster communicate?

NDB Cluster is intended to be used in a high-bandwidth environment, with computers connecting using TCP/IP. Its performance depends directly upon the connection speed between the cluster's computers. The minimum connectivity requirements for NDB Cluster include a typical 100-megabit Ethernet network or the equivalent. We recommend you use gigabit Ethernet whenever available.

**A.10.5** How many computers do I need to run an NDB Cluster, and why?

A minimum of three computers is required to run a viable cluster. However, the minimum *recommended* number of computers in an NDB Cluster is four: one each to run the management and SQL nodes, and two computers to serve as data nodes. The purpose of the two data nodes is to provide redundancy; the management node must run on a separate machine to guarantee continued arbitration services in the event that one of the data nodes fails.

To provide increased throughput and high availability, you should use multiple SQL nodes (MySQL Servers connected to the cluster). It is also possible (although not strictly necessary) to run multiple management servers.

**A.10.6** What do the different computers do in an NDB Cluster?

An NDB Cluster has both a physical and logical organization, with computers being the physical elements. The logical or functional elements of a cluster are referred to as *nodes*, and a computer housing a cluster node is sometimes referred to as a *cluster host*. There are three types of nodes, each corresponding to a specific role within the cluster. These are:

- **Management node.** This node provides management services for the cluster as a whole, including startup, shutdown, backups, and configuration data for the other nodes. The management node server is implemented as the application `ndb_mgmd`; the management client used to control NDB Cluster is `ndb_mgm`. See [Section 23.4.4, “ndb\\_mgmd — The NDB Cluster Management Server Daemon”](#), and [Section 23.4.5, “ndb\\_mgm — The NDB Cluster Management Client”](#), for information about these programs.
- **Data node.** This type of node stores and replicates data. Data node functionality is handled by instances of the *NDB* data node process `ndbd`. For more information, see [Section 23.4.1, “ndbd — The NDB Cluster Data Node Daemon”](#).
- **SQL node.** This is simply an instance of MySQL Server (`mysqld`) that is built with support for the *NDBCLUSTER* storage engine and started with the `--ndb-cluster` option to enable the engine and the `--ndb-connectstring` option to enable it to connect to an NDB Cluster management server. For more about these options, see [MySQL Server Options for NDB Cluster](#).

**Note**

An *API node* is any application that makes direct use of Cluster data nodes for data storage and retrieval. An SQL node can thus be considered a type of API node that uses a MySQL Server to provide an SQL interface to the Cluster. You can write such applications (that

do not depend on a MySQL Server) using the NDB API, which supplies a direct, object-oriented transaction and scanning interface to NDB Cluster data; see [NDB Cluster API Overview: The NDB API](#), for more information.

**A.10.7** When I run the `SHOW` command in the NDB Cluster management client, I see a line of output that looks like this:

```
id=2 @10.100.10.32 (Version: 8.0.26-ndb-8.0.26 Nodegroup: 0, *)
```

What does the `*` mean? How is this node different from the others?

The simplest answer is, “It’s not something you can control, and it’s nothing that you need to worry about in any case, unless you’re a software engineer writing or analyzing the NDB Cluster source code”.

If you don’t find that answer satisfactory, here’s a longer and more technical version:

A number of mechanisms in NDB Cluster require distributed coordination among the data nodes. These distributed algorithms and protocols include global checkpointing, DDL (schema) changes, and node restart handling. To make this coordination simpler, the data nodes “elect” one of their number to act as leader. There is no user-facing mechanism for influencing this selection, which is completely automatic; the fact that it *is* automatic is a key part of NDB Cluster’s internal architecture.

When a node acts as the “leader” for any of these mechanisms, it is usually the point of coordination for the activity, and the other nodes act as “followers”, carrying out their parts of the activity as directed by the leader. If the node acting as leader fails, then the remaining nodes elect a new leader. Tasks in progress that were being coordinated by the old leader may either fail or be continued by the new leader, depending on the actual mechanism involved.

It is possible for some of these different mechanisms and protocols to have different leader nodes, but in general the same leader is chosen for all of them. The node indicated as the leader in the output of `SHOW` in the management client is known internally as the `DICT` manager, responsible for coordinating DDL and metadata activity.

NDB Cluster is designed in such a way that the choice of leader has no discernible effect outside the cluster itself. For example, the current leader does not have significantly higher CPU or resource usage than the other data nodes, and failure of the leader should not have a significantly different impact on the cluster than the failure of any other data node.

**A.10.8** With which operating systems can I use NDB Cluster?

NDB Cluster is supported on most Unix-like operating systems. NDB Cluster is also supported in production settings on Microsoft Windows operating systems.

For more detailed information concerning the level of support which is offered for NDB Cluster on various operating system versions, operating system distributions, and hardware platforms, please refer to <https://www.mysql.com/support/supportedplatforms/cluster.html>.

**A.10.9** What are the hardware requirements for running NDB Cluster?

NDB Cluster should run on any platform for which `NDB`-enabled binaries are available. For data nodes and API nodes, faster CPUs and more memory are likely to improve performance, and 64-bit CPUs are likely to be more effective than 32-bit processors. There must be sufficient memory on machines used for data nodes to hold each node’s share of the database (see *How much RAM do I Need?* for more information). For a computer which is used only for running the NDB Cluster management server, the requirements are minimal; a common desktop PC (or the equivalent) is generally sufficient for this task. Nodes can communicate through the standard TCP/IP network and hardware. They can also use the high-speed SCI protocol; however,

special networking hardware and software are required to use SCI (see [Section 23.3.4, “Using High-Speed Interconnects with NDB Cluster”](#)).

**A.10.10** How much RAM do I need to use NDB Cluster? Is it possible to use disk memory at all?

NDB Cluster was originally implemented as in-memory only, but all versions currently available also provide the ability to store NDB Cluster on disk. See [Section 23.5.10, “NDB Cluster Disk Data Tables”](#), for more information.

For in-memory NDB tables, you can use the following formula for obtaining a rough estimate of how much RAM is needed for each data node in the cluster:

```
(SizeofDatabase × NumberOfReplicas × 1.1) / NumberOfDataNodes
```

To calculate the memory requirements more exactly requires determining, for each table in the cluster database, the storage space required per row (see [Section 11.7, “Data Type Storage Requirements”](#), for details), and multiplying this by the number of rows. You must also remember to account for any column indexes as follows:

- Each primary key or hash index created for an NDBCLUSTER table requires 21–25 bytes per record. These indexes use `IndexMemory`.
- Each ordered index requires 10 bytes storage per record, using `DataMemory`.
- Creating a primary key or unique index also creates an ordered index, unless this index is created with `USING HASH`. In other words:
  - A primary key or unique index on a Cluster table normally takes up 31 to 35 bytes per record.
  - However, if the primary key or unique index is created with `USING HASH`, then it requires only 21 to 25 bytes per record.

Creating NDB Cluster tables with `USING HASH` for all primary keys and unique indexes generally causes table updates to run more quickly—in some cases by as much as 20 to 30 percent faster than updates on tables where `USING HASH` was not used in creating primary and unique keys. This is due to the fact that less memory is required (because no ordered indexes are created), and that less CPU must be utilized (because fewer indexes must be read and possibly updated). However, it also means that queries that could otherwise use range scans must be satisfied by other means, which can result in slower selects.

When calculating Cluster memory requirements, you may find useful the `ndb_size.pl` utility which is available in recent MySQL 8.0 releases. This Perl script connects to a current (non-Cluster) MySQL database and creates a report on how much space that database would require if it used the NDBCLUSTER storage engine. For more information, see [Section 23.4.28, “ndb\\_size.pl — NDBCLUSTER Size Requirement Estimator”](#).

It is especially important to keep in mind that *every NDB Cluster table must have a primary key*. The NDB storage engine creates a primary key automatically if none is defined; this primary key is created without `USING HASH`.

You can determine how much memory is being used for storage of NDB Cluster data and indexes at any given time using the `REPORT MEMORYUSAGE` command in the `ndb_mgm` client; see [Section 23.5.1, “Commands in the NDB Cluster Management Client”](#), for more information. In addition, warnings are written to the cluster log when 80% of available `DataMemory` or (prior to NDB 7.6) `IndexMemory` is in use, and again when usage reaches 90%, 99%, and 100%.

**A.10.11** What file systems can I use with NDB Cluster? What about network file systems or network shares?

Generally, any file system that is native to the host operating system should work well with NDB Cluster. If you find that a given file system works particularly well (or not so especially well) with NDB Cluster, we invite you to discuss your findings in the [NDB Cluster Forums](#).

For Windows, we recommend that you use [NTFS](#) file systems for NDB Cluster, just as we do for standard MySQL. We do not test NDB Cluster with [FAT](#) or [VFAT](#) file systems. Because of this, we do not recommend their use with MySQL or NDB Cluster.

NDB Cluster is implemented as a shared-nothing solution; the idea behind this is that the failure of a single piece of hardware should not cause the failure of multiple cluster nodes, or possibly even the failure of the cluster as a whole. For this reason, the use of network shares or network file systems is not supported for NDB Cluster. This also applies to shared storage devices such as SANs.

**A.10.12** Can I run NDB Cluster nodes inside virtual machines (such as those created by VMWare, VirtualBox, Parallels, or Xen)?

NDB Cluster is supported for use in virtual machines. We currently support and test using [Oracle VM](#).

Some NDB Cluster users have successfully deployed NDB Cluster using other virtualization products; in such cases, Oracle can provide NDB Cluster support, but issues specific to the virtual environment must be referred to that product's vendor.

**A.10.13** I am trying to populate an NDB Cluster database. The loading process terminates prematurely and I get an error message like this one:

```
ERROR 1114: The table 'my_cluster_table' is full
```

Why is this happening?

The cause is very likely to be that your setup does not provide sufficient RAM for all table data and all indexes, *including the primary key required by the [NDB](#) storage engine and automatically created in the event that the table definition does not include the definition of a primary key.*

It is also worth noting that all data nodes should have the same amount of RAM, since no data node in a cluster can use more memory than the least amount available to any individual data node. For example, if there are four computers hosting Cluster data nodes, and three of these have 3GB of RAM available to store Cluster data while the remaining data node has only 1GB RAM, then each data node can devote at most 1GB to NDB Cluster data and indexes.

In some cases it is possible to get [Table is full](#) errors in MySQL client applications even when `ndb_mgm -e "ALL REPORT MEMORYUSAGE"` shows significant free [DataMemory](#). You can force [NDB](#) to create extra partitions for NDB Cluster tables and thus have more memory available for hash indexes by using the [MAX\\_ROWS](#) option for [CREATE TABLE](#). In general, setting [MAX\\_ROWS](#) to twice the number of rows that you expect to store in the table should be sufficient.

For similar reasons, you can also sometimes encounter problems with data node restarts on nodes that are heavily loaded with data. The [MinFreePct](#) parameter can help with this issue by reserving a portion (5% by default) of [DataMemory](#) and (prior to NDB 7.6) [IndexMemory](#) for use in restarts. This reserved memory is not available for storing [NDB](#) tables or data.

**A.10.14** NDB Cluster uses TCP/IP. Does this mean that I can run it over the Internet, with one or more nodes in remote locations?

It is *very unlikely* that a cluster would perform reliably under such conditions, as NDB Cluster was designed and implemented with the assumption that it would be run under conditions guaranteeing dedicated high-speed connectivity such as that found in a LAN setting using 100 Mbps or gigabit Ethernet—preferably the latter. We neither test nor warrant its performance using anything slower than this.

Also, it is extremely important to keep in mind that communications between the nodes in an NDB Cluster are not secure; they are neither encrypted nor safeguarded by any other protective mechanism. The most secure configuration for a cluster is in a private network behind a firewall, with no direct access to any Cluster data or management nodes from outside. (For SQL nodes, you should take the same precautions as you would with any other instance of the MySQL server.) For more information, see [Section 23.5.17, “NDB Cluster Security Issues”](#).

**A.10.15** Do I have to learn a new programming or query language to use NDB Cluster?

No. Although some specialized commands are used to manage and configure the cluster itself, only standard (My)SQL statements are required for the following operations:

- Creating, altering, and dropping tables
- Inserting, updating, and deleting table data
- Creating, changing, and dropping primary and unique indexes

Some specialized configuration parameters and files are required to set up an NDB Cluster—see [Section 23.3.3, “NDB Cluster Configuration Files”](#), for information about these.

A few simple commands are used in the NDB Cluster management client (`ndb_mgm`) for tasks such as starting and stopping cluster nodes. See [Section 23.5.1, “Commands in the NDB Cluster Management Client”](#).

**A.10.16** What programming languages and APIs are supported by NDB Cluster?

NDB Cluster supports the same programming APIs and languages as the standard MySQL Server, including ODBC, .Net, the MySQL C API, and numerous drivers for popular scripting languages such as PHP, Perl, and Python. NDB Cluster applications written using these APIs behave similarly to other MySQL applications; they transmit SQL statements to a MySQL Server (in the case of NDB Cluster, an SQL node), and receive responses containing rows of data. For more information about these APIs, see [Chapter 29, Connectors and APIs](#).

NDB Cluster also supports application programming using the NDB API, which provides a low-level C++ interface to NDB Cluster data without needing to go through a MySQL Server. See [The NDB API](#). In addition, many `NDBCLUSTER` management functions are exposed by the C-language MGM API; see [The MGM API](#), for more information.

NDB Cluster also supports Java application programming using ClusterJ, which supports a domain object model of data using sessions and transactions. See [Java and NDB Cluster](#), for more information.

In addition, NDB Cluster provides support for `memcached`, allowing developers to access data stored in NDB Cluster using the `memcached` interface; for more information, see [ndbmemcache —Memcache API for NDB Cluster \(NO LONGER SUPPORTED\)](#).

NDB Cluster also includes adapters supporting NoSQL applications written against `Node.js`, with NDB Cluster as the data store. See [MySQL NoSQL Connector for JavaScript](#), for more information.

**A.10.17** Does NDB Cluster include any management tools?

NDB Cluster includes a command line client for performing basic management functions. See [Section 23.4.5, “ndb\\_mgm — The NDB Cluster Management Client”](#), and [Section 23.5.1, “Commands in the NDB Cluster Management Client”](#).

NDB Cluster 7.6 and earlier are also supported by MySQL Cluster Manager, a separate product providing an advanced command line interface that can automate many NDB Cluster management tasks such as rolling restarts and configuration changes. Beginning with version

1.4.8, MySQL Cluster Manager also provides experimental support for NDB Cluster 8.0. For more information about MySQL Cluster Manager, see [MySQL™ Cluster Manager 1.4.8 User Manual](#).

NDB Cluster also provides a graphical, browser-based Auto-Installer for setting up and deploying NDB Cluster, as part of the NDB Cluster software distribution. For more information, see [The NDB Cluster Auto-Installer \(NDB 7.5\) \(No longer supported\)](#).

**A.10.18** How do I find out what an error or warning message means when using NDB Cluster?

There are two ways in which this can be done:

- From within the `mysql` client, use `SHOW ERRORS` or `SHOW WARNINGS` immediately upon being notified of the error or warning condition.
- From a system shell prompt, use `pererror --ndb error_code`.

**A.10.19** Is NDB Cluster transaction-safe? What isolation levels are supported?

Yes. For tables created with the `NDB` storage engine, transactions are supported. Currently, NDB Cluster supports only the `READ COMMITTED` transaction isolation level.

**A.10.20** What storage engines are supported by NDB Cluster?

NDB Cluster requires the `NDB` storage engine. That is, in order for a table to be shared between nodes in an NDB Cluster, the table must be created using `ENGINE=NDB` (or the equivalent option `ENGINE=NDBCLUSTER`).

It is possible to create tables using other storage engines (such as `InnoDB` or `MyISAM`) on a MySQL server being used with NDB Cluster, but since these tables do not use `NDB`, they do not participate in clustering; each such table is strictly local to the individual MySQL server instance on which it is created.

NDB Cluster is quite different from `InnoDB` clustering with regard to architecture, requirements, and implementation; despite any similarity in their names, the two are not compatible. For more information about `InnoDB` clustering, see [Using MySQL AdminAPI](#). See also [Section 23.1.6, “MySQL Server Using InnoDB Compared with NDB Cluster”](#), for information about the differences between the `NDB` and `InnoDB` storage engines.

**A.10.21** In the event of a catastrophic failure—for example, the whole city loses power *and* my UPS fails—would I lose all my data?

All committed transactions are logged. Therefore, although it is possible that some data could be lost in the event of a catastrophe, this should be quite limited. Data loss can be further reduced by minimizing the number of operations per transaction. (It is not a good idea to perform large numbers of operations per transaction in any case.)

**A.10.22** Is it possible to use `FULLTEXT` indexes with NDB Cluster?

`FULLTEXT` indexing is currently supported only by the `InnoDB` and `MyISAM` storage engines. See [Section 12.10, “Full-Text Search Functions”](#), for more information.

**A.10.23** Can I run multiple nodes on a single computer?

It is possible but not always advisable. One of the chief reasons to run a cluster is to provide redundancy. To obtain the full benefits of this redundancy, each node should reside on a separate machine. If you place multiple nodes on a single machine and that machine fails, you lose all of those nodes. For this reason, if you do run multiple data nodes on a single machine, it is *extremely* important that they be set up in such a way that the failure of this machine does not cause the loss of all the data nodes in a given node group.

Given that NDB Cluster can be run on commodity hardware loaded with a low-cost (or even no-cost) operating system, the expense of an extra machine or two is well worth it to safeguard

mission-critical data. It also worth noting that the requirements for a cluster host running a management node are minimal. This task can be accomplished with a 300 MHz Pentium or equivalent CPU and sufficient RAM for the operating system, plus a small amount of overhead for the `ndb_mgmd` and `ndb_mgm` processes.

It is acceptable to run multiple cluster data nodes on a single host that has multiple CPUs, cores, or both. The NDB Cluster distribution also provides a multithreaded version of the data node binary intended for use on such systems. For more information, see [Section 23.4.3, “ndbmtid — The NDB Cluster Data Node Daemon \(Multi-Threaded\)”](#).

It is also possible in some cases to run data nodes and SQL nodes concurrently on the same machine; how well such an arrangement performs is dependent on a number of factors such as number of cores and CPUs as well as the amount of disk and memory available to the data node and SQL node processes, and you must take these factors into account when planning such a configuration.

