If a statement passed to `mysql_stmt_prepare()` is one that produces a result set, `mysql_stmt_result_metadata()` returns the result set metadata in the form of a pointer to a `MYSQL_RES` structure that can be used to process the meta information such as number of fields and individual field information. This result set pointer can be passed as an argument to any of the field-based API functions that process result set metadata, such as:

- `mysql_num_fields()`
- `mysql_fetch_field()`
- `mysql_fetch_field_direct()`
- `mysql_fetch_fields()`
- `mysql_field_count()`
- `mysql_field_seek()`
- `mysql_field_tell()`
- `mysql_free_result()`

The result set structure should be freed when you are done with it, which you can do by passing it to `mysql_free_result()`. This is similar to the way you free a result set obtained from a call to `mysql_store_result()`.

The result set returned by `mysql_stmt_result_metadata()` contains only metadata. It does not contain any row results. The rows are obtained by using the statement handler with `mysql_stmt_fetch()`.

Return Values

A `MYSQL_RES` result structure. `NULL` if no meta information exists for the prepared query.

Errors

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

Example

See the Example in [Section 28.6.10.11, “mysql_stmt_fetch\(\)”](#).

28.6.10.24 `mysql_stmt_row_seek()`

```
MYSQL_ROW_OFFSET mysql_stmt_row_seek(MYSQL_STMT *stmt, MYSQL_ROW_OFFSET offset)
```

Description

Sets the row cursor to an arbitrary row in a statement result set. The `offset` value is a row offset that should be a value returned from `mysql_stmt_row_tell()` or from `mysql_stmt_row_seek()`. This value is not a row number; if you want to seek to a row within a result set by number, use `mysql_stmt_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_stmt_row_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_stmt_row_seek()`.

Errors

None.

28.6.10.25 `mysql_stmt_row_tell()`

```
MYSQL_ROW_OFFSET mysql_stmt_row_tell(MYSQL_STMT *stmt)
```

Description

Returns the current position of the row cursor for the last `mysql_stmt_fetch()`. This value can be used as an argument to `mysql_stmt_row_seek()`.

You should use `mysql_stmt_row_tell()` only after `mysql_stmt_store_result()`.

Return Values

The current offset of the row cursor.

Errors

None.

28.6.10.26 `mysql_stmt_send_long_data()`

```
bool mysql_stmt_send_long_data(MYSQL_STMT *stmt, unsigned int parameter_number,
                               const char *data, unsigned long length)
```

Description

Enables an application to send parameter data to the server in pieces (or “chunks”). Call this function after `mysql_stmt_bind_param()` and before `mysql_stmt_execute()`. It can be called multiple times to send the parts of a character or binary data value for a column, which must be one of the `TEXT` or `BLOB` data types.

`parameter_number` indicates which parameter to associate the data with. Parameters are numbered beginning with 0. `data` is a pointer to a buffer containing data to be sent, and `length` indicates the number of bytes in the buffer.

Note

The next `mysql_stmt_execute()` call ignores the bind buffer for all parameters that have been used with `mysql_stmt_send_long_data()` since last `mysql_stmt_execute()` or `mysql_stmt_reset()`.

If you want to reset/forget the sent data, you can do it with `mysql_stmt_reset()`. See [Section 28.6.10.22, “mysql_stmt_reset\(\)”](#).

The `max_allowed_packet` system variable controls the maximum size of parameter values that can be sent with `mysql_stmt_send_long_data()`.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_INVALID_BUFFER_USE`

The parameter does not have a string or binary type.

- `CR_INVALID_PARAMETER_NO`

Invalid parameter number.

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

Example

The following example demonstrates how to send the data for a `TEXT` column in chunks. It inserts the data value `'MySQL - The most popular Open Source database'` into the `text_column` column. The `mysql` variable is assumed to be a valid connection handler.

```
#define INSERT_QUERY "INSERT INTO \  
                    test_long_data(text_column) VALUES(?)"  
  
MYSQL_BIND bind[1];  
long        length;  
  
stmt = mysql_stmt_init(mysql);  
if (!stmt)  
{  
    fprintf(stderr, " mysql_stmt_init(), out of memory\n");  
    exit(0);  
}  
if (mysql_stmt_prepare(stmt, INSERT_QUERY, strlen(INSERT_QUERY)))  
{  
    fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");  
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));  
    exit(0);  
}  
memset(bind, 0, sizeof(bind));
```

```
bind[0].buffer_type= MYSQL_TYPE_STRING;
bind[0].length= &length;
bind[0].is_null= 0;

/* Bind the buffers */
if (mysql_stmt_bind_param(stmt, bind))
{
    fprintf(stderr, "\n param bind failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* Supply data in chunks to server */
if (mysql_stmt_send_long_data(stmt,0,"MySQL",5))
{
    fprintf(stderr, "\n send_long_data failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* Supply the next piece of data */
if (mysql_stmt_send_long_data(stmt,0,
    " - The most popular Open Source database",40))
{
    fprintf(stderr, "\n send_long_data failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* Now, execute the query */
if (mysql_stmt_execute(stmt))
{
    fprintf(stderr, "\n mysql_stmt_execute failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}
```

28.6.10.27 mysql_stmt_sqlstate()

```
const char *mysql_stmt_sqlstate(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_sqlstate()` returns a null-terminated string containing the SQLSTATE error code for the most recently invoked prepared statement API function that can succeed or fail. The error code consists of five characters. "00000" means "no error." The values are specified by ANSI SQL and ODBC. For a list of possible values, see [Appendix B, Errors, Error Codes, and Common Problems](#).

Not all MySQL errors are mapped to SQLSTATE codes. The value "HY000" (general error) is used for unmapped errors.

If the failed statement API function was `mysql_stmt_close()`, do not call `mysql_stmt_sqlstate()` to obtain error information because `mysql_stmt_close()` makes the statement handler invalid. Call `mysql_sqlstate()` instead.

Return Values

A null-terminated character string containing the SQLSTATE error code.

28.6.10.28 mysql_stmt_store_result()

```
int mysql_stmt_store_result(MYSQL_STMT *stmt)
```

Description

Result sets are produced by calling `mysql_stmt_execute()` to executed prepared statements for SQL statements such as `SELECT`, `SHOW`, `DESCRIBE`, and `EXPLAIN`. By default, result sets for successfully executed prepared statements are not buffered on the client and `mysql_stmt_fetch()` fetches them one at a time from the server. To cause the complete result set to be buffered on the client, call `mysql_stmt_store_result()` after binding data buffers with `mysql_stmt_bind_result()` and before calling `mysql_stmt_fetch()` to fetch rows. (For an example, see [Section 28.6.10.11](#), “`mysql_stmt_fetch()`”.)

`mysql_stmt_store_result()` is optional for result set processing, unless you will call `mysql_stmt_data_seek()`, `mysql_stmt_row_seek()`, or `mysql_stmt_row_tell()`. Those functions require a seekable result set.

It is unnecessary to call `mysql_stmt_store_result()` after executing an SQL statement that does not produce a result set, but if you do, it does not harm or cause any notable performance problem. You can detect whether the statement produced a result set by checking if `mysql_stmt_result_metadata()` returns `NULL`. For more information, refer to [Section 28.6.10.23](#), “`mysql_stmt_result_metadata()`”.

Note

MySQL does not by default calculate `MYSQL_FIELD->max_length` for all columns in `mysql_stmt_store_result()` because calculating this would slow down `mysql_stmt_store_result()` considerably and most applications do not need `max_length`. If you want `max_length` to be updated, you can call `mysql_stmt_attr_set(MYSQL_STMT, STMT_ATTR_UPDATE_MAX_LENGTH, &flag)` to enable this. See [Section 28.6.10.3](#), “`mysql_stmt_attr_set()`”.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

28.6.11 C API Asynchronous Interface

As of MySQL 8.0.16, the C API includes asynchronous functions that enable nonblocking communication with the MySQL server. Asynchronous functions enable development of applications that differ from the

query processing model based on synchronous functions that block if reads from or writes to the server connection must wait. Using the asynchronous functions, an application can check whether work on the server connection is ready to proceed. If not, the application can perform other work before checking again later.

For example, an application might open multiple connections to the server and use them to submit multiple statements for execution. The application then can poll the connections to see which of them have results to be fetched, while doing other work.

The asynchronous C API functions cover operations that might otherwise block when reading to or writing from the server connection: The initial connection operation, sending a query, reading the result, and so forth. Each asynchronous function has the same name as its synchronous counterpart, plus a `_nonblocking` suffix:

- `mysql_fetch_row_nonblocking()`: Asynchronously fetches the next row from the result set.
- `mysql_free_result_nonblocking()`: Asynchronously frees memory used by a result set.
- `mysql_next_result_nonblocking()`: Asynchronously returns/initiates the next result in multiple-result executions.
- `mysql_real_connect_nonblocking()`: Asynchronously connects to a MySQL server.
- `mysql_real_query_nonblocking()`: Asynchronously executes an SQL query specified as a counted string.
- `mysql_store_result_nonblocking()`: Asynchronously retrieves a complete result set to the client.

Applications can mix asynchronous and synchronous functions if there are operations that need not be done asynchronously or for which the asynchronous functions do not apply.

The following discussion describes in more detail how to use asynchronous C API functions.

- [Asynchronous Function Calling Conventions](#)
- [Example Program](#)
- [Asynchronous Function Restrictions](#)

Asynchronous Function Calling Conventions

All asynchronous C API functions return an `enum net_async_status` value. The return value can be one of the following values to indicate operation status:

- `NET_ASYNC_NOT_READY`: The operation is still in progress and not yet complete.
- `NET_ASYNC_COMPLETE`: The operation completed successfully.
- `NET_ASYNC_ERROR`: The operation terminated in error.
- `NET_ASYNC_COMPLETE_NO_MORE_RESULTS`: The operation completed successfully and no more results are available. This status applies only to `mysql_next_result_nonblocking()`.

In general, to use an asynchronous function, do this:

- Call the function repeatedly until it no longer returns a status of `NET_ASYNC_NOT_READY`.
- Check whether the final status indicates successful completion (`NET_ASYNC_COMPLETE`) or an error (`NET_ASYNC_ERROR`).

The following examples illustrate some typical calling patterns. `function(args)` represents an asynchronous function and its argument list.

- If it is desirable to perform other processing while the operation is in progress:

```
enum net_async_status status;

status = function(args);
while (status == NET_ASYNC_NOT_READY) {
    /* perform other processing */
    other_processing ();
    /* invoke same function and arguments again */
    status = function(args);
}
if (status == NET_ASYNC_ERROR) {
    /* call failed; handle error */
} else {
    /* call successful; handle result */
}
```

- If there is no need to perform other processing while the operation is in progress:

```
enum net_async_status status;

while ((status = function(args)) == NET_ASYNC_NOT_READY)
    ; /* empty loop */
if (status == NET_ASYNC_ERROR) {
    /* call failed; handle error */
} else {
    /* call successful; handle result */
}
```

- If the function success/failure result does not matter and you want to ensure only that the operation has completed:

```
while (function(args) != NET_ASYNC_COMPLETE)
    ; /* empty loop */
```

For `mysql_next_result_nonblocking()`, it is also necessary to account for the `NET_ASYNC_COMPLETE_NO_MORE_RESULTS` status, which indicates that the operation completed successfully and no more results are available. Use it like this:

```
while ((status = mysql_next_result_nonblocking()) != NET_ASYNC_COMPLETE) {
    if (status == NET_ASYNC_COMPLETE_NO_MORE_RESULTS) {
        /* no more results */
    }
    else if (status == NET_ASYNC_ERROR) {
        /* handle error by calling mysql_error(); */
        break;
    }
}
```

In most cases, arguments for the asynchronous functions are the same as for the corresponding synchronous functions. Exceptions are `mysql_fetch_row_nonblocking()` and `mysql_store_result_nonblocking()`, each of which takes an extra argument compared to its synchronous counterpart. For details, see [Section 28.6.14.1, “mysql_fetch_row_nonblocking\(\)”](#), and [Section 28.6.14.6, “mysql_store_result_nonblocking\(\)”](#).

Example Program

This section shows an example C++ program that illustrates use of asynchronous C API functions.

To set up the SQL objects used by the program, execute the following statements. Substitute a different database or user as desired; in this case, you will need to make some adjustments to the program as well.

```

CREATE DATABASE db;
USE db;
CREATE TABLE test_table (id INT NOT NULL);
INSERT INTO test_table VALUES (10), (20), (30);

CREATE USER 'testuser'@'localhost' IDENTIFIED BY 'testpass';
GRANT ALL ON db.* TO 'testuser'@'localhost';

```

Create a file named `async_app.cc` containing the following program. Adjust the connection parameters as necessary.

```

#include <stdio.h>
#include <string.h>
#include <iostream>
#include <mysql.h>
#include <mysqld_error.h>

using namespace std;

/* change following connection parameters as necessary */
static const char * c_host = "localhost";
static const char * c_user = "testuser";
static const char * c_auth = "testpass";
static int         c_port = 3306;
static const char * c_sock = "/usr/local/mysql/mysql.sock";
static const char * c_dbnm = "db";

void perform_arithmetic() {
    cout<<"dummy function invoked\n";
    for (int i = 0; i < 1000; i++)
        i*i;
}

int main(int argc, char ** argv)
{
    MYSQL *mysql_local;
    MYSQL_RES *result;
    MYSQL_ROW row;
    net_async_status status;
    const char *stmt_text;

    if (!(mysql_local = mysql_init(NULL))) {
        cout<<"mysql_init() failed\n";
        exit(1);
    }
    while ((status = mysql_real_connect_nonblocking(mysql_local, c_host, c_user,
                                                    c_auth, c_dbnm, c_port,
                                                    c_sock, 0))
           == NET_ASYNC_NOT_READY)
        ; /* empty loop */
    if (status == NET_ASYNC_ERROR) {
        cout<<"mysql_real_connect_nonblocking() failed\n";
        exit(1);
    }

    /* run query asynchronously */
    stmt_text = "SELECT * FROM test_table ORDER BY id";
    status = mysql_real_query_nonblocking(mysql_local, stmt_text,
                                          (unsigned long)strlen(stmt_text));

    /* do some other task before checking function result */
    perform_arithmetic();
    while (status == NET_ASYNC_NOT_READY) {
        status = mysql_real_query_nonblocking(mysql_local, stmt_text,
                                              (unsigned long)strlen(stmt_text));
        perform_arithmetic();
    }
    if (status == NET_ASYNC_ERROR) {

```

```

    cout<<"mysql_real_query_nonblocking() failed\n";
    exit(1);
}

/* retrieve query result asynchronously */
status = mysql_store_result_nonblocking(mysql_local, &result);
/* do some other task before checking function result */
perform_arithmetic();
while (status == NET_ASYNC_NOT_READY) {
    status = mysql_store_result_nonblocking(mysql_local, &result);
    perform_arithmetic();
}
if (status == NET_ASYNC_ERROR) {
    cout<<"mysql_store_result_nonblocking() failed\n";
    exit(1);
}
if (result == NULL) {
    cout<<"mysql_store_result_nonblocking() found 0 records\n";
    exit(1);
}

/* fetch a row synchronously */
row = mysql_fetch_row(result);
if (row != NULL && strcmp(row[0], "10") == 0)
    cout<<"ROW: " << row[0] << "\n";
else
    cout<<"incorrect result fetched\n";

/* fetch a row asynchronously, but without doing other work */
while (mysql_fetch_row_nonblocking(result, &row) != NET_ASYNC_COMPLETE)
    ; /* empty loop */
/* 2nd row fetched */
if (row != NULL && strcmp(row[0], "20") == 0)
    cout<<"ROW: " << row[0] << "\n";
else
    cout<<"incorrect result fetched\n";

/* fetch a row asynchronously, doing other work while waiting */
status = mysql_fetch_row_nonblocking(result, &row);
/* do some other task before checking function result */
perform_arithmetic();
while (status != NET_ASYNC_COMPLETE) {
    status = mysql_fetch_row_nonblocking(result, &row);
    perform_arithmetic();
}
/* 3rd row fetched */
if (row != NULL && strcmp(row[0], "30") == 0)
    cout<<"ROW: " << row[0] << "\n";
else
    cout<<"incorrect result fetched\n";

/* fetch a row asynchronously (no more rows expected) */
while ((status = mysql_fetch_row_nonblocking(result, &row))
    != NET_ASYNC_COMPLETE)
    ; /* empty loop */
if (row == NULL)
    cout <<"No more rows to process.\n";
else
    cout <<"More rows found than expected.\n";

/* free result set memory asynchronously */
while (mysql_free_result_nonblocking(result) != NET_ASYNC_COMPLETE)
    ; /* empty loop */

mysql_close(mysql_local);
}

```

Compile the program using a command similar to this; adjust the compiler and options as necessary:

```
gcc -g async_app.cc -std=c++11 \
-I/usr/local/mysql/include \
-o async_app -L/usr/lib64/ -lstdc++ \
-L/usr/local/mysql/lib/ -lmysqlclient
```

Run the program. The results should be similar to what you see here, although you might see a varying number of `dummy function invoked` instances.

```
dummy function invoked
dummy function invoked
ROW: 10
ROW: 20
dummy function invoked
ROW: 30
No more rows to process.
```

To experiment with the program, add and remove rows from `test_table`, running the program again after each change.

Asynchronous Function Restrictions

These restrictions apply to the use of asynchronous C API functions:

- `mysql_real_connect_nonblocking()` can be used only for accounts that authenticate with one of these authentication plugins: `mysql_native_password`, `sha256_password`, or `caching_sha2_password`.
- `mysql_real_connect_nonblocking()` can be used only to establish TCP/IP or Unix socket file connections.
- These statements are not supported and must be processed using synchronous C API functions: `LOAD DATA`, `LOAD XML`.
- Protocol compression is not supported for asynchronous C API functions.

28.6.12 C API Asynchronous Interface Data Structures

This section describes data structures specific to asynchronous C API functions. For information about general-purpose C API data structures, see [Section 28.6.4, “C API Data Structures”](#).

- `enum net_async_status`

The enumeration type used to express the return status of asynchronous C API functions. The following table shows the permitted status values.

Enumeration Status Value	Description
<code>NET_ASYNC_COMPLETE</code>	Asynchronous operation is complete
<code>NET_ASYNC_NOT_READY</code>	Asynchronous operation is still in progress
<code>NET_ASYNC_ERROR</code>	Asynchronous operation terminated in error
<code>NET_ASYNC_COMPLETE_NO_MORE_RESULTS</code>	For <code>mysql_next_result_nonblocking()</code> ; indicates no more results available

For more information, see [Section 28.6.11, “C API Asynchronous Interface”](#).

28.6.13 C API Asynchronous Function Overview

The following list summarizes the functions available for asynchronous interaction with the MySQL server. For greater detail, see the descriptions in [Section 28.6.14, “C API Asynchronous Function Descriptions”](#).

- `mysql_fetch_row_nonblocking()`: Asynchronously fetches the next row from the result set.
- `mysql_free_result_nonblocking()`: Asynchronously frees memory used by a result set.
- `mysql_next_result_nonblocking()`: Asynchronously returns/initiates the next result in multiple-result executions.
- `mysql_real_connect_nonblocking()`: Asynchronously connects to a MySQL server.
- `mysql_real_query_nonblocking()`: Asynchronously executes an SQL query specified as a counted string.
- `mysql_store_result_nonblocking()`: Asynchronously retrieves a complete result set to the client.

28.6.14 C API Asynchronous Function Descriptions

To interact asynchronously with the MySQL server, use the functions described in the following sections. For descriptions of their synchronous counterparts, see [Section 28.6.6, “C API Function Descriptions”](#).

28.6.14.1 `mysql_fetch_row_nonblocking()`

```
enum net_async_status mysql_fetch_row_nonblocking(MYSQL_RES *result, MYSQL_ROW *row)
```

Description

Note

`mysql_fetch_row_nonblocking()` is an asynchronous function. It is the counterpart of the `mysql_fetch_row()` synchronous function, for use by applications that require asynchronous communication with the server. For general information about writing asynchronous C API applications, see [Section 28.6.11, “C API Asynchronous Interface”](#).

`mysql_fetch_row_nonblocking()` is used similarly to `mysql_fetch_row()`. For details about the latter, see [Section 28.6.6.21, “mysql_fetch_row\(\)”](#). The two functions differ as follows:

- `mysql_fetch_row()` returns a `MYSQL_ROW` value containing the next row, or `NULL`. The meaning of a `NULL` return depends on which function was called preceding `mysql_fetch_row()`:
 - When used after `mysql_store_result()` or `mysql_store_result_nonblocking()`, `mysql_fetch_row()` returns `NULL` if there are no more rows to retrieve.
 - When used after `mysql_use_result()`, `mysql_fetch_row()` returns `NULL` if there are no more rows to retrieve or an error occurred.
- `mysql_fetch_row_nonblocking()` returns an `enum net_async_status` status indicator and takes a second `row` argument that provides a pointer to a `MYSQL_ROW` value. When the return status is `NET_ASYNC_COMPLETE`, the `row` argument is a pointer to a `MYSQL_ROW` value containing the next row, or `NULL`. The meaning of `NULL` depends on which function was called preceding `mysql_fetch_row_nonblocking()`:
 - When used after `mysql_store_result()` or `mysql_store_result_nonblocking()`, the `row` argument is `NULL` if there are no more rows to retrieve.

- When used after `mysql_use_result()`, the `row` argument is `NULL` if there are no more rows to retrieve or an error occurred.

`mysql_fetch_row_nonblocking()` was added in MySQL 8.0.16.

Return Values

Returns an `enum net_async_status` value. See the description in [Section 28.6.12, “C API Asynchronous Interface Data Structures”](#). A `NET_ASYNC_ERROR` return status indicates an error.

Example

See [Section 28.6.11, “C API Asynchronous Interface”](#).

28.6.14.2 `mysql_free_result_nonblocking()`

```
enum net_async_status mysql_free_result_nonblocking(MYSQL_RES *result)
```

Description

Note

`mysql_free_result_nonblocking()` is an asynchronous function. It is the counterpart of the `mysql_free_result()` synchronous function, for use by applications that require asynchronous communication with the server. For general information about writing asynchronous C API applications, see [Section 28.6.11, “C API Asynchronous Interface”](#).

`mysql_free_result_nonblocking()` is used similarly to `mysql_free_result()`. For details about the latter, see [Section 28.6.6.25, “mysql_free_result\(\)”](#). The two functions differ as follows:

- `mysql_free_result()` does not return a value.
- `mysql_free_result_nonblocking()` returns an `enum net_async_status` status indicator.

`mysql_free_result_nonblocking()` was added in MySQL 8.0.16.

Return Values

Returns an `enum net_async_status` value. See the description in [Section 28.6.12, “C API Asynchronous Interface Data Structures”](#). A `NET_ASYNC_ERROR` return status indicates an error.

Example

See [Section 28.6.11, “C API Asynchronous Interface”](#).

28.6.14.3 `mysql_next_result_nonblocking()`

```
enum net_async_status mysql_next_result_nonblocking(MYSQL *mysql)
```

Description

Note

`mysql_next_result_nonblocking()` is an asynchronous function. It is the counterpart of the `mysql_next_result()` synchronous function, for use by

applications that require asynchronous communication with the server. For general information about writing asynchronous C API applications, see [Section 28.6.11, “C API Asynchronous Interface”](#).

`mysql_next_result_nonblocking()` is used similarly to `mysql_next_result()`. For details about the latter, see [Section 28.6.6.47, “mysql_next_result\(\)”](#). The two functions differ as follows:

- `mysql_next_result()` returns an integer status indicator.
- `mysql_next_result_nonblocking()` returns an `enum net_async_status` status indicator.

`mysql_next_result_nonblocking()` was added in MySQL 8.0.16.

Return Values

Returns an `enum net_async_status` value. See the description in [Section 28.6.12, “C API Asynchronous Interface Data Structures”](#). A `NET_ASYNC_COMPLETE_NO_MORE_RESULTS` return status indicates there are no more results available. A `NET_ASYNC_ERROR` return status indicates an error.

Example

See [Section 28.6.11, “C API Asynchronous Interface”](#).

28.6.14.4 mysql_real_connect_nonblocking()

```
enum net_async_status mysql_real_connect_nonblocking(MYSQL *mysql, const char
*host, const char *user, const char *passwd, const char *db, unsigned int port,
const char *unix_socket, unsigned long client_flag)
```

Description

Note

`mysql_real_connect_nonblocking()` is an asynchronous function. It is the counterpart of the `mysql_real_connect()` synchronous function, for use by applications that require asynchronous communication with the server. For general information about writing asynchronous C API applications, see [Section 28.6.11, “C API Asynchronous Interface”](#).

`mysql_real_connect_nonblocking()` is used similarly to `mysql_real_connect()`. For details about the latter, see [Section 28.6.6.54, “mysql_real_connect\(\)”](#). The two functions differ as follows:

- `mysql_real_connect()` returns a connection handler or `NULL`.
- `mysql_real_connect_nonblocking()` returns an `enum net_async_status` status indicator.

`mysql_real_connect_nonblocking()` was added in MySQL 8.0.16.

Return Values

Returns an `enum net_async_status` value. See the description in [Section 28.6.12, “C API Asynchronous Interface Data Structures”](#). A `NET_ASYNC_ERROR` return status indicates an error.

Example

See [Section 28.6.11, “C API Asynchronous Interface”](#).

28.6.14.5 `mysql_real_query_nonblocking()`

```
enum net_async_status mysql_real_query_nonblocking(MYSQL *mysql, const char
*stmt_str, unsigned long length)
```

Description

Note

`mysql_real_query_nonblocking()` is an asynchronous function. It is the counterpart of the `mysql_real_query()` synchronous function, for use by applications that require asynchronous communication with the server. For general information about writing asynchronous C API applications, see [Section 28.6.11, “C API Asynchronous Interface”](#).

`mysql_real_query_nonblocking()` is used similarly to `mysql_real_query()`. For details about the latter, see [Section 28.6.6.57, “mysql_real_query\(\)”](#). The two functions differ as follows:

- `mysql_real_query()` returns an integer status indicator.
- `mysql_real_query_nonblocking()` returns an `enum net_async_status` status indicator.

`mysql_real_query_nonblocking()` was added in MySQL 8.0.16.

Return Values

Returns an `enum net_async_status` value. See the description in [Section 28.6.12, “C API Asynchronous Interface Data Structures”](#). A `NET_ASYNC_ERROR` return status indicates an error.

Example

See [Section 28.6.11, “C API Asynchronous Interface”](#).

28.6.14.6 `mysql_store_result_nonblocking()`

```
enum net_async_status mysql_store_result_nonblocking(MYSQL *mysql, MYSQL_RES
**result )
```

Description

Note

`mysql_store_result_nonblocking()` is an asynchronous function. It is the counterpart of the `mysql_store_result()` synchronous function, for use by applications that require asynchronous communication with the server. For general information about writing asynchronous C API applications, see [Section 28.6.11, “C API Asynchronous Interface”](#).

`mysql_store_result_nonblocking()` is used similarly to `mysql_store_result()`. For details about the latter, see [Section 28.6.6.79, “mysql_store_result\(\)”](#). The two functions differ as follows:

- `mysql_store_result()` returns a pointer to a `MYSQL_RESULT` value that contains the result set, or `NULL` if there is no result set or an error occurred.
- `mysql_store_result_nonblocking()` returns an `enum net_async_status` status indicator and takes a second `result` argument that is the address of a pointer to a `MYSQL_RESULT` into which to

store the result set. When the return status is `NET_ASYNC_COMPLETE`, the `result` argument is `NULL` if there is no result set or an error occurred.

`mysql_store_result_nonblocking()` was added in MySQL 8.0.16.

Return Values

Returns an enum `net_async_status` value. See the description in [Section 28.6.12, “C API Asynchronous Interface Data Structures”](#). A `NET_ASYNC_ERROR` return status indicates an error.

When the return status is `NET_ASYNC_COMPLETE`, the `result` argument is `NULL` if there is no result set or an error occurred. To determine whether an error occurred, check whether `mysql_error()` returns a nonempty string, `mysql_errno()` returns nonzero, or `mysql_field_count()` returns zero.

Example

See [Section 28.6.11, “C API Asynchronous Interface”](#).

28.6.15 C API Threaded Function Descriptions

To create a threaded client, use the functions described in the following sections. See also [Section 28.6.3.3, “Writing C API Threaded Client Programs”](#).

28.6.15.1 `mysql_thread_end()`

```
void mysql_thread_end(void)
```

Description

Call this function as necessary before calling `pthread_exit()` to free memory allocated by `mysql_thread_init()`:

- For release/production builds without debugging support enabled, `mysql_thread_end()` need not be called.
- For debug builds, `mysql_thread_init()` allocates debugging information for the DBUG package (see [Section 29.5.4, “The DBUG Package”](#)). `mysql_thread_end()` must be called for each `mysql_thread_init()` call to avoid a memory leak.

`mysql_thread_end()` is not invoked automatically by the client library.

Return Values

None.

28.6.15.2 `mysql_thread_init()`

```
bool mysql_thread_init(void)
```

Description

This function must be called early within each created thread to initialize thread-specific variables. However, it may be unnecessary to invoke it explicitly. Calling `mysql_thread_init()` is automatically handled by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`. If you invoke any of those functions, `mysql_thread_init()` is called for you.

Return Values

Zero for success. Nonzero if an error occurred.

28.6.15.3 `mysql_thread_safe()`

```
unsigned int mysql_thread_safe(void)
```

Description

This function indicates whether the client library is compiled as thread-safe.

Return Values

1 if the client library is thread-safe, 0 otherwise.

28.6.16 C API Client Plugin Functions

This section describes functions used for the client-side plugin API. They enable management of client plugins. For a description of the `st_mysql_client_plugin` structure used by these functions, see [Client Plugin Descriptors](#).

It is unlikely that a client program needs to call the functions in this section. For example, a client that supports the use of authentication plugins normally causes a plugin to be loaded by calling `mysql_options()` to set the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options:

```
char *plugin_dir = "path_to_plugin_dir";
char *default_auth = "plugin_name";

/* ... process command-line options ... */

mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);
```

Typically, the program will also accept `--plugin-dir` and `--default-auth` options that enable users to override the default values.

28.6.16.1 `mysql_client_find_plugin()`

```
struct st_mysql_client_plugin *mysql_client_find_plugin(MYSQL *mysql, const
char *name, int type)
```

Description

Returns a pointer to a loaded plugin, loading the plugin first if necessary. An error occurs if the type is invalid or the plugin cannot be found or loaded.

Specify the parameters as follows:

- `mysql`: A pointer to a `MYSQL` structure. The plugin API does not require a connection to a MySQL server, but this structure must be properly initialized. The structure is used to obtain connection-related information.
- `name`: The plugin name.
- `type`: The plugin type.

Return Values

A pointer to the plugin for success. `NULL` if an error occurred.

Errors

To check for errors, call the `mysql_error()` or `mysql_errno()` function. See [Section 28.6.6.15](#), “`mysql_error()`”, and [Section 28.6.6.14](#), “`mysql_errno()`”.

Example

```
MYSQL mysql;
struct st_mysql_client_plugin *p;

if ((p = mysql_client_find_plugin(&mysql, "myplugin",
                                MYSQL_CLIENT_AUTHENTICATION_PLUGIN, 0)))
{
    printf("Plugin version: %d.%d.%d\n", p->version[0], p->version[1], p->version[2]);
}
```

28.6.16.2 mysql_client_register_plugin()

```
struct st_mysql_client_plugin *mysql_client_register_plugin(MYSQL *mysql,
struct st_mysql_client_plugin *plugin)
```

Description

Adds a plugin structure to the list of loaded plugins. An error occurs if the plugin is already loaded.

Specify the parameters as follows:

- `mysql`: A pointer to a `MYSQL` structure. The plugin API does not require a connection to a MySQL server, but this structure must be properly initialized. The structure is used to obtain connection-related information.
- `plugin`: A pointer to the plugin structure.

Return Values

A pointer to the plugin for success. `NULL` if an error occurred.

Errors

To check for errors, call the `mysql_error()` or `mysql_errno()` function. See [Section 28.6.6.15](#), “`mysql_error()`”, and [Section 28.6.6.14](#), “`mysql_errno()`”.

28.6.16.3 mysql_load_plugin()

```
struct st_mysql_client_plugin *mysql_load_plugin(MYSQL *mysql, const char
*name, int type, int argc, ...)
```

Description

Loads a MySQL client plugin, specified by name and type. An error occurs if the type is invalid or the plugin cannot be loaded.

It is not possible to load multiple plugins of the same type. An error occurs if you try to load a plugin of a type already loaded.

Specify the parameters as follows:

- `mysql`: A pointer to a `MYSQL` structure. The plugin API does not require a connection to a MySQL server, but this structure must be properly initialized. The structure is used to obtain connection-related information.
- `name`: The name of the plugin to load.
- `type`: The type of plugin to load, or `_1` to disable type checking. If type is not `_1`, only plugins matching the type are considered for loading.
- `argc`: The number of following arguments (0 if there are none). Interpretation of any following arguments depends on the plugin type.

Another way to cause plugins to be loaded is to set the `LIBMYSQL_PLUGINS` environment variable to a list of semicolon-separated plugin names. For example:

```
export LIBMYSQL_PLUGINS="myplugin1;myplugin2"
```

Plugins named by `LIBMYSQL_PLUGINS` are loaded when the client program calls `mysql_library_init()`. No error is reported if problems occur loading these plugins.

The `LIBMYSQL_PLUGIN_DIR` environment variable can be set to the path name of the directory in which to look for client plugins. This variable is used in two ways:

- During client plugin preloading, the value of the `--plugin-dir` option is not available, so client plugin loading fails unless the plugins are located in the hardwired default directory. If the plugins are located elsewhere, `LIBMYSQL_PLUGIN_DIR` environment variable can be set to the proper directory to enable plugin preloading to succeed.
- For explicit client plugin loading, the `mysql_load_plugin()` and `mysql_load_plugin_v()` C API functions use the `LIBMYSQL_PLUGIN_DIR` value if it exists and the `--plugin-dir` option was not given. If `--plugin-dir` is given, `mysql_load_plugin()` and `mysql_load_plugin_v()` ignore `LIBMYSQL_PLUGIN_DIR`.

Return Values

A pointer to the plugin if it was loaded successfully. `NULL` if an error occurred.

Errors

To check for errors, call the `mysql_error()` or `mysql_errno()` function. See [Section 28.6.6.15, “mysql_error\(\)”](#), and [Section 28.6.6.14, “mysql_errno\(\)”](#).

Example

```
MYSQL mysql;

if(!mysql_load_plugin(&mysql, "myplugin",
                     MYSQL_CLIENT_AUTHENTICATION_PLUGIN, 0))
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
    exit(-1);
}
```

See Also

See also [Section 28.6.16.3, “mysql_load_plugin\(\)”](#), [Section 28.6.6.15, “mysql_error\(\)”](#), [Section 28.6.6.14, “mysql_errno\(\)”](#).

28.6.16.4 `mysql_load_plugin_v()`

```
struct st_mysql_client_plugin *mysql_load_plugin_v(MYSQL *mysql, const char
*name, int type, int argc, va_list args)
```

Description

This function is equivalent to `mysql_load_plugin()`, but it accepts a `va_list` instead of a variable list of parameters.

See Also

See also [Section 28.6.16.3, “mysql_load_plugin\(\)”](#).

28.6.16.5 `mysql_plugin_options()`

```
int mysql_plugin_options(struct st_mysql_client_plugin *plugin, const char
*option, const void *value)
```

Description

Passes an option type and value to a plugin. This function can be called multiple times to set several options. If the plugin does not have an option handler, an error occurs.

Specify the parameters as follows:

- `plugin`: A pointer to the plugin structure.
- `option`: The option to be set.
- `value`: A pointer to the option value.

Return Values

Zero for success, 1 if an error occurred. If the plugin has an option handler, that handler should also return zero for success and 1 if an error occurred.

28.6.17 C API Binary Log Interface

The MySQL client/server protocol includes a client interface for reading a stream of replication events from a MySQL server binary log. This capability uses the `MYSQL_RPL` data structure and a small set of functions to manage communication between a client program and the server from which the binary log is to be read. The following sections describe aspects of this interface in more detail.

28.6.18 C API Binary Log Data Structures

C API functions for processing a replication event stream from a server require a connection handler (a `MYSQL *` pointer) and a pointer to a `MYSQL_RPL` structure that describes the stream of replication events to read from the server binary log. For example:

```
MYSQL *mysql = mysql_real_connect(...);

MYSQL_RPL rpl;

# ... initialize MYSQL_RPL members ...
```

```
int result = mysql_binlog_open(mysql, &rpl);
```

This section describes the `MYSQL_RPL` structure members. Connection handlers are described in [Section 28.6.4, “C API Data Structures”](#).

The applicable `MYSQL_RPL` members depend on the binary log operation to be performed:

- Before calling `mysql_binlog_open()`, the caller must set the `MYSQL_RPL` members from `file_name_length` through `flags`. In addition, if `flags` has the `MYSQL_RPL_GTID` flag set, the caller must set the members from `gtid_set_encoded_size` through `gtid_set_arg`.
- After a successful `mysql_binlog_fetch()` call, the caller examines the `size` and `buffer` members.

`MYSQL_RPL` structure member descriptions:

- `file_name_length`

The length of the name of the binary log file to read. This member is used in conjunction with `file_name`; see the `file_name` description.

- `file_name`

The name of the binary log file to read:

- If `file_name` is `NULL`, the client library sets it to the empty string and sets `file_name_length` to 0.
- If `file_name` is not `NULL`, `file_name_length` must either be the length of the name or 0. If `file_name_length` is 0, the client library sets it to the length of the name, in which case, `file_name` must be given as a null-terminated string.

To read from the beginning of the binary log without having to know the name of the oldest binary log file, set `file_name` to `NULL` or the empty string, and `start_position` to 4.

- `start_position`

The position at which to start reading the binary log. The position of the first event in any given binary log file is 4.

- `server_id`

The server ID to use for identifying to the server from which the binary log is read.

- `flags`

The union of flags that affect binary log reading, or 0 if no flags are set. These flag values are permitted:

- `MYSQL_RPL_SKIP_HEARTBEAT`

Set this flag to cause `mysql_binlog_fetch()` to skip heartbeat events.

- `MYSQL_RPL_GTID`

Set this flag to read GTID (global transaction ID) data. If set, you must initialize the `MYSQL_RPL` structure GTID-related members from `gtid_set_encoded_size` to `gtid_set_arg` before calling `mysql_binlog_open()`.

It is beyond the scope of this documentation to describe in detail how client programs use those GTID-related members. For more information, examine the `mysqlbinlog.cc` source file. For information about GTID-based replication, see [Section 17.1.3, “Replication with Global Transaction Identifiers”](#).

- `gtid_set_encoded_size`

The size of GTID set data, or 0.

- `fix_gtid_set`

The address of a callback function for `mysql_binlog_open()` to call to fill the command packet GTID set, or `NULL` if there is no such function. The callback function, if used, should have this calling signature:

```
void my_callback(MYSQL_RPL *rpl, unsigned char *packet_gtid_set);
```

- `gtid_set_arg`

Either a pointer to GTID set data (if `fix_gtid_set` is `NULL`), or a pointer to a value to be made available for use within the callback function (if `fix_gtid_set` is not `NULL`). `gtid_set_arg` is a generic pointer, so it can point to any kind of value (for example, a string, a structure, or a function). Its interpretation within the callback depends on how the callback intends to use it.

- `size`

After a successful `mysql_binlog_fetch()` call, the size of the returned binary log event. The value is 0 for an EOF event, greater than 0 for a non-EOF event.

- `buffer`

After a successful `mysql_binlog_fetch()` call, a pointer to the binary log event contents.

28.6.19 C API Binary Log Function Overview

The following list summarizes the functions available for reading a replication event stream from a binary log. For greater detail, see the descriptions in [Section 28.6.20, “C API Binary Log Function Descriptions”](#).

- `mysql_binlog_close()`: Closes the replication event stream.
- `mysql_binlog_fetch()`: Reads an event from the replication event stream.
- `mysql_binlog_open()`: Opens the replication event stream.

28.6.20 C API Binary Log Function Descriptions

The following sections provide detailed descriptions of the functions that enable reading the stream of replication events from a MySQL server binary log.

The following simple example program demonstrates the binary log C API functions. Program notes:

- `mysql` is assumed to be a valid connection handler.
- The initial `SET` statement sets the `@master_binlog_checksum` user-defined variable that the server takes as an indication that the client is checksum-aware. This client does nothing with checksums, but without this statement, a server that includes checksums in binary log events will return an error for the first attempt to read an event containing a checksum. The value assigned to the variable is immaterial; what matters is that the variable exist.

```
if (mysql_query(mysql, "SET @master_binlog_checksum='ALL'"))
{
    fprintf(stderr, "mysql_query() failed\n");
    fprintf(stderr, "Error %u: %s\n",
            mysql_errno(mysql), mysql_error(mysql));
}
```

```
    exit(1);
}

MYSQL_RPL rpl;

rpl.file_name_length = 0;
rpl.file_name = NULL;
rpl.start_position = 4;
rpl.server_id = 0;
rpl.flags = 0;

if (mysql_binlog_open(mysql, &rpl))
{
    fprintf(stderr, "mysql_binlog_open() failed\n");
    fprintf(stderr, "Error %u: %s\n",
            mysql_errno(mysql), mysql_error(mysql));
    exit(1);
}
for (;;) /* read events until error or EOF */
{
    if (mysql_binlog_fetch(mysql, &rpl))
    {
        fprintf(stderr, "mysql_binlog_fetch() failed\n");
        fprintf(stderr, "Error %u: %s\n",
                mysql_errno(mysql), mysql_error(mysql));
        break;
    }
    if (rpl.size == 0) /* EOF */
    {
        fprintf(stderr, "EOF event received\n");
        break;
    }
    fprintf(stderr, "Event received of size %lu.\n", rpl.size);
}
mysql_binlog_close(mysql, &rpl);
```

For additional examples that show how to use these functions, look in a MySQL source distribution for these source files:

- `mysqlbinlog.cc` in the `client` directory
- `mysql_client_test.c` in the `testclients` directory

28.6.20.1 `mysql_binlog_close()`

```
void mysql_binlog_close(MYSQL *mysql, MYSQL_RPL *rpl)
```

Description

Close a replication event stream.

Arguments:

- `mysql`: The connection handler returned from `mysql_init()`. The handler remains open after the `mysql_binlog_close()` call.
- `rpl`: The replication stream structure. After calling `mysql_binlog_close()`, this structure should not be used further without reinitializing it and calling `mysql_binlog_open()` again.

Errors

None.

Example

See [Section 28.6.20, “C API Binary Log Function Descriptions”](#).

28.6.20.2 `mysql_binlog_fetch()`

```
int mysql_binlog_fetch(MYSQL *mysql, MYSQL_RPL *rpl)
```

Description

Fetch one event from the replication event stream.

Arguments:

- `mysql`: The connection handler returned from `mysql_init()`.
- `rpl`: The replication stream structure. After a successful call, the `size` member indicates the event size, which is 0 for an EOF event. For a non-EOF event, `size` is greater than 0 and the `buffer` member points to the event contents.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

Example

See [Section 28.6.20, “C API Binary Log Function Descriptions”](#).

28.6.20.3 `mysql_binlog_open()`

```
int mysql_binlog_open(MYSQL *mysql, MYSQL_RPL *rpl)
```

Description

Open a new replication event stream, to read a MySQL server binary log.

Arguments:

- `mysql`: The connection handler returned from `mysql_init()`.
- `rpl`: A `MYSQL_RPL` structure that has been initialized to indicate the replication event stream source. For a description of the structure members and how to initialize them, see [Section 28.6.18, “C API Binary Log Data Structures”](#).

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_FILE_NAME_TOO_LONG`
The specified binary log file name was too long.
- `CR_OUT_OF_MEMORY`

Out of memory.

Example

See [Section 28.6.20, “C API Binary Log Function Descriptions”](#).

28.6.21 C API Encrypted Connection Support

This section describes how C applications use the C API capabilities for encrypted connections. By default, MySQL programs attempt to connect using encryption if the server supports encrypted connections, falling back to an unencrypted connection if an encrypted connection cannot be established (see [Section 6.3.1, “Configuring MySQL to Use Encrypted Connections”](#)). For applications that require control beyond the default behavior over how encrypted connections are established, the C API provides these capabilities:

- The `mysql_options()` function enables applications to set the appropriate SSL/TLS options before calling `mysql_real_connect()`. For example, to require the use of an encrypted connection, see [Enforcing an Encrypted Connection](#).
- The `mysql_get_ssl_cipher()` function enables applications to determine, after a connection has been established, whether the connection uses encryption. A `NULL` return value indicates that encryption is not being used. A non-`NULL` return value indicates an encrypted connection and names the encryption cipher. See [Section 28.6.6.34, “mysql_get_ssl_cipher\(\)”](#).
- [C API Options for Encrypted Connections](#)
- [Enforcing an Encrypted Connection](#)
- [Improving Security of Encrypted Connections](#)

C API Options for Encrypted Connections

`mysql_options()` provides the following options for control over use of encrypted connections. For option details, see [Section 28.6.6.50, “mysql_options\(\)”](#).

- `MYSQL_OPT_SSL_CA`: The path name of the Certificate Authority (CA) certificate file. This option, if used, must specify the same certificate used by the server.
- `MYSQL_OPT_SSL_CAPATH`: The path name of the directory that contains trusted SSL CA certificate files.
- `MYSQL_OPT_SSL_CERT`: The path name of the client public key certificate file.
- `MYSQL_OPT_SSL_CIPHER`: The list of encryption ciphers the client permits for connections that use TLS protocols up through TLSv1.2.
- `MYSQL_OPT_SSL_CRL`: The path name of the file containing certificate revocation lists.
- `MYSQL_OPT_SSL_CRLPATH`: The path name of the directory that contains certificate revocation list files.
- `MYSQL_OPT_SSL_KEY`: The path name of the client private key file.
- `MYSQL_OPT_SSL_MODE`: The connection security state.
- `MYSQL_OPT_TLS_CIPHERSUITES`: The list of encryption ciphersuites the client permits for connections that use TLSv1.3.
- `MYSQL_OPT_TLS_VERSION`: The encryption protocols the client permits.

`mysql_ssl_set()` can be used as a convenience routine that is equivalent to a set of `mysql_options()` calls that specify certificate and key files, encryption ciphers, and so forth. See [Section 28.6.6.77](#), “`mysql_ssl_set()`”.

Enforcing an Encrypted Connection

`mysql_options()` options for information such as SSL certificate and key files are used to establish an encrypted connection if such connections are available, but do not enforce any requirement that the connection obtained be encrypted. To require an encrypted connection, use the following technique:

1. Call `mysql_options()` as necessary supply the appropriate SSL parameters (certificate and key files, encryption ciphers, and so forth).
2. Call `mysql_options()` to pass the `MYSQL_OPT_SSL_MODE` option with a value of `SSL_MODE_REQUIRED` or one of the more-restrictive option values.
3. Call `mysql_real_connect()` to connect to the server. The call fails if an encrypted connection cannot be obtained; exit with an error.

Improving Security of Encrypted Connections

For additional security relative to that provided by the default encryption, clients can supply a CA certificate matching the one used by the server and enable host name identity verification. In this way, the server and client place their trust in the same CA certificate and the client verifies that the host to which it connected is the one intended:

- To specify the CA certificate, call `mysql_options()` to pass the `MYSQL_OPT_SSL_CA` (or `MYSQL_OPT_SSL_CAPATH`) option, and call `mysql_options()` to pass the `MYSQL_OPT_SSL_MODE` option with a value of `SSL_MODE_VERIFY_CA`.
- To enable host name identity verification as well, call `mysql_options()` to pass the `MYSQL_OPT_SSL_MODE` option with a value of `SSL_MODE_VERIFY_IDENTITY` rather than `SSL_MODE_VERIFY_CA`.

Note

Host name identity verification with `SSL_MODE_VERIFY_IDENTITY` does not work with self-signed certificates created automatically by the server, or manually using `mysql_ssl_rsa_setup` (see [Section 6.3.3.1](#), “[Creating SSL and RSA Certificates and Keys using MySQL](#)”). Such self-signed certificates do not contain the server name as the Common Name value.

Host name identity verification also does not work with certificates that specify the Common Name using wildcards because that name is compared verbatim to the server name.

28.6.22 C API Multiple Statement Execution Support

By default, `mysql_query()` and `mysql_real_query()` interpret their statement string argument as a single statement to be executed, and you process the result according to whether the statement produces a result set (a set of rows, as for `SELECT`) or an affected-rows count (as for `INSERT`, `UPDATE`, and so forth).

MySQL also supports the execution of a string containing multiple statements separated by semicolon (;) characters. This capability is enabled by special options that are specified either when you connect to the server with `mysql_real_connect()` or after connecting by calling `mysql_set_server_option()`.

Executing a multiple-statement string can produce multiple result sets or row-count indicators. Processing these results involves a different approach than for the single-statement case: After handling the result from the first statement, it is necessary to check whether more results exist and process them in turn if so. To support multiple-result processing, the C API includes the `mysql_more_results()` and `mysql_next_result()` functions. These functions are used at the end of a loop that iterates as long as more results are available. *Failure to process the result this way may result in a dropped connection to the server.*

Multiple-result processing also is required if you execute `CALL` statements for stored procedures. Results from a stored procedure have these characteristics:

- Statements within the procedure may produce result sets (for example, if it executes `SELECT` statements). These result sets are returned in the order that they are produced as the procedure executes.

In general, the caller cannot know how many result sets a procedure will return. Procedure execution may depend on loops or conditional statements that cause the execution path to differ from one call to the next. Therefore, you must be prepared to retrieve multiple results.

- The final result from the procedure is a status result that includes no result set. The status indicates whether the procedure succeeded or an error occurred.

The multiple statement and result capabilities can be used only with `mysql_query()` or `mysql_real_query()`. They cannot be used with the prepared statement interface. Prepared statement handlers are defined to work only with strings that contain a single statement. See [Section 28.6.7, “C API Prepared Statements”](#).

To enable multiple-statement execution and result processing, the following options may be used:

- The `mysql_real_connect()` function has a `flags` argument for which two option values are relevant:
 - `CLIENT_MULTI_RESULTS` enables the client program to process multiple results. This option *must* be enabled if you execute `CALL` statements for stored procedures that produce result sets. Otherwise, such procedures result in an error `Error 1312 (0A000): PROCEDURE proc_name can't return a result set in the given context`. `CLIENT_MULTI_RESULTS` is enabled by default.
 - `CLIENT_MULTI_STATEMENTS` enables `mysql_query()` and `mysql_real_query()` to execute statement strings containing multiple statements separated by semicolons. This option also enables `CLIENT_MULTI_RESULTS` implicitly, so a `flags` argument of `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()` is equivalent to an argument of `CLIENT_MULTI_STATEMENTS | CLIENT_MULTI_RESULTS`. That is, `CLIENT_MULTI_STATEMENTS` is sufficient to enable multiple-statement execution and all multiple-result processing.
- After the connection to the server has been established, you can use the `mysql_set_server_option()` function to enable or disable multiple-statement execution by passing it an argument of `MYSQL_OPTION_MULTI_STATEMENTS_ON` or `MYSQL_OPTION_MULTI_STATEMENTS_OFF`. Enabling multiple-statement execution with this function also enables processing of “simple” results for a multiple-statement string where each statement produces a single result, but is *not* sufficient to permit processing of stored procedures that produce result sets.

The following procedure outlines a suggested strategy for handling multiple statements:

1. Pass `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()`, to fully enable multiple-statement execution and multiple-result processing.

2. After calling `mysql_query()` or `mysql_real_query()` and verifying that it succeeds, enter a loop within which you process statement results.
3. For each iteration of the loop, handle the current statement result, retrieving either a result set or an affected-rows count. If an error occurs, exit the loop.
4. At the end of the loop, call `mysql_next_result()` to check whether another result exists and initiate retrieval for it if so. If no more results are available, exit the loop.

One possible implementation of the preceding strategy is shown following. The final part of the loop can be reduced to a simple test of whether `mysql_next_result()` returns nonzero. The code as written distinguishes between no more results and an error, which enables a message to be printed for the latter occurrence.

```
/* connect to server with the CLIENT_MULTI_STATEMENTS option */
if (mysql_real_connect (mysql, host_name, user_name, password,
    db_name, port_num, socket_name, CLIENT_MULTI_STATEMENTS) == NULL)
{
    printf("mysql_real_connect() failed\n");
    mysql_close(mysql);
    exit(1);
}

/* execute multiple statements */
status = mysql_query(mysql,
    "DROP TABLE IF EXISTS test_table;\n
    CREATE TABLE test_table(id INT);\n
    INSERT INTO test_table VALUES(10);\n
    UPDATE test_table SET id=20 WHERE id=10;\n
    SELECT * FROM test_table;\n
    DROP TABLE test_table");

if (status)
{
    printf("Could not execute statement(s)");
    mysql_close(mysql);
    exit(0);
}

/* process each statement result */
do {
    /* did current statement return data? */
    result = mysql_store_result(mysql);
    if (result)
    {
        /* yes; process rows and free the result set */
        process_result_set(mysql, result);
        mysql_free_result(result);
    }
    else /* no result set or error */
    {
        if (mysql_field_count(mysql) == 0)
        {
            printf("%lld rows affected\n",
                mysql_affected_rows(mysql));
        }
        else /* some error occurred */
        {
            printf("Could not retrieve result set\n");
            break;
        }
    }
}
/* more results? -1 = no, >0 = error, 0 = yes (keep looping) */
if ((status = mysql_next_result(mysql)) > 0)
    printf("Could not execute statement\n");
} while (status == 0);
```

```
mysql_close(mysql);
```

28.6.23 C API Prepared Statement Handling of Date and Time Values

The binary (prepared statement) protocol enables you to send and receive date and time values ([DATE](#), [TIME](#), [DATETIME](#), and [TIMESTAMP](#)), using the [MYSQL_TIME](#) structure. The members of this structure are described in [Section 28.6.8, “C API Prepared Statement Data Structures”](#).

To send temporal data values, create a prepared statement using [mysql_stmt_prepare\(\)](#). Then, before calling [mysql_stmt_execute\(\)](#) to execute the statement, use the following procedure to set up each temporal parameter:

1. In the [MYSQL_BIND](#) structure associated with the data value, set the [buffer_type](#) member to the type that indicates what kind of temporal value you're sending. For [DATE](#), [TIME](#), [DATETIME](#), or [TIMESTAMP](#) values, set [buffer_type](#) to [MYSQL_TYPE_DATE](#), [MYSQL_TYPE_TIME](#), [MYSQL_TYPE_DATETIME](#), or [MYSQL_TYPE_TIMESTAMP](#), respectively.
2. Set the [buffer](#) member of the [MYSQL_BIND](#) structure to the address of the [MYSQL_TIME](#) structure in which you pass the temporal value.
3. Fill in the members of the [MYSQL_TIME](#) structure that are appropriate for the type of temporal value to pass.

Use [mysql_stmt_bind_param\(\)](#) to bind the parameter data to the statement. Then you can call [mysql_stmt_execute\(\)](#).

To retrieve temporal values, the procedure is similar, except that you set the [buffer_type](#) member to the type of value you expect to receive, and the [buffer](#) member to the address of a [MYSQL_TIME](#) structure into which the returned value should be placed. Use [mysql_stmt_bind_result\(\)](#) to bind the buffers to the statement after calling [mysql_stmt_execute\(\)](#) and before fetching the results.

Here is a simple example that inserts [DATE](#), [TIME](#), and [TIMESTAMP](#) data. The `mysql` variable is assumed to be a valid connection handler.

```
MYSQL_TIME  ts;
MYSQL_BIND  bind[3];
MYSQL_STMT  *stmt;

strmov(query, "INSERT INTO test_table(date_field, time_field, \
                                     timestamp_field) VALUES(?,?,?);");

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, " mysql_stmt_init(), out of memory\n");
    exit(0);
}
if (mysql_stmt_prepare(mysql, query, strlen(query)))
{
    fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* set up input buffers for all 3 parameters */
bind[0].buffer_type= MYSQL_TYPE_DATE;
bind[0].buffer= (char *)&ts;
bind[0].is_null= 0;
bind[0].length= 0;
...
```

```

bind[1]= bind[2]= bind[0];
...

mysql_stmt_bind_param(stmt, bind);

/* supply the data to be sent in the ts structure */
ts.year= 2002;
ts.month= 02;
ts.day= 03;

ts.hour= 10;
ts.minute= 45;
ts.second= 20;

mysql_stmt_execute(stmt);
..

```

28.6.24 C API Prepared CALL Statement Support

This section describes prepared-statement support in the C API for stored procedures executed using [CALL](#) statements:

Stored procedures executed using prepared [CALL](#) statements can be used in the following ways:

- A stored procedure can produce any number of result sets. The number of columns and the data types of the columns need not be the same for all result sets.
- The final values of [OUT](#) and [INOUT](#) parameters are available to the calling application after the procedure returns. These parameters are returned as an extra single-row result set following any result sets produced by the procedure itself. The row contains the values of the [OUT](#) and [INOUT](#) parameters in the order in which they are declared in the procedure parameter list.

For information about the effect of unhandled conditions on procedure parameters, see [Section 13.6.7.8, “Condition Handling and OUT or INOUT Parameters”](#).

The following discussion shows how to use these capabilities through the C API for prepared statements. To use prepared [CALL](#) statements through the [PREPARE](#) and [EXECUTE](#) statements, see [Section 13.2.1, “CALL Statement”](#).

An application that executes a prepared [CALL](#) statement should use a loop that fetches a result and then invokes `mysql_stmt_next_result()` to determine whether there are more results. The results consist of any result sets produced by the stored procedure followed by a final status value that indicates whether the procedure terminated successfully.

If the procedure has [OUT](#) or [INOUT](#) parameters, the result set preceding the final status value contains their values. To determine whether a result set contains parameter values, test whether the [SERVER_PS_OUT_PARAMS](#) bit is set in the `server_status` member of the [MYSQL](#) connection handler:

```
mysql->server_status & SERVER_PS_OUT_PARAMS
```

The following example uses a prepared [CALL](#) statement to execute a stored procedure that produces multiple result sets and that provides parameter values back to the caller by means of [OUT](#) and [INOUT](#) parameters. The procedure takes parameters of all three types ([IN](#), [OUT](#), [INOUT](#)), displays their initial values, assigns new values, displays the updated values, and returns. The expected return information from the procedure therefore consists of multiple result sets and a final status:

- One result set from a [SELECT](#) that displays the initial parameter values: `10, NULL, 30`. (The [OUT](#) parameter is assigned a value by the caller, but this assignment is expected to be ineffective: [OUT](#) parameters are seen as `NULL` within a procedure until assigned a value within the procedure.)
- One result set from a [SELECT](#) that displays the modified parameter values: `100, 200, 300`.

- One result set containing the final **OUT** and **INOUT** parameter values: 200, 300.
- A final status packet.

The code to execute the procedure:

```

MYSQL_STMT *stmt;
MYSQL_BIND ps_params[3]; /* input parameter buffers */
int         int_data[3]; /* input/output values */
bool        is_null[3];  /* output value nullability */
int         status;

/* set up stored procedure */
status = mysql_query(mysql, "DROP PROCEDURE IF EXISTS p1");
test_error(mysql, status);

status = mysql_query(mysql,
    "CREATE PROCEDURE p1("
    "  IN p_in INT, "
    "  OUT p_out INT, "
    "  INOUT p_inout INT) "
    "BEGIN "
    "  SELECT p_in, p_out, p_inout; "
    "  SET p_in = 100, p_out = 200, p_inout = 300; "
    "  SELECT p_in, p_out, p_inout; "
    "END");
test_error(mysql, status);

/* initialize and prepare CALL statement with parameter placeholders */
stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    printf("Could not initialize statement\n");
    exit(1);
}
status = mysql_stmt_prepare(stmt, "CALL p1(?, ?, ?)", 16);
test_stmt_error(stmt, status);

/* initialize parameters: p_in, p_out, p_inout (all INT) */
memset(ps_params, 0, sizeof (ps_params));

ps_params[0].buffer_type = MYSQL_TYPE_LONG;
ps_params[0].buffer = (char *) &int_data[0];
ps_params[0].length = 0;
ps_params[0].is_null = 0;

ps_params[1].buffer_type = MYSQL_TYPE_LONG;
ps_params[1].buffer = (char *) &int_data[1];
ps_params[1].length = 0;
ps_params[1].is_null = 0;

ps_params[2].buffer_type = MYSQL_TYPE_LONG;
ps_params[2].buffer = (char *) &int_data[2];
ps_params[2].length = 0;
ps_params[2].is_null = 0;