**A.10.24** Can I add data nodes to an NDB Cluster without restarting it?

It is possible to add new data nodes to a running NDB Cluster without taking the cluster offline. For more information, see [Section 23.5.7, “Adding NDB Cluster Data Nodes Online”](#).

For other types of NDB Cluster nodes, a rolling restart is all that is required (see [Section 23.5.5, “Performing a Rolling Restart of an NDB Cluster”](#)).

**A.10.25** Are there any limitations that I should be aware of when using NDB Cluster?

Limitations on [NDB](#) tables in MySQL NDB Cluster include the following:

- Temporary tables are not supported; a `CREATE TEMPORARY TABLE` statement using `ENGINE=NDB` or `ENGINE=NDBCLUSTER` fails with an error.
- The only types of user-defined partitioning supported for `NDBCLUSTER` tables are `KEY` and `LINEAR KEY`. Trying to create an `NDB` table using any other partitioning type fails with an error.
- `FULLTEXT` indexes are not supported.
- Index prefixes are not supported. Only complete columns may be indexed.
- Spatial indexes are not supported (although spatial columns can be used). See [Section 11.4, “Spatial Data Types”](#).
- Support for partial transactions and partial rollbacks is comparable to that of other transactional storage engines such as `InnoDB` that can roll back individual statements.
- The maximum number of attributes allowed per table is 512. Attribute names cannot be any longer than 31 characters. For each table, the maximum combined length of the table and database names is 122 characters.
- Prior to NDB 8.0, the maximum size for a table row is 14 kilobytes, not counting `BLOB` values. In NDB 8.0, this maximum is increased to 30000 bytes. See [Section 23.1.7.5, “Limits Associated with Database Objects in NDB Cluster”](#), for more information.

There is no set limit for the number of rows per `NDB` table. Limits on table size depend on a number of factors, in particular on the amount of RAM available to each data node.

For a complete listing of limitations in NDB Cluster, see [Section 23.1.7, “Known Limitations of NDB Cluster”](#). See also [Section 23.1.7.11, “Previous NDB Cluster Issues Resolved in NDB Cluster 8.0”](#).

**A.10.26** Does NDB Cluster support foreign keys?

NDB Cluster provides support for foreign key constraints which is comparable to that found in the [InnoDB](#) storage engine; see [Section 1.7.3.2, “FOREIGN KEY Constraints”](#), for more detailed information, as well as [Section 13.1.20.5, “FOREIGN KEY Constraints”](#). Applications requiring foreign key support should use NDB Cluster 7.3, 7.4, 7.5, or later.

**A.10.27**How do I import an existing MySQL database into an NDB Cluster?

You can import databases into NDB Cluster much as you would with any other version of MySQL. Other than the limitations mentioned elsewhere in this FAQ, the only other special requirement is that any tables to be included in the cluster must use the [NDB](#) storage engine. This means that the tables must be created with [ENGINE=NDB](#) or [ENGINE=NDBCLUSTER](#).

It is also possible to convert existing tables that use other storage engines to [NDBCLUSTER](#) using one or more [ALTER TABLE](#) statement. However, the definition of the table must be compatible with the [NDBCLUSTER](#) storage engine prior to making the conversion. In MySQL 8.0, an additional workaround is also required; see [Section 23.1.7, “Known Limitations of NDB Cluster”](#), for details.

**A.10.28**How do NDB Cluster nodes communicate with one another?

Cluster nodes can communicate through any of three different transport mechanisms: TCP/IP, SHM (shared memory), and SCI (Scalable Coherent Interface). Where available, SHM is used by default between nodes residing on the same cluster host; however, this is considered experimental. SCI is a high-speed (1 gigabit per second and higher), high-availability protocol used in building scalable multi-processor systems; it requires special hardware and drivers. See [Section 23.3.4, “Using High-Speed Interconnects with NDB Cluster”](#), for more about using SCI as a transport mechanism for NDB Cluster.

**A.10.29**What is an *arbiter*?

If one or more data nodes in a cluster fail, it is possible that not all cluster data nodes are able to “see” one another. In fact, it is possible that two sets of data nodes might become isolated from one another in a network partitioning, also known as a “split-brain” scenario. This type of situation is undesirable because each set of data nodes tries to behave as though it is the entire cluster. An arbiter is required to decide between the competing sets of data nodes.

When all data nodes in at least one node group are alive, network partitioning is not an issue, because no single subset of the cluster can form a functional cluster on its own. The real problem arises when no single node group has all its nodes alive, in which case network partitioning (the “split-brain” scenario) becomes possible. Then an arbiter is required. All cluster nodes recognize the same node as the arbiter, which is normally the management server; however, it is possible to configure any of the MySQL Servers in the cluster to act as the arbiter instead. The arbiter accepts the first set of cluster nodes to contact it, and tells the remaining set to shut down. Arbiter selection is controlled by the [ArbitrationRank](#) configuration parameter for MySQL Server and management server nodes. You can also use the [ArbitrationRank](#) configuration parameter to control the arbiter selection process. For more information about these parameters, see [Section 23.3.3.5, “Defining an NDB Cluster Management Server”](#).

The role of arbiter does not in and of itself impose any heavy demands upon the host so designated, and thus the arbiter host does not need to be particularly fast or to have extra memory especially for this purpose.

**A.10.30**What data types are supported by NDB Cluster?

NDB Cluster supports all of the usual MySQL data types, including those associated with MySQL’s spatial extensions; however, the [NDB](#) storage engine does not support spatial indexes. (Spatial indexes are supported only by [MyISAM](#); see [Section 11.4, “Spatial Data Types”](#), for more information.) In addition, there are some differences with regard to indexes when used with [NDB](#) tables.

**Note**

NDB Cluster Disk Data tables (that is, tables created with `TABLESPACE ... STORAGE DISK ENGINE=NDB` or `TABLESPACE ... STORAGE DISK ENGINE=NDBCLUSTER`) have only fixed-width rows. This means that (for example) each Disk Data table record containing a `VARCHAR(255)` column requires space for 255 characters (as required for the character set and collation being used for the table), regardless of the actual number of characters stored therein.

See [Section 23.1.7, “Known Limitations of NDB Cluster”](#), for more information about these issues.

**A.10.3** How do I start and stop NDB Cluster?

It is necessary to start each node in the cluster separately, in the following order:

1. Start the management node, using the `ndb_mgmd` command.

You must include the `-f` or `--config-file` option to tell the management node where its configuration file can be found.

2. Start each data node with the `ndbd` command.

Each data node must be started with the `-c` or `--ndb-connectstring` option so that the data node knows how to connect to the management server.

3. Start each MySQL Server (SQL node) using your preferred startup script, such as `mysqld_safe`.

Each MySQL Server must be started with the `--ndbcluster` and `--ndb-connectstring` options. These options cause `mysqld` to enable `NDBCLUSTER` storage engine support and how to connect to the management server.

Each of these commands must be run from a system shell on the machine housing the affected node. (You do not have to be physically present at the machine—a remote login shell can be used for this purpose.) You can verify that the cluster is running by starting the `NDB` management client `ndb_mgm` on the machine housing the management node and issuing the `SHOW` or `ALL STATUS` command.

To shut down a running cluster, issue the command `SHUTDOWN` in the management client. Alternatively, you may enter the following command in a system shell:

```
shell> ndb_mgm -e "SHUTDOWN"
```

(The quotation marks in this example are optional, since there are no spaces in the command string following the `-e` option; in addition, the `SHUTDOWN` command, like other management client commands, is not case-sensitive.)

Either of these commands causes the `ndb_mgm`, `ndb_mgm`, and any `ndbd` processes to terminate gracefully. MySQL servers running as SQL nodes can be stopped using `mysqladmin shutdown`.

For more information, see [Section 23.5.1, “Commands in the NDB Cluster Management Client”](#), and [Section 23.2.6, “Safe Shutdown and Restart of NDB Cluster”](#).

MySQL Cluster Manager and the NDB Cluster Auto-Installer provide additional ways to handle starting and stopping of NDB Cluster nodes. See [MySQL™ Cluster Manager 1.4.8 User Manual](#), and [Section 23.2.8, “The NDB Cluster Auto-Installer \(No longer supported\)”](#), for more information about these tools.

**A.10.32** What happens to NDB Cluster data when the NDB Cluster is shut down?

The data that was held in memory by the cluster's data nodes is written to disk, and is reloaded into memory the next time that the cluster is started.

**A.10.33** Is it a good idea to have more than one management node for an NDB Cluster?

It can be helpful as a fail-safe. Only one management node controls the cluster at any given time, but it is possible to configure one management node as primary, and one or more additional management nodes to take over in the event that the primary management node fails.

See [Section 23.3.3, “NDB Cluster Configuration Files”](#), for information on how to configure NDB Cluster management nodes.

**A.10.34** Can I mix different kinds of hardware and operating systems in one NDB Cluster?

Yes, as long as all machines and operating systems have the same “endianness” (all big-endian or all little-endian).

It is also possible to use software from different NDB Cluster releases on different nodes. However, we support such use only as part of a rolling upgrade procedure (see [Section 23.5.5, “Performing a Rolling Restart of an NDB Cluster”](#)).

**A.10.35** Can I run two data nodes on a single host? Two SQL nodes?

Yes, it is possible to do this. In the case of multiple data nodes, it is advisable (but not required) for each node to use a different data directory. If you want to run multiple SQL nodes on one machine, each instance of `mysqld` must use a different TCP/IP port.

Running data nodes and SQL nodes together on the same host is possible, but you should be aware that the `ndbd` or `ndbmtdd` processes may compete for memory with `mysqld`.

**A.10.36** Can I use host names with NDB Cluster?

Yes, it is possible to use DNS and DHCP for cluster hosts. However, if your application requires “five nines” availability, you should use fixed (numeric) IP addresses, since making communication between Cluster hosts dependent on services such as DNS and DHCP introduces additional potential points of failure.

**A.10.37** Does NDB Cluster support IPv6?

IPv6 is supported for connections between SQL nodes (MySQL servers), but connections between all other types of NDB Cluster nodes must use IPv4.

In practical terms, this means that you can use IPv6 for replication between NDB Clusters, but connections between nodes in the same NDB Cluster must use IPv4. For more information, see [Section 23.6.3, “Known Issues in NDB Cluster Replication”](#).

**A.10.38** How do I handle MySQL users in an NDB Cluster having multiple MySQL servers?

MySQL user accounts and privileges are normally not automatically propagated between different MySQL servers accessing the same NDB Cluster. MySQL NDB Cluster provides support for shared and synchronized users and privileges using the `NDB_STORED_USER` privilege; see [Section 23.5.12, “Distributed MySQL Privileges with NDB\\_STORED\\_USER”](#), for more information. You should be aware that this implementation is new to NDB 8.0 and is not compatible with the shared privileges mechanism employed in earlier versions of NDB Cluster, which is no longer supported in NDB 8.0.

**A.10.39** How do I continue to send queries in the event that one of the SQL nodes fails?

MySQL NDB Cluster does not provide any sort of automatic failover between SQL nodes. Your application must be prepared to handle the loss of SQL nodes and to fail over between them.

**A.10.40** How do I back up and restore an NDB Cluster?

You can use the NDB Cluster native backup and restore functionality in the NDB management client and the `ndb_restore` program. See [Section 23.5.8, “Online Backup of NDB Cluster”](#), and [Section 23.4.23, “ndb\\_restore — Restore an NDB Cluster Backup”](#).

You can also use the traditional functionality provided for this purpose in `mysqldump` and the MySQL server. See [Section 4.5.4, “mysqldump — A Database Backup Program”](#), for more information.

**A.10.41** What is an “angel process”?

This process monitors and, if necessary, attempts to restart the data node process. If you check the list of active processes on your system after starting `ndbd`, you can see that there are actually 2 processes running by that name, as shown here (we omit the output from `ndb_mgmd` and `ndbd` for brevity):

```
shell> ./ndb_mgmd

shell> ps aux | grep ndb
me 23002 0.0 0.0 122948 3104 ? Ssl 14:14 0:00 ./ndb_mgmd
me 23025 0.0 0.0 5284 820 pts/2 S+ 14:14 0:00 grep ndb

shell> ./ndbd -c 127.0.0.1 --initial

shell> ps aux | grep ndb
me 23002 0.0 0.0 123080 3356 ? Ssl 14:14 0:00 ./ndb_mgmd
me 23096 0.0 0.0 35876 2036 ? Ss 14:14 0:00 ./ndbmttd -c 127.0.0.1 --initial
me 23097 1.0 2.4 524116 91096 ? Sl 14:14 0:00 ./ndbmttd -c 127.0.0.1 --initial
me 23168 0.0 0.0 5284 812 pts/2 R+ 14:15 0:00 grep ndb
```

The `ndbd` process showing 0.0 for both memory and CPU usage is the angel process (although it actually does use a very small amount of each). This process merely checks to see if the main `ndbd` or `ndbmttd` process (the primary data node process which actually handles the data) is running. If permitted to do so (for example, if the `StopOnError` configuration parameter is set to `false`), the angel process tries to restart the primary data node process.

## A.11 MySQL 8.0 FAQ: MySQL Chinese, Japanese, and Korean Character Sets

This set of Frequently Asked Questions derives from the experience of MySQL's Support and Development groups in handling many inquiries about CJK (Chinese-Japanese-Korean) issues.

|                                                                                                                                           |      |

#### A.11.1 What CJK character sets are available in MySQL?

The list of CJK character sets may vary depending on your MySQL version. For example, the `gb18030` character set is not supported prior to MySQL 5.7.4. However, since the name of the applicable language appears in the `DESCRIPTION` column for every entry in the `INFORMATION_SCHEMA.CHARACTER_SETS` table, you can obtain a current list of all the non-Unicode CJK character sets using this query:

```
mysql> SELECT CHARACTER_SET_NAME, DESCRIPTION
FROM INFORMATION_SCHEMA.CHARACTER_SETS
WHERE DESCRIPTION LIKE '%Chin%'
OR DESCRIPTION LIKE '%Japanese%'
OR DESCRIPTION LIKE '%Korean%'
ORDER BY CHARACTER_SET_NAME;
```

| CHARACTER_SET_NAME | DESCRIPTION                     |
|--------------------|---------------------------------|
| big5               | Big5 Traditional Chinese        |
| cp932              | SJIS for Windows Japanese       |
| eucjpms            | UJIS for Windows Japanese       |
| euckr              | EUC-KR Korean                   |
| gb18030            | China National Standard GB18030 |
| gb2312             | GB2312 Simplified Chinese       |
| gbk                | GBK Simplified Chinese          |
| sjis               | Shift-JIS Japanese              |
| ujis               | EUC-JP Japanese                 |

(For more information, see [Section 26.3.4, “The INFORMATION\\_SCHEMA CHARACTER\\_SETS Table”](#).)

MySQL supports three variants of the *GB* (*Guojia Biaozhun*, or *National Standard*, or *Simplified Chinese*) character sets which are official in the People's Republic of China: `gb2312`, `gbk`, and (as of MySQL 5.7.4) `gb18030`.

Sometimes people try to insert `gbk` characters into `gb2312`, and it works most of the time because `gbk` is a superset of `gb2312`. But eventually they try to insert a rarer Chinese character and it does not work. (For an example, see Bug #16072).

Here, we try to clarify exactly what characters are legitimate in `gb2312` or `gbk`, with reference to the official documents. Please check these references before reporting `gb2312` or `gbk` bugs:

- The MySQL `gbk` character set is in reality “Microsoft code page 936”. This differs from the official `gbk` for characters `A1A4` (middle dot), `A1AA` (em dash), `A6E0–A6F5`, and `A8BB–A8C0`.
- For a listing of `gbk`/Unicode mappings, see <http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP936.TXT>.

It is also possible to store CJK characters in Unicode character sets, although the available collations may not sort characters quite as you expect:

- The `utf8` and `ucs2` character sets support the characters from Unicode Basic Multilingual Plane (BMP). These characters have code point values between `U+0000` and `U+FFFF`.
- The `utf8mb4`, `utf16`, `utf16le`, and `utf32` character sets support BMP characters, as well as supplementary characters that lie outside the BMP. Supplementary characters have code point values between `U+10000` and `U+10FFFF`.

The collation used for a Unicode character set determines the ability to sort (that is, distinguish) characters in the set:

- Collations based on Unicode Collation Algorithm (UCA) 4.0.0 distinguish only BMP characters.
- Collations based on UCA 5.2.0 or 9.0.0 distinguish BMP and supplementary characters.
- Non-UCA collations may not distinguish all Unicode characters. For example, the `utf8mb4` default collation is `utf8mb4_general_ci`, which distinguishes only BMP characters.

Moreover, distinguishing characters is not the same as ordering them per the conventions of a given CJK language. Currently, MySQL has only one CJK-specific UCA collation, `gb18030_unicode_520_ci` (which requires use of the non-Unicode `gb18030` character set).

For information about Unicode collations and their differentiating properties, including collation properties for supplementary characters, see [Section 10.10.1, “Unicode Character Sets”](#).

**A.11.2|** I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?

This problem is usually due to a setting in MySQL that does not match the settings for the application program or the operating system. Here are some common steps for correcting these types of issues:

- *Be certain of what MySQL version you are using.*

Use the statement `SELECT VERSION();` to determine this.

- *Make sure that the database is actually using the desired character set.*

People often think that the client character set is always the same as either the server character set or the character set used for display purposes. However, both of these are false assumptions. You can make sure by checking the result of `SHOW CREATE TABLE tablename` or, better yet, by using this statement:

```
SELECT character_set_name, collation_name
FROM information_schema.columns
WHERE table_schema = your_database_name
 AND table_name = your_table_name
 AND column_name = your_column_name;
```

- *Determine the hexadecimal value of the character or characters that are not being displayed correctly.*

You can obtain this information for a column `column_name` in the table `table_name` using the following query:

```
SELECT HEX(column_name)
FROM table_name;
```

`3F` is the encoding for the `?` character; this means that `?` is the character actually stored in the column. This most often happens because of a problem converting a particular character from your client character set to the target character set.