/* bind parameters */
status = mysql_stmt_bind_param(stmt, ps_params);
test_stmt_error(stmt, status);

/* assign values to parameters and execute statement */
int_data[0] = 10; /* p_in */
int_data[1] = 20; /* p_out */
int_data[2] = 30; /* p_inout */

status = mysql_stmt_execute(stmt);
test_stmt_error(stmt, status);

```

```

/* process results until there are no more */
do {
    int i;
    int num_fields;          /* number of columns in result */
    MYSQL_FIELD *fields;    /* for result set metadata */
    MYSQL_BIND *rs_bind;    /* for output buffers */

    /* the column count is > 0 if there is a result set */
    /* 0 if the result is only the final status packet */
    num_fields = mysql_stmt_field_count(stmt);

    if (num_fields > 0)
    {
        /* there is a result set to fetch */
        printf("Number of columns in result: %d\n", (int) num_fields);

        /* what kind of result set is this? */
        printf("Data: ");
        if(mysql->server_status & SERVER_PS_OUT_PARAMS)
            printf("this result set contains OUT/INOUT parameters\n");
        else
            printf("this result set is produced by the procedure\n");

        MYSQL_RES *rs_metadata = mysql_stmt_result_metadata(stmt);
        test_stmt_error(stmt, rs_metadata == NULL);

        fields = mysql_fetch_fields(rs_metadata);

        rs_bind = (MYSQL_BIND *) malloc(sizeof (MYSQL_BIND) * num_fields);
        if (!rs_bind)
        {
            printf("Cannot allocate output buffers\n");
            exit(1);
        }
        memset(rs_bind, 0, sizeof (MYSQL_BIND) * num_fields);

        /* set up and bind result set output buffers */
        for (i = 0; i < num_fields; ++i)
        {
            rs_bind[i].buffer_type = fields[i].type;
            rs_bind[i].is_null = &is_null[i];

            switch (fields[i].type)
            {
                case MYSQL_TYPE_LONG:
                    rs_bind[i].buffer = (char *) &(int_data[i]);
                    rs_bind[i].buffer_length = sizeof (int_data);
                    break;

                default:
                    fprintf(stderr, "ERROR: unexpected type: %d.\n", fields[i].type);
                    exit(1);
            }
        }
    }

    status = mysql_stmt_bind_result(stmt, rs_bind);
    test_stmt_error(stmt, status);

    /* fetch and display result set rows */
    while (1)
    {
        status = mysql_stmt_fetch(stmt);

        if (status == 1 || status == MYSQL_NO_DATA)
            break;
    }
}

```

```

    for (i = 0; i < num_fields; ++i)
    {
        switch (rs_bind[i].buffer_type)
        {
            case MYSQL_TYPE_LONG:
                if (*rs_bind[i].is_null)
                    printf(" val[%d] = NULL;", i);
                else
                    printf(" val[%d] = %ld;",
                        i, (long) *((int *) rs_bind[i].buffer));
                break;

            default:
                printf(" unexpected type (%d)\n",
                    rs_bind[i].buffer_type);
        }
    }
    printf("\n");
}

mysql_free_result(rs_metadata); /* free metadata */
free(rs_bind);                /* free output buffers */
}
else
{
    /* no columns = final status packet */
    printf("End of procedure output\n");
}

/* more results? -1 = no, >0 = error, 0 = yes (keep looking) */
status = mysql_stmt_next_result(stmt);
if (status > 0)
    test_stmt_error(stmt, status);
} while (status == 0);

mysql_stmt_close(stmt);

```

Execution of the procedure should produce the following output:

```

Number of columns in result: 3
Data: this result set is produced by the procedure
  val[0] = 10; val[1] = NULL; val[2] = 30;
Number of columns in result: 3
Data: this result set is produced by the procedure
  val[0] = 100; val[1] = 200; val[2] = 300;
Number of columns in result: 2
Data: this result set contains OUT/INOUT parameters
  val[0] = 200; val[1] = 300;
End of procedure output

```

The code uses two utility routines, `test_error()` and `test_stmt_error()`, to check for errors and terminate after printing diagnostic information if an error occurred:

```

static void test_error(MYSQL *mysql, int status)
{
    if (status)
    {
        fprintf(stderr, "Error: %s (errno: %d)\n",
            mysql_error(mysql), mysql_errno(mysql));
        exit(1);
    }
}

static void test_stmt_error(MYSQL_STMT *stmt, int status)
{
    if (status)
    {

```

```

fprintf(stderr, "Error: %s (errno: %d)\n",
        mysql_stmt_error(stmt), mysql_stmt_errno(stmt));
exit(1);
}
}

```

28.6.25 C API Prepared Statement Problems

Here follows a list of the currently known problems with prepared statements:

- `TIME`, `TIMESTAMP`, and `DATETIME` do not support parts of seconds (for example, from `DATE_FORMAT()`).
- When converting an integer to string, `ZEROFILL` is honored with prepared statements in some cases where the MySQL server does not print the leading zeros. (For example, with `MIN(number-with-zerofill)`).
- When converting a floating-point number to a string in the client, the rightmost digits of the converted value may differ slightly from those of the original value.
- Prepared statements do not support multi-statements (that is, multiple statements within a single string separated by `;` characters).
- The capabilities of prepared `CALL` statements are described in [Section 28.6.24, “C API Prepared CALL Statement Support”](#).

28.6.26 C API Optional Result Set Metadata

When a client executes a statement that produces a result set, MySQL by default makes available both the data the result set contains, and result set metadata that provides information about the result set data. Metadata is contained in the `MYSQL_FIELD` structure (see [Section 28.6.4, “C API Data Structures”](#)), which is returned by the `mysql_fetch_field()`, `mysql_fetch_field_direct()`, and `mysql_fetch_fields()` functions.

Clients can indicate on a per-connection basis that result set metadata is optional and that the client will indicate to the server whether to return it. Suppression of metadata transfer can improve performance, particularly for sessions that execute many queries that return few rows each.

There are two ways to indicate that result set metadata is optional for a connection. They are equivalent, so either one suffices:

- At connect time, enable the `CLIENT_OPTIONAL_RESULTSET_METADATA` flag for the `client_flag` argument of `mysql_real_connect()`.
- Prior to connect time, enable the `MYSQL_OPT_OPTIONAL_RESULTSET_METADATA` option for `mysql_options()`.

For metadata-optional connections, the client sets the `resultset_metadata` system variable to control whether the server returns result set metadata. Permitted values are `FULL` (return all metadata; this is the default) and `NONE` (return no metadata).

For metadata-optional connections, the `mysql_fetch_field()`, `mysql_fetch_field_direct()`, and `mysql_fetch_fields()` functions return `NULL` when the `resultset_metadata` system variable is set to `NONE`.

To check whether a result set has metadata, use the `mysql_result_metadata()` function. This function returns `RESULTSET_METADATA_FULL` or `RESULTSET_METADATA_NONE` to indicate that the result set has full metadata or no metadata, respectively.

`mysql_result_metadata()` can be useful if the client does not know in advance whether a result set has metadata. For example, if a client executes a stored procedure that returns multiple result sets and might change the `resultset_metadata` system variable, the client can invoke `mysql_result_metadata()` for each result set to determine whether it has metadata.

For connections that are not metadata-optional, setting `resultset_metadata` to `NONE` produces an error.

28.6.27 C API Automatic Reconnection Control

The MySQL client library can perform an automatic reconnection to the server if it finds that the connection is down when you attempt to send a statement to the server to be executed. If auto-reconnect is enabled, the library tries once to reconnect to the server and send the statement again.

Auto-reconnect is disabled by default.

If it is important for your application to know that the connection has been dropped (so that it can exit or take action to adjust for the loss of state information), be sure that auto-reconnect is disabled. To ensure this, call `mysql_options()` with the `MYSQL_OPT_RECONNECT` option:

```
bool reconnect = 0;
mysql_options(&mysql, MYSQL_OPT_RECONNECT, &reconnect);
```

If the connection has gone down, the effect of `mysql_ping()` depends on the auto-reconnect state. If auto-reconnect is enabled, `mysql_ping()` performs a reconnect. Otherwise, it returns an error.

Some client programs might provide the capability of controlling automatic reconnection. For example, `mysql` reconnects by default, but the `--skip-reconnect` option can be used to suppress this behavior.

If an automatic reconnection does occur (for example, as a result of calling `mysql_ping()`), there is no explicit indication of it. To check for reconnection, call `mysql_thread_id()` to get the original connection identifier before calling `mysql_ping()`, then call `mysql_thread_id()` again to see whether the identifier changed.

Automatic reconnection can be convenient because you need not implement your own reconnect code, but if a reconnection does occur, several aspects of the connection state are reset on the server side and your application will not be notified.

The connection-related state is affected as follows:

- Any active transactions are rolled back and autocommit mode is reset.
- All table locks are released.
- All `TEMPORARY` tables are closed (and dropped).
- Session system variables are reinitialized to the values of the corresponding global system variables, including system variables that are set implicitly by statements such as `SET NAMES`.
- User variable settings are lost.
- Prepared statements are released.
- `HANDLER` variables are closed.
- The value of `LAST_INSERT_ID()` is reset to 0.
- Locks acquired with `GET_LOCK()` are released.

- The association of the client with the Performance Schema `threads` table row that determines connection thread instrumentation is lost. If the client reconnects after a disconnect, the session is associated with a new row in the `threads` table and the thread monitoring state may be different. See [Section 26.12.18.5, “The threads Table”](#).

If reconnection occurs, any SQL statement specified by calling `mysql_options()` with the `MYSQL_INIT_COMMAND` option is re-executed.

If the connection drops, it is possible that the session associated with the connection on the server side will still be running if the server has not yet detected that the client is no longer connected. In this case, any locks held by the original connection still belong to that session, so you may want to kill it by calling `mysql_kill()`.

28.6.28 C API Common Issues

28.6.28.1 Why `mysql_store_result()` Sometimes Returns NULL After `mysql_query()` Returns Success

It is possible for `mysql_store_result()` to return `NULL` following a successful call to `mysql_query()`. When this happens, it means one of the following conditions occurred:

- There was a `malloc()` failure (for example, if the result set was too large).
- The data could not be read (an error occurred on the connection).
- The query returned no data (for example, it was an `INSERT`, `UPDATE`, or `DELETE`).

You can always check whether the statement should have produced a nonempty result by calling `mysql_field_count()`. If `mysql_field_count()` returns zero, the result is empty and the last query was a statement that does not return values (for example, an `INSERT` or a `DELETE`). If `mysql_field_count()` returns a nonzero value, the statement should have produced a nonempty result. See the description of the `mysql_field_count()` function for an example.

You can test for an error by calling `mysql_error()` or `mysql_errno()`.

28.6.28.2 What Results You Can Get from a Query

In addition to the result set returned by a query, you can also get the following information:

- `mysql_affected_rows()` returns the number of rows affected by the last query when doing an `INSERT`, `UPDATE`, or `DELETE`.

For a fast re-create, use `TRUNCATE TABLE`.

- `mysql_num_rows()` returns the number of rows in a result set. With `mysql_store_result()`, `mysql_num_rows()` may be called as soon as `mysql_store_result()` returns. With `mysql_use_result()`, `mysql_num_rows()` may be called only after you have fetched all the rows with `mysql_fetch_row()`.
- `mysql_insert_id()` returns the ID generated by the last query that inserted a row into a table with an `AUTO_INCREMENT` index. See [Section 28.6.6.38, “mysql_insert_id\(\)”](#).
- Some queries (`LOAD DATA`, `INSERT INTO ... SELECT`, `UPDATE`) return additional information. The result is returned by `mysql_info()`. See the description for `mysql_info()` for the format of the string that it returns. `mysql_info()` returns a `NULL` pointer if there is no additional information.

28.6.28.3 How to Get the Unique ID for the Last Inserted Row

If you insert a record into a table that contains an [AUTO_INCREMENT](#) column, you can obtain the value stored into that column by calling the `mysql_insert_id()` function.

You can check from your C applications whether a value was stored in an [AUTO_INCREMENT](#) column by executing the following code (which assumes that you've checked that the statement succeeded). It determines whether the query was an [INSERT](#) with an [AUTO_INCREMENT](#) index:

```
if ((result = mysql_store_result(&mysql)) == 0 &&
    mysql_field_count(&mysql) == 0 &&
    mysql_insert_id(&mysql) != 0)
{
    used_id = mysql_insert_id(&mysql);
}
```

When a new [AUTO_INCREMENT](#) value has been generated, you can also obtain it by executing a [SELECT LAST_INSERT_ID\(\)](#) statement with `mysql_query()` and retrieving the value from the result set returned by the statement.

When inserting multiple values, the last automatically incremented value is returned.

For [LAST_INSERT_ID\(\)](#), the most recently generated ID is maintained in the server on a per-connection basis. It is not changed by another client. It is not even changed if you update another [AUTO_INCREMENT](#) column with a nonmagic value (that is, a value that is not [NULL](#) and not 0). Using [LAST_INSERT_ID\(\)](#) and [AUTO_INCREMENT](#) columns simultaneously from multiple clients is perfectly valid. Each client will receive the last inserted ID for the last statement *that* client executed.

If you want to use the ID that was generated for one table and insert it into a second table, you can use SQL statements like this:

```
INSERT INTO foo (auto,text)
VALUES(NULL,'text');           # generate ID by inserting NULL
INSERT INTO foo2 (id,text)
VALUES(LAST_INSERT_ID(),'text'); # use ID in second table
```

`mysql_insert_id()` returns the value stored into an [AUTO_INCREMENT](#) column, whether that value is automatically generated by storing [NULL](#) or 0 or was specified as an explicit value. [LAST_INSERT_ID\(\)](#) returns only automatically generated [AUTO_INCREMENT](#) values. If you store an explicit value other than [NULL](#) or 0, it does not affect the value returned by [LAST_INSERT_ID\(\)](#).

For more information on obtaining the last ID in an [AUTO_INCREMENT](#) column:

- For information on [LAST_INSERT_ID\(\)](#), which can be used within an SQL statement, see [Section 12.15, “Information Functions”](#).
- For information on `mysql_insert_id()`, the function you use from within the C API, see [Section 28.6.6.38, “mysql_insert_id\(\)”](#).
- For information on obtaining the auto-incremented value when using Connector/J, see [Retrieving AUTO_INCREMENT Column Values through JDBC](#).
- For information on obtaining the auto-incremented value when using Connector/ODBC, see [Obtaining Auto-Increment Values](#).

28.7 MySQL PHP API

The MySQL PHP API manual is now published in standalone form, not as part of the MySQL Reference Manual. See [MySQL and PHP](#).

28.8 MySQL Perl API

The Perl `DBI` module provides a generic interface for database access. You can write a DBI script that works with many different database engines without change. To use DBI with MySQL, install the following:

1. The `DBI` module.
2. The `DBD::mysql` module. This is the DataBase Driver (DBD) module for Perl.
3. Optionally, the DBD module for any other type of database server you want to access.

Perl DBI is the recommended Perl interface. It replaces an older interface called `mysqlperl`, which should be considered obsolete.

These sections contain information about using Perl with MySQL and writing MySQL applications in Perl:

- For installation instructions for Perl DBI support, see [Section 2.13, “Perl Installation Notes”](#).
- For an example of reading options from option files, see [Section 5.8.4, “Using Client Programs in a Multiple-Server Environment”](#).
- For secure coding tips, see [Section 6.1.1, “Security Guidelines”](#).
- For debugging tips, see [Section 29.5.1.4, “Debugging mysqld under gdb”](#).
- For some Perl-specific environment variables, see [Section 4.9, “Environment Variables”](#).
- For considerations for running on macOS, see [Section 2.4, “Installing MySQL on macOS”](#).
- For ways to quote string literals, see [Section 9.1.1, “String Literals”](#).

DBI information is available at the command line, online, or in printed form:

- Once you have the `DBI` and `DBD::mysql` modules installed, you can get information about them at the command line with the `perldoc` command:

```
shell> perldoc DBI
shell> perldoc DBI::FAQ
shell> perldoc DBD::mysql
```

You can also use `pod2man`, `pod2html`, and so on to translate this information into other formats.

- For online information about Perl DBI, visit the DBI website, <http://dbi.perl.org/>. That site hosts a general DBI mailing list.
- For printed information, the official DBI book is *Programming the Perl DBI* (Alligator Descartes and Tim Bunce, O'Reilly & Associates, 2000). Information about the book is available at the DBI website, <http://dbi.perl.org/>.

28.9 MySQL Python API

`MySQLdb` is a third-party driver that provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at <http://sourceforge.net/projects/mysql-python/>.

The new MySQL Connector/Python component provides an interface to the same Python API, and is built into the MySQL Server and supported by Oracle. See [MySQL Connector/Python Developer Guide](#) for details on the Connector, as well as coding guidelines for Python applications and sample Python code.

28.10 MySQL Ruby APIs

Two APIs are available for Ruby programmers developing MySQL applications:

- The MySQL/Ruby API is based on the `libmysqlclient` API library. For information on installing and using the MySQL/Ruby API, see [Section 28.10.1, “The MySQL/Ruby API”](#).
- The Ruby/MySQL API is written to use the native MySQL network protocol (a native driver). For information on installing and using the Ruby/MySQL API, see [Section 28.10.2, “The Ruby/MySQL API”](#).

For background and syntax information about the Ruby language, see [Ruby Programming Language](#).

28.10.1 The MySQL/Ruby API

The MySQL/Ruby module provides access to MySQL databases using Ruby through `libmysqlclient`.

For information on installing the module, and the functions exposed, see [MySQL/Ruby](#).

28.10.2 The Ruby/MySQL API

The Ruby/MySQL module provides access to MySQL databases using Ruby through a native driver interface using the MySQL network protocol.

For information on installing the module, and the functions exposed, see [Ruby/MySQL](#).

28.11 MySQL Tcl API

`MySQLtcl` is a simple API for accessing a MySQL database server from the [Tcl programming language](#). It can be found at <http://www.xdobry.de/mysqltcl/>.

28.12 MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the [Eiffel programming language](#), written by Michael Ravits. It can be found at <http://efsa.sourceforge.net/archive/ravits/mysql.htm>.

Chapter 29 Extending MySQL

Table of Contents

29.1 MySQL Internals	4921
29.1.1 MySQL Threads	4921
29.1.2 The MySQL Test Suite	4922
29.2 The MySQL Plugin API	4923
29.2.1 Types of Plugins	4923
29.2.2 Plugin API Characteristics	4928
29.2.3 Plugin API Components	4929
29.2.4 Writing Plugins	4930
29.3 MySQL Services for Plugins	4989
29.3.1 The Locking Service	4991
29.3.2 The Keyring Service	4996
29.4 Adding Functions to MySQL	4998
29.4.1 Features of the User-Defined Function Interface	4999
29.4.2 Adding a User-Defined Function	5000
29.4.3 Adding a Native Function	5010
29.5 Debugging and Porting MySQL	5012
29.5.1 Debugging a MySQL Server	5012
29.5.2 Debugging a MySQL Client	5018
29.5.3 The LOCK_ORDER Tool	5018
29.5.4 The DBUG Package	5025

29.1 MySQL Internals

This chapter describes what you need to know when working on the MySQL code. To track or contribute to MySQL development, follow the instructions in [Section 2.9.5, “Installing MySQL Using a Development Source Tree”](#). If you are interested in MySQL internals, you should also join the [MySQL Community Slack](#). Feel free to ask questions about the code and to send patches that you would like to contribute to the MySQL project!

Note

The MySQL source code contains internal documentation written using Doxygen. This documentation is useful for understanding how MySQL works from a developer perspective. The generated Doxygen content is available at <https://dev.mysql.com/doc/index-other.html>. It is also possible to generate this content locally from a MySQL source distribution using the instructions at [Section 2.9.10, “Generating MySQL Doxygen Documentation Content”](#).

29.1.1 MySQL Threads

The MySQL server creates the following threads:

- Connection manager threads handle client connection requests on the network interfaces that the server listens to. On all platforms, one manager thread handles TCP/IP connection requests. On Unix, this manager thread also handles Unix socket file connection requests. On Windows, a manager thread handles shared-memory connection requests, and another handles named-pipe connection requests. The server does not create threads to handle interfaces that it does not listen to. For example, a Windows server that does not have support for named-pipe connections enabled does not create a thread to handle them.

- Connection manager threads associate each client connection with a thread dedicated to it that handles authentication and request processing for that connection. Manager threads create a new thread when necessary but try to avoid doing so by consulting the thread cache first to see whether it contains a thread that can be used for the connection. When a connection ends, its thread is returned to the thread cache if the cache is not full.

For information about tuning the parameters that control thread resources, see [Section 8.12.4.1, “How MySQL Handles Client Connections”](#).

- On a master replication server, connections from slave servers are handled like client connections: There is one thread per connected slave.
- On a slave replication server, an I/O thread is started to connect to the master server and read updates from it. An SQL thread is started to apply updates read from the master. These two threads run independently and can be started and stopped independently.
- A signal thread handles all signals. This thread also normally handles alarms and calls `process_alarm()` to force timeouts on connections that have been idle too long.
- If `InnoDB` is used, there will be additional read and write threads by default. The number of these are controlled by the `innodb_read_io_threads` and `innodb_write_io_threads` parameters. See [Section 15.14, “InnoDB Startup Options and System Variables”](#).
- If the server is started with the `--flush_time=val` option, a dedicated thread is created to flush all tables every `val` seconds.
- If the event scheduler is active, there is one thread for the scheduler, and a thread for each event currently running. See [Section 24.4.1, “Event Scheduler Overview”](#).

`mysqladmin processlist` only shows the connection, replication, and event threads.

29.1.2 The MySQL Test Suite

The test system that is included in Unix source and binary distributions makes it possible for users and developers to perform regression tests on the MySQL code. These tests can be run on Unix.

You can also write your own test cases. For information, including system requirements, see The MySQL Test Framework in the MySQL Server Doxygen documentation, available at <https://dev.mysql.com/doc/index-other.html>.

The current set of test cases does not test everything in MySQL, but it should catch most obvious bugs in the SQL processing code, operating system or library issues, and is quite thorough in testing replication. Our goal is to have the tests cover 100% of the code. We welcome contributions to our test suite. You may especially want to contribute tests that examine the functionality critical to your system because this ensures that all future MySQL releases work well with your applications.

The test system consists of a test language interpreter (`mysqltest`), a Perl script to run all tests (`mysql-test-run.pl`), the actual test cases written in a special test language, and their expected results. To run the test suite on your system after a build, type `make test` from the source root directory, or change location to the `mysql-test` directory and type `./mysql-test-run.pl`. If you have installed a binary distribution, change location to the `mysql-test` directory under the installation root directory (for example, `/usr/local/mysql/mysql-test`), and run `./mysql-test-run.pl`. All tests should succeed. If any do not, feel free to try to find out why and report the problem if it indicates a bug in MySQL. See [Section 1.7, “How to Report Bugs or Problems”](#).

If one test fails, you should run `mysql-test-run.pl` with the `--force` option to check whether any other tests fail.

If you have a copy of `mysqld` running on the machine where you want to run the test suite, you do not have to stop it, as long as it is not using ports `9306` or `9307`. If either of those ports is taken, you should set the `MTR_BUILD_THREAD` environment variable to an appropriate value, and the test suite will use a different set of ports for master, slave, and NDB). For example:

```
shell> export MTR_BUILD_THREAD=31
shell> ./mysql-test-run.pl [options] [test_name]
```

In the `mysql-test` directory, you can run an individual test case with `./mysql-test-run.pl test_name`.

If you have a question about the test suite, or have a test case to contribute, join the [MySQL Community Slack](#).

29.2 The MySQL Plugin API

MySQL supports a plugin API that enables creation of server components. Plugins can be loaded at server startup, or loaded and unloaded at runtime without restarting the server. The API is generic and does not specify what plugins can do. The components supported by this interface include, but are not limited to, storage engines, full-text parser plugins, and server extensions.

For example, full-text parser plugins can be used to replace or augment the built-in full-text parser. A plugin can parse text into words using rules that differ from those used by the built-in parser. This can be useful if you need to parse text with characteristics different from those expected by the built-in parser.

The plugin interface is more general than the older user-defined function (UDF) interface.

The plugin interface uses the `plugin` table in the `mysql` database to record information about plugins that have been installed permanently with the `INSTALL PLUGIN` statement. This table is created as part of the MySQL installation process. Plugins can also be installed for a single server invocation with the `--plugin-load` option. Plugins installed this way are not recorded in the `plugin` table. See [Section 5.6.1, “Installing and Uninstalling Plugins”](#).

MySQL supports an API for client plugins in addition to that for server plugins. This is used, for example, by authentication plugins where a server-side plugin and a client-side plugin cooperate to enable clients to connect to the server through a variety of authentication methods.

Note

The MySQL source code contains internal documentation written using Doxygen. This documentation is useful for understanding how MySQL works from a developer perspective. The generated Doxygen content is available at <https://dev.mysql.com/doc/index-other.html>. It is also possible to generate this content locally from a MySQL source distribution using the instructions at [Section 2.9.10, “Generating MySQL Doxygen Documentation Content”](#).

Additional Resources

The book *MySQL 5.1 Plugin Development* by Sergei Golubchik and Andrew Hutchings provides a wealth of detail about the plugin API. Despite the fact that the book's title refers to MySQL Server 5.1, most of the information in it applies to later versions as well.

29.2.1 Types of Plugins

The plugin API enables creation of plugins that implement several capabilities:

- [Storage engines](#)

- [Full-text parsers](#)
- [Daemons](#)
- [INFORMATION_SCHEMA tables](#)
- [Semisynchronous replication](#)
- [Auditing](#)
- [Authentication](#)
- [Password validation and strength checking](#)
- [Protocol tracing](#)
- [Query rewriting](#)
- [Secure keyring storage and retrieval](#)

The following sections provide an overview of these plugin types.

- [Storage Engine Plugins](#)
- [Full-Text Parser Plugins](#)
- [Daemon Plugins](#)
- [INFORMATION_SCHEMA Plugins](#)
- [Semisynchronous Replication Plugins](#)
- [Audit Plugins](#)
- [Authentication Plugins](#)
- [Password-Validation Plugins](#)
- [Protocol Trace Plugins](#)
- [Query Rewrite Plugins](#)
- [Keyring Plugins](#)

Storage Engine Plugins

The pluggable storage engine architecture used by MySQL Server enables storage engines to be written as plugins and loaded into and unloaded from a running server. For a description of this architecture, see [Section 16.11, “Overview of MySQL Storage Engine Architecture”](#).

For information on how to use the plugin API to write storage engines, see [MySQL Internals: Writing a Custom Storage Engine](#).

Full-Text Parser Plugins

MySQL has a built-in parser that it uses by default for full-text operations (parsing text to be indexed, or parsing a query string to determine the terms to be used for a search). The built-in full-text parser is supported with [InnoDB](#) and [MyISAM](#) tables.

MySQL also has a character-based ngram full-text parser that supports Chinese, Japanese, and Korean (CJK), and a word-based MeCab parser plugin that supports Japanese, for use with [InnoDB](#) and [MyISAM](#) tables.

For full-text processing, “parsing” means extracting words (or “tokens”, in the case of an n-gram character-based parser) from text or a query string based on rules that define which character sequences make up a word and where word boundaries lie.

When parsing for indexing purposes, the parser passes each word to the server, which adds it to a full-text index. When parsing a query string, the parser passes each word to the server, which accumulates the words for use in a search.

The parsing properties of the built-in full-text parser are described in [Section 12.9, “Full-Text Search Functions”](#). These properties include rules for determining how to extract words from text. The parser is influenced by certain system variables that cause words shorter or longer to be excluded, and by the stopwords list that identifies common words to be ignored. For more information, see [Section 12.9.4, “Full-Text Stopwords”](#), and [Section 12.9.6, “Fine-Tuning MySQL Full-Text Search”](#).

The plugin API enables you to use a full-text parser other than the default built-in full-text parser. For example, if you are working with Japanese, you may choose to use the MeCab full-text parser. The plugin API also enables you to provide a full-text parser of your own so that you have control over the basic duties of a parser. A parser plugin can operate in either of two roles:

- The plugin can replace the built-in parser. In this role, the plugin reads the input to be parsed, splits it up into words, and passes the words to the server (either for indexing or for token accumulation). The ngram and MeCab parsers operate as replacements for the built-in full-text parser.

You may choose to provide your own full-text parser if you need to use different rules from those of the built-in parser for determining how to split up input into words. For example, the built-in parser considers the text “case-sensitive” to consist of two words “case” and “sensitive,” whereas an application might need to treat the text as a single word.

- The plugin can act in conjunction with the built-in parser by serving as a front end for it. In this role, the plugin extracts text from the input and passes the text to the parser, which splits up the text into words using its normal parsing rules. This parsing is affected by the `innodb_ft_xxx` or `ft_xxx` system variables and the stopwords list.

One reason to use a parser this way is that you need to index content such as PDF documents, XML documents, or `.doc` files. The built-in parser is not intended for those types of input but a plugin can pull out the text from these input sources and pass it to the built-in parser.

It is also possible for a parser plugin to operate in both roles. That is, it could extract text from noncleartext input (the front end role), and also parse the text into words (thus replacing the built-in parser).

A full-text plugin is associated with full-text indexes on a per-index basis. That is, when you install a parser plugin initially, that does not cause it to be used for any full-text operations. It simply becomes available. For example, a full-text parser plugin becomes available to be named in a `WITH PARSER` clause when creating individual `FULLTEXT` indexes. To create such an index at table-creation time, do this:

```
CREATE TABLE t
(
  doc CHAR(255),
  FULLTEXT INDEX (doc) WITH PARSER parser_name
) ENGINE=InnoDB;
```

Or you can add the index after the table has been created:

```
ALTER TABLE t ADD FULLTEXT INDEX (doc) WITH PARSER parser_name;
```

The only SQL change for associating the parser with the index is the `WITH PARSER` clause. Searches are specified as before, with no changes needed for queries.

When you associate a parser plugin with a `FULLTEXT` index, the plugin is required for using the index. If the parser plugin is dropped, any index associated with it becomes unusable. Any attempt to use a table for which a plugin is not available results in an error, although `DROP TABLE` is still possible.

For more information about full-text plugins, see [Section 29.2.4.4, “Writing Full-Text Parser Plugins”](#). MySQL 8.0 supports full-text plugins with `MyISAM` and `InnoDB`.

Daemon Plugins

A daemon plugin is a simple type of plugin used for code that should be run by the server but that does not communicate with it. MySQL distributions include an example daemon plugin that writes periodic heartbeat messages to a file.

For more information about daemon plugins, see [Section 29.2.4.5, “Writing Daemon Plugins”](#).

INFORMATION_SCHEMA Plugins

`INFORMATION_SCHEMA` plugins enable the creation of tables containing server metadata that are exposed to users through the `INFORMATION_SCHEMA` database. For example, `InnoDB` uses `INFORMATION_SCHEMA` plugins to provide tables that contain information about current transactions and locks.

For more information about `INFORMATION_SCHEMA` plugins, see [Section 29.2.4.6, “Writing INFORMATION_SCHEMA Plugins”](#).

Semisynchronous Replication Plugins

MySQL replication is asynchronous by default. With semisynchronous replication, a commit performed on the master side blocks before returning to the session that performed the transaction until at least one slave acknowledges that it has received and logged the events for the transaction. Semisynchronous replication is implemented through complementary master and client plugins. See [Section 17.4.9, “Semisynchronous Replication”](#).

For more information about semisynchronous replication plugins, see [Section 29.2.4.7, “Writing Semisynchronous Replication Plugins”](#).

Audit Plugins

The MySQL server provides a pluggable audit interface that enables information about server operations to be reported to interested parties. Audit notification occurs for these operations (although the interface is general and the server could be modified to report others):

- Write a message to the general query log (if the log is enabled)
- Write a message to the error log
- Send a query result to a client

Audit plugins may register with the audit interface to receive notification about server operations. When an auditable event occurs within the server, the server determines whether notification is needed. For each registered audit plugin, the server checks the event against those event classes in which the plugin is interested and passes the event to the plugin if there is a match.

This interface enables audit plugins to receive notifications only about operations in event classes they consider significant and to ignore others. The interface provides for categorization of operations into event classes and further division into event subclasses within each class.

When an audit plugin is notified of an auditable event, it receives a pointer to the current THD structure and a pointer to a structure that contains information about the event. The plugin can examine the event and perform whatever auditing actions are appropriate. For example, the plugin can see what statement produced a result set or was logged, the number of rows in a result, who the current user was for an operation, or the error code for failed operations.

For more information about audit plugins, see [Section 29.2.4.8, “Writing Audit Plugins”](#).

Authentication Plugins

MySQL supports pluggable authentication. Authentication plugins exist on both the server and client sides. Plugins on the server side implement authentication methods for use by clients when they connect to the server. A plugin on the client side communicates with a server-side plugin to provide the authentication information that it requires. A client-side plugin may interact with the user, performing tasks such as soliciting a password or other authentication credentials to be sent to the server. See [Section 6.2.17, “Pluggable Authentication”](#).

Pluggable authentication also enables proxy user capability, in which one user takes the identity of another user. A server-side authentication plugin can return to the server the name of the user whose identity the connecting user should have. See [Section 6.2.18, “Proxy Users”](#).

For more information about authentication plugins, see [Section 29.2.4.9, “Writing Authentication Plugins”](#).

Password-Validation Plugins

The MySQL server provides an interface for writing plugins that test passwords. Such a plugin implements two capabilities:

- Rejection of too-weak passwords in statements that assign passwords (such as `CREATE USER` and `ALTER USER` statements).
- Assessing the strength of potential passwords for the `VALIDATE_PASSWORD_STRENGTH()` SQL function.

For information about writing this type of plugin, see [Section 29.2.4.10, “Writing Password-Validation Plugins”](#).

Protocol Trace Plugins

MySQL supports the use of protocol trace plugins: client-side plugins that implement tracing of communication between a client and the server that takes place using the client/server protocol.

For more information about protocol trace plugins, see [Section 29.2.4.11, “Writing Protocol Trace Plugins”](#).

Query Rewrite Plugins

MySQL Server supports query rewrite plugins that can examine and possibly modify statements received by the server before the server executes them. A query rewrite plugin takes statements either before or after the server has parsed them.

A preparse query rewrite plugin has these characteristics:

- The plugin enables rewriting of SQL statements arriving at the server before the server processes them.
- The plugin receives a statement string and may return a different string.

A postparse query rewrite plugin has these characteristics:

- The plugin enables statement rewriting based on parse trees.

- The server parses each statement and passes its parse tree to the plugin, which may traverse the tree. The plugin can return the original tree to the server for further processing, or construct a different tree and return that instead.
- The plugin can use the `mysql_parser` plugin service for these purposes:
 - To activate statement digest calculation and obtain the normalized version of statements independent of whether the Performance Schema produces digests.
 - To traverse parse trees.
 - To parse statements. This is useful if the plugin constructs a new statement string from the parse tree. The plugin can have the server parse the string to produce a new tree, then return that tree as the representation of the rewritten statement.

For more information about plugin services, see [Section 29.3, “MySQL Services for Plugins”](#).

Preparse and postparse query rewrite plugins share these characteristics:

- If a query rewrite plugin is installed, the `--log-raw` option affects statement logging as follows:
 - Without `--log-raw`, the server logs the statement returned by the query rewrite plugin. This may differ from the statement as received.
 - With `--log-raw`, the server logs the original statement as received.
- If a plugin rewrites a statement, the server decides whether to write it to the binary log (and thus to any replication slaves) based on the rewritten statement, not the original statement. If a plugin rewrites only `SELECT` statements to `SELECT` statements, there is no impact on binary logging because the server does not write `SELECT` statements to the binary log.
- If a plugin rewrites a statement, the server produces a `Note` message that the client can view using `SHOW WARNINGS`. Messages have this format, where `stmt_in` is the original statement and `stmt_out` is the rewritten statement:

```
Query 'stmt_in' rewritten to 'stmt_out' by a query rewrite plugin
```

MySQL distributions include a postparse query rewrite plugin named `Rewriter`. This plugin is rule based. You can add rows to its rules table to cause `SELECT` statement rewriting. For more information, see [Section 5.6.4, “The Rewriter Query Rewrite Plugin”](#).

Query rewrite plugins use the same API as audit plugins. For more information about audit plugins, see [Section 29.2.4.8, “Writing Audit Plugins”](#).

Keyring Plugins

MySQL Server supports keyring plugins that enable internal server components and plugins to securely store sensitive information for later retrieval.

All MySQL distributions include a keyring plugin named `keyring_file`. MySQL Enterprise Edition distributions include additional keyring plugins. See [Section 6.4.4, “The MySQL Keyring”](#).

For more information about keyring plugins, see [Section 29.2.4.12, “Writing Keyring Plugins”](#).

29.2.2 Plugin API Characteristics

The server plugin API has these characteristics:

- All plugins have several things in common.

Each plugin has a name that it can be referred to in SQL statements, as well as other metadata such as an author and a description that provide other information. This information can be examined in the `INFORMATION_SCHEMA.PLUGINS` table or using the `SHOW PLUGINS` statement.

- The plugin framework is extendable to accommodate different kinds of plugins.

Although some aspects of the plugin API are common to all types of plugins, the API also permits type-specific interface elements so that different types of plugins can be created. A plugin with one purpose can have an interface most appropriate to its own requirements and not the requirements of some other plugin type.

Interfaces for several types of plugins exist, such as storage engines, full-text parser, and `INFORMATION_SCHEMA` tables. Others can be added.

- Plugins can expose information to users.

A plugin can implement system and status variables that are available through the `SHOW VARIABLES` and `SHOW STATUS` statements.

- The plugin API includes versioning information.

The version information included in the plugin API enables a plugin library and each plugin that it contains to be self-identifying with respect to the API version that was used to build the library. If the API changes over time, the version numbers will change, but a server can examine a given plugin library's version information to determine whether it supports the plugins in the library.

There are two types of version numbers. The first is the version for the general plugin framework itself. Each plugin library includes this kind of version number. The second type of version applies to individual plugins. Each specific type of plugin has a version for its interface, so each plugin in a library has a type-specific version number. For example, a library containing a full-text parser plugin has a general plugin API version number, and the plugin has a version number specific to the full-text plugin interface.

- The plugin API implements security restrictions.

A plugin library must be installed in a specific dedicated directory for which the location is controlled by the server and cannot be changed at runtime. Also, the library must contain specific symbols that identify it as a plugin library. The server will not load something as a plugin if it was not built as a plugin.

- Plugins have access to server services.

The services interface exposes server functionality that plugins can access using ordinary function calls. For details, see [Section 29.3, “MySQL Services for Plugins”](#).

In some respects, the server plugin API is similar to the older user-defined function (UDF) API that it supersedes, but the plugin API has several advantages over the older interface. For example, UDFs had no versioning information. Also, the newer plugin interface eliminates the security issues of the older UDF interface. The older interface for writing nonplugin UDFs permitted libraries to be loaded from any directory searched by the system's dynamic linker, and the symbols that identified the UDF library were relatively nonspecific.

The client plugin API has similar architectural characteristics, but client plugins have no direct access to the server the way server plugins do.

29.2.3 Plugin API Components

The server plugin implementation comprises several components.

SQL statements:

- `INSTALL PLUGIN` registers a plugin in the `mysql.plugin` table and loads the plugin code.
- `UNINSTALL PLUGIN` unregisters a plugin from the `mysql.plugin` table and unloads the plugin code.
- The `WITH PARSER` clause for full-text index creation associates a full-text parser plugin with a given `FULLTEXT` index.
- `SHOW PLUGINS` displays information about server plugins.

Command-line options and system variables:

- The `--plugin-load` option enables plugins to be loaded at server startup time.
- The `plugin_dir` system variable indicates the location of the directory where all plugins must be installed. The value of this variable can be specified at server startup with a `--plugin_dir=dir_name` option. `mysql_config --plugindir` displays the default plugin directory path name.

For additional information about plugin loading, see [Section 5.6.1, “Installing and Uninstalling Plugins”](#).

Plugin-related tables:

- The `INFORMATION_SCHEMA.PLUGINS` table contains plugin information.
- The `mysql.plugin` table lists each plugin that was installed with `INSTALL PLUGIN` and is required for plugin use. For new MySQL installations, this table is created during the installation process.

The client plugin implementation is simpler:

- For the `mysql_options()` C API function, the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options enable client programs to load authentication plugins.
- There are C API functions that enable management of client plugins.

To examine how MySQL implements plugins, consult the following source files in a MySQL source distribution:

- In the `include/mysql` directory, `plugin.h` exposes the public plugin API. This file should be examined by anyone who wants to write a plugin library. `plugin_xxx.h` files provide additional information that pertains to specific types of plugins. `client_plugin.h` contains information specific to client plugins.
- In the `sql` directory, `sql_plugin.h` and `sql_plugin.cc` comprise the internal plugin implementation. `sql_acl.cc` is where the server uses authentication plugins. These files need not be consulted by plugin developers. They may be of interest for those who want to know more about how the server handles plugins.
- In the `sql-common` directory, `client_plugin.h` implements the C API client plugin functions, and `client.c` implements client authentication support. These files need not be consulted by plugin developers. They may be of interest for those who want to know more about how the server handles plugins.

29.2.4 Writing Plugins

To create a plugin library, you must provide the required descriptor information that indicates what plugins the library file contains, and write the interface functions for each plugin.

Every server plugin must have a general descriptor that provides information to the plugin API, and a type-specific descriptor that provides information about the plugin interface for a given type of plugin.

The structure of the general descriptor is the same for all plugin types. The structure of the type-specific descriptor varies among plugin types and is determined by the requirements of what the plugin needs to do. The server plugin interface also enables plugins to expose status and system variables. These variables become visible through the [SHOW STATUS](#) and [SHOW VARIABLES](#) statements and the corresponding [INFORMATION_SCHEMA](#) tables.

For client-side plugins, the architecture is a bit different. Each plugin must have a descriptor, but there is no division into separate general and type-specific descriptors. Instead, the descriptor begins with a fixed set of members common to all client plugin types, and the common members are followed by any additional members required to implement the specific plugin type.

A server plugin contains code that becomes part of the running server, so when you write the plugin, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the [libstdc++](#) library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to plugins originally written for older servers. For information about these constraints, see [Section 2.9.7, “MySQL Source-Configuration Options”](#), and [Section 2.9.8, “Dealing with Problems Compiling MySQL”](#).

Client plugin writers should avoid dependencies on what symbols the calling application has because you cannot be sure what applications will use the plugin.

29.2.4.1 Overview of Plugin Writing

These conditions apply to plugin writing:

- MySQL header files used by plugins contain C++ code, so plugins must be compiled as C++ code.
- You must compile plugins with the entire server source code present, not just the libraries and header files.
- Compiled plugins are not compatible across server versions. For a plugin compiled against MySQL 8.0.[X](#), there is no guarantee it will work with a MySQL 8.0.[Y](#) server without recompiling for MySQL 8.0.[Y](#).
- Plugins are loaded and unloaded dynamically, so your operating system must support dynamic loading and you must have compiled the calling application dynamically (not statically). For server plugins, this means that [mysql_d](#) must be linked dynamically.

The following procedure provides an overview of the steps needed to create a plugin library. The next sections provide additional details on setting plugin data structures and writing specific types of plugins.

1. In the plugin source file, include the header files that the plugin library needs. The [plugin.h](#) file is required, and the library might require other files as well. For example:

```
#include <stdlib.h>
#include <ctype.h>
#include <mysql/plugin.h>
```

2. Set up the descriptor information for the plugin library file. For server plugins, write the library descriptor, which must contain the general plugin descriptor for each server plugin in the file. For more information, see [Server Plugin Library and Plugin Descriptors](#). In addition, set up the type-specific descriptor for each server plugin in the library. Each plugin's general descriptor points to its type-specific descriptor.

For client plugins, write the client descriptor. For more information, see [Client Plugin Descriptors](#).

3. Write the plugin interface functions for each plugin. For example, each plugin's general plugin descriptor points to the initialization and deinitialization functions that the server should invoke when

it loads and unloads the plugin. The plugin's type-specific description may also point to interface functions.

4. For server plugins, set up the status and system variables, if there are any.
5. Compile the plugin library as a shared library and install it in the plugin directory. For more information, see [Section 29.2.4.3, “Compiling and Installing Plugin Libraries”](#).
6. For server plugins, register the plugin with the server. For more information, see [Section 5.6.1, “Installing and Uninstalling Plugins”](#).
7. Test the plugin to verify that it works properly.

29.2.4.2 Plugin Data Structures

A plugin library file includes descriptor information to indicate what plugins it contains.

If the plugin library contains any server plugins, it must include the following descriptor information:

- A library descriptor indicates the general server plugin API version number used by the library and contains a general plugin descriptor for each server plugin in the library. To provide the framework for this descriptor, invoke two macros from the `plugin.h` header file:

```
mysql_declare_plugin(name)
... one or more server plugin descriptors here ...
mysql_declare_plugin_end;
```

The macros expand to provide a declaration for the API version automatically. You must provide the plugin descriptors.

- Within the library descriptor, each general server plugin is described by a `st_mysql_plugin` structure. This plugin descriptor structure contains information that is common to every type of server plugin: A value that indicates the plugin type; the plugin name, author, description, and license type; pointers to the initialization and deinitialization functions that the server invokes when it loads and unloads the plugin, and pointers to any status or system variables the plugin implements.
- Each general server plugin descriptor within the library descriptor also contains a pointer to a type-specific plugin descriptor. The structure of the type-specific descriptors varies from one plugin type to another because each type of plugin can have its own API. A type-specific plugin descriptor contains a type-specific API version number and pointers to the functions that are needed to implement that plugin type. For example, a full-text parser plugin has initialization and deinitialization functions, and a main parsing function. The server invokes these functions when it uses the plugin to parse text.

The plugin library also contains the interface functions that are referenced by the general and type-specific descriptors for each plugin in the library.

If the plugin library contains a client plugin, it must include a descriptor for the plugin. The descriptor begins with a fixed set of members common to all client plugins, followed by any members specific to the plugin type. To provide the descriptor framework, invoke two macros from the `client_plugin.h` header file:

```
mysql_declare_client_plugin(plugin_type)
... members common to all client plugins ...
... type-specific extra members ...
mysql_end_client_plugin;
```

The plugin library also contains any interface functions referenced by the client descriptor.

The `mysql_declare_plugin()` and `mysql_declare_client_plugin()` macros differ somewhat in how they can be invoked, which has implications for the contents of plugin libraries. The following guidelines summarize the rules:

- `mysql_declare_plugin()` and `mysql_declare_client_plugin()` can both be used in the same source file, which means that a plugin library can contain both server and client plugins. However, each of `mysql_declare_plugin()` and `mysql_declare_client_plugin()` can be used at most once.
- `mysql_declare_plugin()` permits multiple server plugin declarations, so a plugin library can contain multiple server plugins.
- `mysql_declare_client_plugin()` permits only a single client plugin declaration. To create multiple client plugins, separate plugin libraries must be used.

When a client program looks for a client plugin that is in a plugin library and not built into `libmysqlclient`, it looks for a file with a base name that is the same as the plugin name. For example, if a program needs to use a client authentication plugin named `auth_xxx` on a system that uses `.so` as the library suffix, it looks in the file named `auth_xxx.so`. (On macOS, the program looks first for `auth_xxx.dylib`, then for `auth_xxx.so`.) For this reason, if a plugin library contains a client plugin, the library must have the same base name as that plugin.

The same is not true for a library that contains server plugins. The `--plugin-load` option and the `INSTALL PLUGIN` statement provide the library file name explicitly, so there need be no explicit relationship between the library name and the name of any server plugins it contains.

Server Plugin Library and Plugin Descriptors

Every plugin library that contains server plugins must include a library descriptor that contains the general plugin descriptor for each server plugin in the file. This section discusses how to write the library and general descriptors for server plugins.

The library descriptor must define two symbols:

- `_mysql_plugin_interface_version` specifies the version number of the general plugin framework. This is given by the `MYSQL_PLUGIN_INTERFACE_VERSION` symbol, which is defined in the `plugin.h` file.
- `_mysql_plugin_declarations` defines an array of plugin declarations, terminated by a declaration with all members set to 0. Each declaration is an instance of the `st_mysql_plugin` structure (also defined in `plugin.h`). There must be one of these for each server plugin in the library.

If the server does not find those two symbols in a library, it does not accept it as a legal plugin library and rejects it with an error. This prevents use of a library for plugin purposes unless it was built specifically as a plugin library.

The conventional way to define the two required symbols is by using the `mysql_declare_plugin()` and `mysql_declare_plugin_end` macros from the `plugin.h` file:

```
mysql_declare_plugin(name)
... one or more server plugin descriptors here ...
mysql_declare_plugin_end;
```

Each server plugin must have a general descriptor that provides information to the server plugin API. The general descriptor has the same structure for all plugin types. The `st_mysql_plugin` structure in the `plugin.h` file defines this descriptor:

```
struct st_mysql_plugin
{
    int type;           /* the plugin type (a MYSQL_XXX_PLUGIN value) */
    void *info;         /* pointer to type-specific plugin descriptor */
    const char *name;   /* plugin name */
    const char *author; /* plugin author (for I_S.PLUGINS) */
    const char *descr;  /* general descriptive text (for I_S.PLUGINS) */
    int license;        /* the plugin license (PLUGIN_LICENSE_XXX) */
};
```

```

int (*init)(void *); /* the function to invoke when plugin is loaded */
int (*deinit)(void *); /* the function to invoke when plugin is unloaded */
unsigned int version; /* plugin version (for I_S.PLUGINS) */
struct st_mysql_show_var *status_vars;
struct st_mysql_sys_var **system_vars;
void * __reserved1; /* reserved for dependency checking */
unsigned long flags; /* flags for plugin */
};

```

The `st_mysql_plugin` descriptor structure members are used as follows. `char *` members should be specified as null-terminated strings.

- **type**: The plugin type. This must be one of the plugin-type values from `plugin.h`:

```

/*
 * The allowable types of plugins
 */
#define MYSQL_UDF_PLUGIN 0 /* User-defined function */
#define MYSQL_STORAGE_ENGINE_PLUGIN 1 /* Storage Engine */
#define MYSQL_FTPARSER_PLUGIN 2 /* Full-text parser plugin */
#define MYSQL_DAEMON_PLUGIN 3 /* The daemon/raw plugin type */
#define MYSQL_INFORMATION_SCHEMA_PLUGIN 4 /* The I_S plugin type */
#define MYSQL_AUDIT_PLUGIN 5 /* The Audit plugin type */
#define MYSQL_REPLICATION_PLUGIN 6 /* The replication plugin type */
#define MYSQL_AUTHENTICATION_PLUGIN 7 /* The authentication plugin type */
...

```

For example, for a full-text parser plugin, the `type` value is `MYSQL_FTPARSER_PLUGIN`.

- **info**: A pointer to the type-specific descriptor for the plugin. This descriptor's structure depends on the particular type of plugin, unlike that of the general plugin descriptor structure. For version-control purposes, the first member of the type-specific descriptor for every plugin type is expected to be the interface version for the type. This enables the server to check the type-specific version for every plugin no matter its type. Following the version number, the descriptor includes any other members needed, such as callback functions and other information needed by the server to invoke the plugin properly. Later sections on writing particular types of server plugins describe the structure of their type-specific descriptors.
- **name**: A string that gives the plugin name. This is the name that will be listed in the `mysql.plugin` table and by which you refer to the plugin in SQL statements such as `INSTALL PLUGIN` and `UNINSTALL PLUGIN`, or with the `--plugin-load` option. The name is also visible in the `INFORMATION_SCHEMA.PLUGINS` table or the output from `SHOW PLUGINS`.

The plugin name should not begin with the name of any server option. If it does, the server will fail to initialize it. For example, the server has a `--socket` option, so you should not use a plugin name such as `socket`, `socket_plugin`, and so forth.

- **author**: A string naming the plugin author. This can be whatever you like.
- **desc**: A string that provides a general description of the plugin. This can be whatever you like.
- **license**: The plugin license type. The value can be one of `PLUGIN_LICENSE_PROPRIETARY`, `PLUGIN_LICENSE_GPL`, or `PLUGIN_LICENSE_BSD`.
- **init**: A once-only initialization function, or `NULL` if there is no such function. The server executes this function when it loads the plugin, which happens for `INSTALL PLUGIN` or, for plugins listed in the `mysql.plugin` table, at server startup. The function takes one argument that points to the internal structure used to identify the plugin. It returns zero for success and nonzero for failure.
- **deinit**: A once-only deinitialization function, or `NULL` if there is no such function. The server executes this function when it unloads the plugin, which happens for `UNINSTALL PLUGIN` or, for plugins listed

in the `mysql.plugin` table, at server shutdown. The function takes one argument that points to the internal structure used to identify the plugin. It returns zero for success and nonzero for failure.

- **version:** The plugin version number. When the plugin is installed, this value can be retrieved from the `INFORMATION_SCHEMA.PLUGINS` table. The value includes major and minor numbers. If you write the value as a hex constant, the format is `0xMMNN`, where `MM` and `NN` are the major and minor numbers, respectively. For example, `0x0302` represents version 3.2.
- **status_vars:** A pointer to a structure for status variables associated with the plugin, or `NULL` if there are no such variables. When the plugin is installed, these variables are displayed in the output of the `SHOW STATUS` statement.

The `status_vars` member, if not `NULL`, points to an array of `st_mysql_show_var` structures that describe status variables. See [Server Plugin Status and System Variables](#).

- **system_vars:** A pointer to a structure for system variables associated with the plugin, or `NULL` if there are no such variables. These options and system variables can be used to help initialize variables within the plugin. When the plugin is installed, these variables are displayed in the output of the `SHOW VARIABLES` statement.

The `system_vars` member, if not `NULL`, points to an array of `st_mysql_sys_var` structures that describe system variables. See [Server Plugin Status and System Variables](#).

- **__reserved1:** A placeholder for the future. It should be set to `NULL`.
- **flags:** Plugin flags. Individual bits correspond to different flags. The value should be set to the OR of the applicable flags. These flags are available:

```
#define PLUGIN_OPT_NO_INSTALL    1UL    /* Not dynamically loadable */
#define PLUGIN_OPT_NO_UNINSTALL 2UL    /* Not dynamically unloadable */
#define PLUGIN_OPT_ALLOW_EARLY  4UL    /* allow --early-plugin-load */
```

The flags have the following meanings when enabled:

- **PLUGIN_OPT_NO_INSTALL:** The plugin cannot be loaded at runtime with the `INSTALL PLUGIN` statement. This is appropriate for plugins that must be loaded at server startup with the `--plugin-load`, `--plugin-load-add`, or `--early-plugin-load` option.
- **PLUGIN_OPT_NO_UNINSTALL:** The plugin cannot be unloaded at runtime with the `UNINSTALL PLUGIN` statement.
- **PLUGIN_OPT_ALLOW_EARLY:** The plugin can be loaded early in the server startup sequence with the `--early-plugin-load` option. This flag has no effect on whether a plugin can be loaded at server startup with the `--plugin-load` or `--plugin-load-add` option, or at runtime with the `INSTALL PLUGIN` statement.

This flag was added in MySQL 8.0.17. All plugins compiled using MySQL distributions prior to 8.0.17 do not have this flag set. When loading these into pre-8.0.17 servers this does not matter, but attempts to use `--early-plugin-load` to load plugin binaries compiled using pre-8.0.17 MySQL distributions into a 8.0.17 or higher server will fail. The plugins must be recompiled against MySQL 8.0.17 or higher.

The server invokes the `init` and `deinit` functions in the general plugin descriptor only when loading and unloading the plugin. They have nothing to do with use of the plugin such as happens when an SQL statement causes the plugin to be invoked.

For example, the descriptor information for a library that contains a single full-text parser plugin named `simple_parser` looks like this:

```
mysql_declare_plugin(ftexample)
{
    MYSQL_FTPARSER_PLUGIN,      /* type */
    &simple_parser_descriptor,    /* descriptor */
    "simple_parser",              /* name */
    "Oracle Corporation",        /* author */
    "Simple Full-Text Parser",    /* description */
    PLUGIN_LICENSE_GPL,          /* plugin license */
    simple_parser_plugin_init,    /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001,                      /* version */
    simple_status,               /* status variables */
    simple_system_variables,      /* system variables */
    NULL,
    0
}
mysql_declare_plugin_end;
```

For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as being legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

`plugin.h` defines the `mysql_declare_plugin()` and `mysql_declare_plugin_end` macros like this:

```
#ifndef MYSQL_DYNAMIC_PLUGIN
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
MYSQL_PLUGIN_EXPORT int VERSION= MYSQL_PLUGIN_INTERFACE_VERSION; \
MYSQL_PLUGIN_EXPORT int PSIZE= sizeof(struct st_mysql_plugin); \
MYSQL_PLUGIN_EXPORT struct st_mysql_plugin DECLS[]= {
#else
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
MYSQL_PLUGIN_EXPORT int _mysql_plugin_interface_version= MYSQL_PLUGIN_INTERFACE_VERSION; \
MYSQL_PLUGIN_EXPORT int _mysql_sizeof_struct_st_plugin= sizeof(struct st_mysql_plugin); \
MYSQL_PLUGIN_EXPORT struct st_mysql_plugin _mysql_plugin_declarations[]= {
#endif

#define mysql_declare_plugin(NAME) \
__MYSQL_DECLARE_PLUGIN(NAME, \
    builtin_ ## NAME ## _plugin_interface_version, \
    builtin_ ## NAME ## _sizeof_struct_st_plugin, \
    builtin_ ## NAME ## _plugin)

#define mysql_declare_plugin_end ,{0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0}}
```

Note

Those declarations define the `_mysql_plugin_interface_version` symbol only if the `MYSQL_DYNAMIC_PLUGIN` symbol is defined. This means that `-DMYSQL_DYNAMIC_PLUGIN` must be provided as part of the compilation command to build the plugin as a shared library.

When the macros are used as just shown, they expand to the following code, which defines both of the required symbols (`_mysql_plugin_interface_version` and `_mysql_plugin_declarations`):

```
int _mysql_plugin_interface_version= MYSQL_PLUGIN_INTERFACE_VERSION;
int _mysql_sizeof_struct_st_plugin= sizeof(struct st_mysql_plugin);
struct st_mysql_plugin _mysql_plugin_declarations[]= {
{
    MYSQL_FTPARSER_PLUGIN,      /* type */
    &simple_parser_descriptor,    /* descriptor */
    "simple_parser",              /* name */
    "Oracle Corporation",        /* author */
    "Simple Full-Text Parser",    /* description */
    PLUGIN_LICENSE_GPL,          /* plugin license */
    simple_parser_plugin_init,    /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001,                      /* version */
    simple_status,               /* status variables */
    simple_system_variables,      /* system variables */
    NULL,
    0
}
```

```

simple_parser_plugin_init, /* init function (when loaded) */
simple_parser_plugin_deinit, /* deinit function (when unloaded) */
0x0001, /* version */
simple_status, /* status variables */
simple_system_variables, /* system variables */
NULL,
0
}
, {0,0,0,0,0,0,0,0,0,0,0,0}
};

```

The preceding example declares a single plugin in the general descriptor, but it is possible to declare multiple plugins. List the declarations one after the other between `mysql_declare_plugin()` and `mysql_declare_plugin_end`, separated by commas.

MySQL server plugins must be compiled as C++ code. One C++ feature that you should not use is nonconstant variables to initialize global structures. Members of structures such as the `st_mysql_plugin` structure should be initialized only with constant variables. The `simple_parser` descriptor shown earlier is permissible in a C++ plugin because it satisfies that requirement:

```

mysql_declare_plugin(ftexample)
{
    MYSQL_FTPARSER_PLUGIN, /* type */
    &simple_parser_descriptor, /* descriptor */
    "simple_parser", /* name */
    "Oracle Corporation", /* author */
    "Simple Full-Text Parser", /* description */
    PLUGIN_LICENSE_GPL, /* plugin license */
    simple_parser_plugin_init, /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001, /* version */
    simple_status, /* status variables */
    simple_system_variables, /* system variables */
    NULL,
    0
}
mysql_declare_plugin_end;

```

Here is another valid way to write the general descriptor. It uses constant variables to indicate the plugin name, author, and description:

```

const char *simple_parser_name = "simple_parser";
const char *simple_parser_author = "Oracle Corporation";
const char *simple_parser_description = "Simple Full-Text Parser";

mysql_declare_plugin(ftexample)
{
    MYSQL_FTPARSER_PLUGIN, /* type */
    &simple_parser_descriptor, /* descriptor */
    simple_parser_name, /* name */
    simple_parser_author, /* author */
    simple_parser_description, /* description */
    PLUGIN_LICENSE_GPL, /* plugin license */
    simple_parser_plugin_init, /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001, /* version */
    simple_status, /* status variables */
    simple_system_variables, /* system variables */
    NULL,
    0
}
mysql_declare_plugin_end;

```

However, the following general descriptor is invalid. It uses structure members to indicate the plugin name, author, and description, but structures are not considered constant initializers in C++:

```

typedef struct
{
    const char *name;
    const char *author;
    const char *description;
} plugin_info;

plugin_info parser_info = {
    "simple_parser",
    "Oracle Corporation",
    "Simple Full-Text Parser"
};

mysql_declare_plugin(ftexample)
{
    MYSQL_FTPARSER_PLUGIN, /* type */
    &simple_parser_descriptor, /* descriptor */
    parser_info.name, /* name */
    parser_info.author, /* author */
    parser_info.description, /* description */
    PLUGIN_LICENSE_GPL, /* plugin license */
    simple_parser_plugin_init, /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001, /* version */
    simple_status, /* status variables */
    simple_system_variables, /* system variables */
    NULL,
    0
}
mysql_declare_plugin_end;

```

Server Plugin Status and System Variables

The server plugin interface enables plugins to expose status and system variables using the `status_vars` and `system_vars` members of the general plugin descriptor.

The `status_vars` member of the general plugin descriptor, if not 0, points to an array of `st_mysql_show_var` structures, each of which describes one status variable, followed by a structure with all members set to 0. The `st_mysql_show_var` structure has this definition:

```

struct st_mysql_show_var {
    const char *name;
    char *value;
    enum enum_mysql_show_type type;
};

```

The following table shows the permissible status variable `type` values and what the corresponding variable should be.

Table 29.1 Server Plugin Status Variable Types

Variable Type	Meaning
<code>SHOW_BOOL</code>	Pointer to a boolean variable
<code>SHOW_INT</code>	Pointer to an integer variable
<code>SHOW_LONG</code>	Pointer to a long integer variable
<code>SHOW_LONGLONG</code>	Pointer to a longlong integer variable
<code>SHOW_CHAR</code>	A string
<code>SHOW_CHAR_PTR</code>	Pointer to a string
<code>SHOW_ARRAY</code>	Pointer to another <code>st_mysql_show_var</code> array

Variable Type	Meaning
<code>SHOW_FUNC</code>	Pointer to a function
<code>SHOW_DOUBLE</code>	Pointer to a double

For the `SHOW_FUNC` type, the function is called and fills in its `out` parameter, which then provides information about the variable to be displayed. The function has this signature:

```
#define SHOW_VAR_FUNC_BUFF_SIZE 1024

typedef int (*mysql_show_var_func) (void *thd,
                                   struct st_mysql_show_var *out,
                                   char *buf);
```

The `system_vars` member, if not 0, points to an array of `st_mysql_sys_var` structures, each of which describes one system variable (which can also be set from the command-line or configuration file), followed by a structure with all members set to 0. The `st_mysql_sys_var` structure is defined as follows:

```
struct st_mysql_sys_var {
    int flags;
    const char *name, *comment;
    int (*check)(THD*, struct st_mysql_sys_var *, void*, st_mysql_value*);
    void (*update)(THD*, struct st_mysql_sys_var *, void*, const void*);
};
```

Additional fields are append as required depending upon the flags.

For convenience, a number of macros are defined that make creating new system variables within a plugin much simpler.

Throughout the macros, the following fields are available:

- `name`: An unquoted identifier for the system variable.
- `varname`: The identifier for the static variable. Where not available, it is the same as the `name` field.
- `opt`: Additional use flags for the system variable. The following table shows the permissible flags.

Table 29.2 Server Plugin System Variable Flags

Flag Value	Description
<code>PLUGIN_VAR_READONLY</code>	The system variable is read only
<code>PLUGIN_VAR_NOSYSVAR</code>	The system variable is not user visible at runtime
<code>PLUGIN_VAR_NOCMDOPT</code>	The system variable is not configurable from the command line
<code>PLUGIN_VAR_NOCMDARG</code>	No argument is required at the command line (typically used for boolean variables)
<code>PLUGIN_VAR_RQCMDARG</code>	An argument is required at the command line (this is the default)
<code>PLUGIN_VAR_OPCMDARG</code>	An argument is optional at the command line
<code>PLUGIN_VAR_MEMALLOC</code>	Used for string variables; indicates that memory is to be allocated for storage of the string

- `comment`: A descriptive comment to be displayed in the server help message. `NULL` if this variable is to be hidden.
- `check`: The check function, `NULL` for default.
- `update`: The update function, `NULL` for default.

- `default`: The variable default value.
- `minimum`: The variable minimum value.
- `maximum`: The variable maximum value.
- `blocksize`: The variable block size. When the value is set, it is rounded to the nearest multiple of `blocksize`.

A system variable may be accessed either by using the static variable directly or by using the `SYSVAR()` accessor macro. The `SYSVAR()` macro is provided for completeness. Usually it should be used only when the code cannot directly access the underlying variable.

For example:

```
static int my_foo;
static MYSQL_SYSVAR_INT(foo_var, my_foo,
                        PLUGIN_VAR_RQCMDARG, "foo comment",
                        NULL, NULL, 0, 0, INT_MAX, 0);
...
SYSVAR(foo_var)= value;
value= SYSVAR(foo_var);
my_foo= value;
value= my_foo;
```

Session variables may be accessed only through the `THDVAR()` accessor macro. For example:

```
static MYSQL_THDVAR_BOOL(some_flag,
                        PLUGIN_VAR_NOCMDARG, "flag comment",
                        NULL, NULL, FALSE);
...
if (THDVAR(thd, some_flag))
{
    do_something();
    THDVAR(thd, some_flag)= FALSE;
}
```

All global and session system variables must be published to `mysqld` before use. This is done by constructing a `NULL`-terminated array of the variables and linking to it in the plugin public interface. For example:

```
static struct st_mysql_sys_var *my_plugin_vars[]= {
    MYSQL_SYSVAR(foo_var),
    MYSQL_SYSVAR(some_flag),
    NULL
};
mysql_declare_plugin(fooplug)
{
    MYSQL_..._PLUGIN,
    &plugin_data,
    "fooplug",
    "foo author",
    "This does foo!",
    PLUGIN_LICENSE_GPL,
    foo_init,
    foo_fini,
    0x0001,
    NULL,
    my_plugin_vars,
    NULL,
    0
}
mysql_declare_plugin_end;
```

The following convenience macros enable you to declare different types of system variables:

- Boolean system variables of type `bool`, which is a 1-byte boolean. (0 = `false`, 1 = `true`)

```
MYSQL_THDVAR_BOOL(name, opt, comment, check, update, default)
MYSQL_SYSVAR_BOOL(name, varname, opt, comment, check, update, default)
```

- String system variables of type `char*`, which is a pointer to a null-terminated string.

```
MYSQL_THDVAR_STR(name, opt, comment, check, update, default)
MYSQL_SYSVAR_STR(name, varname, opt, comment, check, update, default)
```

- Integer system variables, of which there are several varieties.

- An `int` system variable, which is typically a 4-byte signed word.

```
MYSQL_THDVAR_INT(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_INT(name, varname, opt, comment, check, update, default,
                 minimum, maximum, blocksize)
```

- An `unsigned int` system variable, which is typically a 4-byte unsigned word.

```
MYSQL_THDVAR_UINT(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_UINT(name, varname, opt, comment, check, update, default,
                 minimum, maximum, blocksize)
```

- A `long` system variable, which is typically either a 4- or 8-byte signed word.

```
MYSQL_THDVAR_LONG(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_LONG(name, varname, opt, comment, check, update, default,
                 minimum, maximum, blocksize)
```

- An `unsigned long` system variable, which is typically either a 4- or 8-byte unsigned word.

```
MYSQL_THDVAR_ULONG(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_ULONG(name, varname, opt, comment, check, update, default,
                 minimum, maximum, blocksize)
```

- A `long long` system variable, which is typically an 8-byte signed word.

```
MYSQL_THDVAR_LONGLONG(name, opt, comment, check, update,
                     default, minimum, maximum, blocksize)
MYSQL_SYSVAR_LONGLONG(name, varname, opt, comment, check, update,
                     default, minimum, maximum, blocksize)
```

- An `unsigned long long` system variable, which is typically an 8-byte unsigned word.

```
MYSQL_THDVAR_ULONGLONG(name, opt, comment, check, update,
                     default, minimum, maximum, blocksize)
MYSQL_SYSVAR_ULONGLONG(name, varname, opt, comment, check, update,
                     default, minimum, maximum, blocksize)
```

- A `double` system variable, which is typically an 8-byte signed word.

```
MYSQL_THDVAR_DOUBLE(name, opt, comment, check, update,
                   default, minimum, maximum, blocksize)
MYSQL_SYSVAR_DOUBLE(name, varname, opt, comment, check, update,
                   default, minimum, maximum, blocksize)
```

- An `unsigned long` system variable, which is typically either a 4- or 8-byte unsigned word. The range of possible values is an ordinal of the number of elements in the `typelib`, starting from 0.

```
MYSQL_THDVAR_ENUM(name, opt, comment, check, update, default, typelib)
MYSQL_SYSVAR_ENUM(name, varname, opt, comment, check, update,
```

```
default, typelib)
```

- An `unsigned long long` system variable, which is typically an 8-byte unsigned word. Each bit represents an element in the `typelib`.

```
MYSQL_THDVAR_SET(name, opt, comment, check, update, default, typelib)
MYSQL_SYSVAR_SET(name, varname, opt, comment, check, update,
                  default, typelib)
```

Internally, all mutable and plugin system variables are stored in a `HASH` structure.

Display of the server command-line help text is handled by compiling a `DYNAMIC_ARRAY` of all variables relevant to command-line options, sorting them, and then iterating through them to display each option.

When a command-line option has been handled, it is then removed from the `argv` by the `handle_option()` function (`my_getopt.c`); in effect, it is consumed.

The server processes command-line options during the plugin installation process, immediately after the plugin has been successfully loaded but before the plugin initialization function has been called

Plugins loaded at runtime do not benefit from any configuration options and must have usable defaults. Once they are installed, they are loaded at `mysqld` initialization time and configuration options can be set at the command line or within `my.cnf`.

Plugins should consider the `thd` parameter to be read only.

Client Plugin Descriptors

Each client plugin must have a descriptor that provides information to the client plugin API. The descriptor structure begins with a fixed set of members common to all client plugins, followed by any members specific to the plugin type.

The `st_mysql_client_plugin` structure in the `client_plugin.h` file defines a “generic” descriptor that contains the common members:

```
struct st_mysql_client_plugin
{
    int type;
    unsigned int interface_version;
    const char *name;
    const char *author;
    const char *desc;
    unsigned int version[3];
    const char *license;
    void *mysql_api;
    int (*init)(char *, size_t, int, va_list);
    int (*deinit)();
    int (*options)(const char *option, const void *);
};
```

The common `st_mysql_client_plugin` descriptor structure members are used as follows. `char *` members should be specified as null-terminated strings.

- `type`: The plugin type. This must be one of the plugin-type values from `client_plugin.h`, such as `MYSQL_CLIENT_AUTHENTICATION_PLUGIN`.
- `interface_version`: The plugin interface version. For example, this is `MYSQL_CLIENT_AUTHENTICATION_PLUGIN_INTERFACE_VERSION` for an authentication plugin.
- `name`: A string that gives the plugin name. This is the name by which you refer to the plugin when you call `mysql_options()` with the `MYSQL_DEFAULT_AUTH` option or specify the `--default-auth` option to a MySQL client program.

- `author`: A string naming the plugin author. This can be whatever you like.
- `desc`: A string that provides a general description of the plugin. This can be whatever you like.
- `version`: The plugin version as an array of three integers indicating the major, minor, and teeny versions. For example, `{1,2,3}` indicates version 1.2.3.
- `license`: A string that specifies the license type.
- `mysql_api`: For internal use. Specify it as `NULL` in the plugin descriptor.
- `init`: A once-only initialization function, or `NULL` if there is no such function. The client library executes this function when it loads the plugin. The function returns zero for success and nonzero for failure.

The `init` function uses its first two arguments to return an error message if an error occurs. The first argument is a pointer to a `char` buffer, and the second argument indicates the buffer length. Any message returned by the `init` function must be null-terminated, so the maximum message length is the buffer length minus one. The next arguments are passed to `mysql_load_plugin()`. The first indicates how many more arguments there are (0 if none), followed by any remaining arguments.

- `deinit`: A once-only deinitialization function, or `NULL` if there is no such function. The client library executes this function when it unloads the plugin. The function takes no arguments. It returns zero for success and nonzero for failure.
- `options`: A function for handling options passed to the plugin, or `NULL` if there is no such function. The function takes two arguments representing the option name and a pointer to its value. The function returns zero for success and nonzero for failure.

For a given client plugin type, the common descriptor members may be followed by additional members necessary to implement plugins of that type. For example, the `st_mysql_client_plugin_AUTHENTICATION` structure for authentication plugins has a function at the end that the client library calls to perform authentication.

To declare a plugin, use the `mysql_declare_client_plugin()` and `mysql_end_client_plugin` macros:

```
mysql_declare_client_plugin(plugin_type)
... members common to all client plugins ...
... type-specific extra members ...
mysql_end_client_plugin;
```

Do not specify the `type` or `interface_version` member explicitly. The `mysql_declare_client_plugin()` macro uses the `plugin_type` argument to generate their values automatically. For example, declare an authentication client plugin like this:

```
mysql_declare_client_plugin(AUTHENTICATION)
"my_auth_plugin",
"Author Name",
"My Client Authentication Plugin",
{1,0,0},
"GPL",
NULL,
my_auth_init,
my_auth_deinit,
my_auth_options,
my_auth_main
mysql_end_client_plugin;
```

This declaration uses the `AUTHENTICATION` argument to set the `type` and `interface_version` members to `MYSQL_CLIENT_AUTHENTICATION_PLUGIN` and `MYSQL_CLIENT_AUTHENTICATION_PLUGIN_INTERFACE_VERSION`.

Depending on the plugin type, the descriptor may have other members following the common members. For example, for an authentication plugin, there is a function (`my_auth_main()` in the descriptor just shown) that handles communication with the server. See [Section 29.2.4.9, “Writing Authentication Plugins”](#).

Normally, a client program that supports the use of authentication plugins causes a plugin to be loaded by calling `mysql_options()` to set the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options:

```
char *plugin_dir = "path_to_plugin_dir";
char *default_auth = "plugin_name";

/* ... process command-line options ... */

mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);
```

Typically, the program will also accept `--plugin-dir` and `--default-auth` options that enable users to override the default values.

Should a client program require lower-level plugin management, the client library contains functions that take an `st_mysql_client_plugin` argument. See [Section 28.6.16, “C API Client Plugin Functions”](#).

29.2.4.3 Compiling and Installing Plugin Libraries

After your plugin is written, you must compile it and install it. The procedure for compiling shared objects varies from system to system. If you build your library using `CMake`, it should be able to generate the correct compilation commands for your system. If the library is named `somepluglib`, you should end up with a shared library file that has a name something like `somepluglib.so`. (The `.so` file name suffix might differ on your system.)

To use `CMake`, you'll need to set up the configuration files to enable the plugin to be compiled and installed. Use the plugin examples under the `plugin` directory of a MySQL source distribution as a guide.

Create `CMakeLists.txt`, which should look something like this:

```
MYSQL_ADD_PLUGIN(somepluglib somepluglib.c
  MODULE_ONLY MODULE_OUTPUT_NAME "somepluglib")
```

When `CMake` generates the `Makefile`, it should take care of passing to the compilation command the `-DMYSQL_DYNAMIC_PLUGIN` flag, and passing to the linker the `-lmysqldservices` flag, which is needed to link in any functions from services provided through the plugin services interface. See [Section 29.3, “MySQL Services for Plugins”](#).

Run `CMake`, then run `make`:

```
shell> cmake .
shell> make
```

If you need to specify configuration options to `CMake`, see [Section 2.9.7, “MySQL Source-Configuration Options”](#), for a list. For example, you might want to specify `CMAKE_INSTALL_PREFIX` to indicate the MySQL base directory under which the plugin should be installed. You can see what value to use for this option with `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'basedir';
+-----+-----+
| Variable_name | Value                |
+-----+-----+
| base          | /usr/local/mysql    |
+-----+-----+
```

The location of the plugin directory where you should install the library is given by the `plugin_dir` system variable. For example:

```
mysql> SHOW VARIABLES LIKE 'plugin_dir';
+-----+
| Variable_name | Value                                     |
+-----+
| plugin_dir    | /usr/local/mysql/lib/mysql/plugin      |
+-----+
```

To install the plugin library, use `make`:

```
shell> make install
```

Verify that `make install` installed the plugin library in the proper directory. After installing it, make sure that the library permissions permit it to be executed by the server.

29.2.4.4 Writing Full-Text Parser Plugins

MySQL supports server-side full-text parser plugins with [MyISAM](#) and [InnoDB](#). For introductory information about full-text parser plugins, see [Full-Text Parser Plugins](#).

A full-text parser plugin can be used to replace or modify the built-in full-text parser. This section describes how to write a full-text parser plugin named `simple_parser`. This plugin performs parsing based on simpler rules than those used by the MySQL built-in full-text parser: Words are nonempty runs of whitespace characters.

The instructions use the source code in the `plugin/fulltext` directory of MySQL source distributions, so change location into that directory. The following procedure describes how the plugin library is created:

1. To write a full-text parser plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin.h>
```

`plugin.h` defines the `MYSQL_FTPARSER_PLUGIN` server plugin type and the data structures needed to declare the plugin.

2. Set up the library descriptor for the plugin library file.

This descriptor contains the general plugin descriptor for the server plugin. For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as being legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

For example, the library descriptor for a library that contains a single full-text parser plugin named `simple_parser` looks like this:

```
mysql_declare_plugin(ftexample)
{
    MYSQL_FTPARSER_PLUGIN,      /* type */
    &simple_parser_descriptor,   /* descriptor */
    "simple_parser",             /* name */
    "Oracle Corporation",       /* author */
    "Simple Full-Text Parser",  /* description */
    PLUGIN_LICENSE_GPL,         /* plugin license */
    simple_parser_plugin_init,  /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001,                     /* version */
    simple_status,              /* status variables */
    simple_system_variables,    /* system variables */
    NULL,                       /* */
    0
}
mysql_declare_plugin_end;
```

The `name` member (`simple_parser`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

For more information, see [Server Plugin Library and Plugin Descriptors](#).

3. Set up the type-specific plugin descriptor.

Each general plugin descriptor in the library descriptor points to a type-specific descriptor. For a full-text parser plugin, the type-specific descriptor is an instance of the `st_mysql_ftparser` structure in the `plugin.h` file:

```
struct st_mysql_ftparser
{
    int interface_version;
    int (*parse)(MYSQL_FTPARSER_PARAM *param);
    int (*init)(MYSQL_FTPARSER_PARAM *param);
    int (*deinit)(MYSQL_FTPARSER_PARAM *param);
};
```

As shown by the structure definition, the descriptor has an interface version number and contains pointers to three functions.

The interface version number is specified using a symbol, which is in the form: `MYSQL_XXX_INTERFACE_VERSION`. For full-text parser plugins, the symbol is `MYSQL_FTPARSER_INTERFACE_VERSION`. In the source code, you will find the actual interface version number for the full-text parser plugin defined in `include/mysql/plugin_ftparser.h`. The current interface version number is `0x0101`.

The `init` and `deinit` members should point to a function or be set to 0 if the function is not needed. The `parse` member must point to the function that performs the parsing.

In the `simple_parser` declaration, that descriptor is indicated by `&simple_parser_descriptor`. The descriptor specifies the version number for the full-text plugin interface (as given by `MYSQL_FTPARSER_INTERFACE_VERSION`), and the plugin's parsing, initialization, and deinitialization functions:

```
static struct st_mysql_ftparser simple_parser_descriptor=
{
    MYSQL_FTPARSER_INTERFACE_VERSION, /* interface version */
    simple_parser_parse,              /* parsing function */
    simple_parser_init,               /* parser init function */
    simple_parser_deinit              /* parser deinit function */
};
```

A full-text parser plugin is used in two different contexts, indexing and searching. In both contexts, the server calls the initialization and deinitialization functions at the beginning and end of processing each SQL statement that causes the plugin to be invoked. However, during statement processing, the server calls the main parsing function in context-specific fashion:

- For indexing, the server calls the parser for each column value to be indexed.
- For searching, the server calls the parser to parse the search string. The parser might also be called for rows processed by the statement. In natural language mode, there is no need for the server to call the parser. For boolean mode phrase searches or natural language searches with query expansion, the parser is used to parse column values for information that is not in the index. Also, if a boolean mode search is done for a column that has no `FULLTEXT` index, the built-in parser will be called. (Plugins are associated with specific indexes. If there is no index, no plugin is used.)

The plugin declaration in the general plugin descriptor has `init` and `deinit` members that point initialization and deinitialization functions, and so does the type-specific plugin descriptor to which it points. However, these pairs of functions have different purposes and are invoked for different reasons:

- For the plugin declaration in the general plugin descriptor, the initialization and deinitialization functions are invoked when the plugin is loaded and unloaded.
- For the type-specific plugin descriptor, the initialization and deinitialization functions are invoked per SQL statement for which the plugin is used.

Each interface function named in the plugin descriptor should return zero for success or nonzero for failure, and each of them receives an argument that points to a `MYSQL_FTPARSER_PARAM` structure containing the parsing context. The structure has this definition:

```
typedef struct st_mysql_ftparser_param
{
    int (*mysql_parse)(struct st_mysql_ftparser_param *,
                      char *doc, int doc_len);
    int (*mysql_add_word)(struct st_mysql_ftparser_param *,
                        char *word, int word_len,
                        MYSQL_FTPARSER_BOOLEAN_INFO *boolean_info);
    void *ftparser_state;
    void *mysql_ftparam;
    struct charset_info_st *cs;
    char *doc;
    int length;
    int flags;
    enum enum_ftparser_mode mode;
} MYSQL_FTPARSER_PARAM;
```

The structure members are used as follows:

- `mysql_parse`: A pointer to a callback function that invokes the server's built-in parser. Use this callback when the plugin acts as a front end to the built-in parser. That is, when the plugin parsing function is called, it should process the input to extract the text and pass the text to the `mysql_parse` callback.

The first parameter for this callback function should be the `param` value itself:

```
param->mysql_parse(param, ...);
```

A front end plugin can extract text and pass it all at once to the built-in parser, or it can extract and pass text to the built-in parser a piece at a time. However, in this case, the built-in parser treats the pieces of text as though there are implicit word breaks between them.

- `mysql_add_word`: A pointer to a callback function that adds a word to a full-text index or to the list of search terms. Use this callback when the parser plugin replaces the built-in parser. That is, when the plugin parsing function is called, it should parse the input into words and invoke the `mysql_add_word` callback for each word.

The first parameter for this callback function should be the `param` value itself:

```
param->mysql_add_word(param, ...);
```

- `ftparser_state`: This is a generic pointer. The plugin can set it to point to information to be used internally for its own purposes.

- `mysql_ftparam`: This is set by the server. It is passed as the first argument to the `mysql_parse` or `mysql_add_word` callback.
- `cs`: A pointer to information about the character set of the text, or 0 if no information is available.
- `doc`: A pointer to the text to be parsed.
- `length`: The length of the text to be parsed, in bytes.
- `flags`: Parser flags. This is zero if there are no special flags. The only nonzero flag is `MYSQL_FTFLAGS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.)

This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.

- `mode`: The parsing mode. This value will be one of the following constants:
 - `MYSQL_FTPARSER_SIMPLE_MODE`: Parse in fast and simple mode, which is used for indexing and for natural language queries. The parser should pass to the server only those words that should be indexed. If the parser uses length limits or a stopwords list to determine which words to ignore, it should not pass such words to the server.
 - `MYSQL_FTPARSER_WITH_STOPWORDS`: Parse in stopwords mode. This is used in boolean searches for phrase matching. The parser should pass all words to the server, even stopwords or words that are outside any normal length limits.
 - `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`: Parse in boolean mode. This is used for parsing boolean query strings. The parser should recognize not only words but also boolean-mode operators and pass them to the server as tokens using the `mysql_add_word` callback. To tell the server what kind of token is being passed, the plugin needs to fill in a `MYSQL_FTPARSER_BOOLEAN_INFO` structure and pass a pointer to it.

Note

For `MyISAM`, the stopwords list and `ft_min_word_len` and `ft_max_word_len` are checked inside the tokenizer. For `InnoDB`, the stopwords list and equivalent word length variable settings (`innodb_ft_min_token_size` and `innodb_ft_max_token_size`) are checked outside of the tokenizer. As a result, `InnoDB` plugin parsers do not need to check the stopwords list, `innodb_ft_min_token_size`, or `innodb_ft_max_token_size`. Instead, it is recommended that all words be returned to `InnoDB`. However, if you want to check stopwords within your plugin parser, use `MYSQL_FTPARSER_SIMPLE_MODE`, which is for full-text search index and natural language search. For `MYSQL_FTPARSER_WITH_STOPWORDS` and `MYSQL_FTPARSER_FULL_BOOLEAN_INFO` modes, it is recommended that all words be returned to `InnoDB` including stopwords, in case of phrase searches.

If the parser is called in boolean mode, the `param->mode` value will be `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`. The `MYSQL_FTPARSER_BOOLEAN_INFO` structure that the parser uses for passing token information to the server looks like this:

```
typedef struct st_mysql_ftparser_boolean_info
```

```
{
    enum enum_ft_token_type type;
    int yesno;
    int weight_adjust;
    char wasign;
    char trunc;
    int position;
    /* These are parser state and must be removed. */
    char prev;
    char *quot;
} MYSQL_FTPARSER_BOOLEAN_INFO;
```

The parser should fill in the structure members as follows:

- **type**: The token type. The following table shows the permissible types.

Table 29.3 Full-Text Parser Token Types

Token Value	Meaning
FT_TOKEN_EOF	End of data
FT_TOKEN_WORD	A regular word
FT_TOKEN_LEFT_PAREN	The beginning of a group or subexpression
FT_TOKEN_RIGHT_PAREN	The end of a group or subexpression
FT_TOKEN_STOPWORD	A stopword

- **yesno**: Whether the word must be present for a match to occur. 0 means that the word is optional but increases the match relevance if it is present. Values larger than 0 mean that the word must be present. Values smaller than 0 mean that the word must not be present.
- **weight_adjust**: A weighting factor that determines how much a match for the word counts. It can be used to increase or decrease the word's importance in relevance calculations. A value of zero indicates no weight adjustment. Values greater than or less than zero mean higher or lower weight, respectively. The examples at [Section 12.9.2, “Boolean Full-Text Searches”](#), that use the < and > operators illustrate how weighting works.
- **wasign**: The sign of the weighting factor. A negative value acts like the ~ boolean-search operator, which causes the word's contribution to the relevance to be negative.
- **trunc**: Whether matching should be done as if the boolean-mode * truncation operator had been given.
- **position**: Start position of the word in the document, in bytes. Used by [InnoDB](#) full-text search. For existing plugins that are called in boolean mode, support must be added for the position member.

Plugins should not use the `prev` and `quot` members of the `MYSQL_FTPARSER_BOOLEAN_INFO` structure.

Note

The plugin parser framework does not support:

- The `@distance` boolean operator.
- A leading plus sign (+) or minus sign (-) boolean operator followed by a space and then a word ('+ apple' or '- apple'). The leading plus or

minus sign must be directly adjacent to the word, for example: `'+apple'` or `'-apple'`.

For information about boolean full-text search operators, see [Section 12.9.2, “Boolean Full-Text Searches”](#).

4. Set up the plugin interface functions.

The general plugin descriptor in the library descriptor names the initialization and deinitialization functions that the server should invoke when it loads and unloads the plugin. For `simple_parser`, these functions do nothing but return zero to indicate that they succeeded:

```
static int simple_parser_plugin_init(void *arg __attribute__((unused)))
{
    return(0);
}

static int simple_parser_plugin_deinit(void *arg __attribute__((unused)))
{
    return(0);
}
```

Because those functions do not actually do anything, you could omit them and specify 0 for each of them in the plugin declaration.

The type-specific plugin descriptor for `simple_parser` names the initialization, deinitialization, and parsing functions that the server invokes when the plugin is used. For `simple_parser`, the initialization and deinitialization functions do nothing:

```
static int simple_parser_init(MYSQL_FTPARSER_PARAM *param
                             __attribute__((unused)))
{
    return(0);
}

static int simple_parser_deinit(MYSQL_FTPARSER_PARAM *param
                               __attribute__((unused)))
{
    return(0);
}
```

Here too, because those functions do nothing, you could omit them and specify 0 for each of them in the plugin descriptor.

The main parsing function, `simple_parser_parse()`, acts as a replacement for the built-in full-text parser, so it needs to split text into words and pass each word to the server. The parsing function's first argument is a pointer to a structure that contains the parsing context. This structure has a `doc` member that points to the text to be parsed, and a `length` member that indicates how long the text is. The simple parsing done by the plugin considers nonempty runs of whitespace characters to be words, so it identifies words like this:

```
static int simple_parser_parse(MYSQL_FTPARSER_PARAM *param)
{
    char *end, *start, *docend= param->doc + param->length;

    for (end= start= param->doc;; end++)
    {
        if (end == docend)
        {
            if (end > start)
                add_word(param, start, end - start);
            break;
        }
    }
}
```

```

    }
    else if (isspace(*end))
    {
        if (end > start)
            add_word(param, start, end - start);
        start= end + 1;
    }
}
return(0);
}

```

As the parser finds each word, it invokes a function `add_word()` to pass the word to the server. `add_word()` is a helper function only; it is not part of the plugin interface. The parser passes the parsing context pointer to `add_word()`, as well as a pointer to the word and a length value:

```

static void add_word(MYSQL_FTPARSER_PARAM *param, char *word, size_t len)
{
    MYSQL_FTPARSER_BOOLEAN_INFO bool_info=
        { FT_TOKEN_WORD, 0, 0, 0, 0, 0, ' ', 0 };

    param->mysql_add_word(param, word, len, &bool_info);
}

```

For boolean-mode parsing, `add_word()` fills in the members of the `bool_info` structure as described earlier in the discussion of the `st_mysql_ftparser_boolean_info` structure.

5. Set up the status variables. For the `simple_parser` plugin, the following status variable array sets up one status variable with a value that is static text, and another with a value that is stored in a long integer variable:

```

long number_of_calls= 0;

struct st_mysql_show_var simple_status[]=
{
    {"simple_parser_static", (char *)"just a static text", SHOW_CHAR},
    {"simple_parser_called", (char *)&number_of_calls, SHOW_LONG},
    {0,0,0}
};

```

By using status variable names that begin with the plugin name, you can easily display the variables for a plugin with `SHOW STATUS`:

```

mysql> SHOW STATUS LIKE 'simple_parser%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| simple_parser_static | just a static text |
| simple_parser_called | 0 |
+-----+-----+

```

6. To compile and install a plugin library file, use the instructions in [Section 29.2.4.3, “Compiling and Installing Plugin Libraries”](#). To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `simple_parser` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `mypluglib.so` (the `.so` suffix might differ depending on your platform).

- To use the plugin, register it with the server. For example, to register the plugin at runtime, use this statement (adjust the `.so` suffix for your platform as necessary):

```
INSTALL PLUGIN simple_parser SONAME 'mypluglib.so';
```

For additional information about plugin loading, see [Section 5.6.1, “Installing and Uninstalling Plugins”](#).

- To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement. See [Section 5.6.2, “Obtaining Server Plugin Information”](#).
- Test the plugin to verify that it works properly.

Create a table that contains a string column and associate the parser plugin with a `FULLTEXT` index on the column:

```
mysql> CREATE TABLE t (c VARCHAR(255),
->   FULLTEXT (c) WITH PARSER simple_parser
-> ) ENGINE=MyISAM;
Query OK, 0 rows affected (0.01 sec)
```

Insert some text into the table and try some searches. These should verify that the parser plugin treats all nonwhitespace characters as word characters:

```
mysql> INSERT INTO t VALUES
->   ('utf8mb4_0900_as_cs is a case-sensitive collation'),
->   ('I\'d like a case of oranges'),
->   ('this is sensitive information'),
->   ('another row'),
->   ('yet another row');
Query OK, 5 rows affected (0.02 sec)
Records: 5  Duplicates: 0  Warnings: 0
```

```
mysql> SELECT c FROM t;
+-----+
| c |
+-----+
| utf8mb4_0900_as_cs is a case-sensitive collation |
| I'd like a case of oranges |
| this is sensitive information |
| another row |
| yet another row |
+-----+
5 rows in set (0.00 sec)
```

```
mysql> SELECT MATCH(c) AGAINST('case') FROM t;
+-----+
| MATCH(c) AGAINST('case') |
+-----+
| 0 |
| 1.2968142032623 |
| 0 |
| 0 |
| 0 |
+-----+
5 rows in set (0.00 sec)
```

```
mysql> SELECT MATCH(c) AGAINST('sensitive') FROM t;
+-----+
| MATCH(c) AGAINST('sensitive') |
+-----+
| 0 |
| 0 |
| 1.3253291845322 |
| 0 |
```

```

|          0 |
+-----+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('case-sensitive') FROM t;
+-----+
| MATCH(c) AGAINST('case-sensitive') |
+-----+
|          1.3109166622162 |
|          0 |
|          0 |
|          0 |
|          0 |
+-----+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('I\'d') FROM t;
+-----+
| MATCH(c) AGAINST('I\'d') |
+-----+
|          0 |
|          1.2968142032623 |
|          0 |
|          0 |
|          0 |
+-----+
5 rows in set (0.01 sec)

```

Neither “case” nor “insensitive” match “case-insensitive” the way that they would for the built-in parser.

29.2.4.5 Writing Daemon Plugins

A daemon plugin is a simple type of plugin used for code that should be run by the server but that does not communicate with it. This section describes how to write a daemon server plugin, using the example plugin found in the `plugin/daemon_example` directory of MySQL source distributions. That directory contains the `daemon_example.cc` source file for a daemon plugin named `daemon_example` that writes a heartbeat string at regular intervals to a file named `mysql-heartbeat.log` in the data directory.

To write a daemon plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin.h>
```

`plugin.h` defines the `MYSQL_DAEMON_PLUGIN` server plugin type and the data structures needed to declare the plugin.