- *Make sure that a round trip is possible. When you select `literal` (or `_introducer hexadecimal-value`), do you obtain `literal` as a result?*

For example, the Japanese Katakana character *Pe* (ペ) exists in all CJK character sets, and has the code point value (hexadecimal coding) `0x30da`. To test a round trip for this character, use this query:

```
SELECT 'ペ' AS `ペ`; /* or SELECT _ucs2 0x30da; */
```

If the result is not also [🐬](#), the round trip failed.

For bug reports regarding such failures, we might ask you to follow up with `SELECT HEX( '🐬' );`. Then we can determine whether the client encoding is correct.

- *Make sure that the problem is not with the browser or other application, rather than with MySQL.*

Use the `mysql` client program to accomplish this task. If `mysql` displays characters correctly but your application does not, your problem is probably due to system settings.

To determine your settings, use the `SHOW VARIABLES` statement, whose output should resemble what is shown here:

```
mysql> SHOW VARIABLES LIKE 'char%';
```

| Variable_name            | Value                                 |
|--------------------------|---------------------------------------|
| character_set_client     | utf8                                  |
| character_set_connection | utf8                                  |
| character_set_database   | latin1                                |
| character_set_filesystem | binary                                |
| character_set_results    | utf8                                  |
| character_set_server     | latin1                                |
| character_set_system     | utf8                                  |
| character_sets_dir       | /usr/local/mysql/share/mysqlCharsets/ |

These are typical character-set settings for an international-oriented client (notice the use of `utf8` Unicode) connected to a server in the West (`latin1` is a West Europe character set).

Although Unicode (usually the `utf8` variant on Unix, and the `ucs2` variant on Windows) is preferable to Latin, it is often not what your operating system utilities support best. Many Windows users find that a Microsoft character set, such as `cp932` for Japanese Windows, is suitable.

If you cannot control the server settings, and you have no idea what setting your underlying computer uses, try changing to a common character set for the country that you're in (`euckr` = Korea; `gb18030`, `gb2312` or `gbk` = People's Republic of China; `big5` = Taiwan; `sjis`, `ujis`, `cp932`, or `eucjpms` = Japan; `ucs2` or `utf8` = anywhere). Usually it is necessary to change only the client and connection and results settings. The `SET NAMES.` statement changes all three at once. For example:

```
SET NAMES 'big5';
```

Once the setting is correct, you can make it permanent by editing `my.cnf` or `my.ini`. For example you might add lines looking like these:

```
[mysqld]
character-set-server=big5
[client]
default-character-set=big5
```

It is also possible that there are issues with the API configuration setting being used in your application; see *Why does my GUI front end or browser not display CJK characters correctly...?* for more information.

### A.11.3 What problems should I be aware of when working with the Big5 Chinese character set?

MySQL supports the Big5 character set which is common in Hong Kong and Taiwan (Republic of China). The MySQL `big5` character set is in reality Microsoft code page 950, which is very similar to the original `big5` character set.

A feature request for adding [HKSCS](#) extensions has been filed. People who need this extension may find the suggested patch for Bug #13577 to be of interest.

#### A.11.4 Why do Japanese character set conversions fail?

MySQL supports the [sjis](#), [ujis](#), [cp932](#), and [eucjpms](#) character sets, as well as Unicode. A common need is to convert between character sets. For example, there might be a Unix server (typically with [sjis](#) or [ujis](#)) and a Windows client (typically with [cp932](#)).

In the following conversion table, the [ucs2](#) column represents the source, and the [sjis](#), [cp932](#), [ujis](#), and [eucjpms](#) columns represent the destinations; that is, the last 4 columns provide the hexadecimal result when we use `CONVERT(ucs2)` or we assign a [ucs2](#) column containing the value to an [sjis](#), [cp932](#), [ujis](#), or [eucjpms](#) column.

| Character Name            | ucs2 | sjis | cp932 | ujis   | eucjpms |
|---------------------------|------|------|-------|--------|---------|
| BROKEN BAR                | 00A6 | 3F   | 3F    | 8FA2C3 | 3F      |
| FULLWIDTH BROKEN BAR      | FFE4 | 3F   | FA55  | 3F     | 8FA2    |
| YEN SIGN                  | 00A5 | 3F   | 3F    | 20     | 3F      |
| FULLWIDTH YEN SIGN        | FFE5 | 818F | 818F  | A1EF   | 3F      |
| TILDE                     | 007E | 7E   | 7E    | 7E     | 7E      |
| OVERLINE                  | 203E | 3F   | 3F    | 20     | 3F      |
| HORIZONTAL BAR            | 2015 | 815C | 815C  | A1BD   | A1BD    |
| EM DASH                   | 2014 | 3F   | 3F    | 3F     | 3F      |
| REVERSE SOLIDUS           | 005C | 815F | 5C    | 5C     | 5C      |
| FULLWIDTH REVERSE SOLIDUS | FF3C | 3F   | 815F  | 3F     | A1C0    |
| WAVE DASH                 | 301C | 8160 | 3F    | A1C1   | 3F      |
| FULLWIDTH TILDE           | FF5E | 3F   | 8160  | 3F     | A1C1    |
| DOUBLE VERTICAL LINE      | 2016 | 8161 | 3F    | A1C2   | 3F      |
| PARALLEL TO               | 2225 | 3F   | 8161  | 3F     | A1C2    |
| MINUS SIGN                | 2212 | 817C | 3F    | A1DD   | 3F      |
| FULLWIDTH HYPHEN-MINUS    | FF0D | 3F   | 817C  | 3F     | A1DD    |
| CENT SIGN                 | 00A2 | 8191 | 3F    | A1F1   | 3F      |
| FULLWIDTH CENT SIGN       | FFE0 | 3F   | 8191  | 3F     | A1F1    |
| POUND SIGN                | 00A3 | 8192 | 3F    | A1F2   | 3F      |
| FULLWIDTH POUND SIGN      | FFE1 | 3F   | 8192  | 3F     | A1F2    |

| Character Name     | ucs2 | sjis | cp932 | ujis | eucjpms |
|--------------------|------|------|-------|------|---------|
| NOT SIGN           | 00AC | 81CA | 3F    | A2CC | 3F      |
| FULLWIDTH NOT SIGN | FFE2 | 3F   | 81CA  | 3F   | A2CC    |

Now consider the following portion of the table.

|                    | ucs2 | sjis | cp932 |
|--------------------|------|------|-------|
| NOT SIGN           | 00AC | 81CA | 3F    |
| FULLWIDTH NOT SIGN | FFE2 | 3F   | 81CA  |

This means that MySQL converts the `NOT SIGN` (Unicode `U+00AC`) to `sjis` code point `0x81CA` and to `cp932` code point `3F`. (`3F` is the question mark (“?”). This is what is always used when the conversion cannot be performed.)

#### A.11.5 What should I do if I want to convert SJIS `81CA` to `cp932`?

Our answer is: “?”. There are disadvantages to this, and many people would prefer a “loose” conversion, so that `81CA` (`NOT SIGN`) in `sjis` becomes `81CA` (`FULLWIDTH NOT SIGN`) in `cp932`.

#### A.11.6 How does MySQL represent the Yen (¥) sign?

A problem arises because some versions of Japanese character sets (both `sjis` and `euc`) treat `5C` as a *reverse solidus* (`\`, also known as a backslash), whereas others treat it as a yen sign (¥).

MySQL follows only one version of the JIS (Japanese Industrial Standards) standard description. In MySQL, `5C` is *always the reverse solidus* (`\`).

#### A.11.7 Of what issues should I be aware when working with Korean character sets in MySQL?

In theory, while there have been several versions of the `euckr` (*Extended Unix Code Korea*) character set, only one problem has been noted. We use the “ASCII” variant of EUC-KR, in which the code point `0x5c` is REVERSE SOLIDUS, that is `\`, instead of the “KS-Roman” variant of EUC-KR, in which the code point `0x5c` is `WON SIGN` (₩). This means that you cannot convert Unicode `U+20A9` to `euckr`:

```
mysql> SELECT
 CONVERT('₩' USING euckr) AS euckr,
 HEX(CONVERT('₩' USING euckr)) AS hexeuckr;
+-----+-----+
| euckr | hexeuckr |
+-----+-----+
| ? | 3F |
+-----+-----+
```

#### A.11.8 Why do I get `Incorrect string value` error messages?

To see the problem, create a table with one Unicode (`ucs2`) column and one Chinese (`gb2312`) column.

```
mysql> CREATE TABLE ch
 (ucs2 CHAR(3) CHARACTER SET ucs2,
 gb2312 CHAR(3) CHARACTER SET gb2312);
```

In nonstrict SQL mode, try to place the rare character ㄸ in both columns.

```
mysql> SET sql_mode = '';
mysql> INSERT INTO ch VALUES ('AㄸB','AㄸB');
```

```
Query OK, 1 row affected, 1 warning (0.00 sec)
```

The `INSERT` produces a warning. Use the following statement to see what it is:

```
mysql> SHOW WARNINGS\G
***** 1. row *****
Level: Warning
Code: 1366
Message: Incorrect string value: '\xE6\xB1\x8CB' for column 'gb2312' at row 1
```

So it is a warning about the `gb2312` column only.

```
mysql> SELECT ucs2,HEX(ucs2),gb2312,HEX(gb2312) FROM ch;
+-----+-----+-----+-----+
| ucs2 | HEX(ucs2) | gb2312 | HEX(gb2312) |
+-----+-----+-----+-----+
| A?B | 00416C4C0042 | A?B | 413F42 |
+-----+-----+-----+-----+
```

Several things need explanation here:

1. The `A?B` character is not in the `gb2312` character set, as described earlier.
2. If you are using an old version of MySQL, you may see a different message.
3. A warning occurs rather than an error because MySQL is not set to use strict SQL mode. In nonstrict mode, MySQL tries to do what it can, to get the best fit, rather than give up. With strict SQL mode, the `Incorrect string value` message occurs as an error rather than a warning, and the `INSERT` fails.

#### A.11.9 Why does my GUI front end or browser display CJK characters incorrectly in my application using Access, PHP, or another API?

Obtain a direct connection to the server using the `mysql` client, and try the same query there. If `mysql` responds correctly, the trouble may be that your application interface requires initialization. Use `mysql` to tell you what character set or sets it uses with the statement `SHOW VARIABLES LIKE 'char%'`. If you are using Access, you are most likely connecting with Connector/ODBC. In this case, you should check [Configuring Connector/ODBC](#). If, for example, you use `big5`, you would enter `SET NAMES 'big5'`. (In this case, no `;` character is required.) If you are using ASP, you might need to add `SET NAMES` in the code. Here is an example that has worked in the past:

```
<%
Session.CodePage=0
Dim strConnection
Dim Conn
strConnection="driver={MySQL ODBC 3.51 Driver};server=server;uid=username;" \
 & "pwd=password;database=database;stmt=SET NAMES 'big5';"
Set Conn = Server.CreateObject("ADODB.Connection")
Conn.Open strConnection
%>
```

In much the same way, if you are using any character set other than `latin1` with Connector/NET, you must specify the character set in the connection string. See [Connector/NET Connections](#), for more information.

If you are using PHP, try this:

```
<?php
$link = new mysqli($host, $usr, $pwd, $db);

if(mysqli_connect_errno())
{
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}
```

```
$link->query("SET NAMES 'utf8'");
?>
```

In this case, we used `SET NAMES` to change `character_set_client`, `character_set_connection`, and `character_set_results`.

Another issue often encountered in PHP applications has to do with assumptions made by the browser. Sometimes adding or changing a `<meta>` tag suffices to correct the problem: for example, to insure that the user agent interprets page content as UTF-8, include `<meta http-equiv="Content-Type" content="text/html; charset=utf-8">` in the `<head>` section of the HTML page.

If you are using Connector/J, see [Using Character Sets and Unicode](#).

#### A.11.10 I've upgraded to MySQL 8.0. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?

In MySQL Version 4.0, there was a single “global” character set for both server and client, and the decision as to which character to use was made by the server administrator. This changed starting with MySQL Version 4.1. What happens now is a “handshake”, as described in [Section 10.4, “Connection Character Sets and Collations”](#):

When a client connects, it sends to the server the name of the character set that it wants to use. The server uses the name to set the `character_set_client`, `character_set_results`, and `character_set_connection` system variables. In effect, the server performs a `SET NAMES` operation using the character set name.

The effect of this is that you cannot control the client character set by starting `mysqld` with `--character-set-server=utf8`. However, some Asian customers prefer the MySQL 4.0 behavior. To make it possible to retain this behavior, we added a `mysqld` switch, `--character-set-client-handshake`, which can be turned off with `--skip-character-set-client-handshake`. If you start `mysqld` with `--skip-character-set-client-handshake`, then, when a client connects, it sends to the server the name of the character set that it wants to use. However, *the server ignores this request from the client*.

By way of example, suppose that your favorite server character set is `latin1`. Suppose further that the client uses `utf8` because this is what the client's operating system supports. Start the server with `latin1` as its default character set:

```
mysqld --character-set-server=latin1
```

And then start the client with the default character set `utf8`:

```
mysql --default-character-set=utf8
```

The resulting settings can be seen by viewing the output of `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
character_set_client	utf8
character_set_connection	utf8
character_set_database	latin1
character_set_filesystem	binary
character_set_results	utf8
character_set_server	latin1
character_set_system	utf8
character_sets_dir	/usr/local/mysql/share/mysql/charsets/
+-----+-----+
```

Now stop the client, and stop the server using `mysqladmin`. Then start the server again, but this time tell it to skip the handshake like so:

```
mysqld --character-set-server=utf8 --skip-character-set-client-handshake
```

Start the client with `utf8` once again as the default character set, then display the resulting settings:

```
mysql> SHOW VARIABLES LIKE 'char%';
```

| Variable_name            | Value                                 |
|--------------------------|---------------------------------------|
| character_set_client     | latin1                                |
| character_set_connection | latin1                                |
| character_set_database   | latin1                                |
| character_set_filesystem | binary                                |
| character_set_results    | latin1                                |
| character_set_server     | latin1                                |
| character_set_system     | utf8                                  |
| character_sets_dir       | /usr/local/mysql/share/mysqlCharsets/ |

As you can see by comparing the differing results from `SHOW VARIABLES`, the server ignores the client's initial settings if the `--skip-character-set-client-handshake` option is used.

#### A.11.1 Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?

For `LIKE` searches, there is a very simple problem with binary string column types such as `BINARY` and `BLOB`: we must know where characters end. With multibyte character sets, different characters might have different octet lengths. For example, in `utf8`, `A` requires one byte but `ㄹ` requires three bytes, as shown here:

| OCTET_LENGTH(_utf8 'A') | OCTET_LENGTH(_utf8 'ㄹ') |
|-------------------------|-------------------------|
| 1                       | 3                       |

If we do not know where the first character in a string ends, we do not know where the second character begins, in which case even very simple searches such as `LIKE '_A%'` fail. The solution is to use a nonbinary string column type defined to have the proper CJK character set. For example: `mycol TEXT CHARACTER SET sjis`. Alternatively, convert to a CJK character set before comparing.

This is one reason why MySQL cannot permit encodings of nonexistent characters. If it is not strict about rejecting bad input, it has no way of knowing where characters end.

For `FULLTEXT` searches, we must know where words begin and end. With Western languages, this is rarely a problem because most (if not all) of these use an easy-to-identify word boundary: the space character. However, this is not usually the case with Asian writing. We could use arbitrary halfway measures, like assuming that all Han characters represent words, or (for Japanese) depending on changes from Katakana to Hiragana due to grammatical endings. However, the only sure solution requires a comprehensive word list, which means that we would have to include a dictionary in the server for each Asian language supported. This is simply not feasible.

#### A.11.2 How do I know whether character `x` is available in all character sets?

The majority of simplified Chinese and basic nonhalfwidth Japanese Kana characters appear in all CJK character sets. The following stored procedure accepts a `UCS-2` Unicode character, converts it to other character sets, and displays the results in hexadecimal.

```
DELIMITER //
```

```

CREATE PROCEDURE p_convert(ucs2_char CHAR(1) CHARACTER SET ucs2)
BEGIN

CREATE TABLE tj
(ucs2 CHAR(1) character set ucs2,
 utf8 CHAR(1) character set utf8,
 big5 CHAR(1) character set big5,
 cp932 CHAR(1) character set cp932,
 eucjpms CHAR(1) character set eucjpms,
 euckr CHAR(1) character set euckr,
 gb2312 CHAR(1) character set gb2312,
 gbk CHAR(1) character set gbk,
 sjis CHAR(1) character set sjis,
 ujis CHAR(1) character set ujis);

INSERT INTO tj (ucs2) VALUES (ucs2_char);

UPDATE tj SET utf8=ucs2,
 big5=ucs2,
 cp932=ucs2,
 eucjpms=ucs2,
 euckr=ucs2,
 gb2312=ucs2,
 gbk=ucs2,
 sjis=ucs2,
 ujis=ucs2;

/* If there are conversion problems, UPDATE produces warnings. */

SELECT hex(ucs2) AS ucs2,
 hex(utf8) AS utf8,
 hex(big5) AS big5,
 hex(cp932) AS cp932,
 hex(eucjpms) AS eucjpms,
 hex(euckr) AS euckr,
 hex(gb2312) AS gb2312,
 hex(gbk) AS gbk,
 hex(sjis) AS sjis,
 hex(ujis) AS ujis
FROM tj;

DROP TABLE tj;

END//

DELIMITER ;

```

The input can be any single `ucs2` character, or it can be the code value (hexadecimal representation) of that character. For example, from Unicode's list of `ucs2` encodings and names (<http://www.unicode.org/Public/UNIDATA/UnicodeData.txt>), we know that the Katakana character *Pe* appears in all CJK character sets, and that its code value is `X'30DA'`. If we use this value as the argument to `p_convert()`, the result is as shown here:

```

mysql> CALL p_convert('X'30DA');
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| ucs2 | utf8 | big5 | cp932 | eucjpms | euckr | gb2312 | gbk | sjis | ujis |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 30DA | E3839A | C772 | 8379 | A5DA | ABDA | A5DA | A5DA | 8379 | A5DA |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+

```

Since none of the column values is `3F` (that is, the question mark character, `?`), we know that every conversion worked.

#### A.11.13 Why do CJK strings sort incorrectly in Unicode? (I)

CJK sorting problems that occurred in older MySQL versions can be solved as of MySQL 8.0 by using the `utf8mb4` character set and the `utf8mb4_ja_0900_as_cs` collation.

#### A.11.14 Why do CJK strings sort incorrectly in Unicode? (II)

CJK sorting problems that occurred in older MySQL versions can be solved as of MySQL 8.0 by using the `utf8mb4` character set and the `utf8mb4_ja_0900_as_cs` collation.

**A.11.15** Why are my supplementary characters rejected by MySQL?

Supplementary characters lie outside the Unicode *Basic Multilingual Plane / Plane 0*. BMP characters have code point values between `U+0000` and `U+FFFF`. Supplementary characters have code point values between `U+10000` and `U+10FFFF`.

To store supplementary characters, you must use a character set that permits them:

- The `utf8` and `ucs2` character sets support BMP characters only.

The `utf8` character set permits only UTF-8 characters that take up to three bytes. This has led to reports such as that found in Bug #12600, which we rejected as “not a bug”. With `utf8`, MySQL must truncate an input string when it encounters bytes that it does not understand. Otherwise, it is unknown how long the bad multibyte character is.

One possible workaround is to use `ucs2` instead of `utf8`, in which case the “bad” characters are changed to question marks. However, no truncation takes place. You can also change the data type to `BLOB` or `BINARY`, which perform no validity checking.

- The `utf8mb4`, `utf16`, `utf16le`, and `utf32` character sets support BMP characters, as well as supplementary characters outside the BMP.

**A.11.16** Should “CJK” be “CJKV”?

No. The term “CJKV” (*Chinese Japanese Korean Vietnamese*) refers to Vietnamese character sets which contain Han (originally Chinese) characters. MySQL supports the modern Vietnamese script with Western characters, but does not support the old Vietnamese script using Han characters.

As of MySQL 5.6, there are Vietnamese collations for Unicode character sets, as described in [Section 10.10.1, “Unicode Character Sets”](#).

**A.11.17** Does MySQL permit CJK characters to be used in database and table names?

Yes.

**A.11.18** Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?

The Japanese translation of the MySQL 5.6 manual can be downloaded from <https://dev.mysql.com/doc/>.

**A.11.19** Where can I get help with CJK and related issues in MySQL?

The following resources are available:

- A listing of MySQL user groups can be found at <https://wikis.oracle.com/display/mysql/List+of+MySQL+User+Groups>.
- View feature requests relating to character set issues at <http://tinyurl.com/y6xcuf>.
- Visit the MySQL [Character Sets, Collation, Unicode Forum](#). <http://forums.mysql.com/> also provides foreign-language forums.

## A.12 MySQL 8.0 FAQ: Connectors & APIs

For common questions, issues, and answers relating to the MySQL Connectors and other APIs, see the following areas of the Manual:

- [Using C API Features](#)

- [Common Problems with MySQL and PHP](#)
- [Connector/ODBC Notes and Tips](#)
- [Connector/NET Programming](#)
- [MySQL Connector/J 8.0 Developer Guide](#)

## A.13 MySQL 8.0 FAQ: C API, libmysql

Frequently asked questions about MySQL C API and libmysql.

|                                                                                     |      |
|-------------------------------------------------------------------------------------|------|
| A.13.1 What is “MySQL Native C API”? What are typical benefits and use cases? ..... | 5015 |
| A.13.2 Which version of libmysql should I use? .....                                | 5015 |
| A.13.3 What if I want to use the “NoSQL” X DevAPI? .....                            | 5015 |
| A.13.4 How to I download libmysql? .....                                            | 5015 |
| A.13.5 Where is the documentation? .....                                            | 5015 |
| A.13.6 How do I report bugs? .....                                                  | 5015 |
| A.13.7 Is it possible to compile the library myself? .....                          | 5015 |

### A.13.1 What is “MySQL Native C API”? What are typical benefits and use cases?

libmysql is a C-based API that you can use in C applications to connect with the MySQL database server. It is also itself used as the foundation for drivers for standard database APIs like ODBC, Perl's DBI, and Python's DB API.

### A.13.2 Which version of libmysql should I use?

For MySQL 8.0, 5.7, 5.6, and 5.5, we recommend libmysql 8.0.

### A.13.3 What if I want to use the “NoSQL” X DevAPI?

For C-language and X DevApi Document Store for MySQL 8.0, we recommend MySQL Connector/C++. Connector/C++ 8.0 has compatible C headers. (This is not applicable to MySQL 5.7 or before.)

### A.13.4 How to I download libmysql?

- Linux: The Client Utilities Package is available from the [MySQL Community Server](#) download page.
- Repos: The Client Utilities Package is available from the [Yum](#), [APT](#), [SuSE repositories](#).
- Windows: The Client Utilities Package is available from [Windows Installer](#).

### A.13.5 Where is the documentation?

See [MySQL 8.0 C API Developer Guide](#).

### A.13.6 How do I report bugs?

Please report any bugs or inconsistencies you observe to our [Bugs Database](#). Select the C API Client as shown.

### A.13.7 Is it possible to compile the library myself?

Yes, you can download the libmysqlclient source code and compile it on your own. Here's an example:

```
$ git clone --depth 1 https://github.com/mysql/mysql-server
$ cd mysql-server
$ mkdir build
$ cd build
$ cmake .. -GNinja -DDOWNLOAD_BOOST=1 \
 -DWITH_BOOST=/tmp -DCMAKE_BUILD_TYPE=Release -DWITHOUT_SERVER=ON \
```

```
-DWITH_SSL=system
$ ninja libmysqlclient.a
$ ls -la archive_output_directory/libmysqlclient.a
-rw-rw-r-- 1 kg kg 8,5M wrz 5 04:57 archive_output_directory/libmysqlclient.a
```

**Note**

This example uses <https://ninja-build.org/> as a build system instead of make.

## A.14 MySQL 8.0 FAQ: Replication

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication.

|                                                                                                                                                                  |      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|
| A.14.1 Must the replica be connected to the source all the time? .....                                                                                           | 5016 |
| A.14.2 Must I enable networking on my source and replica to enable replication? .....                                                                            | 5016 |
| A.14.3 How do I know how late a replica is compared to the source? In other words, how do I know the date of the last statement replicated by the replica? ..... | 5016 |
| A.14.4 How do I force the source to block updates until the replica catches up? .....                                                                            | 5017 |
| A.14.5 What issues should I be aware of when setting up two-way replication? .....                                                                               | 5017 |
| A.14.6 How can I use replication to improve performance of my system? .....                                                                                      | 5017 |
| A.14.7 What should I do to prepare client code in my own applications to use performance-enhancing replication? .....                                            | 5018 |
| A.14.8 When and how much can MySQL replication improve the performance of my system? .....                                                                       | 5018 |
| A.14.9 How can I use replication to provide redundancy or high availability? .....                                                                               | 5019 |
| A.14.10 How do I tell whether a replication source server is using statement-based or row-based binary logging format? .....                                     | 5019 |
| A.14.11 How do I tell a replica to use row-based replication? .....                                                                                              | 5019 |
| A.14.12 How do I prevent <a href="#">GRANT</a> and <a href="#">REVOKE</a> statements from replicating to replica machines? ..                                    | 5019 |
| A.14.13 Does replication work on mixed operating systems (for example, the source runs on Linux while replicas run on macOS and Windows)? .....                  | 5019 |
| A.14.14 Does replication work on mixed hardware architectures (for example, the source runs on a 64-bit machine while replicas run on 32-bit machines)? .....    | 5019 |

### A.14.1 Must the replica be connected to the source all the time?

No, it does not. The replica can go down or stay disconnected for hours or even days, and then reconnect and catch up on updates. For example, you can set up a source/replica relationship over a dial-up link where the link is up only sporadically and for short periods of time. The implication of this is that, at any given time, the replica is not guaranteed to be in synchrony with the source unless you take some special measures.

To ensure that catchup can occur for a replica that has been disconnected, you must not remove binary log files from the source that contain information that has not yet been replicated to the replicas. Asynchronous replication can work only if the replica is able to continue reading the binary log from the point where it last read events.

### A.14.2 Must I enable networking on my source and replica to enable replication?

Yes, networking must be enabled on the source and replica. If networking is not enabled, the replica cannot connect to the source and transfer the binary log. Verify that the [skip\\_networking](#) system variable has not been enabled in the configuration file for either server.

### A.14.3 How do I know how late a replica is compared to the source? In other words, how do I know the date of the last statement replicated by the replica?

Check the [Seconds\\_Behind\\_Master](#) column in the output from [SHOW REPLICA | SLAVE STATUS](#). See [Section 17.1.7.1, “Checking Replication Status”](#).

When the replication SQL thread executes an event read from the source, it modifies its own time to the event timestamp. (This is why `TIMESTAMP` is well replicated.) In the `Time` column in the output of `SHOW PROCESSLIST`, the number of seconds displayed for the replication SQL thread is the number of seconds between the timestamp of the last replicated event and the real time of the replica machine. You can use this to determine the date of the last replicated event. Note that if your replica has been disconnected from the source for one hour, and then reconnects, you may immediately see large `Time` values such as 3600 for the replication SQL thread in `SHOW PROCESSLIST`. This is because the replica is executing statements that are one hour old. See [Section 17.2.3, “Replication Threads”](#).

#### A.14.4 How do I force the source to block updates until the replica catches up?

Use the following procedure:

1. On the source, execute these statements:

```
mysql> FLUSH TABLES WITH READ LOCK;
mysql> SHOW MASTER STATUS;
```

Record the replication coordinates (the current binary log file name and position) from the output of the `SHOW` statement.

2. On the replica, issue the following statement, where the arguments to the `MASTER_POS_WAIT()` function are the replication coordinate values obtained in the previous step:

```
mysql> SELECT MASTER_POS_WAIT('log_name', log_pos);
```

The `SELECT` statement blocks until the replica reaches the specified log file and position. At that point, the replica is in synchrony with the source and the statement returns.

3. On the source, issue the following statement to enable the source to begin processing updates again:

```
mysql> UNLOCK TABLES;
```

#### A.14.5 What issues should I be aware of when setting up two-way replication?

MySQL replication currently does not support any locking protocol between source and replica to guarantee the atomicity of a distributed (cross-server) update. In other words, it is possible for client A to make an update to co-source 1, and in the meantime, before it propagates to co-source 2, client B could make an update to co-source 2 that makes the update of client A work differently than it did on co-source 1. Thus, when the update of client A makes it to co-source 2, it produces tables that are different from what you have on co-source 1, even after all the updates from co-source 2 have also propagated. This means that you should not chain two servers together in a two-way replication relationship unless you are sure that your updates can safely happen in any order, or unless you take care of mis-ordered updates somehow in the client code.

You should also realize that two-way replication actually does not improve performance very much (if at all) as far as updates are concerned. Each server must do the same number of updates, just as you would have a single server do. The only difference is that there is a little less lock contention because the updates originating on another server are serialized in one replication thread. Even this benefit might be offset by network delays.

#### A.14.6 How can I use replication to improve performance of my system?

Set up one server as the source and direct all writes to it. Then configure as many replicas as you have the budget and rackspace for, and distribute the reads among the source and the replicas. You can also start the replicas with the `--skip-innodb` option, enable the `low_priority_updates` system variable, and set the `delay_key_write` system

variable to [ALL](#) to get speed improvements on the replica end. In this case, the replica uses nontransactional [MyISAM](#) tables instead of [InnoDB](#) tables to get more speed by eliminating transactional overhead.

**A.14.7** What should I do to prepare client code in my own applications to use performance-enhancing replication?

See the guide to using replication as a scale-out solution, [Section 17.4.5, “Using Replication for Scale-Out”](#).

**A.14.8** When and how much can MySQL replication improve the performance of my system?

MySQL replication is most beneficial for a system that processes frequent reads and infrequent writes. In theory, by using a single-source/multiple-replica setup, you can scale the system by adding more replicas until you either run out of network bandwidth, or your update load grows to the point that the source cannot handle it.

To determine how many replicas you can use before the added benefits begin to level out, and how much you can improve performance of your site, you must know your query patterns, and determine empirically by benchmarking the relationship between the throughput for reads and writes on a typical source and a typical replica. The example here shows a rather simplified calculation of what you can get with replication for a hypothetical system. Let [reads](#) and [writes](#) denote the number of reads and writes per second, respectively.

Let's say that system load consists of 10% writes and 90% reads, and we have determined by benchmarking that [reads](#) is  $1200 - 2 * \text{writes}$ . In other words, the system can do 1,200 reads per second with no writes, the average write is twice as slow as the average read, and the relationship is linear. Suppose that the source and each replica have the same capacity, and that we have one source and  $N$  replicas. Then we have for each server (source or replica):

$$\text{reads} = 1200 - 2 * \text{writes}$$

$$\text{reads} = 9 * \text{writes} / (N + 1) \text{ (reads are split, but writes replicated to all replicas)}$$

$$9 * \text{writes} / (N + 1) + 2 * \text{writes} = 1200$$

$$\text{writes} = 1200 / (2 + 9/(N + 1))$$

The last equation indicates the maximum number of writes for  $N$  replicas, given a maximum possible read rate of 1,200 per second and a ratio of nine reads per write.

This analysis yields the following conclusions:

- If  $N = 0$  (which means we have no replication), our system can handle about  $1200/11 = 109$  writes per second.
- If  $N = 1$ , we get up to 184 writes per second.
- If  $N = 8$ , we get up to 400 writes per second.
- If  $N = 17$ , we get up to 480 writes per second.
- Eventually, as  $N$  approaches infinity (and our budget negative infinity), we can get very close to 600 writes per second, increasing system throughput about 5.5 times. However, with only eight servers, we increase it nearly four times.

These computations assume infinite network bandwidth and neglect several other factors that could be significant on your system. In many cases, you may not be able to perform a computation similar to the one just shown that accurately predicts what happens on your system if you add  $N$  replicas. However, answering the following questions should help you decide whether and by how much replication may improve the performance of your system:

- What is the read/write ratio on your system?
- How much more write load can one server handle if you reduce the reads?
- For how many replicas do you have bandwidth available on your network?

**A.14.9**How can I use replication to provide redundancy or high availability?

How you implement redundancy is entirely dependent on your application and circumstances. High-availability solutions (with automatic failover) require active monitoring and either custom scripts or third party tools to provide the failover support from the original MySQL server to the replica.

To handle the process manually, you should be able to switch from a failed source to a pre-configured replica by altering your application to talk to the new server or by adjusting the DNS for the MySQL server from the failed server to the new server.

For more information and some example solutions, see [Section 17.4.8, “Switching Sources During Failover”](#).

**A.14.10**How do I tell whether a replication source server is using statement-based or row-based binary logging format?

Check the value of the `binlog_format` system variable:

```
mysql> SHOW VARIABLES LIKE 'binlog_format';
```

The value shown is always one of `STATEMENT`, `ROW`, or `MIXED`. For `MIXED` mode, statement-based logging is used by default but replication switches automatically to row-based logging under certain conditions, such as unsafe statements. For information about when this may occur, see [Section 5.4.4.3, “Mixed Binary Logging Format”](#).

**A.14.11**How do I tell a replica to use row-based replication?

Replicas automatically know which format to use.

**A.14.12**How do I prevent `GRANT` and `REVOKE` statements from replicating to replica machines?

Start the server with the `--replicate-wild-ignore-table=mysql.%` option to ignore replication for tables in the `mysql` database.

**A.14.13**Does replication work on mixed operating systems (for example, the source runs on Linux while replicas run on macOS and Windows)?

Yes.

**A.14.14**Does replication work on mixed hardware architectures (for example, the source runs on a 64-bit machine while replicas run on 32-bit machines)?

Yes.

## A.15 MySQL 8.0 FAQ: MySQL Enterprise Thread Pool

|                                                                                                                                     |      |
|-------------------------------------------------------------------------------------------------------------------------------------|------|
| A.15.1 What is the Thread Pool and what problem does it solve? .....                                                                | 5019 |
| A.15.2 How does the Thread Pool limit and manage concurrent sessions and transactions for optimal performance and throughput? ..... | 5020 |
| A.15.3 How is the Thread Pool different from the client side Connection Pool? .....                                                 | 5020 |
| A.15.4 When should I use the Thread Pool? .....                                                                                     | 5020 |
| A.15.5 Are there recommended Thread Pool configurations? .....                                                                      | 5021 |

**A.15.1**What is the Thread Pool and what problem does it solve?

The MySQL Thread Pool is a MySQL server plugin that extends the default connection-handling capabilities of the MySQL server to limit the number of concurrently executing statements/queries and transactions to ensure that each has sufficient CPU and memory resources to fulfill its task. For MySQL 8.0, the Thread Pool plugin is included in MySQL Enterprise Edition, a commercial product.

The default thread-handling model in MySQL Server executes statements using one thread per client connection. As more clients connect to the server and execute statements, overall performance degrades. The Thread Pool plugin provides an alternative thread-handling model designed to reduce overhead and improve performance. The Thread Pool plugin increases server performance by efficiently managing statement execution threads for large numbers of client connections, especially on modern multi-CPU/Core systems.

For more information, see [Section 5.6.3, “MySQL Enterprise Thread Pool”](#).

**A.15.2**How does the Thread Pool limit and manage concurrent sessions and transactions for optimal performance and throughput?

The Thread Pool uses a “divide and conquer” approach to limiting and balancing concurrency. Unlike the default connection handling of the MySQL Server, the Thread Pool separates connections and threads, so there is no fixed relationship between connections and the threads that execute statements received from those connections. The Thread Pool then manages client connections within configurable thread groups, where they are prioritized and queued based on the nature of the work they were submitted to accomplish.

For more information, see [Section 5.6.3.3, “Thread Pool Operation”](#).

**A.15.3**How is the Thread Pool different from the client side Connection Pool?

The MySQL Connection Pool operates on the client side to ensure that a MySQL client does not constantly connect to and disconnect from the MySQL server. It is designed to cache idle connections in the MySQL client for use by other users as they are needed. This minimizes the overhead and expense of establishing and tearing down connections as queries are submitted to the MySQL server. The MySQL Connection Pool has no visibility as to the query handling capabilities or load of the back-end MySQL server. By contrast, the Thread Pool operates on the MySQL server side and is designed to manage the execution of inbound concurrent connections and queries as they are received from the client connections accessing the back-end MySQL database. Because of the separation of duties, the MySQL Connection Pool and Thread Pool are orthogonal and can be used independent of each other.

MySQL Connection Pooling via the MySQL Connectors is covered in [Chapter 29, Connectors and APIs](#).

**A.15.4**When should I use the Thread Pool?

There are a few rules of thumb to consider for optimal Thread Pool use cases:

The MySQL `Threads_running` variable keeps track of the number of concurrent statements currently executing in the MySQL Server. If this variable consistently exceeds a region where the server won't operate optimally (usually going beyond 40 for InnoDB workloads), the Thread Pool should be beneficial, especially in extreme parallel overload situations.

If you are using the `innodb_thread_concurrency` to limit the number of concurrently executing statements, you should find that the Thread Pool solves the same problem, only better, by assigning connections to thread groups, then queuing executions based on transactional content, user defined designations, and so forth.

Lastly, if your workload comprises mainly short queries, the Thread Pool should be beneficial.

To learn more, see [Section 5.6.3.4, “Thread Pool Tuning”](#).

**A.15.5** Are there recommended Thread Pool configurations?

The Thread Pool has a number of user case driven configuration parameters that affect its performance. To learn about these and tips on tuning, see [Section 5.6.3.4, “Thread Pool Tuning”](#).

**A.16 MySQL 8.0 FAQ: InnoDB Change Buffer**

|                                                                                                |      |
|------------------------------------------------------------------------------------------------|------|
| A.16.1 What types of operations modify secondary indexes and result in change buffering? ..... | 5021 |

| A.16.3 Does the change buffer support other types of indexes? .....                            | 5021 |
| A.16.4 How much space does <a href="#">InnoDB</a> use for the change buffer? .....             | 5021 |
| A.16.5 How do I determine the current size of the change buffer? .....                         | 5021 |
| A.16.6 When does change buffer merging occur? .....                                            | 5022 |
| A.16.7 When is the change buffer flushed? .....                                                | 5022 |
| A.16.8 When should the change buffer be used? .....                                            | 5022 |
| A.16.9 When should the change buffer not be used? .....                                        | 5022 |
| A.16.10 Where can I find additional information about the change buffer? .....                 | 5022 |

**A.16.1** What types of operations modify secondary indexes and result in change buffering?

[INSERT](#), [UPDATE](#), and [DELETE](#) operations can modify secondary indexes. If an affected index page is not in the buffer pool, the changes can be buffered in the change buffer.

**A.16.2** What is the benefit of the [InnoDB](#) change buffer?

Buffering secondary index changes when secondary index pages are not in the buffer pool avoids expensive random access I/O operations that would be required to immediately read in affected index pages from disk. Buffered changes can be applied later, in batches, as pages are read into the buffer pool by other read operations.

**A.16.3** Does the change buffer support other types of indexes?

No. The change buffer only supports secondary indexes. Clustered indexes, full-text indexes, and spatial indexes are not supported. Full-text indexes have their own caching mechanism.

**A.16.4** How much space does [InnoDB](#) use for the change buffer?

Prior to the introduction of the [innodb\\_change\\_buffer\\_max\\_size](#) configuration option in MySQL 5.6, the maximum size of the on-disk change buffer in the system tablespace was 1/3 of the [InnoDB](#) buffer pool size.

In MySQL 5.6 and later, the [innodb\\_change\\_buffer\\_max\\_size](#) configuration option defines the maximum size of the change buffer as a percentage of the total buffer pool size. By default, [innodb\\_change\\_buffer\\_max\\_size](#) is set to 25. The maximum setting is 50.

[InnoDB](#) does not buffer an operation if it would cause the on-disk change buffer to exceed the defined limit.

Change buffer pages are not required to persist in the buffer pool and may be evicted by LRU operations.

**A.16.5** How do I determine the current size of the change buffer?

The current size of the change buffer is reported by [SHOW ENGINE INNODB STATUS \G](#), under the [INSERT BUFFER AND ADAPTIVE HASH INDEX](#) heading. For example:

```

INSERT BUFFER AND ADAPTIVE HASH INDEX

Ibuf: size 1, free list len 0, seg size 2, 0 merges
```

Relevant data points include:

- `size`: The number of pages used within the change buffer. Change buffer size is equal to `seg size - (1 + free list len)`. The `1 +` value represents the change buffer header page.
- `seg size`: The size of the change buffer, in pages.

For information about monitoring change buffer status, see [Section 15.5.2, “Change Buffer”](#).

#### A.16.6 When does change buffer merging occur?

- When a page is read into the buffer pool, buffered changes are merged upon completion of the read, before the page is made available.
- Change buffer merging is performed as a background task. The `innodb_io_capacity` parameter sets an upper limit on the I/O activity performed by InnoDB background tasks such as merging data from the change buffer.
- A change buffer merge is performed during crash recovery. Changes are applied from the change buffer (in the system tablespace) to leaf pages of secondary indexes as index pages are read into the buffer pool.
- The change buffer is fully durable and can survive a system crash. Upon restart, change buffer merge operations resume as part of normal operations.
- A full merge of the change buffer can be forced as part of a slow server shutdown using `--innodb-fast-shutdown=0`.

#### A.16.7 When is the change buffer flushed?

Updated pages are flushed by the same flushing mechanism that flushes the other pages that occupy the buffer pool.

#### A.16.8 When should the change buffer be used?

The change buffer is a feature designed to reduce random I/O to secondary indexes as indexes grow larger and no longer fit in the InnoDB buffer pool. Generally, the change buffer should be used when the entire data set does not fit into the buffer pool, when there is substantial DML activity that modifies secondary index pages, or when there are lots of secondary indexes that are regularly changed by DML activity.

#### A.16.9 When should the change buffer not be used?

You might consider disabling the change buffer if the entire data set fits within the InnoDB buffer pool, if you have relatively few secondary indexes, or if you are using solid-state storage, where random reads are about as fast as sequential reads. Before making configuration changes, it is recommended that you run tests using a representative workload to determine if disabling the change buffer provides any benefit.

#### A.16.10 Where can I find additional information about the change buffer?

See [Section 15.5.2, “Change Buffer”](#).

## A.17 MySQL 8.0 FAQ: InnoDB Data-at-Rest Encryption

|                                                                                                                                                |      |
|------------------------------------------------------------------------------------------------------------------------------------------------|------|
| A.17.1 Is data decrypted for users who are authorized to see it? .....                                                                         | 5023 |
| A.17.2 What is the overhead associated with InnoDB data-at-rest encryption? .....                                                              | 5023 |
| A.17.3 What are the encryption algorithms used with InnoDB data-at-rest encryption? .....                                                      | 5023 |
| A.17.4 Is it possible to use 3rd party encryption algorithms in place of the one provided by the InnoDB data-at-rest encryption feature? ..... | 5023 |

|                                                                                                                                           |      |
|-------------------------------------------------------------------------------------------------------------------------------------------|------|
| A.17.5 Can indexed columns be encrypted? .....                                                                                            | 5023 |
| A.17.6 What data types and data lengths does <a href="#">InnoDB</a> data-at-rest encryption support? .....                                | 5023 |
| A.17.7 Does data remain encrypted on the network? .....                                                                                   | 5023 |
| A.17.8 Does database memory contain cleartext or encrypted data? .....                                                                    | 5023 |
| A.17.9 How do I know which data to encrypt? .....                                                                                         | 5024 |
| A.17.10 How is <a href="#">InnoDB</a> data-at-rest encryption different from encryption functions MySQL already provides? .....           | 5024 |
| A.17.11 Does the transportable tablespaces feature work with <a href="#">InnoDB</a> data-at-rest encryption? ..                           | 5024 |
| A.17.12 Does compression work with <a href="#">InnoDB</a> data-at-rest encryption? .....                                                  | 5024 |
| A.17.13 Can I use <a href="#">mysqldump</a> or <a href="#">mysqlpump</a> with encrypted tables? .....                                     | 5024 |
| A.17.14 How do I change (rotate, re-key) the master encryption key? .....                                                                 | 5024 |
| A.17.15 How do I migrate data from a cleartext <a href="#">InnoDB</a> tablespace to an encrypted <a href="#">InnoDB</a> tablespace? ..... | 5024 |

**A.17.1**Is data decrypted for users who are authorized to see it?

Yes. [InnoDB](#) data-at-rest encryption is designed to transparently apply encryption within the database without impacting existing applications. Returning data in encrypted format would break most existing applications. [InnoDB](#) data-at-rest encryption provides the benefit of encryption without the overhead associated with traditional database encryption solutions, which would typically require expensive and substantial changes to applications, database triggers, and views.

**A.17.2**What is the overhead associated with [InnoDB](#) data-at-rest encryption?

There is no additional storage overhead. According to internal benchmarks, performance overhead amounts to a single digit percentage difference.

**A.17.3**What are the encryption algorithms used with [InnoDB](#) data-at-rest encryption?

[InnoDB](#) data-at-rest encryption supports the Advanced Encryption Standard (AES256) block-based encryption algorithm. It uses Electronic Codebook (ECB) block encryption mode for tablespace key encryption and Cipher Block Chaining (CBC) block encryption mode for data encryption.

**A.17.4**Is it possible to use 3rd party encryption algorithms in place of the one provided by the [InnoDB](#) data-at-rest encryption feature?

No, it is not possible to use other encryption algorithms. The provided encryption algorithm is broadly accepted.

**A.17.5**Can indexed columns be encrypted?

[InnoDB](#) data-at-rest encryption supports all indexes transparently.

**A.17.6**What data types and data lengths does [InnoDB](#) data-at-rest encryption support?

[InnoDB](#) data-at-rest encryption supports all supported data types. There is no data length limitation.

**A.17.7**Does data remain encrypted on the network?

Data encrypted by the [InnoDB](#) data-at-rest feature is decrypted when it is read from the tablespace file. Thus, if the data is on the network, it is in cleartext form. However, data on the network can be encrypted using MySQL network encryption, which encrypts data traveling to and from a database using SSL/TLS.

**A.17.8**Does database memory contain cleartext or encrypted data?

With [InnoDB](#) data-at-rest encryption, in-memory data is decrypted, which provides complete transparency.

**A.17.9**How do I know which data to encrypt?

Compliance with the PCI-DSS standard requires that credit card numbers (Primary Account Number, or 'PAN') be stored in encrypted form. Breach Notification Laws (for example, CA SB 1386, CA AB 1950, and similar laws in 43+ more US states) require encryption of first name, last name, driver license number, and other PII data. In early 2008, CA AB 1298 added medical and health insurance information to PII data. Additionally, industry specific privacy and security standards may require encryption of certain assets. For example, assets such as pharmaceutical research results, oil field exploration results, financial contracts, or personal data of law enforcement informants may require encryption. In the health care industry, the privacy of patient data, health records and X-ray images is of the highest importance.

**A.17.10**How is [InnoDB](#) data-at-rest encryption different from encryption functions MySQL already provides?

There are symmetric and asymmetric encryption APIs in MySQL that can be used to manually encrypt data within the database. However, the application must manage encryption keys and perform required encryption and decryption operations by calling API functions. [InnoDB](#) data-at-rest encryption requires no application changes, is transparent to end users, and provides automated, built-in key management.

**A.17.11**Does the transportable tablespaces feature work with [InnoDB](#) data-at-rest encryption?

Yes. It is supported for encrypted file-per-table tablespaces. For more information, see [Exporting Encrypted Tablespaces](#).

**A.17.12**Does compression work with [InnoDB](#) data-at-rest encryption?

Customers using [InnoDB](#) data-at-rest encryption receive the full benefit of compression because compression is applied before data blocks are encrypted.

**A.17.13**Can I use [mysqlpump](#) or [mysqldump](#) with encrypted tables?

Yes. Because these utilities create logical backups, the data dumped from encrypted tables is not encrypted.

**A.17.14**How do I change (rotate, re-key) the master encryption key?

[InnoDB](#) data-at-rest encryption uses a two tier key mechanism. When data-at-rest encryption is used, individual tablespace keys are stored in the header of the underlying tablespace data file. Tablespace keys are encrypted using the master encryption key. The master encryption key is generated when tablespace encryption is enabled, and is stored outside the database. The master encryption key is rotated using the [ALTER INSTANCE ROTATE INNODB MASTER KEY](#) statement, which generates a new master encryption key, stores the key, and rotates the key into use.

**A.17.15**How do I migrate data from a cleartext [InnoDB](#) tablespace to an encrypted [InnoDB](#) tablespace?

Transferring data from one tablespace to another is not required. To encrypt data in an [InnoDB](#) file-per-table tablespace, run [ALTER TABLE \*tbl\\_name\* ENCRYPTION = 'Y'](#). To encrypt a general tablespace or the [mysql](#) tablespace, run [ALTER TABLESPACE \*tablespace\\_name\* ENCRYPTION = 'Y'](#). Encryption support for general tablespaces was introduced in MySQL 8.0.13. Encryption support for the [mysql](#) system tablespace is available as of MySQL 8.0.16.

## A.18 MySQL 8.0 FAQ: Virtualization Support

**A.18.1** Is MySQL supported on virtualized environments such as Oracle VM, VMWare, Docker, Microsoft Hyper-V, or others? ..... 5024**A.18.1** Is MySQL supported on virtualized environments such as Oracle VM, VMWare, Docker, Microsoft Hyper-V, or others?

MySQL is supported on virtualized environments, but is certified only for [Oracle VM](#). Contact Oracle Support for more information.

Be aware of potential problems when using virtualization software. The usual ones are related to performance, performance degradations, slowness, or unpredictability of disk, I/O, network, and memory.

---

## Appendix B Error Messages and Common Problems

This appendix describes the types of error information MySQL provides and how to obtain information about them. The final section is for troubleshooting. It describes common problems and errors that may occur and potential resolutions.

### Additional Resources

Other error-related documentation includes:

- Information about configuring where and how the server writes the error log: [Section 5.4.2, “The Error Log”](#)
- Information about the character set used for error messages: [Section 10.6, “Error Message Character Set”](#)
- Information about the language used for error messages: [Section 10.12, “Setting the Error Message Language”](#)
- Information about errors related to [InnoDB](#): [Section 15.21.5, “InnoDB Error Handling”](#)
- Descriptions of the error messages that the MySQL server and client programs generate: [MySQL 8.0 Error Message Reference](#)

### B.1 Error Message Sources and Elements

This section discusses how error messages originate within MySQL and the elements they contain.

- [Error Message Sources](#)
- [Error Message Elements](#)
- [Error Code Ranges](#)

#### Error Message Sources

Error messages can originate on the server side or the client side:

- On the server side, error messages may occur during the startup and shutdown processes, as a result of issues that occur during SQL statement execution, and so forth.
  - The MySQL server writes some error messages to its error log. These indicate issues of interest to database administrators or that require DBA action.
  - The server sends other error messages to client programs. These indicate issues pertaining only to a particular client. The MySQL client library takes errors received from the server and makes them available to the host client program.

- Client-side error messages are generated from within the MySQL client library, usually involving problems communicating with the server.

Example server-side error messages written to the error log:

- This message produced during the startup process provides a status or progress indicator:

```
2018-10-28T13:01:32.735983Z 0 [Note] [MY-010303] [Server] Skipping
generation of SSL certificates as options related to SSL are specified.
```

- This message indicates an issue that requires DBA action:

```
2018-10-02T03:20:39.410387Z 768 [ERROR] [MY-010045] [Server] Event Scheduler:
[evtuser@localhost][myschema.e_daily] Unknown database 'mydb'
```

Example server-side error message sent to client programs, as displayed by the `mysql` client:

```
mysql> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Example client-side error message originating from within the client library, as displayed by the `mysql` client:

```
shell> mysql -h no-such-host
ERROR 2005 (HY000): Unknown MySQL server host 'no-such-host' (0)
```

Whether an error originates from within the client library or is received from the server, a MySQL client program may respond in varying ways. As just illustrated, the client may display the error message so the user can take corrective measures. The client may instead internally attempt to resolve or retry a failed operation, or take other action.

## Error Message Elements

When an error occurs, error information includes several elements: an error code, SQLSTATE value, and message string. These elements have the following characteristics:

- Error code: This value is numeric. It is MySQL-specific and is not portable to other database systems.

Each error number has a corresponding symbolic value. Examples:

- The symbol for server error number `1146` is `ER_NO_SUCH_TABLE`.
- The symbol for client error number `2005` is `CR_UNKNOWN_HOST`.

The set of error codes used in error messages is partitioned into distinct ranges; see [Error Code Ranges](#).

Error codes are stable across General Availability (GA) releases of a given MySQL series. Before a series reaches GA status, new codes may still be under development and are subject to change.

- SQLSTATE value: This value is a five-character string (for example, `'42S02'`). SQLSTATE values are taken from ANSI SQL and ODBC and are more standardized than the numeric error codes. The first two characters of an SQLSTATE value indicate the error class:
  - Class = `'00'` indicates success.
  - Class = `'01'` indicates a warning.
  - Class = `'02'` indicates “not found.” This is relevant within the context of cursors and is used to control what happens when a cursor reaches the end of a data set. This condition also occurs for `SELECT ... INTO var_list` statements that retrieve no rows.
  - Class > `'02'` indicates an exception.

For server-side errors, not all MySQL error numbers have corresponding SQLSTATE values. In these cases, 'HY000' (general error) is used.

For client-side errors, the SQLSTATE value is always 'HY000' (general error), so it is not meaningful for distinguishing one client error from another.

- Message string: This string provides a textual description of the error.

## Error Code Ranges

The set of error codes used in error messages is partitioned into distinct ranges, each with its own purpose:

- 1 to 999: Global error codes. This error code range is called “global” because it is a shared range that is used by the server as well as by clients.

When an error in this range originates on the server side, the server writes it to the error log, padding the error code with leading zeros to six digits and adding a prefix of MY-.

When an error in this range originates on the client side, the client library makes it available to the client program with no zero-padding or prefix.

- 1,000 to 1,999: Server error codes reserved for messages sent to clients.
- 2,000 to 2,999: Client error codes reserved for use by the client library.
- 3,000 to 4,999: Server error codes reserved for messages sent to clients.
- 5,000 to 5,999: Error codes reserved for use by X Plugin for messages sent to clients.
- 10,000 to 49,999: Server error codes reserved for messages to be written to the error log (not sent to clients).