The `daemon_example.cc` file sets up the library descriptor as follows. The library descriptor includes a single general server plugin descriptor.

```
mysql_declare_plugin(daemon_example)
{
    MYSQL_DAEMON_PLUGIN,
    &daemon_example_plugin,
    "daemon_example",
    "Brian Aker",
    "Daemon example, creates a heartbeat beat file in mysql-heartbeat.log",
    PLUGIN_LICENSE_GPL,
    daemon_example_plugin_init, /* Plugin Init */
    daemon_example_plugin_deinit, /* Plugin Deinit */
    0x0100 /* 1.0 */,
    NULL, /* status variables */
    NULL, /* system variables */
    NULL, /* config options */
    0, /* flags */
}
```

```
}
mysql_declare_plugin_end;
```

The `name` member (`daemon_example`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

The second member of the plugin descriptor, `daemon_example_plugin`, points to the type-specific daemon plugin descriptor. This structure consists only of the type-specific API version number:

```
struct st_mysql_daemon daemon_example_plugin=
{ MYSQL_DAEMON_INTERFACE_VERSION };
```

The type-specific structure has no interface functions. There is no communication between the server and the plugin, except that the server calls the initialization and deinitialization functions from the general plugin descriptor to start and stop the plugin:

- `daemon_example_plugin_init()` opens the heartbeat file and spawns a thread that wakes up periodically and writes the next message to the file.
- `daemon_example_plugin_deinit()` closes the file and performs other cleanup.

To compile and install a plugin library file, use the instructions in [Section 29.2.4.3, “Compiling and Installing Plugin Libraries”](#). To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `daemon_example` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `libdaemon_example.so` (the `.so` suffix might differ depending on your platform).

To use the plugin, register it with the server. For example, to register the plugin at runtime, use this statement (adjust the `.so` suffix for your platform as necessary):

```
INSTALL PLUGIN daemon_example SONAME 'libdaemon_example.so';
```

For additional information about plugin loading, see [Section 5.6.1, “Installing and Uninstalling Plugins”](#).

To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement. See [Section 5.6.2, “Obtaining Server Plugin Information”](#).

While the plugin is loaded, it writes a heartbeat string at regular intervals to a file named `mysql-heartbeat.log` in the data directory. This file grows without limit, so after you have satisfied yourself that the plugin operates correctly, unload it:

```
UNINSTALL PLUGIN daemon_example;
```

29.2.4.6 Writing INFORMATION_SCHEMA Plugins

This section describes how to write a server-side `INFORMATION_SCHEMA` table plugin. For example code that implements such plugins, see the `sql/sql_show.cc` file of a MySQL source distribution. You can also look at the example plugins found in the `InnoDB` source. See the `handler/i_s.cc` and `handler/ha_innodb.cc` files within the `InnoDB` source tree (in the `storage/innobase` directory).

To write an `INFORMATION_SCHEMA` table plugin, include the following header files in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <sql_class.h>
#include <table.h>
```

These header files are located in the `sql` directory of MySQL source distributions. They contain C++ structures, so the source file for an `INFORMATION_SCHEMA` plugin must be compiled as C++ code.

The source file for the example plugin developed here is named `simple_i_s_table.cc`. It creates a simple `INFORMATION_SCHEMA` table named `SIMPLE_I_S_TABLE` that has two columns named `NAME` and `VALUE`. The general descriptor for a plugin library that implements the table looks like this:

```
mysql_declare_plugin(simple_i_s_library)
{
    MYSQL_INFORMATION_SCHEMA_PLUGIN,
    &simple_table_info,           /* type-specific descriptor */
    "SIMPLE_I_S_TABLE",         /* table name */
    "Author Name",              /* author */
    "Simple INFORMATION_SCHEMA table", /* description */
    PLUGIN_LICENSE_GPL,         /* license type */
    simple_table_init,          /* init function */
    NULL,
    0x0100,                     /* version = 1.0 */
    NULL,                       /* no status variables */
    NULL,                       /* no system variables */
    NULL,                       /* no reserved information */
    0                           /* no flags */
}
mysql_declare_plugin_end;
```

The `name` member (`SIMPLE_I_S_TABLE`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

The `simple_table_info` member of the general descriptor points to the type-specific descriptor, which consists only of the type-specific API version number:

```
static struct st_mysql_information_schema simple_table_info =
{ MYSQL_INFORMATION_SCHEMA_INTERFACE_VERSION };
```

The general descriptor points to the initialization and deinitialization functions:

- The initialization function provides information about the table structure and a function that populates the table.
- The deinitialization function performs any required cleanup. If no cleanup is needed, this descriptor member can be `NULL` (as in the example shown).

The initialization function should return 0 for success, 1 if an error occurs. The function receives a generic pointer, which it should interpret as a pointer to the table structure:

```
static int table_init(void *ptr)
{
    ST_SCHEMA_TABLE *schema_table= (ST_SCHEMA_TABLE*)ptr;

    schema_table->fields_info= simple_table_fields;
    schema_table->fill_table= simple_fill_table;
    return 0;
}
```

The function should set these two members of the table structure:

- `fields_info`: An array of `ST_FIELD_INFO` structures that contain information about each column.
- `fill_table`: A function that populates the table.

The array pointed to by `fields_info` should contain one element per column of the `INFORMATION_SCHEMA` plus a terminating element. The following `simple_table_fields` array for the

example plugin indicates that `SIMPLE_I_S_TABLE` has two columns. `NAME` is string-valued with a length of 10 and `VALUE` is integer-valued with a display width of 20. The last structure marks the end of the array.

```
static ST_FIELD_INFO simple_table_fields[]=
{
    {"NAME", 10, MYSQL_TYPE_STRING, 0, 0 0, 0},
    {"VALUE", 6, MYSQL_TYPE_LONG, 0, MY_I_S_UNSIGNED, 0, 0},
    {0, 0, MYSQL_TYPE_NULL, 0, 0, 0, 0}
};
```

For more information about the column information structure, see the definition of `ST_FIELD_INFO` in the `table.h` header file. The permissible `MYSQL_TYPE_XXX` type values are those used in the C API; see [Section 28.6.4, “C API Data Structures”](#).

The `fill_table` member should be set to a function that populates the table and returns 0 for success, 1 if an error occurs. For the example plugin, the `simple_fill_table()` function looks like this:

```
static int simple_fill_table(THD *thd, TABLE_LIST *tables, Item *cond)
{
    TABLE *table= tables->table;

    table->field[0]->store("Name 1", 6, system_charset_info);
    table->field[1]->store(1);
    if (schema_table_store_record(thd, table))
        return 1;
    table->field[0]->store("Name 2", 6, system_charset_info);
    table->field[1]->store(2);
    if (schema_table_store_record(thd, table))
        return 1;
    return 0;
}
```

For each row of the `INFORMATION_SCHEMA` table, this function initializes each column, then calls `schema_table_store_record()` to install the row. The `store()` method arguments depend on the type of value to be stored. For column 0 (`NAME`, a string), `store()` takes a pointer to a string, its length, and information about the character set of the string:

```
store(const char *to, uint length, CHARSET_INFO *cs);
```

For column 1 (`VALUE`, an integer), `store()` takes the value and a flag indicating whether it is unsigned:

```
store(longlong nr, bool unsigned_value);
```

For other examples of how to populate `INFORMATION_SCHEMA` tables, search for instances of `schema_table_store_record()` in `sql_show.cc`.

To compile and install a plugin library file, use the instructions in [Section 29.2.4.3, “Compiling and Installing Plugin Libraries”](#). To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable).

To test the plugin, install it:

```
mysql> INSTALL PLUGIN SIMPLE_I_S_TABLE SONAME 'simple_i_s_table.so';
```

Verify that the table is present:

```
mysql> SELECT TABLE_NAME FROM INFORMATION_SCHEMA.TABLES
-> WHERE TABLE_NAME = 'SIMPLE_I_S_TABLE';
+-----+
| TABLE_NAME |
+-----+
| SIMPLE_I_S_TABLE |
+-----+
```

Try to select from it:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.SIMPLE_I_S_TABLE;
+-----+-----+
| NAME   | VALUE |
+-----+-----+
| Name 1 | 1     |
| Name 2 | 2     |
+-----+-----+
```

Uninstall it:

```
mysql> UNINSTALL PLUGIN SIMPLE_I_S_TABLE;
```

29.2.4.7 Writing Semisynchronous Replication Plugins

This section describes how to write server-side semisynchronous replication plugins, using the example plugins found in the `plugin/semisync` directory of MySQL source distributions. That directory contains the source files for master and slave plugins named `rpl_semi_sync_master` and `rpl_semi_sync_slave`. The information here covers only how to set up the plugin framework. For details about how the plugins implement replication functions, see the source.

To write a semisynchronous replication plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin.h>
```

`plugin.h` defines the `MYSQL_REPLICATION_PLUGIN` server plugin type and the data structures needed to declare the plugin.

For the master side, `semisync_master_plugin.cc` contains this general descriptor for a plugin named `rpl_semi_sync_master`:

```
mysql_declare_plugin(semi_sync_master)
{
    MYSQL_REPLICATION_PLUGIN,
    &semi_sync_master_plugin,
    "rpl_semi_sync_master",
    "He Zhenxing",
    "Semi-synchronous replication master",
    PLUGIN_LICENSE_GPL,
    semi_sync_master_plugin_init, /* Plugin Init */
    semi_sync_master_plugin_deinit, /* Plugin Deinit */
    0x0100 /* 1.0 */,
    semi_sync_master_status_vars, /* status variables */
    semi_sync_master_system_vars, /* system variables */
    NULL, /* config options */
    0, /* flags */
}
mysql_declare_plugin_end;
```

For the slave side, `semisync_slave_plugin.cc` contains this general descriptor for a plugin named `rpl_semi_sync_slave`:

```
mysql_declare_plugin(semi_sync_slave)
{
    MYSQL_REPLICATION_PLUGIN,
    &semi_sync_slave_plugin,
    "rpl_semi_sync_slave",
    "He Zhenxing",
    "Semi-synchronous replication slave",
    PLUGIN_LICENSE_GPL,
```

```

semi_sync_slave_plugin_init, /* Plugin Init */
semi_sync_slave_plugin_deinit, /* Plugin Deinit */
0x0100 /* 1.0 */,
semi_sync_slave_status_vars, /* status variables */
semi_sync_slave_system_vars, /* system variables */
NULL, /* config options */
0, /* flags */
}
mysql_declare_plugin_end;

```

For both the master and slave plugins, the general descriptor has pointers to the type-specific descriptor, the initialization and deinitialization functions, and to the status and system variables implemented by the plugin. For information about variable setup, see [Server Plugin Status and System Variables](#). The following remarks discuss the type-specific descriptor and the initialization and deinitialization functions for the master plugin but apply similarly to the slave plugin.

The `semi_sync_master_plugin` member of the master general descriptor points to the type-specific descriptor, which consists only of the type-specific API version number:

```

struct Mysql_replication semi_sync_master_plugin= {
    MYSQL_REPLICATION_INTERFACE_VERSION
};

```

The initialization and deinitialization function declarations look like this:

```

static int semi_sync_master_plugin_init(void *p);
static int semi_sync_master_plugin_deinit(void *p);

```

The initialization function uses the pointer to register transaction and binary logging “observers” with the server. After successful initialization, the server takes care of invoking the observers at the appropriate times. (For details on the observers, see the source files.) The deinitialization function cleans up by deregistering the observers. Each function returns 0 for success or 1 if an error occurs.

To compile and install a plugin library file, use the instructions in [Section 29.2.4.3, “Compiling and Installing Plugin Libraries”](#). To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `rpl_semi_sync_master` and `rpl_semi_sync_slave` plugins, they are compiled and installed when you build MySQL from source. They are also included in binary distributions. The build process produces shared object libraries with names of `semisync_master.so` and `semisync_slave.so` (the `.so` suffix might differ depending on your platform).

29.2.4.8 Writing Audit Plugins

This section describes how to write a server-side audit plugin, using the example plugin found in the `plugin/audit_null` directory of MySQL source distributions. The `audit_null.c` and `audit_null_variables.h` source files in that directory implement an audit plugin named `NULL_AUDIT`.

Note

Other examples of plugins that use the audit plugin API are the query rewrite plugin (see [Section 5.6.4, “The Rewriter Query Rewrite Plugin”](#)) and the Version Tokens plugin (see [Section 5.6.6, “Version Tokens”](#)).

Within the server, the pluggable audit interface is implemented in the `sql_audit.h` and `sql_audit.cc` files in the `sql` directory of MySQL source distributions. Additionally, several places in the server call the audit interface when an auditable event occurs, so that registered audit plugins can be notified about the event if necessary. To see where such calls occur, search the server source files for invocations of functions with names of the form `mysql_audit_xxx()`. Audit notification occurs for server operations such as these:

- Client connect and disconnect events
- Writing a message to the general query log (if the log is enabled)
- Writing a message to the error log
- Sending a query result to a client

To write an audit plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin_audit.h>
```

`plugin_audit.h` includes `plugin.h`, so you need not include the latter file explicitly. `plugin.h` defines the `MYSQL_AUDIT_PLUGIN` server plugin type and the data structures needed to declare the plugin. `plugin_audit.h` defines data structures specific to audit plugins.

- [Audit Plugin General Descriptor](#)
- [Audit Plugin Type-Specific Descriptor](#)
- [Audit Plugin Notification Function](#)
- [Audit Plugin Error Handling](#)
- [Audit Plugin Usage](#)

Audit Plugin General Descriptor

An audit plugin, like any MySQL server plugin, has a general plugin descriptor (see [Server Plugin Library and Plugin Descriptors](#)) and a type-specific plugin descriptor. In `audit_null.c`, the general descriptor for `audit_null` looks like this:

```
mysql_declare_plugin(audit_null)
{
    MYSQL_AUDIT_PLUGIN,          /* type */
    &audit_null_descriptor,       /* descriptor */
    "NULL_AUDIT",               /* name */
    "Oracle Corp",              /* author */
    "Simple NULL Audit",        /* description */
    PLUGIN_LICENSE_GPL,
    audit_null_plugin_init,      /* init function (when loaded) */
    audit_null_plugin_deinit,    /* deinit function (when unloaded) */
    0x0003,                     /* version */
    simple_status,               /* status variables */
    system_variables,            /* system variables */
    NULL,
    0,
}
mysql_declare_plugin_end;
```

The first member, `MYSQL_AUDIT_PLUGIN`, identifies this plugin as an audit plugin.

`audit_null_descriptor` points to the type-specific plugin descriptor, described later.

The `name` member (`NULL_AUDIT`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `INFORMATION_SCHEMA.PLUGINS` or `SHOW PLUGINS`.

The `audit_null_plugin_init` initialization function performs plugin initialization when the plugin is loaded. The `audit_null_plugin_deinit` function performs cleanup when the plugin is unloaded.

The general plugin descriptor also refers to `simple_status` and `system_variables`, structures that expose several status and system variables. When the plugin is enabled, these variables can be inspected using `SHOW` statements (`SHOW STATUS`, `SHOW VARIABLES`) or the appropriate Performance Schema tables.

The `simple_status` structure declares several status variables with names of the form `Audit_null_xxx`. `NULL_AUDIT` increments the `Audit_null_called` status variable for every notification that it receives. The other status variables are more specific and `NULL_AUDIT` increments them only for notifications of specific events.

`system_variables` is an array of system variable elements, each of which is defined using a `MYSQL_THDVAR_xxx` macro. These system variables have names of the form `null_audit_xxx`. These variables can be used to communicate with the plugin at runtime.

Audit Plugin Type-Specific Descriptor

The `audit_null_descriptor` value in the general plugin descriptor points to the type-specific plugin descriptor. For audit plugins, this descriptor has the following structure (defined in `plugin_audit.h`):

```
struct st_mysql_audit
{
    int interface_version;
    void (*release_thd)(MYSQL_THD);
    int (*event_notify)(MYSQL_THD, mysql_event_class_t, const void *);
    unsigned long class_mask[MYSQL_AUDIT_CLASS_MASK_SIZE];
};
```

The type-specific descriptor for audit plugins has these members:

- `interface_version`: By convention, type-specific plugin descriptors begin with the interface version for the given plugin type. The server checks `interface_version` when it loads the plugin to see whether the plugin is compatible with it. For audit plugins, the value of the `interface_version` member is `MYSQL_AUDIT_INTERFACE_VERSION` (defined in `plugin_audit.h`).
- `release_thd`: A function that the server calls to inform the plugin that it is being dissociated from its thread context. This should be `NULL` if there is no such function.
- `event_notify`: A function that the server calls to notify the plugin that an auditable event has occurred. This function should not be `NULL`; that would not make sense because no auditing would occur.
- `class_mask`: An array of `MYSQL_AUDIT_CLASS_MASK_SIZE` elements. Each element specifies a bitmask for a given event class to indicate the subclasses for which the plugin wants notification. (This is how the plugin “subscribes” to events of interest.) An element should be 0 to ignore all events for the corresponding event class.

The server uses the `event_notify` and `release_thd` functions together. They are called within the context of a specific thread, and a thread might perform an activity that produces several event notifications. The first time the server calls `event_notify` for a thread, it creates a binding of the plugin to the thread. The plugin cannot be uninstalled while this binding exists. When no more events for the thread will occur, the server informs the plugin of this by calling the `release_thd` function, and then destroys the binding. For example, when a client issues a statement, the thread processing the statement might notify audit plugins about the result set produced by the statement and about the statement being logged. After these notifications occur, the server releases the plugin before putting the thread to sleep until the client issues another statement.

This design enables the plugin to allocate resources needed for a given thread in the first call to the `event_notify` function and release them in the `release_thd` function:

```

event_notify function:
    if memory is needed to service the thread
        allocate memory
    ... rest of notification processing ...

release_thd function:
    if memory was allocated
        release memory
    ... rest of release processing ...

```

That is more efficient than allocating and releasing memory repeatedly in the notification function.

For the `NULL_AUDIT` audit plugin, the type-specific plugin descriptor looks like this:

```

static struct st_mysql_audit audit_null_descriptor=
{
    MYSQL_AUDIT_INTERFACE_VERSION,          /* interface version */
    NULL,                                    /* release_thd function */
    audit_null_notify,                       /* notify function */
    { (unsigned long) MYSQL_AUDIT_GENERAL_ALL,
      (unsigned long) MYSQL_AUDIT_CONNECTION_ALL,
      (unsigned long) MYSQL_AUDIT_PARSE_ALL,
      (unsigned long) MYSQL_AUDIT_AUTHORIZATION_ALL,
      (unsigned long) MYSQL_AUDIT_TABLE_ACCESS_ALL,
      (unsigned long) MYSQL_AUDIT_GLOBAL_VARIABLE_ALL,
      (unsigned long) MYSQL_AUDIT_SERVER_STARTUP_ALL,
      (unsigned long) MYSQL_AUDIT_SERVER_SHUTDOWN_ALL,
      (unsigned long) MYSQL_AUDIT_COMMAND_ALL,
      (unsigned long) MYSQL_AUDIT_QUERY_ALL,
      (unsigned long) MYSQL_AUDIT_STORED_PROGRAM_ALL }
};

```

The server calls `audit_null_notify()` to pass audit event information to the plugin. The plugin has no `release_thd` function.

The `class_mask` member is an array that indicates which event classes the plugin subscribes to. As shown, the array contents subscribe to all subclasses of all event classes that are available. To ignore all notifications for a given event class, specify the corresponding `class_mask` element as 0.

The number of `class_mask` elements corresponds to the number of event classes, each of which is listed in the `mysql_event_class_t` enumeration defined in `plugin_audit.h`:

```

typedef enum
{
    MYSQL_AUDIT_GENERAL_CLASS      = 0,
    MYSQL_AUDIT_CONNECTION_CLASS   = 1,
    MYSQL_AUDIT_PARSE_CLASS        = 2,
    MYSQL_AUDIT_AUTHORIZATION_CLASS = 3,
    MYSQL_AUDIT_TABLE_ACCESS_CLASS = 4,
    MYSQL_AUDIT_GLOBAL_VARIABLE_CLASS = 5,
    MYSQL_AUDIT_SERVER_STARTUP_CLASS = 6,
    MYSQL_AUDIT_SERVER_SHUTDOWN_CLASS = 7,
    MYSQL_AUDIT_COMMAND_CLASS      = 8,
    MYSQL_AUDIT_QUERY_CLASS        = 9,
    MYSQL_AUDIT_STORED_PROGRAM_CLASS = 10,
    /* This item must be last in the list. */
    MYSQL_AUDIT_CLASS_MASK_SIZE
} mysql_event_class_t;

```

For any given event class, `plugin_audit.h` defines bitmask symbols for individual event subclasses, as well as an `xxx_ALL` symbol that is the union of the all subclass bitmasks. For example, for `MYSQL_AUDIT_CONNECTION_CLASS` (the class that covers connect and disconnect events), `plugin_audit.h` defines these symbols:

```
typedef enum
{
    /** occurs after authentication phase is completed. */
    MYSQL_AUDIT_CONNECTION_CONNECT      = 1 << 0,
    /** occurs after connection is terminated. */
    MYSQL_AUDIT_CONNECTION_DISCONNECT    = 1 << 1,
    /** occurs after COM_CHANGE_USER RPC is completed. */
    MYSQL_AUDIT_CONNECTION_CHANGE_USER   = 1 << 2,
    /** occurs before authentication. */
    MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE = 1 << 3
} mysql_event_connection_subclass_t;

#define MYSQL_AUDIT_CONNECTION_ALL (MYSQL_AUDIT_CONNECTION_CONNECT | \
                                     MYSQL_AUDIT_CONNECTION_DISCONNECT | \
                                     MYSQL_AUDIT_CONNECTION_CHANGE_USER | \
                                     MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE)
```

To subscribe to all subclasses of the connection event class (as the `NULL_AUDIT` plugin does), a plugin specifies `MYSQL_AUDIT_CONNECTION_ALL` in the corresponding `class_mask` element (`class_mask[1]` in this case). To subscribe to only some subclasses, the plugin sets the `class_mask` element to the union of the subclasses of interest. For example, to subscribe only to the connect and change-user subclasses, the plugin sets `class_mask[1]` to this value:

```
MYSQL_AUDIT_CONNECTION_CONNECT | MYSQL_AUDIT_CONNECTION_CHANGE_USER
```

Audit Plugin Notification Function

Most of the work for an audit plugin occurs in the notification function (the `event_notify` member of the type-specific plugin descriptor). The server calls this function for each auditable event. Audit plugin notification functions have this prototype:

```
int (*event_notify)(MYSQL_THD, mysql_event_class_t, const void *);
```

The second and third parameters of the `event_notify` function prototype represent the event class and a generic pointer to an event structure. (Events in different classes have different structures. The notification function can use the event class value to determine which event structure applies.) The function processes the event and returns a status indicating whether the server should continue processing the event or terminate it.

For `NULL_AUDIT`, the notification function is `audit_null_notify()`. This function increments a global event counter (which the plugin exposes as the value of the `Audit_null_called` status value), and then examines the event class to determine how to process the event structure:

```
static int audit_null_notify(MYSQL_THD thd __attribute__((unused)),
                           mysql_event_class_t event_class,
                           const void *event)
{
    ...

    number_of_calls++;

    if (event_class == MYSQL_AUDIT_GENERAL_CLASS)
    {
        const struct mysql_event_general *event_general=
            (const struct mysql_event_general *)event;
        ...
    }
    else if (event_class == MYSQL_AUDIT_CONNECTION_CLASS)
    {
        const struct mysql_event_connection *event_connection=
            (const struct mysql_event_connection *) event;
        ...
    }
}
```

```

}
else if (event_class == MYSQL_AUDIT_PARSE_CLASS)
{
    const struct mysql_event_parse *event_parse =
        (const struct mysql_event_parse *)event;

    ...
}
...
}

```

The notification function interprets the `event` argument according to the value of `event_class`. The `event` argument is a generic pointer to the event record, the structure of which differs per event class. (The `plugin_audit.h` file contains the structures that define the contents of each event class.) For each class, `audit_null_notify()` casts the event to the appropriate class-specific structure and then checks its subclass to determine which subclass counter to increment. For example, the code to handle events in the connection-event class looks like this:

```

else if (event_class == MYSQL_AUDIT_CONNECTION_CLASS)
{
    const struct mysql_event_connection *event_connection=
        (const struct mysql_event_connection *) event;

    switch (event_connection->event_subclass)
    {
    case MYSQL_AUDIT_CONNECTION_CONNECT:
        number_of_calls_connection_connect++;
        break;
    case MYSQL_AUDIT_CONNECTION_DISCONNECT:
        number_of_calls_connection_disconnect++;
        break;
    case MYSQL_AUDIT_CONNECTION_CHANGE_USER:
        number_of_calls_connection_change_user++;
        break;
    case MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE:
        number_of_calls_connection_pre_authenticate++;
        break;
    default:
        break;
    }
}

```

Note

The general event class (`MYSQL_AUDIT_GENERAL_CLASS`) is deprecated and will be removed in a future MySQL release. To reduce plugin overhead, it is preferable to subscribe only to the more specific event classes of interest.

For some event classes, the `NULL_AUDIT` plugin performs other processing in addition to incrementing a counter. In any case, when the notification function finishes processing the event, it should return a status indicating whether the server should continue processing the event or terminate it.

Audit Plugin Error Handling

Audit plugin notification functions can report a status value for the current event two ways:

- Use the notification function return value. In this case, the function returns zero if the server should continue processing the event, or nonzero if the server should terminate the event.
- Call the `my_message()` function to set the error state before returning from the notification function. In this case, the notification function return value is ignored and the server aborts the event and terminates event processing with an error. The `my_message()` arguments indicate which error to report, and its message. For example:

```
my_message(ER_AUDIT_API_ABORT, "This is my error message.", MYF(0));
```

Some events cannot be aborted. A nonzero return value is not taken into consideration and the `my_message()` error call must follow an `is_error()` check. For example:

```
if (!thd->get_stmt_da()->is_error())
{
    my_message(ER_AUDIT_API_ABORT, "This is my error message.", MYF(0));
}
```

These events cannot be aborted:

- `MYSQL_AUDIT_CONNECTION_DISCONNECT`: The server cannot prevent a client from disconnecting.
- `MYSQL_AUDIT_COMMAND_END`: This event provides the status of a command that has finished executing, so there is no purpose to terminating it.