When an error in this range occurs, the server writes it to the error log, padding the error code with leading zeros to six digits and adding a prefix of MY-.

- 50,000 to 51,999: Error codes reserved for use by third parties.

The server handles error messages written to the error log differently from error messages sent to clients:

- When the server writes a message to the error log, it pads the error code with leading zeros to six digits and adds a prefix of MY- (examples: MY-000022, MY-010048).
- When the server sends a message to a client program, it adds no zero-padding or prefix to the error code (examples: 1036, 3013).

## B.2 Error Information Interfaces

Error messages can originate on the server side or the client side, and each error message includes an error code, SQLSTATE value, and message string, as described in [Section B.1, “Error Message Sources and Elements”](#). For lists of server-side, client-side, and global (shared between server and clients) errors, see [MySQL 8.0 Error Message Reference](#).

For error checking from within programs, use error code numbers or symbols, not error message strings. Message strings do not change often, but it is possible. Also, if the database administrator changes the language setting, that affects the language of message strings; see [Section 10.12, “Setting the Error Message Language”](#).

Error information in MySQL is available in the server error log, at the SQL level, from within client programs, and at the command line.

- [Error Log](#)
- [SQL Error Message Interface](#)
- [Client Error Message Interface](#)
- [Command-Line Error Message Interface](#)

## Error Log

On the server side, some messages are intended for the error log. For information about configuring where and how the server writes the log, see [Section 5.4.2, “The Error Log”](#).

Other server error messages are intended to be sent to client programs and are available as described in [Client Error Message Interface](#).

The range within which a particular error code lies determines whether the server writes an error message to the error log or sends it to clients. For information about these ranges, see [Error Code Ranges](#).

## SQL Error Message Interface

At the SQL level, there are several sources of error information in MySQL:

- SQL statement warning and error information is available through the [SHOW WARNINGS](#) and [SHOW ERRORS](#) statements. The [warning\\_count](#) system variable indicates the number of errors, warnings, and notes (with notes excluded if the [sql\\_notes](#) system variable is disabled). The [error\\_count](#) system variable indicates the number of errors. Its value excludes warnings and notes.
- The [GET DIAGNOSTICS](#) statement may be used to inspect the diagnostic information in the diagnostics area. See [Section 13.6.7.3, “GET DIAGNOSTICS Statement”](#).
- [SHOW SLAVE STATUS](#) statement output includes information about replication errors occurring on replica servers.
- [SHOW ENGINE INNODB STATUS](#) statement output includes information about the most recent foreign key error if a [CREATE TABLE](#) statement for an [InnoDB](#) table fails.

## Client Error Message Interface

Client programs receive errors from two sources:

- Errors that originate on the client side from within the MySQL client library.
- Errors that originate on the server side and are sent to the client by the server. These are received within the client library, which makes them available to the host client program.

The range within which a particular error code lies determines whether it originated from within the client library or was received by the client from the server. For information about these ranges, see [Error Code Ranges](#).

Regardless of whether an error originates from within the client library or is received from the server, a MySQL client program obtains the error code, SQLSTATE value, message string, and other related information by calling C API functions in the client library:

- [mysql\\_errno\(\)](#) returns the MySQL error code.
- [mysql\\_sqlstate\(\)](#) returns the SQLSTATE value.
- [mysql\\_error\(\)](#) returns the message string.

- `mysql_stmt_errno()`, `mysql_stmt_sqlstate()`, and `mysql_stmt_error()` are the corresponding error functions for prepared statements.
- `mysql_warning_count()` returns the number of errors, warnings, and notes for the most recent statement.

For descriptions of the client library error functions, see [MySQL 8.0 C API Developer Guide](#).

A MySQL client program may respond to an error in varying ways. The client may display the error message so the user can take corrective measures, internally attempt to resolve or retry a failed operation, or take other action. For example, (using the `mysql` client), a failure to connect to the server might result in this message:

```
shell> mysql -h no-such-host
ERROR 2005 (HY000): Unknown MySQL server host 'no-such-host' (0)
```

## Command-Line Error Message Interface

The `pererror` program provides information from the command line about error numbers. See [Section 4.8.2, “pererror — Display MySQL Error Message Information”](#).

```
shell> pererror 1231
MySQL error code MY-001231 (ER_WRONG_VALUE_FOR_VAR): Variable '%-.64s'
can't be set to the value of '%-.200s'
```

For MySQL NDB Cluster errors, use `ndb_pererror`. See [Section 23.4.16, “ndb\\_pererror — Obtain NDB Error Message Information”](#).

```
shell> ndb_pererror 323
NDB error code 323: Invalid nodegroup id, nodegroup already existing:
Permanent error: Application error
```

## B.3 Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

### B.3.1 How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:
  - The keyboard does not work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light does not change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
  - The mouse pointer does not move.
  - The machine does not answer to a remote machine's pings.
  - Other programs that are not related to MySQL do not behave correctly.
  - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as `glibc`) are up to date.

It is always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.
- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See [Section 5.4, “MySQL Server Logs”](#).
- If you do not think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it does not want to die, there is probably a bug in the operating system.

If you have examined all other possibilities and concluded that the MySQL server or a MySQL client is causing the problem, it is time to create a bug report, see [Section 1.6, “How to Report Bugs or Problems”](#). In the bug report, try to give a complete description of how the system is behaving and what you think is happening. Also state why you think that MySQL is causing the problem. Take into consideration all the situations described in this chapter. State any problems exactly how they appear when you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system does not work.” This provides us with no information about what could be the problem.

If a program fails, it is always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in [Section 1.6, “How to Report Bugs or Problems”](#).

## B.3.2 Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

### B.3.2.1 Access denied

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server permits client programs to use when connecting. See [Section 6.2, “Access Control and Account Management”](#), and [Section 6.2.21, “Troubleshooting Problems Connecting to MySQL”](#).

#### B.3.2.2 Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the file system (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you do not specify a host name or if you specify the special host name `localhost`.

If the MySQL server is running on Windows, you can connect using TCP/IP. If the server is started with the `named_pipe` system variable enabled, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you do not give a host name when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that does not work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the host name.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket file name or TCP/IP port number when trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See [Section 2.10.2, "Starting the Server"](#).

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket file name might be different in your setup. `host_ip` represents the IP address of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=SOCKET --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotation marks with the `hostname` command; these cause the output of `hostname` (that is, the current host name) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the host name of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with the `skip_networking` system variable enabled, it cannot accept TCP/IP connections at all. If the server was started with the `bind_address` system variable set to `127.0.0.1`, it listens for TCP/IP connections only locally on the loopback interface and does not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or Windows Firewall may need to be configured not to block the MySQL port.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running on the local host. Check your operating system's process list to ensure the `mysqld` process is present.

- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: [Connection to MySQL Server Failing on Windows](#).
- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See [Section B.3.3.6, "How to Protect or Change the MySQL Unix Socket File"](#).
- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket path name for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

```
shell> netstat -ln | grep mysql
```

See [Section B.3.3.6, "How to Protect or Change the MySQL Unix Socket File"](#).

- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill`) before you can restart the MySQL server. See [Section B.3.3.3, "What to Do If MySQL Keeps Crashing"](#).
- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket file name in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.
- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)
- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, see [Section 6.7, "SELinux"](#).

## Connection to MySQL Server Failing on Windows

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows does not allow for enough ephemeral (short-lived) ports to serve those connections.

The purpose of `TIME_WAIT` is to keep a connection accepting packets even after the connection has been closed. This is because Internet routing can cause a packet to take a slow route to its destination and it may arrive after both sides have agreed to close. If the port is in use for a new connection, that packet from the old connection could break the protocol or compromise personal information from the original connection. The `TIME_WAIT` delay prevents this by ensuring that the port cannot be reused until after some time has been permitted for those delayed packets to arrive.

It is safe to reduce `TIME_WAIT` greatly on LAN connections because there is little chance of packets arriving at very long delays, as they could through the Internet with its comparatively large distances and latencies.

Windows permits ephemeral (short-lived) TCP ports to the user. After any port is closed, it remains in a `TIME_WAIT` status for 120 seconds. The port is not available again until this time expires. The default range of port numbers depends on the version of Windows, with a more limited number of ports in older versions:

- Windows through Server 2003: Ports in range 1025–5000
- Windows Vista, Server 2008, and newer: Ports in range 49152–65535

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

#### Important

The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore it if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: <http://support.microsoft.com/kb/256986/EN-US/>.

1. Start Registry Editor ([Regedt32.exe](#)).
2. Locate the following key in the registry:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
```

3. On the [Edit](#) menu, click [Add Value](#), and then add the following registry value:

```
Value Name: MaxUserPort
Data Type: REG_DWORD
Value: 65534
```

This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the [Edit](#) menu, click [Add Value](#), and then add the following registry value:

```
Value Name: TcpTimedWaitDelay
Data Type: REG_DWORD
Value: 30
```

This sets the number of seconds to hold a TCP port connection in `TIME_WAIT` state before closing. The valid range is between 30 and 300 decimal, although you may wish to check with Microsoft for the latest permitted values. The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

### B.3.2.3 Lost connection to MySQL server

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes “during query,” this is probably the case you are experiencing.

Sometimes the “during query” form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing `net_read_timeout` from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your `connect_timeout` value is set to only a few seconds, you may be able to resolve the problem by increasing it to ten seconds, perhaps more if you have a very long distance or slow connection. You can determine whether you are experiencing this more uncommon cause by using `SHOW GLOBAL STATUS LIKE 'Aborted_connects'`. It increases by one for each initial connection attempt that the server aborts. You may see “reading authorization packet” as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with `BLOB` values that are larger than `max_allowed_packet`, which can cause this error with some clients. Sometime you may see an `ER_NET_PACKET_TOO_LARGE` error, and that confirms that you need to increase `max_allowed_packet`.

#### B.3.2.4 Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

#### B.3.2.5 Too many connections

If clients encounter `Too many connections` errors when attempting to connect to the `mysqld` server, all available connections are in use by other clients.

The permitted number of connections is controlled by the `max_connections` system variable. To support more connections, set `max_connections` to a larger value.

`mysqld` actually permits `max_connections + 1` client connections. The extra connection is reserved for use by accounts that have the `CONNECTION_ADMIN` privilege (or the deprecated `SUPER` privilege). By granting the privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See [Section 13.7.7.29, “SHOW PROCESSLIST Statement”](#).

The server also permits administrative connections on a dedicated interface. For more information about how the server handles client connections, see [Section 5.1.12.1, “Connection Interfaces”](#).

#### B.3.2.6 Out of memory

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

### B.3.2.7 MySQL server has gone away

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent).

| Error Code                        | Description                                                                                                                 |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <code>CR_SERVER_GONE_ERROR</code> | The client couldn't send a question to the server.                                                                          |
| <code>CR_SERVER_LOST</code>       | The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question. |

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See [Section 5.1.8, “Server System Variables”](#).

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` expired) before the command was issued.

The problem on Windows is that in some cases MySQL does not get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

The solution to this is to either do a `mysql_ping()` on the connection if there has been a long time since the last query (this is what Connector/ODBC does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone

wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` variable, which has a default value of 64MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in [Section B.3.2.8, “Packet Too Large”](#).

An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.

- It is also possible to see this error if host name lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working—from MySQL's point of view the problem is indistinguishable from any other network timeout.

You may also see the `MySQL server has gone away` error if MySQL is started with the `skip_networking` system variable enabled.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See [Section B.3.3.3, “What to Do If MySQL Keeps Crashing”](#).

You can obtain more information about lost connections by starting `mysqld` with the `log_error_verbosity` system variable set to 3. This logs some of the disconnection messages in the `hostname.err` file. See [Section 5.4.2, “The Error Log”](#).

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See [Section B.3.3.3, “What to Do If MySQL Keeps Crashing”](#).
- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See [Section 5.9, “Debugging MySQL”](#).
- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the general query log enabled to determine whether the problem query appears in the log? (See [Section 5.4.3, “The General Query Log”](#).)

See also [Section B.3.2.9, “Communication Errors and Aborted Connections”](#), and [Section 1.6, “How to Report Bugs or Problems”](#).

### B.3.2.8 Packet Too Large

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a replication source server to a replica.

The largest possible packet that can be transmitted to or from a MySQL 8.0 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues an `ER_NET_PACKET_TOO_LARGE` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 64MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 128MB, start the server like this:

```
shell> mysqld --max_allowed_packet=128M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 128MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=128M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

### B.3.2.9 Communication Errors and Aborted Connections

If connection problems occur such as communication errors or aborted connections, use these sources of information to diagnose problems:

- The error log. See [Section 5.4.2, “The Error Log”](#).
- The general query log. See [Section 5.4.3, “The General Query Log”](#).
- The `Aborted_xxx` and `Connection_errors_xxx` status variables. See [Section 5.1.10, “Server Status Variables”](#).
- The host cache, which is accessible using the Performance Schema `host_cache` table. See [Section 5.1.12.3, “DNS Lookups and the Host Cache”](#), and [Section 27.12.21.2, “The host\\_cache Table”](#).

If the `log_error_verbosity` system variable is set to 3, you might find messages like this in your error log:

```
[Note] Aborted connection 854 to db: 'employees' user: 'josh'
```

If a client is unable even to connect, the server increments the `Aborted_connects` status variable. Unsuccessful connection attempts can occur for the following reasons:

- A client attempts to access a database but has no privileges for it.
- A client uses an incorrect password.
- A connection packet does not contain the right information.
- It takes more than `connect_timeout` seconds to obtain a connect packet. See [Section 5.1.8, “Server System Variables”](#).

If these kinds of things happen, it might indicate that someone is trying to break into your server! If the general query log is enabled, messages for these types of problems are logged to it.

If a client successfully connects but later disconnects improperly or is terminated, the server increments the `Aborted_clients` status variable, and logs an `Aborted connection` message to the error log. The cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See [Section 5.1.8, “Server System Variables”](#).
- The client program ended abruptly in the middle of a data transfer.

Other reasons for problems with aborted connections or aborted clients:

- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See [Section B.3.2.8, “Packet Too Large”](#).
- Use of Ethernet protocol with Linux, both half and full duplex. Some Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file using FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. Switch the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and test the results to determine the best setting.
- A problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.

See also [Section B.3.2.7, “MySQL server has gone away”](#).

### B.3.2.10 The table is full

If a table-full error occurs, it may be that the disk is full or that the table has reached its maximum size. The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. See [Section 8.4.6, “Limits on Table Size”](#).

### B.3.2.11 Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file 'C:\temp\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
```

```
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See [Section 4.2.2.2, “Using Option Files”](#).

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `pererror`. One reason the server cannot write to a table is that the file system is full:

```
shell> pererror 28
OS error code 28: No space left on device
```

If you get an error of the following type during startup, it indicates that the file system or directory used for storing data files is write protected. Provided that the write error is to a test file, the error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

### B.3.2.12 Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

### B.3.2.13 Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

```
Found wrong password for user 'some_user'@'some_host'; ignoring user
```

As a result, the account is simply ignored by the permission system. To fix this problem, assign a new, valid password to the account.

### B.3.2.14 Table 'tbl\_name' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case-sensitive if they are located on a file system that has case-sensitive file names.
- Even for file systems that are not case-sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See [Section 13.7.7, “SHOW Statements”](#).

### B.3.2.15 Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multibyte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `CMake` with the `-DDEFAULT_CHARSET=charset_name` option. See [Section 2.9.7, “MySQL Source-Configuration Options”](#).

All standard MySQL binaries are compiled with support for all multibyte character sets.

- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

In this case, you need to use one of the following methods to solve the problem:

- Recompile the client with support for the character set. See [Section 2.9.7, “MySQL Source-Configuration Options”](#).
- Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
- Copy the character definition files to the path where the client expects them to be.

### B.3.2.16 File Not Found and Similar Errors

If you get `ERROR 'file_name' not found (errno: 23)`, `Can't open file: file_name (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you have not allocated enough file descriptors for the MySQL server. You can use the `pererror` utility to get a description of what the error number means:

```
shell> pererror 23
OS error code 23: File table overflow
shell> pererror 24
OS error code 24: Too many open files
shell> pererror 11
OS error code 11: Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` system variable (the default value is 64). This may not entirely prevent running out of file descriptors because in some circumstances the server may attempt to extend the cache size temporarily, as described in [Section 8.4.3.1, “How MySQL Opens and Closes Tables”](#). Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or set the `open_files_limit` system variable. See [Section 5.1.8, “Server System Variables”](#). The easiest way to set these values is to add an option to your option file. See [Section 4.2.2.2, “Using Option Files”](#). If you have an old version of `mysqld` that does not support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the `#` character to uncomment this line, and change the number `256` to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to

increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

#### Note

If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

### B.3.2.17 Table-Corruption Issues

If you have started `mysqld` with the `myisam_recover_options` system variable set, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file 'Warning: Checking table ...' which is followed by 'Warning: Repairing table' if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further.

When the server detects `MyISAM` table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: `Got an error from thread_id=1, mi_dynrec.c:368`. This is useful information to include in bug reports.

See also [Section 5.1.7, “Server Command Options”](#), and [Section 5.9.1.7, “Making a Test Case If You Experience Table Corruption”](#).

## B.3.3 Administration-Related Issues

### B.3.3.1 Problems with File Permissions

If you have problems with file permissions, the `UMASK` or `UMASK_DIR` environment variable might be set incorrectly when `mysqld` starts. For example, `mysqld` might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/file_name' (Errcode: 13)
```

The default `UMASK` and `UMASK_DIR` values are `0640` and `0750`, respectively. `mysqld` assumes that the value for `UMASK` or `UMASK_DIR` is in octal if it starts with a zero. For example, setting `UMASK=0600` is equivalent to `UMASK=384` because `0600` octal is `384` decimal.

Assuming that you start `mysqld` using `mysqld_safe`, change the default `UMASK` value as follows:

```
UMASK=384 # = 600 in octal
export UMASK
mysqld_safe &
```

#### Note

An exception applies for the error log file if you start `mysqld` using `mysqld_safe`, which does not respect `UMASK`: `mysqld_safe` may create the error log file if it does not exist prior to starting `mysqld`, and `mysqld_safe` uses a umask set to a strict value of `0137`. If this is unsuitable, create the error file manually with the desired access mode prior to executing `mysqld_safe`.