If an audit plugin returns nonzero status for a nonterminable event, the server ignores the status and continues processing the event. This is also true if an audit plugin uses the `my_message()` function to terminate a nonterminable event.

Audit Plugin Usage

To compile and install a plugin library file, use the instructions in [Section 29.2.4.3, “Compiling and Installing Plugin Libraries”](#). To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `NULL_AUDIT` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `adt_null.so` (the `.so` suffix might differ depending on your platform).

To register the plugin at runtime, use this statement (adjust the `.so` suffix for your platform as necessary):

```
INSTALL PLUGIN NULL_AUDIT SONAME 'adt_null.so';
```

For additional information about plugin loading, see [Section 5.6.1, “Installing and Uninstalling Plugins”](#).

To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement. See [Section 5.6.2, “Obtaining Server Plugin Information”](#).

While the `NULL_AUDIT` audit plugin is installed, it exposes status variables that indicate the events for which the plugin has been called:

```
mysql> SHOW STATUS LIKE 'Audit_null%';
```

Variable_name	Value
Audit_null_authorization_column	0
Audit_null_authorization_db	0
Audit_null_authorization_procedure	0
Audit_null_authorization_proxy	0
Audit_null_authorization_table	0
Audit_null_authorization_user	0
Audit_null_called	185547
Audit_null_command_end	20999
Audit_null_command_start	21001
Audit_null_connection_change_user	0
Audit_null_connection_connect	5823
Audit_null_connection_disconnect	5818
Audit_null_connection_pre_authenticate	5823
Audit_null_general_error	1
Audit_null_general_log	26559

Audit_null_general_result	19922
Audit_null_general_status	21000
Audit_null_global_variable_get	0
Audit_null_global_variable_set	0
Audit_null_message_internal	0
Audit_null_message_user	0
Audit_null_parse_postparse	14648
Audit_null_parse_preparse	14648
Audit_null_query_nested_start	6
Audit_null_query_nested_status_end	6
Audit_null_query_start	14648
Audit_null_query_status_end	14647
Audit_null_server_shutdown	0
Audit_null_server_startup	1
Audit_null_table_access_delete	104
Audit_null_table_access_insert	2839
Audit_null_table_access_read	97842
Audit_null_table_access_update	278

`Audit_null_called` counts all events, and the other variables count instances of specific event subclasses. For example, the preceding `SHOW STATUS` statement causes the server to send a result to the client and to write a message to the general query log if that log is enabled. Thus, a client that issues the statement repeatedly causes `Audit_null_called`, `Audit_null_general_result`, and `Audit_null_general_log` to be incremented each time. Notifications occur whether or not that log is enabled.

The status variables values are global and aggregated across all sessions. There are no counters for individual sessions.

`NULL_AUDIT` exposes several system variables that enable communication with the plugin at runtime:

```
mysql> SHOW VARIABLES LIKE 'null_audit%';
```

Variable_name	Value
null_audit_abort_message	
null_audit_abort_value	1
null_audit_event_order_check	
null_audit_event_order_check_consume_ignore_count	0
null_audit_event_order_check_exact	1
null_audit_event_order_started	0
null_audit_event_record	
null_audit_event_record_def	

The `NULL_AUDIT` system variables have these meanings:

- `null_audit_abort_message`: The custom error message to use when an event is aborted.
- `null_audit_abort_value`: The custom error code to use when an event is aborted.
- `null_audit_event_order_check`: Prior to event matching, the expected event order. After event matching, the matching outcome.
- `null_audit_event_order_check_consume_ignore_count`: Number of times event matching should not consume matched events.
- `null_audit_event_order_check_exact`: Whether event matching must be exact. Disabling this variable enables skipping events not listed in `null_audit_event_order_check` during event-order matching. Of the events specified, they must still match in the order given.
- `null_audit_event_order_started`: For internal use.

- `null_audit_event_record`: The recorded events after event recording takes place.
- `null_audit_event_record_def`: The names of the start and end events to match when recording events, separated by a semicolon. The value must be set before each statement for which events are recorded.

To demonstrate use of those system variables, suppose that a table `db1.t1` exists, created as follows:

```
CREATE DATABASE db1;
CREATE TABLE db1.t1 (a VARCHAR(255));
```

For test-creation purposes, it is possible to record events that pass through the plugin. To start recording, specify the start and end events in the `null_audit_event_record_def` variable. For example:

```
SET @@null_audit_event_record_def =
'MYSQL_AUDIT_COMMAND_START;MYSQL_AUDIT_COMMAND_END';
```

After a statement occurs that matches those start and end events, the `null_audit_event_record` system variable contains the resulting event sequence. For example, after recording the events for a `SELECT 1` statement, `null_audit_event_record` is a string that has a value consisting of a set of event strings:

```
MYSQL_AUDIT_COMMAND_START;command_id="3";
MYSQL_AUDIT_PARSE_PREPARSE;;
MYSQL_AUDIT_PARSE_POSTPARSE;;
MYSQL_AUDIT_GENERAL_LOG;;
MYSQL_AUDIT_QUERY_START;sql_command_id="0";
MYSQL_AUDIT_QUERY_STATUS_END;sql_command_id="0";
MYSQL_AUDIT_GENERAL_RESULT;;
MYSQL_AUDIT_GENERAL_STATUS;;
MYSQL_AUDIT_COMMAND_END;command_id="3";
```

After recording the events for an `INSERT INTO db1.t1 VALUES ('some data')` statement, `null_audit_event_record` has this value:

```
MYSQL_AUDIT_COMMAND_START;command_id="3";
MYSQL_AUDIT_PARSE_PREPARSE;;
MYSQL_AUDIT_PARSE_POSTPARSE;;
MYSQL_AUDIT_GENERAL_LOG;;
MYSQL_AUDIT_QUERY_START;sql_command_id="5";
MYSQL_AUDIT_TABLE_ACCESS_INSERT;db="db1" table="t1";
MYSQL_AUDIT_QUERY_STATUS_END;sql_command_id="5";
MYSQL_AUDIT_GENERAL_RESULT;;
MYSQL_AUDIT_GENERAL_STATUS;;
MYSQL_AUDIT_COMMAND_END;command_id="3";
```

Each event string has this format, with semicolons separating the string parts:

```
event_name;event_data;command
```

Event strings have these parts:

- `event_name`: The event name (a symbol that begins with `MYSQL_AUDIT_`).
- `event_data`: Empty, or, as described later, data associated with the event.
- `command`: Empty, or, as described later, a command to execute when the event is matched.

Note

A limitation of the `NULL_AUDIT` plugin is that event recording works for a single session only. Once you record events in a given session, event recording in

subsequent sessions yields a `null_audit_event_record` value of `NULL`. To record events again, it is necessary to restart the plugin.

To check the order of audit API calls, set the `null_audit_event_order_check` variable to the expected event order for a particular operation, listing one or more event strings, each containing two semicolons internally, with additional semicolons separating adjacent event strings:

```
event_name;event_data;command [;event_name;event_data;command] ...
```

For example:

```
SET @@null_audit_event_order_check =
'MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE;;; '
'MYSQL_AUDIT_GENERAL_LOG;;; '
'MYSQL_AUDIT_CONNECTION_CONNECT;;; '
```

For better readability, the statement takes advantage of the SQL syntax that concatenates adjacent strings into a single string.

After you set the `null_audit_event_order_check` variable to a list of event strings, the next matching operation replaces the variable value with a value that indicates the operation outcome:

- If the expected event order was matched successfully, the resulting `null_audit_event_order_check` value is `EVENT-ORDER-OK`.
- If the `null_audit_event_order_check` value specified aborting a matched event (as described later), the resulting `null_audit_event_order_check` value is `EVENT-ORDER-ABORT`.
- If the expected event order failed with unexpected data, the resulting `null_audit_event_order_check` value is `EVENT-ORDER-INVALID-DATA`. This occurs, for example, if an event was specified as expected to affect table `t1` but actually affected `t2`.

When you assign to `null_audit_event_order_check` the list of events to be matched, some events should be specified with a nonempty `event_data` part of the event string. The following table shows the `event_data` format for these events. If an event takes multiple data values, they must be specified in the order shown. Alternatively, it is possible to specify an `event_data` value as `<IGNORE>` to ignore event data content; in this case, it does not matter whether or not an event has data.

Applicable Events	Event Data Format
<code>MYSQL_AUDIT_COMMAND_START</code>	<code>command_id="id_value"</code>
<code>MYSQL_AUDIT_COMMAND_END</code>	
<code>MYSQL_AUDIT_GLOBAL_VARIABLE_GET</code>	<code>name="var_value" value="var_value"</code>
<code>MYSQL_AUDIT_GLOBAL_VARIABLE_SET</code>	
<code>MYSQL_AUDIT_QUERY_NESTED_START</code>	<code>sql_command_id="id_value"</code>
<code>MYSQL_AUDIT_QUERY_NESTED_STATUS_END</code>	
<code>MYSQL_AUDIT_QUERY_START</code>	
<code>MYSQL_AUDIT_QUERY_STATUS_END</code>	
<code>MYSQL_AUDIT_TABLE_ACCESS_DELETE</code>	<code>db="db_name" table="table_name"</code>
<code>MYSQL_AUDIT_TABLE_ACCESS_INSERT</code>	
<code>MYSQL_AUDIT_TABLE_ACCESS_READ</code>	

Applicable Events	Event Data Format
<code>MYSQL_AUDIT_TABLE_ACCESS_UPDATE</code>	

In the `null_audit_event_order_check` value, specifying `ABORT_RET` in the `command` part of an event string makes it possible to abort the audit API call on the specified event. (Assuming that the event is one that can be aborted. Those that cannot were described previously.) For example, as shown previously, this is the expected order of events for an insert into `t1`:

```
MYSQL_AUDIT_COMMAND_START;command_id="3";
MYSQL_AUDIT_PARSE_PREPARSE;;
MYSQL_AUDIT_PARSE_POSTPARSE;;
MYSQL_AUDIT_GENERAL_LOG;;
MYSQL_AUDIT_QUERY_START;sql_command_id="5";
MYSQL_AUDIT_TABLE_ACCESS_INSERT;db="db1" table="t1";
MYSQL_AUDIT_QUERY_STATUS_END;sql_command_id="5";
MYSQL_AUDIT_GENERAL_RESULT;;
MYSQL_AUDIT_GENERAL_STATUS;;
MYSQL_AUDIT_COMMAND_END;command_id="3";
```

To abort `INSERT` statement execution when the `MYSQL_AUDIT_QUERY_STATUS_END` event occurs, set `null_audit_event_order_check` like this (remember to add semicolon separators between adjacent event strings):

```
SET @@null_audit_event_order_check =
'MYSQL_AUDIT_COMMAND_START;command_id="3";;'
'MYSQL_AUDIT_PARSE_PREPARSE;;; '
'MYSQL_AUDIT_PARSE_POSTPARSE;;; '
'MYSQL_AUDIT_GENERAL_LOG;;; '
'MYSQL_AUDIT_QUERY_START;sql_command_id="5";;'
'MYSQL_AUDIT_TABLE_ACCESS_INSERT;db="db1" table="t1";;'
'MYSQL_AUDIT_QUERY_STATUS_END;sql_command_id="5";ABORT_RET';
```

It is not necessary to list events that are expected to occur after the event string that contains a `command` value of `ABORT_RET`.

After the audit plugin matches the preceding sequence, it aborts event processing and sends an error message to the client. It also sets `null_audit_event_order_check` to `EVENT-ORDER-ABORT`:

```
mysql> INSERT INTO db1.t1 VALUES ('some data');
ERROR 3164 (HY000): Aborted by Audit API ('MYSQL_AUDIT_QUERY_STATUS_END';1).
mysql> SELECT @@null_audit_event_order_check;
+-----+
| @@null_audit_event_order_check |
+-----+
| EVENT-ORDER-ABORT              |
+-----+
```

Returning a nonzero value from the audit API notification routine is the standard way to abort event execution. It is also possible to specify a custom error code by setting the `null_audit_abort_value` variable to the value that the notification routine should return:

```
SET @@null_audit_abort_value = 123;
```

Aborting a sequence results in a standard message with the custom error code. Suppose that you set audit log system variables like this, to abort on a match for the events that occur for a `SELECT 1` statement:

```
SET @@null_audit_abort_value = 123;
SET @@null_audit_event_order_check =
'MYSQL_AUDIT_COMMAND_START;command_id="3";;'
'MYSQL_AUDIT_PARSE_PREPARSE;;; '
'MYSQL_AUDIT_PARSE_POSTPARSE;;; '
'MYSQL_AUDIT_GENERAL_LOG;;; '
'MYSQL_AUDIT_QUERY_START;sql_command_id="0";ABORT_RET';
```

Then execution of `SELECT 1` results in this error message that includes the custom error code:

```
mysql> SELECT 1;
ERROR 3164 (HY000): Aborted by Audit API ('MYSQL_AUDIT_QUERY_START';123).

mysql> SELECT @@null_audit_event_order_check;
+-----+
| @@null_audit_event_order_check |
+-----+
| EVENT-ORDER-ABORT              |
+-----+
```

An event can be also aborted with a custom message, specified by setting the `null_audit_abort_message` variable. Suppose that you set audit log system variables like this:

```
SET @@null_audit_abort_message = 'Custom error text.';
SET @@null_audit_event_order_check =
  'MYSQL_AUDIT_COMMAND_START;command_id="3";';
  'MYSQL_AUDIT_PARSE_PREPARSE;;;';
  'MYSQL_AUDIT_PARSE_POSTPARSE;;;';
  'MYSQL_AUDIT_GENERAL_LOG;;;';
  'MYSQL_AUDIT_QUERY_START;sql_command_id="0";ABORT_RET';
```

Then aborting a sequence results in the following error message:

```
mysql> SELECT 1;
ERROR 3164 (HY000): Custom error text.
mysql> SELECT @@null_audit_event_order_check;
+-----+
| @@null_audit_event_order_check |
+-----+
| EVENT-ORDER-ABORT              |
+-----+
```

To disable the `NULL_AUDIT` plugin after testing it, use this statement to unload it:

```
UNINSTALL PLUGIN NULL_AUDIT;
```

29.2.4.9 Writing Authentication Plugins

MySQL supports pluggable authentication, in which plugins are invoked to authenticate client connections. Authentication plugins enable the use of authentication methods other than the built-in method of passwords stored in the `mysql.user` system table. For example, plugins can be written to access external authentication methods. Also, authentication plugins can support the proxy user capability, such that the connecting user is a proxy for another user and is treated, for purposes of access control, as having the privileges of a different user. For more information, see [Section 6.2.17, “Pluggable Authentication”](#), and [Section 6.2.18, “Proxy Users”](#).

An authentication plugin can be written for the server side or the client side. Server-side plugins use the same plugin API that is used for the other server plugin types such as full-text parser or audit plugins (although with a different type-specific descriptor). Client-side plugins use the client plugin API.

Several header files contain information relevant to authentication plugins:

- `plugin.h`: Defines the `MYSQL_AUTHENTICATION_PLUGIN` server plugin type.
- `client_plugin.h`: Defines the API for client plugins. This includes the client plugin descriptor and function prototypes for client plugin C API calls (see [Section 28.6.16, “C API Client Plugin Functions”](#)).
- `plugin_auth.h`: Defines the part of the server plugin API specific to authentication plugins. This includes the type-specific descriptor for server-side authentication plugins and the `MYSQL_SERVER_AUTH_INFO` structure.

- `plugin_auth_common.h`: Contains common elements of client and server authentication plugins. This includes return value definitions and the `MYSQL_PLUGIN_VIO` structure.

To write an authentication plugin, include the following header files in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

- For a source file that implements a server authentication plugin, include this file:

```
#include <mysql/plugin_auth.h>
```

- For a source file that implements a client authentication plugin, or both client and server plugins, include these files:

```
#include <mysql/plugin_auth.h>
#include <mysql/client_plugin.h>
#include <mysql.h>
```

`plugin_auth.h` includes `plugin.h` and `plugin_auth_common.h`, so you need not include the latter files explicitly.

This section describes how to write a pair of simple server and client authentication plugins that work together.

Warning

These plugins accept any non-empty password and the password is sent as cleartext. This is insecure, so the plugins *should not be used in production environments*.

The server-side and client-side plugins developed here both are named `auth_simple`. As described in [Section 29.2.4.2, “Plugin Data Structures”](#), the plugin library file must have the same base name as the client plugin, so the source file name is `auth_simple.c` and produces a library named `auth_simple.so` (assuming that your system uses `.so` as the suffix for library files).

In MySQL source distributions, authentication plugin source is located in the `plugin/auth` directory and can be examined as a guide to writing other authentication plugins. Also, to see how the built-in authentication plugins are implemented, see `sql/sql_acl.cc` for plugins that are built in to the MySQL server and `sql-common/client.c` for plugins that are built in to the `libmysqlclient` client library. (For the built-in client plugins, note that the `auth_plugin_t` structures used there differ from the structures used with the usual client plugin declaration macros. In particular, the first two members are provided explicitly, not by declaration macros.)

Writing the Server-Side Authentication Plugin

Declare the server-side plugin with the usual general descriptor format that is used for all server plugin types (see [Server Plugin Library and Plugin Descriptors](#)). For the `auth_simple` plugin, the descriptor looks like this:

```
mysql_declare_plugin(auth_simple)
{
    MYSQL_AUTHENTICATION_PLUGIN,
    &auth_simple_handler,           /* type-specific descriptor */
    "auth_simple",                 /* plugin name */
    "Author Name",                 /* author */
    "Any-password authentication plugin", /* description */
    PLUGIN_LICENSE_GPL,           /* license type */
    NULL,                         /* no init function */
    NULL,                         /* no deinit function */
    0x0100,                       /* version = 1.0 */
    NULL,                         /* no status variables */
}
```

```

    NULL,                /* no system variables */
    NULL,                /* no reserved information */
    0                    /* no flags */
}
mysql_declare_plugin_end;

```

The `name` member (`auth_simple`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

The `auth_simple_handler` member of the general descriptor points to the type-specific descriptor. For an authentication plugin, the type-specific descriptor is an instance of the `st_mysql_auth` structure (defined in `plugin_auth.h`):

```

struct st_mysql_auth
{
    int interface_version;
    const char *client_auth_plugin;
    int (*authenticate_user)(MYSQL_PLUGIN_VIO *vio, MYSQL_SERVER_AUTH_INFO *info);
    int (*generate_authentication_string)(char *outbuf,
        unsigned int *outbuflen, const char *inbuf, unsigned int inbuflen);
    int (*validate_authentication_string)(char* const inbuf, unsigned int buflen);
    int (*set_salt)(const char *password, unsigned int password_len,
        unsigned char* salt, unsigned char *salt_len);
    const unsigned long authentication_flags;
};

```

The `st_mysql_auth` structure has these members:

- `interface_version`: The type-specific API version number, always `MYSQL_AUTHENTICATION_INTERFACE_VERSION`
- `client_auth_plugin`: The client plugin name
- `authenticate_user`: A pointer to the main plugin function that communicates with the client
- `generate_authentication_string`: A pointer to a plugin function that generates a password digest from an authentication string
- `validate_authentication_string`: A pointer to a plugin function that validates a password digest
- `set_salt`: A pointer to a plugin function that converts a scrambled password to binary form
- `authentication_flags`: A flags word

The `client_auth_plugin` member should indicate the name of the client plugin if a specific plugin is required. A value of `NULL` means “any plugin.” In the latter case, whatever plugin the client uses will do. This is useful if the server plugin does not care about the client plugin or what user name or password it sends. For example, this might be true if the server plugin authenticates only local clients and uses some property of the operating system rather than the information sent by the client plugin.

For `auth_simple`, the type-specific descriptor looks like this:

```

static struct st_mysql_auth auth_simple_handler =
{
    MYSQL_AUTHENTICATION_INTERFACE_VERSION,
    "auth_simple",          /* required client-side plugin name */
    auth_simple_server       /* server-side plugin main function */
    generate_auth_string_hash, /* generate digest from password string */
    validate_auth_string_hash, /* validate password digest */
    set_salt,               /* generate password salt value */
    AUTH_FLAG_PRIVILEGED_USER_FOR_PASSWORD_CHANGE
};

```

```
};
```

The main function, `auth_simple_server()`, takes two arguments representing an I/O structure and a `MYSQL_SERVER_AUTH_INFO` structure. The structure definition, found in `plugin_auth.h`, looks like this:

```
typedef struct st_mysql_server_auth_info
{
    char *user_name;
    unsigned int user_name_length;
    const char *auth_string;
    unsigned long auth_string_length;
    char authenticated_as[MYSQL_USERNAME_LENGTH+1];
    char external_user[512];
    int password_used;
    const char *host_or_ip;
    unsigned int host_or_ip_length;
} MYSQL_SERVER_AUTH_INFO;
```

The character set for string members is UTF-8. If there is a `_length` member associated with a string, it indicates the string length in bytes. Strings are also null-terminated.

When an authentication plugin is invoked by the server, it should interpret the `MYSQL_SERVER_AUTH_INFO` structure members as follows. Some of these are used to set the value of SQL functions or system variables within the client session, as indicated.

- `user_name`: The user name sent by the client. The value becomes the `USER()` function value.
- `user_name_length`: The length of `user_name` in bytes.
- `auth_string`: The value of the `authentication_string` column of the row in the `mysql.user` system table for the matching account name (that is, the row that matches the client user name and host name and that the server uses to determine how to authenticate the client).

Suppose that you create an account using the following statement:

```
CREATE USER 'my_user'@'localhost'
  IDENTIFIED WITH my_plugin AS 'my_auth_string';
```

When `my_user` connects from the local host, the server invokes `my_plugin` and passes `'my_auth_string'` to it as the `auth_string` value.

- `auth_string_length`: The length of `auth_string` in bytes.
- `authenticated_as`: The server sets this to the user name (the value of `user_name`). The plugin can alter it to indicate that the client should have the privileges of a different user. For example, if the plugin supports proxy users, the initial value is the name of the connecting (proxy) user, and the plugin can change this member to the proxied user name. The server then treats the proxy user as having the privileges of the proxied user (assuming that the other conditions for proxy user support are satisfied; see [Implementing Proxy User Support in Authentication Plugins](#)). The value is represented as a string at most `MYSQL_USER_NAME_LENGTH` bytes long, plus a terminating null. The value becomes the `CURRENT_USER()` function value.
- `external_user`: The server sets this to the empty string (null terminated). Its value becomes the `external_user` system variable value. If the plugin wants that system variable to have a different value, it should set this member accordingly (for example, to the connecting user name). The value is represented as a string at most 511 bytes long, plus a terminating null.
- `password_used`: This member applies when authentication fails. The plugin can set it or ignore it. The value is used to construct the failure error message of `Authentication fails. Password used: %s`. The value of `password_used` determines how `%s` is handled, as shown in the following table.

<code>password_used</code>	<code>%s</code> Handling
0	NO
1	YES
2	There will be no <code>%s</code>

- `host_or_ip`: The name of the client host if it can be resolved, or the IP address otherwise.
- `host_or_ip_length`: The length of `host_or_ip` in bytes.

The `auth_simple` main function, `auth_simple_server()`, reads the password (a null-terminated string) from the client and succeeds if the password is nonempty (first byte not null):

```
static int auth_simple_server (MYSQL_PLUGIN_VIO *vio,
                              MYSQL_SERVER_AUTH_INFO *info)
{
    unsigned char *pkt;
    int pkt_len;

    /* read the password as null-terminated string, fail on error */
    if ((pkt_len= vio->read_packet(vio, &pkt)) < 0)
        return CR_ERROR;

    /* fail on empty password */
    if (!pkt_len || *pkt == '\0')
    {
        info->password_used= PASSWORD_USED_NO;
        return CR_ERROR;
    }

    /* accept any nonempty password */
    info->password_used= PASSWORD_USED_YES;

    return CR_OK;
}
```

The main function should return one of the error codes shown in the following table.

Error Code	Meaning
<code>CR_OK</code>	Success
<code>CR_OK_HANDSHAKE_COMPLETE</code>	Do not send a status packet back to client
<code>CR_ERROR</code>	Error
<code>CR_AUTH_USER_CREDENTIALS</code>	Authentication failure
<code>CR_AUTH_HANDSHAKE</code>	Authentication handshake failure
<code>CR_AUTH_PLUGIN_ERROR</code>	Internal plugin error

For an example of how the handshake works, see the `plugin/auth/dialog.c` source file.

The server counts plugin errors in the Performance Schema `host_cache` table.

`auth_simple_server()` is so basic that it does not use the authentication information structure except to set the member that indicates whether a password was received.

A plugin that supports proxy users must return to the server the name of the proxied user (the MySQL user whose privileges the client user should get). To do this, the plugin must set the `info->authenticated_as` member to the proxied user name. For information about proxying, see [Section 6.2.18, “Proxy Users”](#), and [Implementing Proxy User Support in Authentication Plugins](#).

The `generate_authentication_string` member of the plugin descriptor takes the password and generates a password hash (digest) from it:

- The first two arguments are pointers to the output buffer and its maximum length in bytes. The function should write the password hash to the output buffer and reset the length to the actual hash length.
- The second two arguments indicate the password input buffer and its length in bytes.
- The function returns 0 for success, 1 if an error occurred.

For the `auth_simple` plugin, the `generate_auth_string_hash()` function implements the `generate_authentication_string` member. It just makes a copy of the password, unless it is too long to fit in the output buffer.

```
int generate_auth_string_hash(char *outbuf, unsigned int *buflen,
                             const char *inbuf, unsigned int inbuflen)
{
    /*
     * fail if buffer specified by server cannot be copied to output buffer
     */
    if (*buflen < inbuflen)
        return 1; /* error */
    strncpy(outbuf, inbuf, inbuflen);
    *buflen = strlen(inbuf);
    return 0; /* success */
}
```

The `validate_authentication_string` member of the plugin descriptor validates a password hash:

- The arguments are a pointer to the password hash and its length in bytes.
- The function returns 0 for success, 1 if the password hash cannot be validated.

For the `auth_simple` plugin, the `validate_auth_string_hash()` function implements the `validate_authentication_string` member. It returns success unconditionally:

```
int validate_auth_string_hash(char* const inbuf __attribute__((unused)),
                             unsigned int buflen __attribute__((unused)))
{
    return 0; /* success */
}
```

The `set_salt` member of the plugin descriptor is used only by the `mysql_native_password` plugin (see [Section 6.4.1.1, “Native Pluggable Authentication”](#)). For other authentication plugins, you can use this trivial implementation:

```
int set_salt(const char* password __attribute__((unused)),
             unsigned int password_len __attribute__((unused)),
             unsigned char* salt __attribute__((unused)),
             unsigned char* salt_len)
{
    *salt_len = 0;
    return 0; /* success */
}
```

The `authentication_flags` member of the plugin descriptor contains flags that affect plugin operation. The permitted flags are:

- `AUTH_FLAG_PRIVILEGED_USER_FOR_PASSWORD_CHANGE`: Credential changes are a privileged operation. If this flag is set, the server requires that the user has the global `CREATE USER` privilege or the `UPDATE` privilege for the `mysql` database.

- [AUTH_FLAG_USES_INTERNAL_STORAGE](#): Whether the plugin uses internal storage (in the [authentication_string](#) column of [mysql.user](#) rows). If this flag is not set, attempts to set the password fail and the server produces a warning.

Writing the Client-Side Authentication Plugin

Declare the client-side plugin descriptor with the [mysql_declare_client_plugin\(\)](#) and [mysql_end_client_plugin](#) macros (see [Client Plugin Descriptors](#)). For the [auth_simple](#) plugin, the descriptor looks like this:

```
mysql_declare_client_plugin(AUTHENTICATION)
    "auth_simple",           /* plugin name */
    "Author Name",          /* author */
    "Any-password authentication plugin", /* description */
    {1,0,0},                /* version = 1.0.0 */
    "GPL",                  /* license type */
    NULL,                   /* for internal use */
    NULL,                   /* no init function */
    NULL,                   /* no deinit function */
    NULL,                   /* no option-handling function */
    auth_simple_client       /* main function */
mysql_end_client_plugin;
```

The descriptor members from the plugin name through the option-handling function are common to all client plugin types. (For descriptions, see [Client Plugin Descriptors](#).) Following the common members, the descriptor has an additional member specific to authentication plugins. This is the “main” function, which handles communication with the server. The function takes two arguments representing an I/O structure and a connection handler. For our simple any-password plugin, the main function does nothing but write to the server the password provided by the user:

```
static int auth_simple_client (MYSQL_PLUGIN_VIO *vio, MYSQL *mysql)
{
    int res;

    /* send password as null-terminated string as cleartext */
    res= vio->write_packet(vio, (const unsigned char *) mysql->passwd,
                           strlen(mysql->passwd) + 1);

    return res ? CR_ERROR : CR_OK;
}
```

The main function should return one of the error codes shown in the following table.

Error Code	Meaning
CR_OK	Success
CR_OK_HANDSHAKE_COMPLETE	Success, client done
CR_ERROR	Error

[CR_OK_HANDSHAKE_COMPLETE](#) indicates that the client has done its part successfully and has read the last packet. A client plugin may return [CR_OK_HANDSHAKE_COMPLETE](#) if the number of round trips in the authentication protocol is not known in advance and the plugin must read another packet to determine whether authentication is finished.

Using the Authentication Plugins

To compile and install a plugin library file, use the instructions in [Section 29.2.4.3, “Compiling and Installing Plugin Libraries”](#). To make the library file available for use, install it in the plugin directory (the directory named by the [plugin_dir](#) system variable).

Register the server-side plugin with the server. For example, to load the plugin at server startup, use a `--plugin-load=auth_simple.so` option (adjust the `.so` suffix for your platform as necessary).

Create a user for whom the server will use the `auth_simple` plugin for authentication:

```
mysql> CREATE USER 'x'@'localhost'
-> IDENTIFIED WITH auth_simple;
```

Use a client program to connect to the server as user `x`. The server-side `auth_simple` plugin communicates with the client program that it should use the client-side `auth_simple` plugin, and the latter sends the password to the server. The server plugin should reject connections that send an empty password and accept connections that send a nonempty password. Invoke the client program each way to verify this:

```
shell> mysql --user=x --skip-password
ERROR 1045 (28000): Access denied for user 'x'@'localhost' (using password: NO)

shell> mysql --user=x --password
Enter password: abc
mysql>
```

Because the server plugin accepts any nonempty password, it should be considered insecure. After testing the plugin to verify that it works, restart the server without the `--plugin-load` option so as not to inadvertently leave the server running with an insecure authentication plugin loaded. Also, drop the user with `DROP USER 'x'@'localhost'`.