By default, `mysqld` creates database directories with an access permission value of `0750`. To modify this behavior, set the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, to give group access to all new directories, start `mysqld_safe` as follows:

```
UMASK_DIR=504 # = 770 in octal
export UMASK_DIR
```

```
mysqld_safe &
```

For additional details, see [Section 4.9, “Environment Variables”](#).

### B.3.3.2 How to Reset the Root Password

If you have never assigned a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, this is insecure. For instructions on assigning a password, see [Section 2.10.4, “Securing the Initial MySQL Account”](#).

If you know the `root` password and want to change it, see [Section 13.7.1.1, “ALTER USER Statement”](#), and [Section 13.7.1.10, “SET PASSWORD Statement”](#).

If you assigned a `root` password previously but have forgotten it, you can assign a new password. The following sections provide instructions for Windows and Unix and Unix-like systems, as well as generic instructions that apply to any system.

#### Resetting the Root Password: Windows Systems

On Windows, use the following procedure to reset the password for the MySQL `'root'@'localhost'` account. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

1. Log on to your system as Administrator.
2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager: From the **Start** menu, select **Control Panel**, then **Administrative Tools**, then **Services**. Find the MySQL service in the list and stop it.

If your server is not running as a service, you may need to use the Task Manager to force it to stop.

3. Create a text file containing the password-assignment statement on a single line. Replace the password with the password that you want to use.

```
ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

4. Save the file. This example assumes that you name the file `C:\mysql-init.txt`.
5. Open a console window to get to the command prompt: From the **Start** menu, select **Run**, then enter `cmd` as the command to be run.
6. Start the MySQL server with the `init_file` system variable set to name the file (notice that the backslash in the option value is doubled):

```
C:\> cd "C:\Program Files\MySQL\MySQL Server 8.0\bin"
C:\> mysqld --init-file=C:\mysql-init.txt
```

If you installed MySQL to a different location, adjust the `cd` command accordingly.

The server executes the contents of the file named by the `init_file` system variable at startup, changing the `'root'@'localhost'` account password.

To have server output to appear in the console window rather than in a log file, add the `--console` option to the `mysqld` command.

If you installed MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option. For example:

```
C:\> mysqld
 --defaults-file="C:\\ProgramData\\MySQL\\MySQL Server 8.0\\my.ini"
 --init-file=C:\\mysql-init.txt
```

The appropriate `--defaults-file` setting can be found using the Services Manager: From the **Start** menu, select **Control Panel**, then **Administrative Tools**, then **Services**. Find the MySQL

service in the list, right-click it, and choose the `Properties` option. The `Path to executable` field contains the `--defaults-file` setting.

7. After the server has started successfully, delete `C:\mysql-init.txt`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the MySQL server and restart it normally. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

## Resetting the Root Password: Unix and Unix-Like Systems

On Unix, use the following procedure to reset the password for the MySQL `'root'@'localhost'` account. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

The instructions assume that you start the MySQL server from the Unix login account that you normally use for running it. For example, if you run the server using the `mysql` login account, you should log in as `mysql` before using the instructions. Alternatively, you can log in as `root`, but in this case you *must* start `mysqld` with the `--user=mysql` option. If you start the server as `root` without using `--user=mysql`, the server may create `root`-owned files in the data directory, such as log files, and these may cause permission-related problems for future server startups. If that happens, you must either change the ownership of the files to `mysql` or remove them.

1. Log on to your system as the Unix user that the MySQL server runs as (for example, `mysql`).
2. Stop the MySQL server if it is running. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, host name, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the file name has an extension of `.pid` and begins with either `mysqld` or your system's host name.

Stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process. Use the actual path name of the `.pid` file in the following command:

```
shell> kill `cat /mysql-data-directory/host_name.pid`
```

Use backticks (not forward quotation marks) with the `cat` command. These cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file containing the password-assignment statement on a single line. Replace the password with the password that you want to use.

```
ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

4. Save the file. This example assumes that you name the file `/home/me/mysql-init`. The file contains the password, so do not save it where it can be read by other users. If you are not logged in as `mysql` (the user the server runs as), make sure that the file has permissions that permit `mysql` to read it.

5. Start the MySQL server with the `init_file` system variable set to name the file:

```
shell> mysqld --init-file=/home/me/mysql-init &
```

The server executes the contents of the file named by the `init_file` system variable at startup, changing the `'root'@'localhost'` account password.

Other options may be necessary as well, depending on how you normally start your server. For example, `--defaults-file` may be needed before the `init_file` argument.

6. After the server has started successfully, delete `/home/me/mysql-init`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally.

## Resetting the Root Password: Generic Instructions

The preceding sections provide password-resetting instructions specifically for Windows and Unix and Unix-like systems. Alternatively, on any platform, you can reset the password using the `mysql` client (but this approach is less secure):

1. Stop the MySQL server if necessary, then restart it with the `--skip-grant-tables` option. This enables anyone to connect without a password and with all privileges, and disables account-management statements such as `ALTER USER` and `SET PASSWORD`. Because this is insecure, if the server is started with the `--skip-grant-tables` option, it also disables remote connections by enabling `skip_networking`.
2. Connect to the MySQL server using the `mysql` client; no password is necessary because the server was started with `--skip-grant-tables`:

```
shell> mysql
```

3. In the `mysql` client, tell the server to reload the grant tables so that account-management statements work:

```
mysql> FLUSH PRIVILEGES;
```

Then change the `'root'@'localhost'` account password. Replace the password with the password that you want to use. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

```
mysql> ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally (without the `--skip-grant-tables` option and without enabling the `skip_networking` system variable).

### B.3.3.3 What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This does not mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See [Section 5.4.2, "The Error Log"](#).

On some systems, you can find in the error log a stack trace of where `mysqld` died. Note that the variable values written in the error log may not always be 100% correct.

Many unexpected server exits are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with the `delay_key_write` system variable enabled, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.

- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that does not support good file system locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it is at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others result in an unexpected exit for you. Try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all MyISAM tables, and restart `mysqld`. This ensures that you are running from a clean state. See [Chapter 5, MySQL Server Administration](#).
- Start `mysqld` with the general query log enabled (see [Section 5.4.3, “The General Query Log”](#)). Then try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See [Section 5.4.3, “The General Query Log”](#). If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have isolated the bug and should submit a bug report for it. See [Section 1.6, “How to Report Bugs or Problems”](#).
- Try to make a test case that we can use to repeat the problem. See [Section 5.9, “Debugging MySQL”](#).
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- Configuring MySQL for debugging makes it much easier to gather information about possible errors if something goes wrong. Reconfigure MySQL with the `-DWITH_DEBUG=1` option to `CMake` and then recompile. See [Section 5.9, “Debugging MySQL”](#).
- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- If `mysqld` appears to be running but not responding, try `mysqladmin -u root processlist`. Sometimes `mysqld` is not hung even though it seems unresponsive. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while running other queries.
- Try the following:
  1. Start `mysqld` from `gdb` (or another debugger). See [Section 5.9, “Debugging MySQL”](#).
  2. Run your test scripts.
  3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

```
backtrace
info local
up
info local
up
info local
```

With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where *N* is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to exit or misbehave.
- Send a normal bug report. See [Section 1.6, “How to Report Bugs or Problems”](#). Be even more detailed than usual. Because MySQL works for many people, the crash might result from something that exists only on your computer (for example, an error that is related to your particular system libraries).
- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

The current dynamic row code has been in use for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Consider the possibility of hardware faults when diagnosing problems. Defective hardware can be the cause of data corruption. Pay particular attention to your memory and disk subsystems when troubleshooting hardware.

### B.3.3.4 How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- Alternatively, to abort the thread, use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition enables the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations,

it removes the big temporary files and mark the table as crashed. The exception is that for [ALTER TABLE](#), the old table is left unchanged.

### B.3.3.5 Where MySQL Stores Temporary Files

On Unix, MySQL uses the value of the [TMPDIR](#) environment variable as the path name of the directory in which to store temporary files. If [TMPDIR](#) is not set, MySQL uses the system default, which is usually [/tmp](#), [/var/tmp](#), or [/usr/tmp](#).

On Windows, MySQL checks in order the values of the [TMPDIR](#), [TEMP](#), and [TMP](#) environment variables. For the first one found to be set, MySQL uses it and does not check those remaining. If none of [TMPDIR](#), [TEMP](#), or [TMP](#) are set, MySQL uses the Windows system default, which is usually [C:\windows\temp\](#).

If the file system containing your temporary file directory is too small, you can use the [mysqld --tmpdir](#) option to specify a directory in a file system where you have enough space.

The [--tmpdir](#) option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (:) on Unix and semicolon characters (;) on Windows.

#### Note

To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replica, you can set the [slave\\_load\\_tmpdir](#) system variable to specify a separate directory for holding temporary files when replicating [LOAD DATA](#) statements. This directory should be in a disk-based file system (not a memory-based file system) so that the temporary files used to replicate [LOAD DATA](#) can survive machine restarts. The directory also should not be one that is cleared by the operating system during the system startup process. However, replication can now continue after a restart if the temporary files have been removed.

MySQL arranges that temporary files are removed if [mysqld](#) is terminated. On platforms that support it (such as Unix), this is done by unlinking the file after opening it. The disadvantage of this is that the name does not appear in directory listings and you do not see a big temporary file that fills up the file system in which the temporary file directory is located. (In such cases, [lsof +L1](#) may be helpful in identifying large files associated with [mysqld](#).)

When sorting ([ORDER BY](#) or [GROUP BY](#)), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some statements, MySQL creates temporary SQL tables that are not hidden and have names that begin with [#sql](#).

Some [SELECT](#) queries creates temporary SQL tables to hold intermediate results.

DDL operations that rebuild the table and are not performed online using the [ALGORITHM=INPLACE](#) technique create a temporary copy of the original table in the same directory as the original table.

Online DDL operations may use temporary log files for recording concurrent DML, temporary sort files when creating an index, and temporary intermediate tables files when rebuilding the table. For more information, see [Section 15.12.3, “Online DDL Space Requirements”](#).

[InnoDB](#) user-created temporary tables and on-disk internal temporary tables are created in a temporary tablespace file named [ibtmp1](#) in the MySQL data directory. For more information, see [Section 15.6.3.5, “Temporary Tablespaces”](#).

See also [Section 15.15.7](#), “InnoDB INFORMATION\_SCHEMA Temporary Table Info Table”.

The optional `EXTENDED` modifier causes `SHOW TABLES` to list hidden tables created by failed `ALTER TABLE` statements. See [Section 13.7.7.39](#), “SHOW TABLES Statement”.

### B.3.3.6 How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the `sticky` bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

```
[mysqld]
socket=/path/to/socket

[client]
socket=/path/to/socket
```

See [Section 4.2.2.2](#), “Using Option Files”.

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.
- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.
- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `MYSQL_UNIX_ADDR` option when you run `CMake`. See [Section 2.9.7](#), “MySQL Source-Configuration Options”.

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

### B.3.3.7 Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs (for example, in `mysqld_safe` or `mysql.server`). See [Section 4.9](#), “Environment Variables”.

You can set the time zone for the server with the `--timezone=timezone_name` option to `mysqld_safe`. You can also set it by setting the `TZ` environment variable before you start `mysqld`.

The permissible values for `--timezone` or `TZ` are system dependent. Consult your operating system documentation to see what values are acceptable.

## B.3.4 Query-Related Issues

### B.3.4.1 Case Sensitivity in String Searches

For nonbinary strings ([CHAR](#), [VARCHAR](#), [TEXT](#)), string searches use the collation of the comparison operands. For binary strings ([BINARY](#), [VARBINARY](#), [BLOB](#)), comparisons use the numeric values of the bytes in the operands; this means that for alphabetic characters, comparisons are case-sensitive.

A comparison between a nonbinary string and binary string is treated as a comparison of binary strings.

Simple comparison operations ([>=](#), [>](#), [=](#), [<](#), [<=](#), sorting, and grouping) are based on each character's "sort value." Characters with the same sort value are treated as the same character. For example, if [e](#) and [é](#) have the same sort value in a given collation, they compare as equal.

The default character set and collation are [utf8mb4](#) and [utf8mb4\\_0900\\_ai\\_ci](#), so nonbinary string comparisons are case-insensitive by default. This means that if you search with [col\\_name LIKE 'a %'](#), you get all column values that start with [A](#) or [a](#). To make this search case-sensitive, make sure that one of the operands has a case-sensitive or binary collation. For example, if you are comparing a column and a string that both have the [utf8mb4](#) character set, you can use the [COLLATE](#) operator to cause either operand to have the [utf8mb4\\_0900\\_as\\_cs](#) or [utf8mb4\\_bin](#) collation:

```
col_name COLLATE utf8mb4_0900_as_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE utf8mb4_0900_as_cs
col_name COLLATE utf8mb4_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE utf8mb4_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case-sensitive or binary collation. See [Section 13.1.20, "CREATE TABLE Statement"](#).

To cause a case-sensitive comparison of nonbinary strings to be case-insensitive, use [COLLATE](#) to name a case-insensitive collation. The strings in the following example normally are case-sensitive, but [COLLATE](#) changes the comparison to be case-insensitive:

```
mysql> SET NAMES 'utf8mb4';
mysql> SET @s1 = 'MySQL' COLLATE utf8mb4_bin,
 @s2 = 'mysql' COLLATE utf8mb4_bin;
mysql> SELECT @s1 = @s2;
+-----+
| @s1 = @s2 |
+-----+
| 0 |
+-----+
mysql> SELECT @s1 COLLATE utf8mb4_0900_ai_ci = @s2;
+-----+
| @s1 COLLATE utf8mb4_0900_ai_ci = @s2 |
+-----+
| 1 |
+-----+
```

A binary string is case-sensitive in comparisons. To compare the string as case-insensitive, convert it to a nonbinary string and use [COLLATE](#) to name a case-insensitive collation:

```
mysql> SET @s = BINARY 'MySQL';
mysql> SELECT @s = 'mysql';
+-----+
| @s = 'mysql' |
+-----+
| 0 |
+-----+
mysql> SELECT CONVERT(@s USING utf8mb4) COLLATE utf8mb4_0900_ai_ci = 'mysql';
+-----+
| CONVERT(@s USING utf8mb4) COLLATE utf8mb4_0900_ai_ci = 'mysql' |
+-----+
| 1 |
+-----+
```

To determine whether a value is compared as a nonbinary or binary string, use the `COLLATION()` function. This example shows that `VERSION()` returns a string that has a case-insensitive collation, so comparisons are case-insensitive:

```
mysql> SELECT COLLATION(VERSION());
+-----+
| COLLATION(VERSION()) |
+-----+
| utf8_general_ci |
+-----+
```

For binary strings, the collation value is `binary`, so comparisons are case sensitive. One context in which you can expect to see `binary` is for compression functions, which return binary strings as a general rule: string:

```
mysql> SELECT COLLATION(COMPRESS('x'));
+-----+
| COLLATION(COMPRESS('x')) |
+-----+
| binary |
+-----+
```

To check the sort value of a string, the `WEIGHT_STRING()` may be helpful. See [Section 12.8, “String Functions and Operators”](#).

### B.3.4.2 Problems Using DATE Columns

The format of a `DATE` value is `'YYYY-MM-DD'`. According to standard SQL, no other format is permitted. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
SELECT * FROM t1 WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in numeric context and vice versa. MySQL also permits a “relaxed” string format when updating and in a `WHERE` clause that compares a date to a `DATE`, `DATETIME`, or `TIMESTAMP` column. “Relaxed” format means that any punctuation character may be used as the separator between parts. For example, `'2004-08-15'` and `'2004#08#15'` are equivalent. MySQL can also convert a string containing no separators (such as `'20040815'`), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any comparison method other than those just listed, such as `IN` or `STRCMP()`.

For those exceptions, the comparison is done by converting the objects to strings and performing a string comparison.

To be on the safe side, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special “zero” date `'0000-00-00'` can be stored and retrieved as `'0000-00-00'`. When a `'0000-00-00'` date is used through Connector/ODBC, it is automatically converted to `NULL` because ODBC cannot handle that kind of date.

Because MySQL performs the conversions just described, the following statements work (assume that `idate` is a `DATE` column):

```

INSERT INTO t1 (idate) VALUES (19970505);
INSERT INTO t1 (idate) VALUES ('19970505');
INSERT INTO t1 (idate) VALUES ('97-05-05');
INSERT INTO t1 (idate) VALUES ('1997.05.05');
INSERT INTO t1 (idate) VALUES ('1997 05 05');
INSERT INTO t1 (idate) VALUES ('0000-00-00');

SELECT idate FROM t1 WHERE idate >= '1997-05-05';
SELECT idate FROM t1 WHERE idate >= 19970505;
SELECT MOD(idate,100) FROM t1 WHERE idate >= 19970505;
SELECT idate FROM t1 WHERE idate >= '19970505';

```

However, the following statement does not work:

```

SELECT idate FROM t1 WHERE STRCMP(idate,'20030505')=0;

```

`STRCMP()` is a string function, so it converts `idate` to a string in `'YYYY-MM-DD'` format and performs a string comparison. It does not convert `'20030505'` to the date `'2003-05-05'` and perform a date comparison.

If you enable the `ALLOW_INVALID_DATES` SQL mode, MySQL permits you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12. This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

MySQL permits you to store dates where the day or month and day are zero. This is convenient if you want to store a birthdate in a `DATE` column and you know only part of the date. To disallow zero month or day parts in dates, enable the `NO_ZERO_IN_DATE` mode.

MySQL permits you to store a “zero” value of `'0000-00-00'` as a “dummy date.” This is in some cases more convenient than using `NULL` values. If a date to be stored in a `DATE` column cannot be converted to any reasonable value, MySQL stores `'0000-00-00'`. To disallow `'0000-00-00'`, enable the `NO_ZERO_DATE` mode.

To have MySQL check all dates and accept only legal dates (unless overridden by `IGNORE`), set the `sql_mode` system variable to `"NO_ZERO_IN_DATE,NO_ZERO_DATE"`.

### B.3.4.3 Problems with NULL Values

The concept of the `NULL` value is a common source of confusion for newcomers to SQL, who often think that `NULL` is the same thing as an empty string `' '`. This is not the case. For example, the following statements are completely different:

```

mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');

```

Both statements insert a value into the `phone` column, but the first inserts a `NULL` value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the person is known to have no phone, and thus no phone number.”

To help with `NULL` handling, you can use the `IS NULL` and `IS NOT NULL` operators and the `IFNULL()` function.

In SQL, the `NULL` value is never true in comparison to any other value, even `NULL`. An expression that contains `NULL` always produces a `NULL` value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return `NULL`:

```

mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);

```

To search for column values that are `NULL`, you cannot use an `expr = NULL` test. The following statement returns no rows, because `expr = NULL` is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for `NULL` values, you must use the `IS NULL` test. The following statements show how to find the `NULL` phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See [Section 3.3.4.6, “Working with NULL Values”](#), for additional information and examples.

You can add an index on a column that can have `NULL` values if you are using the `MyISAM`, `InnoDB`, or `MEMORY` storage engine. Otherwise, you must declare an indexed column `NOT NULL`, and you cannot insert `NULL` into the column.

When reading data with `LOAD DATA`, empty or missing columns are updated with `' '`. To load a `NULL` value into a column, use `\N` in the data file. The literal word `NULL` may also be used under some circumstances. See [Section 13.2.7, “LOAD DATA Statement”](#).

When using `DISTINCT`, `GROUP BY`, or `ORDER BY`, all `NULL` values are regarded as equal.

When using `ORDER BY`, `NULL` values are presented first, or last if you specify `DESC` to sort in descending order.

Aggregate (group) functions such as `COUNT()`, `MIN()`, and `SUM()` ignore `NULL` values. The exception to this is `COUNT(*)`, which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-`NULL` values in the `age` column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles `NULL` values specially. If you insert `NULL` into a `TIMESTAMP` column, the current date and time is inserted. If you insert `NULL` into an integer or floating-point column that has the `AUTO_INCREMENT` attribute, the next number in the sequence is inserted.

### B.3.4.4 Problems with Column Aliases

An alias can be used in a query select list to give a column a different name. You can use the alias in `GROUP BY`, `ORDER BY`, or `HAVING` clauses to refer to the column:

```
SELECT SQRT(a*b) AS root FROM tbl_name
 GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name
 GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL disallows references to column aliases in a `WHERE` clause. This restriction is imposed because when the `WHERE` clause is evaluated, the column value may not yet have been determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name
 WHERE cnt > 0 GROUP BY id;
```

The `WHERE` clause determines which rows should be included in the `GROUP BY` clause, but it refers to the alias of a column value that is not known until after the rows have been selected, and grouped by the `GROUP BY`.

In the select list of a query, a quoted column alias can be specified using identifier or string quoting characters:

```
SELECT 1 AS `one`, 2 AS 'two';
```

Elsewhere in the statement, quoted references to the alias must use identifier quoting or the reference is treated as a string literal. For example, this statement groups by the values in column `id`, referenced using the alias ``a``:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
GROUP BY `a`;
```

This statement groups by the literal string 'a' and does not work as you may expect:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
GROUP BY 'a';
```

### B.3.4.5 Rollback Failure for Nontransactional Tables

If you receive the following message when trying to perform a [ROLLBACK](#), it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These nontransactional tables are not affected by the [ROLLBACK](#) statement.

If you were not deliberately mixing transactional and nontransactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your [mysqld](#) server (or that was disabled with a startup option). If [mysqld](#) does not support a storage engine, it instead creates the table as a [MyISAM](#) table, which is nontransactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';
SHOW CREATE TABLE tbl_name;
```

See [Section 13.7.7.38, “SHOW TABLE STATUS Statement”](#), and [Section 13.7.7.10, “SHOW CREATE TABLE Statement”](#).

To check which storage engines your [mysqld](#) server supports, use this statement:

```
SHOW ENGINES;
```

See [Section 13.7.7.16, “SHOW ENGINES Statement”](#) for full details.

### B.3.4.6 Deleting Rows from Related Tables

If the total length of the [DELETE](#) statement for [related\\_table](#) is more than the default value of the [max\\_allowed\\_packet](#) system variable, you should split it into smaller parts and execute multiple [DELETE](#) statements. You probably get the fastest [DELETE](#) by specifying only 100 to 1,000 [related\\_column](#) values per statement if the [related\\_column](#) is indexed. If the [related\\_column](#) isn't indexed, the speed is independent of the number of arguments in the [IN](#) clause.

### B.3.4.7 Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that returns no rows, you should use the following procedure to find out what is wrong:

1. Test the query with [EXPLAIN](#) to check whether you can find something that is obviously wrong. See [Section 13.8.2, “EXPLAIN Statement”](#).
2. Select only those columns that are used in the [WHERE](#) clause.
3. Remove one table at a time from the query until it returns some rows. If the tables are large, it is a good idea to use [LIMIT 10](#) with the query.
4. Issue a [SELECT](#) for the column that should have matched a row against the table that was last removed from the query.
5. If you are comparing [FLOAT](#) or [DOUBLE](#) columns with numbers that have decimals, you cannot use equality (=) comparisons. This problem is common in most computer languages because not all

floating-point values can be stored with exact precision. In some cases, changing the `FLOAT` to a `DOUBLE` fixes this. See [Section B.3.4.8, “Problems with Floating-Point Values”](#).

6. If you still cannot figure out what is wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your `SELECT` statement at the end of the file.

Verify that the test file demonstrates the problem by executing these commands:

```
shell> mysqladmin create test2
shell> mysql test2 < query.sql
```

Attach the test file to a bug report, which you can file using the instructions in [Section 1.6, “How to Report Bugs or Problems”](#).

### B.3.4.8 Problems with Floating-Point Values

Floating-point numbers sometimes cause confusion because they are approximate and not stored as exact values. A floating-point value as written in an SQL statement may not be the same as the value represented internally. Attempts to treat floating-point values as exact in comparisons may lead to problems. They are also subject to platform or implementation dependencies. The `FLOAT` and `DOUBLE` data types are subject to these issues. For `DECIMAL` columns, MySQL performs operations with a precision of 65 decimal digits, which should solve most common inaccuracy problems.

The following example uses `DOUBLE` to demonstrate how calculations that are done using floating-point operations are subject to floating-point error.

```
mysql> CREATE TABLE t1 (i INT, d1 DOUBLE, d2 DOUBLE);
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
-> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
-> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
-> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
-> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
-> (6, 0.00, 0.00), (6, -51.40, 0.00);
```

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;
```

| i | a     | b    |
|---|-------|------|
| 1 | 21.4  | 21.4 |
| 2 | 76.8  | 76.8 |
| 3 | 7.4   | 7.4  |
| 4 | 15.4  | 15.4 |
| 5 | 7.2   | 7.2  |
| 6 | -51.4 | 0    |

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

If columns `d1` and `d2` had been defined as `DECIMAL` rather than `DOUBLE`, the result of the `SELECT` query would have contained only one row—the last one shown above.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) > 0.0001;
```

| i | a     | b |
|---|-------|---|
| 6 | -51.4 | 0 |

```
1 row in set (0.00 sec)
```

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) <= 0.0001;
```

| i | a    | b    |
|---|------|------|
| 1 | 21.4 | 21.4 |
| 2 | 76.8 | 76.8 |
| 3 | 7.4  | 7.4  |
| 4 | 15.4 | 15.4 |
| 5 | 7.2  | 7.2  |

```
5 rows in set (0.03 sec)
```

Floating-point values are subject to platform or implementation dependencies. Suppose that you execute the following statements:

```
CREATE TABLE t1(c1 FLOAT(53,0), c2 FLOAT(53,0));
INSERT INTO t1 VALUES('1e+52','-1e+52');
SELECT * FROM t1;
```

On some platforms, the `SELECT` statement returns `inf` and `-inf`. On others, it returns `0` and `-0`.

An implication of the preceding issues is that if you attempt to create a replica by dumping table contents with `mysqldump` on the source and reloading the dump file into the replica, tables containing floating-point columns might differ between the two hosts.

## B.3.5 Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL does not have enough information about the data at hand and has to make “educated” guesses about the data.

For the cases when MySQL does not do the “right” thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `EXPLAIN` to the front of your `SELECT` statement:

```
mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
```

`EXPLAIN` is discussed in more detail in [Section 13.8.2, “EXPLAIN Statement”](#).

- Use `ANALYZE TABLE tbl_name` to update the key distributions for the scanned table. See [Section 13.7.3.1, “ANALYZE TABLE Statement”](#).
- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

```
SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
WHERE t1.col_name=t2.col_name;
```

`USE INDEX` and `IGNORE INDEX` may also be useful. See [Section 8.9.4, “Index Hints”](#).

- Global and table-level `STRAIGHT_JOIN`. See [Section 13.2.10, “SELECT Statement”](#).

- You can tune global or thread-specific system variables. For example, start `mysqld` with the `--max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See [Section 5.1.8, “Server System Variables”](#).

## B.3.6 Table Definition-Related Issues

### B.3.6.1 Problems with ALTER TABLE

If you get a duplicate-key error when using `ALTER TABLE` to change the character set or collation of a character column, the cause is either that the new column collation maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table. `REPAIR TABLE` works for `MyISAM`, `ARCHIVE`, and `CSV` tables.

If you use `ALTER TABLE` on a transactional table or if you are using Windows, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

### B.3.6.2 TEMPORARY Table Problems

Temporary tables created with `CREATE TEMPORARY TABLE` have the following limitations:

- `TEMPORARY` tables are supported only by the `InnoDB`, `MEMORY`, `MyISAM`, and `MERGE` storage engines.
- Temporary tables are not supported for NDB Cluster.
- The `SHOW TABLES` statement does not list `TEMPORARY` tables.
- To rename `TEMPORARY` tables, `RENAME TABLE` does not work. Use `ALTER TABLE` instead:

```
ALTER TABLE old_name RENAME new_name;
```

- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
SELECT * FROM temp_table JOIN temp_table AS t2;
```

The statement produces this error:

```
ERROR 1137: Can't reopen table: 'temp_table'
```

You can work around this issue if your query permits use of a common table expression (CTE) rather than a `TEMPORARY` table. For example, this fails with the `Can't reopen table` error:

```
CREATE TEMPORARY TABLE t SELECT 1 AS col_a, 2 AS col_b;
SELECT * FROM t AS t1 JOIN t AS t2;
```

To avoid the error, use a `WITH` clause that defines a CTE, rather than the `TEMPORARY` table:

```
WITH cte AS (SELECT 1 AS col_a, 2 AS col_b)
SELECT * FROM cte AS t1 JOIN cte AS t2;
```

- The `Can't reopen table` error also occurs if you refer to a temporary table multiple times in a stored function under different aliases, even if the references occur in different statements within the function. It may occur for temporary tables created outside stored functions and referred to across multiple calling and callee functions.
- If a `TEMPORARY` is created with the same name as an existing non-`TEMPORARY` table, the non-`TEMPORARY` table is hidden until the `TEMPORARY` table is dropped, even if the tables use different storage engines.

- There are known issues in using temporary tables with replication. See [Section 17.5.1.31, “Replication and Temporary Tables”](#), for more information.

## B.3.7 Known Issues in MySQL

This section lists known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and debugging instructions in [Section 2.1, “General Installation Guidance”](#), and [Section 5.9, “Debugging MySQL”](#).

The following problems are known:

- Subquery optimization for `IN` is not as effective as for `=`.
- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` or within the various logs (on case-insensitive systems).
- Dropping a `FOREIGN KEY` constraint does not work in replication because the constraint may have another name on the replica.
- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.
- `DISTINCT` with `ORDER BY` does not work inside `GROUP_CONCAT()` if you do not use all and only those columns that are in the `DISTINCT` list.
- When inserting a big integer value (between  $2^{63}$  and  $2^{64}-1$ ) into a decimal or string column, it is inserted as a negative value because the number is evaluated in signed integer context.
- With statement-based binary logging, the source server writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases. However, it is possible for the data on the source and replica to become different if a query is designed in such a way that the data modification is nondeterministic (generally not a recommended practice, even outside of replication).

For example:

- `CREATE TABLE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
- `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
- `REPLACE ... SELECT, INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

**If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic order.**

For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the source and replica.

A query is optimized differently on the source and replica only if:

- The table is stored using a different storage engine on the source than on the replica. (It is possible to use different storage engines on the source and replica. For example, you can use `InnoDB` on the source, but `MyISAM` on the replica if the replica has less available disk space.)
- MySQL buffer sizes (`key_buffer_size`, and so on) are different on the source and replica.

- The source and replica run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using `mysqlbinlog|mysql`.

The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned nondeterministic queries to ensure that the rows are always stored or modified in the same order. Using row-based or mixed logging format also avoids the problem.

- Log file names are based on the server host name if you do not specify a file name with the startup option. To retain the same log file names if you change your host name to something else, you must explicitly use options such as `--log-bin=old_host_name-bin`. See [Section 5.1.7, “Server Command Options”](#). Alternatively, rename the old files to reflect your host name change. If these are binary logs, you must edit the binary log index file and fix the binary log file names there as well. (The same is true for the relay logs on a replica.)
- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA` statement. See [Section 4.6.9, “mysqlbinlog — Utility for Processing Binary Log Files”](#).
- `RENAME` does not work with `TEMPORARY` tables or tables used in a `MERGE` table.
- When using `SET CHARACTER SET`, you cannot use translated characters in database, table, and column names.
- Prior to MySQL 8.0.17, you cannot use `_` or `%` with `ESCAPE` in `LIKE ... ESCAPE`.
- The server uses only the first `max_sort_length` bytes when comparing data values. This means that values cannot reliably be used in `GROUP BY`, `ORDER BY`, or `DISTINCT` if they differ only after the first `max_sort_length` bytes. To work around this, increase the variable value. The default value of `max_sort_length` is 1024 and can be changed at server startup time or at runtime.
- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF()` and `ELT()` with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.
- You can have up to 255 `ENUM` and `SET` columns in one table.
- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.
- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by 2, **not** 1:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns do not participate in the `DISTINCT` comparison.

An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads
WHERE userid = 9 ORDER BY id DESC;
```

and

```
SELECT DISTINCT band_downloads.mp3id
FROM band_downloads,band_mp3
WHERE band_downloads.userid = 9
AND band_mp3.id = band_downloads.mp3id
ORDER BY band_downloads.id DESC;
```

In the second case, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

Note that this happens only for queries that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` does not check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

---

Section 13.2.8, “LOAD XML Statement”  
Section 7.4.5.1, “Making a Copy of a Database”  
Section 15.6.1.4, “Moving or Copying InnoDB Tables”  
Section A.10, “MySQL 8.0 FAQ: NDB Cluster”  
Section 4.5.1.1, “mysql Client Options”  
Section 5.4, “MySQL Server Logs”  
Section 4.6.7, “mysql\_config\_editor — MySQL Configuration Utility”  
Section 7.4.5, “mysqldump Tips”  
Section 4.5.4, “mysqldump — A Database Backup Program”  
Section 4.5.6, “mysqlpump — A Database Backup Program”  
Section 23.2.5, “NDB Cluster Example with Tables and Data”  
Section 23.1, “NDB Cluster Overview”  
Section 23.4.13, “ndb\_import — Import CSV Data Into NDB”  
Section 23.5.14, “ndbinfo: The NDB Cluster Information Database”  
Section 17.1.2.4, “Obtaining the Replication Source Binary Log Coordinates”  
Section 23.5.8, “Online Backup of NDB Cluster”  
Section 4.1, “Overview of MySQL Programs”  
Section 27.12.9, “Performance Schema Connection Attribute Tables”  
Section 23.5.5, “Performing a Rolling Restart of an NDB Cluster”  
Section 23.6.9.2, “Point-In-Time Recovery Using NDB Cluster Replication”  
Section 23.6.5, “Preparing the NDB Cluster for Replication”  
Section 6.2.2, “Privileges Provided by MySQL”  
Section B.3.4.8, “Problems with Floating-Point Values”  
Section 17.1.5.2, “Provisioning a Multi-Source Replica for GTID-Based Replication”  
Section 15.8.9, “Purge Configuration”  
Section 2.11.13, “Rebuilding or Repairing Tables or Indexes”  
Section 7.4.4, “Reloading Delimited-Text Format Backups”  
Section 7.4.2, “Reloading SQL-Format Backups”  
Section 17.4.6, “Replicating Different Databases to Different Replicas”  
Section 17.5.1.34, “Replication and Transaction Inconsistencies”  
Restoring an NDB backup to a later version of NDB Cluster  
Restoring an NDB backup to a previous version of NDB Cluster  
Restoring to More Nodes Than the Original  
Section 27.20, “Restrictions on Performance Schema”  
Section 25.9, “Restrictions on Views”  
Section 5.4.1, “Selecting General Query Log and Slow Query Log Output Destinations”  
Section 5.4.6, “Server Log Maintenance”  
Section 5.1.11, “Server SQL Modes”  
Section 5.1.8, “Server System Variables”  
Section 13.4.1.3, “SET sql\_log\_bin Statement”  
Setting Up Replication with Existing Data  
Section 6.4.1.3, “SHA-256 Pluggable Authentication”  
Section B.3.4.7, “Solving Problems with No Matching Rows”  
Section 2.3.4.8, “Starting MySQL as a Windows Service”  
Section 17.1.3.8, “Stored Function Examples to Manipulate GTIDs”  
Section 11.3.4, “The BLOB and TEXT Types”  
Section 15.20.7, “The InnoDB memcached Plugin and Replication”  
Section 1.2.2, “The Main Features of MySQL”  
Section 6.2.21, “Troubleshooting Problems Connecting to MySQL”  
Section 13.7.4.6, “UNINSTALL PLUGIN Statement”  
Section 17.5.3, “Upgrading a Replication Setup”  
Section 2.11.6, “Upgrading MySQL Binary or Package-based Installations on Unix/Linux”  
Section 17.1.3.5, “Using GTIDs for Failover and Scaleout”  
Section 4.6.9.3, “Using mysqlbinlog to Back Up Binary Log Files”  
Section 7.4, “Using mysqldump for Backups”  
Section 4.2.2.2, “Using Option Files”  
Section 17.4.1, “Using Replication for Backups”  
Section 17.4.4, “Using Replication with Different Source and Replica Storage Engines”