For additional information about loading and using authentication plugins, see [Section 5.6.1, “Installing and Uninstalling Plugins”](#), and [Section 6.2.17, “Pluggable Authentication”](#).

If you are writing a client program that supports the use of authentication plugins, normally such a program causes a plugin to be loaded by calling `mysql_options()` to set the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options:

```
char *plugin_dir = "path_to_plugin_dir";
char *default_auth = "plugin_name";

/* ... process command-line options ... */

mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);
```

Typically, the program will also accept `--plugin-dir` and `--default-auth` options that enable users to override the default values.

Should a client program require lower-level plugin management, the client library contains functions that take an `st_mysql_client_plugin` argument. See [Section 28.6.16, “C API Client Plugin Functions”](#).

Implementing Proxy User Support in Authentication Plugins

One of the capabilities that pluggable authentication makes possible is proxy users (see [Section 6.2.18, “Proxy Users”](#)). For a server-side authentication plugin to participate in proxy user support, these conditions must be satisfied:

- When a connecting client should be treated as a proxy user, the plugin must return a different name in the `authenticated_as` member of the `MYSQL_SERVER_AUTH_INFO` structure, to indicate the proxied user name. It may also optionally set the `external_user` member, to set the value of the `external_user` system variable.
- Proxy user accounts must be set up to be authenticated by the plugin. Use the `CREATE USER` or `GRANT` statement to associate accounts with plugins.

- Proxy user accounts must have the `PROXY` privilege for the proxied accounts. Use the `GRANT` statement to grant this privilege.

In other words, the only aspect of proxy user support required of the plugin is that it set `authenticated_as` to the proxied user name. The rest is optional (setting `external_user`) or done by the DBA using SQL statements.

How does an authentication plugin determine which proxied user to return when the proxy user connects? That depends on the plugin. Typically, the plugin maps clients to proxied users based on the authentication string passed to it by the server. This string comes from the `AS` part of the `IDENTIFIED WITH` clause of the `CREATE USER` statement that specifies use of the plugin for authentication.

The plugin developer determines the syntax rules for the authentication string and implements the plugin according to those rules. Suppose that a plugin takes a comma-separated list of pairs that map external users to MySQL users. For example:

```
CREATE USER '@%.example.com'
  IDENTIFIED WITH my_plugin AS 'extuser1=mysqlusera, extuser2=mysqluserb'
CREATE USER '@%.example.org'
  IDENTIFIED WITH my_plugin AS 'extuser1=mysqluserc, extuser2=mysqluserd'
```

When the server invokes a plugin to authenticate a client, it passes the appropriate authentication string to the plugin. The plugin is responsible to:

1. Parse the string into its components to determine the mapping to use
2. Compare the client user name to the mapping
3. Return the proper MySQL user name

For example, if `extuser2` connects from an `example.com` host, the server passes `'extuser1=mysqlusera, extuser2=mysqluserb'` to the plugin, and the plugin should copy `mysqluserb` into `authenticated_as`, with a terminating null byte. If `extuser2` connects from an `example.org` host, the server passes `'extuser1=mysqluserc, extuser2=mysqluserd'`, and the plugin should copy `mysqluserd` instead.

If there is no match in the mapping, the action depends on the plugin. If a match is required, the plugin likely will return an error. Or the plugin might simply return the client name; in this case, it should not change `authenticated_as`, and the server will not treat the client as a proxy.

The following example demonstrates how to handle proxy users using a plugin named `auth_simple_proxy`. Like the `auth_simple` plugin described earlier, `auth_simple_proxy` accepts any nonempty password as valid (and thus should not be used in production environments). In addition, it examines the `auth_string` authentication string member and uses these very simple rules for interpreting it:

- If the string is empty, the plugin returns the user name as given and no proxying occurs. That is, the plugin leaves the value of `authenticated_as` unchanged.
- If the string is nonempty, the plugin treats it as the name of the proxied user and copies it to `authenticated_as` so that proxying occurs.

For testing, set up one account that is not proxied according to the preceding rules, and one that is. This means that one account has no `AS` clause, and one includes an `AS` clause that names the proxied user:

```
CREATE USER 'plugin_user1'@'localhost'
  IDENTIFIED WITH auth_simple_proxy;
CREATE USER 'plugin_user2'@'localhost'
```

```
IDENTIFIED WITH auth_simple_proxy AS 'proxied_user';
```

In addition, create an account for the proxied user and grant `plugin_user2` the `PROXY` privilege for it:

```
CREATE USER 'proxied_user'@'localhost'
  IDENTIFIED BY 'proxied_user_pass';
GRANT PROXY
  ON 'proxied_user'@'localhost'
  TO 'plugin_user2'@'localhost';
```

Before the server invokes an authentication plugin, it sets `authenticated_as` to the client user name. To indicate that the user is a proxy, the plugin should set `authenticated_as` to the proxied user name. For `auth_simple_proxy`, this means that it must examine the `auth_string` value, and, if the value is nonempty, copy it to the `authenticated_as` member to return it as the name of the proxied user. In addition, when proxying occurs, the plugin sets the `external_user` member to the client user name; this becomes the value of the `external_user` system variable.

```
static int auth_simple_proxy_server (MYSQL_PLUGIN_VIO *vio,
                                     MYSQL_SERVER_AUTH_INFO *info)
{
    unsigned char *pkt;
    int pkt_len;

    /* read the password as null-terminated string, fail on error */
    if ((pkt_len= vio->read_packet(vio, &pkt)) < 0)
        return CR_ERROR;

    /* fail on empty password */
    if (!pkt_len || *pkt == '\0')
    {
        info->password_used= PASSWORD_USED_NO;
        return CR_ERROR;
    }

    /* accept any nonempty password */
    info->password_used= PASSWORD_USED_YES;

    /* if authentication string is nonempty, use as proxied user name */
    /* and use client name as external_user value */
    if (info->auth_string_length > 0)
    {
        strcpy (info->authenticated_as, info->auth_string);
        strcpy (info->external_user, info->user_name);
    }

    return CR_OK;
}
```

After a successful connection, the `USER()` function should indicate the connecting client user and host name, and `CURRENT_USER()` should indicate the account whose privileges apply during the session. The latter value should be the connecting user account if no proxying occurs or the proxied account if proxying does occur.

Compile and install the plugin, then test it. First, connect as `plugin_user1`:

```
shell> mysql --user=plugin_user1 --password
Enter password: x
```

In this case, there should be no proxying:

```
mysql> SELECT USER(), CURRENT_USER(), @@proxy_user, @@external_user\G
***** 1. row *****
      USER(): plugin_user1@localhost
    CURRENT_USER(): plugin_user1@localhost
```

```
@@proxy_user: NULL
@@external_user: NULL
```

Then connect as `plugin_user2`:

```
shell> mysql --user=plugin_user2 --password
Enter password: x
```

In this case, `plugin_user2` should be proxied to `proxied_user`:

```
mysql> SELECT USER(), CURRENT_USER(), @@proxy_user, @@external_user\G
***** 1. row *****
      USER(): plugin_user2@localhost
  CURRENT_USER(): proxied_user@localhost
      @@proxy_user: 'plugin_user2'@'localhost'
  @@external_user: 'plugin_user2'@'localhost'
```

29.2.4.10 Writing Password-Validation Plugins

This section describes how to write a server-side password-validation plugin. The instructions are based on the source code in the `plugin/password_validation` directory of MySQL source distributions. The `validate_password.cc` source file in that directory implements the plugin named `validate_password`.

Note

In MySQL 8.0.4, the `validate_password` plugin was reimplemented as the `validate_password` component. The plugin form of `validate_password` is still available but is now deprecated and will be removed in a future version of MySQL. MySQL installations that use the plugin should make the transition to using the component instead. See [Section 6.4.3.3, “Transitioning to the Password Validation Component”](#).

To write a password-validation plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin_validate_password.h>
```

`plugin_validate_password.h` includes `plugin.h`, so you need not include the latter file explicitly. `plugin.h` defines the `MYSQL_VALIDATE_PASSWORD_PLUGIN` server plugin type and the data structures needed to declare the plugin. `plugin_validate_password.h` defines data structures specific to password-validation plugins.

A password-validation plugin, like any MySQL server plugin, has a general plugin descriptor (see [Server Plugin Library and Plugin Descriptors](#)). In `validate_password.cc`, the general descriptor for `validate_password` looks like this:

```
mysql_declare_plugin(validate_password)
{
    MYSQL_VALIDATE_PASSWORD_PLUGIN, /* type */
    &validate_password_descriptor, /* descriptor */
    "validate_password", /* name */
    "Oracle Corporation", /* author */
    "check password strength", /* description */
    PLUGIN_LICENSE_GPL,
    validate_password_init, /* init function (when loaded) */
    validate_password_deinit, /* deinit function (when unloaded) */
    0x0100, /* version */
    NULL,
    validate_password_system_variables, /* system variables */
}
```

```

    NULL,
    0,
}
mysql_declare_plugin_end;

```

The `name` member (`validate_password`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `INFORMATION_SCHEMA.PLUGINS` or `SHOW PLUGINS`.

The general descriptor also refers to `validate_password_system_variables`, a structure that exposes several system variables to the `SHOW VARIABLES` statement:

```

static struct st_mysql_sys_var* validate_password_system_variables[] = {
    MYSQL_SYSVAR(length),
    MYSQL_SYSVAR(number_count),
    MYSQL_SYSVAR(mixed_case_count),
    MYSQL_SYSVAR(special_char_count),
    MYSQL_SYSVAR(policy),
    MYSQL_SYSVAR(dictionary_file),
    NULL
};

```

The `validate_password_init` initialization function reads the dictionary file if one was specified, and the `validate_password_deinit` function frees data structures associated with the file.

The `validate_password_descriptor` value in the general descriptor points to the type-specific descriptor. For password-validation plugins, this descriptor has the following structure:

```

struct st_mysql_validate_password
{
    int interface_version;
    /*
     * This function returns TRUE for passwords which satisfy the password
     * policy (as chosen by plugin variable) and FALSE for all other
     * password
     */
    int (*validate_password)(mysql_string_handle password);
    /*
     * This function returns the password strength (0-100) depending
     * upon the policies
     */
    int (*get_password_strength)(mysql_string_handle password);
};

```

The type-specific descriptor has these members:

- `interface_version`: By convention, type-specific plugin descriptors begin with the interface version for the given plugin type. The server checks `interface_version` when it loads the plugin to see whether the plugin is compatible with it. For password-validation plugins, the value of the `interface_version` member is `MYSQL_VALIDATE_PASSWORD_INTERFACE_VERSION` (defined in `plugin_validate_password.h`).
- `validate_password`: A function that the server calls to test whether a password satisfies the current password policy. It returns 1 if the password is okay and 0 otherwise. The argument is the password, passed as a `mysql_string_handle` value. This data type is implemented by the `mysql_string` server service. For details, see the `string_service.h` and `string_service.cc` source files in the `sql` directory.
- `get_password_strength`: A function that the server calls to assess the strength of a password. It returns a value from 0 (weak) to 100 (strong). The argument is the password, passed as a `mysql_string_handle` value.

For the `validate_password` plugin, the type-specific descriptor looks like this:

```
static struct st_mysql_validate_password validate_password_descriptor=
{
    MYSQL_VALIDATE_PASSWORD_INTERFACE_VERSION,
    validate_password,                /* validate function */
    get_password_strength             /* validate strength function */
};
```

To compile and install a plugin library file, use the instructions in [Section 29.2.4.3, “Compiling and Installing Plugin Libraries”](#). To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `validate_password` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `validate_password.so` (the `.so` suffix might differ depending on your platform).

To register the plugin at runtime, use this statement (adjust the `.so` suffix for your platform as necessary):

```
INSTALL PLUGIN validate_password SONAME 'validate_password.so';
```

For additional information about plugin loading, see [Section 5.6.1, “Installing and Uninstalling Plugins”](#).

To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement. See [Section 5.6.2, “Obtaining Server Plugin Information”](#).

While the `validate_password` plugin is installed, it exposes system variables that indicate the password-checking parameters:

```
mysql> SHOW VARIABLES LIKE 'validate_password%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| validate_password_dictionary_file |      |
| validate_password_length          | 8     |
| validate_password_mixed_case_count | 1     |
| validate_password_number_count    | 1     |
| validate_password_policy          | MEDIUM |
| validate_password_special_char_count | 1     |
+-----+-----+
```

For descriptions of these variables, see [Section 6.4.3.2, “Password Validation Options and Variables”](#).

To disable the plugin after testing it, use this statement to unload it:

```
UNINSTALL PLUGIN validate_password;
```

29.2.4.11 Writing Protocol Trace Plugins

MySQL supports the use of protocol trace plugins: client-side plugins that implement tracing of communication between a client and the server that takes place using the client/server protocol.

Using the Test Protocol Trace Plugin

MySQL includes a test protocol trace plugin that serves to illustrate the information available from such plugins, and as a guide to writing other protocol trace plugins. To see how the test plugin works, use a MySQL source distribution; binary distributions are built with the test plugin disabled.

Enable the test protocol trace plugin by configuring MySQL with the `WITH_TEST_TRACE_PLUGIN` CMake option enabled. This causes the test trace plugin to be built and MySQL client programs to load it, but the plugin has no effect by default. Control the plugin using these environment variables:

- `MYSQL_TEST_TRACE_DEBUG`: Set this variable to a value other than 0 to cause the test plugin to produce diagnostic output on `stderr`.
- `MYSQL_TEST_TRACE_CRASH`: Set this variable to a value other than 0 to cause the test plugin to abort the client program if it detects an invalid trace event.

Caution

Diagnostic output from the test protocol trace plugin can disclose passwords and other sensitive information.

Given a MySQL installation built from source with the test plugin enabled, you can see a trace of the communication between the `mysql` client and the MySQL server as follows:

```
shell> export MYSQL_TEST_TRACE_DEBUG=1
shqll> mysql
test_trace: Test trace plugin initialized
test_trace: Starting tracing in stage CONNECTING
test_trace: stage: CONNECTING, event: CONNECTING
test_trace: stage: CONNECTING, event: CONNECTED
test_trace: stage: WAIT_FOR_INIT_PACKET, event: READ_PACKET
test_trace: stage: WAIT_FOR_INIT_PACKET, event: PACKET_RECEIVED
test_trace: packet received: 87 bytes
  0A 35 2E 37 2E 33 2D 6D 31 33 2D 64 65 62 75 67 .5.7.3-m13-debug
  2D 6C 6F 67 00 04 00 00 00 2B 7C 4F 55 3F 79 67 -log.....+|OU?yg
test_trace: 004: stage: WAIT_FOR_INIT_PACKET, event: INIT_PACKET_RECEIVED
test_trace: 004: stage: AUTHENTICATE, event: AUTH_PLUGIN
test_trace: 004: Using authentication plugin: mysql_native_password
test_trace: 004: stage: AUTHENTICATE, event: SEND_AUTH_RESPONSE
test_trace: 004: sending packet: 188 bytes
  85 A6 7F 00 00 00 00 01 21 00 00 00 00 00 00 00 .?.....!.....
  00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 .....
...
mysql> quit
test_trace: 008: stage: READY_FOR_COMMAND, event: SEND_COMMAND
test_trace: 008: QUIT
test_trace: 008: stage: READY_FOR_COMMAND, event: PACKET_SENT
test_trace: 008: packet sent: 0 bytes
test_trace: 008: stage: READY_FOR_COMMAND, event: DISCONNECTED
test_trace: 008: Connection closed
test_trace: 008: Tracing connection has ended
Bye
test_trace: Test trace plugin de-initialized
```

To disable trace output, do this:

```
shell> MYSQL_TEST_TRACE_DEBUG=
```

Using Your Own Protocol Trace Plugins

Note

To use your own protocol trace plugins, you must configure MySQL with the `WITH_TEST_TRACE_PLUGIN` CMake option *disabled* because only one protocol trace plugin can be loaded at a time and an error occurs for attempts to load a second one. If you have already built MySQL with the test protocol trace plugin enabled to see how it works, you must rebuild MySQL without it before you can use your own plugins.

This section discusses how to write a basic protocol trace plugin named `simple_trace`. This plugin provides a framework showing how to set up the client plugin descriptor and create the trace-related callback functions. In `simple_trace`, these functions are rudimentary and do little other than illustrate the

arguments required. To see in detail how a trace plugin can make use of trace event information, check the source file for the test protocol trace plugin (`test_trace_plugin.cc` in the `libmysql` directory of a MySQL source distribution). However, note that the `st_mysql_client_plugin_TRACE` structure used there differs from the structures used with the usual client plugin declaration macros. In particular, the first two members are defined explicitly, not implicitly by declaration macros.

Several header files contain information relevant to protocol trace plugins:

- `client_plugin.h`: Defines the API for client plugins. This includes the client plugin descriptor and function prototypes for client plugin C API calls (see [Section 28.6.16, “C API Client Plugin Functions”](#)).
- `plugin_trace.h`: Contains declarations for client-side plugins of type `MYSQL_CLIENT_TRACE_PLUGIN`. It also contains descriptions of the permitted protocol stages, transitions between stages, and the types of events permitted at each stage.

To write a protocol trace plugin, include the following header files in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin_trace.h>
#include <mysql.h>
```

`plugin_trace.h` includes `client_plugin.h`, so you need not include the latter file explicitly.

Declare the client-side plugin descriptor with the `mysql_declare_client_plugin()` and `mysql_end_client_plugin` macros (see [Client Plugin Descriptors](#)). For the `simple_trace` plugin, the descriptor looks like this:

```
mysql_declare_client_plugin	TRACE)
"simple_trace",				/* plugin name */
"Author Name",				/* author */
"Simple protocol trace plugin",	/* description */
{1,0,0},					/* version = 1.0.0 */
"GPL",						/* license type */
NULL,						/* for internal use */
plugin_init,					/* initialization function */
plugin_deinit,				/* deinitialization function */
plugin_options,				/* option-handling function */
trace_start,					/* start-trace function */
trace_stop,					/* stop-trace function */
trace_event					/* event-handling function */
mysql_end_client_plugin;
```

The descriptor members from the plugin name through the option-handling function are common to all client plugin types. The members following the common members implement trace event handling.

Function members for which the plugin needs no processing can be declared as `NULL` in the descriptor, in which case you need not write any corresponding function. For illustration purposes and to show the argument syntax, the following discussion implements all functions listed in the descriptor, even though some of them do nothing,

The initialization, deinitialization, and options functions common to all client plugins are declared as follows. For a description of the arguments and return values, see [Client Plugin Descriptors](#).

```
static int
plugin_init(char *errbuf, size_t errbuf_len, int argc, va_list args)
{
    return 0;
}

static int
plugin_deinit()
```

```

{
    return 0;
}

static int
plugin_options(const char *option, const void *value)
{
    return 0;
}

```

The trace-specific members of the client plugin descriptor are callback functions. The following descriptions provide more detail on how they are used. Each has a first argument that is a pointer to the plugin instance in case your implementation needs to access it.

trace_start(): This function is called at the start of each traced connection (each connection that starts after the plugin is loaded). It is passed the connection handler and the protocol stage at which tracing starts. **trace_start()** allocates memory needed by the **trace_event()** function, if any, and returns a pointer to it. If no memory is needed, this function returns **NULL**.

```

static void*
trace_start(struct st_mysql_client_plugin_TRACE *self,
            MYSQL *conn,
            enum protocol_stage stage)
{
    struct st_trace_data *plugin_data= malloc(sizeof(struct st_trace_data));

    fprintf(stderr, "Initializing trace: stage %d\n", stage);
    if (plugin_data)
    {
        memset(plugin_data, 0, sizeof(struct st_trace_data));
        fprintf(stderr, "Trace initialized\n");
        return plugin_data;
    }
    fprintf(stderr, "Could not initialize trace\n");
    exit(1);
}

```

trace_stop(): This function is called when tracing of the connection ends. That usually happens when the connection is closed, but can happen earlier. For example, **trace_event()** can return a nonzero value at any time and that causes tracing of the connection to terminate. **trace_stop()** is then called even though the connection has not ended.

trace_stop() is passed the connection handler and a pointer to the memory allocated by **trace_start()** (**NULL** if none). If the pointer is non-**NULL**, **trace_stop()** should deallocate the memory. This function returns no value.

```

static void
trace_stop(struct st_mysql_client_plugin_TRACE *self,
            MYSQL *conn,
            void *plugin_data)
{
    fprintf(stderr, "Terminating trace\n");
    if (plugin_data)
        free(plugin_data);
}

```

trace_event(): This function is called for each event occurrence. It is passed a pointer to the memory allocated by **trace_start()** (**NULL** if none), the connection handler, the current protocol stage and event codes, and event data. This function returns 0 to continue tracing, nonzero if tracing should stop.

```

static int
trace_event(struct st_mysql_client_plugin_TRACE *self,
            void *plugin_data,

```

```

        MYSQL *conn,
        enum protocol_stage stage,
        enum trace_event event,
        struct st_trace_event_args args)
{
    fprintf(stderr, "Trace event received: stage %d, event %d\n", stage, event);
    if (event == TRACE_EVENT_DISCONNECTED)
        fprintf(stderr, "Connection closed\n");
    return 0;
}

```

The tracing framework shuts down tracing of the connection when the connection ends, so `trace_event()` should return nonzero only if you want to terminate tracing of the connection early. Suppose that you want to trace only connections for a certain MySQL account. After authentication, you can check the user name for the connection and stop tracing if it is not the user in whom you are interested.

For each call to `trace_event()`, the `st_trace_event_args` structure contains the event data. It has this definition:

```

struct st_trace_event_args
{
    const char      *plugin_name;
    int             cmd;
    const unsigned char *hdr;
    size_t          hdr_len;
    const unsigned char *pkt;
    size_t          pkt_len;
};

```

For different event types, the `st_trace_event_args` structure contains the information described following. All lengths are in bytes. Unused members are set to 0/NULL.

AUTH_PLUGIN event:

<code>plugin_name</code>	The name of the plugin
--------------------------	------------------------

SEND_COMMAND event:

<code>cmd</code>	The command code
<code>hdr</code>	Pointer to the command packet header
<code>hdr_len</code>	Length of the header
<code>pkt</code>	Pointer to the command arguments
<code>pkt_len</code>	Length of the arguments

Other SEND_xxx and xxx_RECEIVED events:

<code>pkt</code>	Pointer to the data sent or received
<code>pkt_len</code>	Length of the data

PACKET_SENT event:

<code>pkt_len</code>	Number of bytes sent
----------------------	----------------------

To compile and install a plugin library file, use the instructions in [Section 29.2.4.3, “Compiling and Installing Plugin Libraries”](#). To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable).

After the plugin library file is compiled and installed in the plugin directory, you can test it easily by setting the `LIBMYSQL_PLUGINS` environment variable to the plugin name, which affects any client program that uses that variable. `mysql` is one such program:

```

shell> export LIBMYSQL_PLUGINS=simple_trace

```

```

shqll> mysql
Initializing trace: stage 0
Trace initialized
Trace event received: stage 0, event 1
Trace event received: stage 0, event 2
...
Welcome to the MySQL monitor.  Commands end with ; or \g.
Trace event received
Trace event received
...
mysql> SELECT 1;
Trace event received: stage 4, event 12
Trace event received: stage 4, event 16
...
Trace event received: stage 8, event 14
Trace event received: stage 8, event 15
+----+
| 1 |
+----+
| 1 |
+----+
1 row in set (0.00 sec)

mysql> quit
Trace event received: stage 4, event 12
Trace event received: stage 4, event 16
Trace event received: stage 4, event 3
Connection closed
Terminating trace
Bye

```

To stop the trace plugin from being loaded, do this:

```
shell> LIBMYSQL_PLUGINS=
```

It is also possible to write client programs that directly load the plugin. You can tell the client where the plugin directory is located by calling `mysql_options()` to set the `MYSQL_PLUGIN_DIR` option:

```

char *plugin_dir = "path_to_plugin_dir";

/* ... process command-line options ... */

mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);

```

Typically, the program will also accept a `--plugin-dir` option that enables users to override the default value.

Should a client program require lower-level plugin management, the client library contains functions that take an `st_mysql_client_plugin` argument. See [Section 28.6.16, “C API Client Plugin Functions”](#).

29.2.4.12 Writing Keyring Plugins

MySQL Server supports a keyring service that enables internal server components and plugins to securely store sensitive information for later retrieval. This section describes how to write a server-side keyring plugin that can be used by service functions to perform key-management operations. For general keyring information, see [Section 6.4.4, “The MySQL Keyring”](#).

The instructions here are based on the source code in the `plugin/keyring` directory of MySQL source distributions. The source files in that directory implement a plugin named `keyring_file` that uses a file local to the server host for data storage.

To write a keyring plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin_keyring.h>
```

`plugin_keyring.h` includes `plugin.h`, so you need not include the latter file explicitly. `plugin.h` defines the `MYSQL_KEYRING_PLUGIN` server plugin type and the data structures needed to declare the plugin. `plugin_keyring.h` defines data structures specific to keyring plugins.

A keyring plugin, like any MySQL server plugin, has a general plugin descriptor (see [Server Plugin Library and Plugin Descriptors](#)). In `keyring.cc`, the general descriptor for `keyring_file` looks like this:

```
mysql_declare_plugin(keyring_file)
{
    MYSQL_KEYRING_PLUGIN,          /* type */
    &keyring_descriptor,           /* descriptor */
    "keyring_file",                /* name */
    "Oracle Corporation",          /* author */
    "store/fetch authentication data to/from a flat file", /* description */
    PLUGIN_LICENSE_GPL,
    keyring_init,                  /* init function (when loaded) */
    keyring_deinit,                /* deinit function (when unloaded) */
    0x0100,                        /* version */
    NULL,                          /* status variables */
    keyring_system_variables,       /* system variables */
    NULL,
    0,
}
mysql_declare_plugin_end;
```

The `name` member (`keyring_file`) indicates the plugin name. This is the name displayed by `INFORMATION_SCHEMA.PLUGINS` or `SHOW PLUGINS`.

The general descriptor also refers to `keyring_system_variables`, a structure that exposes a system variable to the `SHOW VARIABLES` statement:

```
static struct st_mysql_sys_var *keyring_system_variables[] = {
    MYSQL_SYSVAR(data),
    NULL
};
```

The `keyring_init` initialization function creates the data file if it does not exist, then reads it and initializes the keystore. The `keyring_deinit` function frees data structures associated with the file.

The `keyring_descriptor` value in the general descriptor points to the type-specific descriptor. For keyring plugins, this descriptor has the following structure:

```
struct st_mysql_keyring
{
    int interface_version;
    bool (*mysql_key_store)(const char *key_id, const char *key_type,
                           const char* user_id, const void *key, size_t key_len);
    bool (*mysql_key_fetch)(const char *key_id, char **key_type,
                           const char *user_id, void **key, size_t *key_len);
    bool (*mysql_key_remove)(const char *key_id, const char *user_id);
    bool (*mysql_key_generate)(const char *key_id, const char *key_type,
                              const char *user_id, size_t key_len);
};
```

The type-specific descriptor has these members:

- `interface_version`: By convention, type-specific plugin descriptors begin with the interface version for the given plugin type. The server checks `interface_version` when it loads the plugin to see whether the plugin is compatible with it. For keyring plugins, the value of the `interface_version` member is `MYSQL_KEYRING_INTERFACE_VERSION` (defined in `plugin_keyring.h`).

- `mysql_key_store`: A function that obfuscates and stores a key in the keyring.
- `mysql_key_fetch`: A function that deobfuscates and retrieves a key from the keyring.
- `mysql_key_remove`: A function that removes a key from the keyring.
- `mysql_key_generate`: A function that generates a new random key and stores it in the keyring.

For the `keyring_file` plugin, the type-specific descriptor looks like this:

```
static struct st_mysql_keyring keyring_descriptor=
{
    MYSQL_KEYRING_INTERFACE_VERSION,
    mysql_key_store,
    mysql_key_fetch,
    mysql_key_remove,
    mysql_key_generate
};
```

The `mysql_key_xxx` functions implemented by a keyring plugin are analogous to the `my_key_xxx` functions exposed by the keyring service API. For example, the `mysql_key_store` plugin function is analogous to the `my_key_store` keyring service function. For information about the arguments to keyring service functions and how they are used, see [Section 29.3.2, “The Keyring Service”](#).

To compile and install a plugin library file, use the instructions in [Section 29.2.4.3, “Compiling and Installing Plugin Libraries”](#). To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `keyring_file` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `keyring_file.so` (the `.so` suffix might differ depending on your platform).

Keyring plugins typically are loaded early during the server startup process so that they are available to built-in plugins and storage engines that might depend on them. For `keyring_file`, use these lines in the server `my.cnf` file (adjust the `.so` suffix for your platform as necessary):

```
[mysqld]
early-plugin-load=keyring_file.so
```

For additional information about plugin loading, see [Section 5.6.1, “Installing and Uninstalling Plugins”](#).

To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement (see [Section 5.6.2, “Obtaining Server Plugin Information”](#)). For example:

```
mysql> SELECT PLUGIN_NAME, PLUGIN_STATUS
       FROM INFORMATION_SCHEMA.PLUGINS
       WHERE PLUGIN_NAME LIKE 'keyring%';
+-----+-----+
| PLUGIN_NAME | PLUGIN_STATUS |
+-----+-----+
| keyring_file | ACTIVE        |
+-----+-----+
```

While the `keyring_file` plugin is installed, it exposes a system variable that indicates the location of the data file it uses for secure information storage:

```
mysql> SHOW VARIABLES LIKE 'keyring_file%';
+-----+-----+
| Variable_name | Value                                     |
+-----+-----+
| keyring_file_data | /usr/local/mysql/keyring/keyring |
+-----+-----+
```

+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
For a description of the `keyring_file_data` variable, see [Section 5.1.8, “Server System Variables”](#).

To disable the plugin after testing it, restart the server without an `--early-plugin-load` option that names the plugin.

29.3 MySQL Services for Plugins

MySQL server plugins have access to server “plugin services.” The plugin services interface exposes server functionality that plugins can call. It complements the plugin API and has these characteristics:

- Services enable plugins to access code inside the server using ordinary function calls. Services are also available to user-defined functions (UDFs).
- Services are portable and work on multiple platforms.
- The interface includes a versioning mechanism so that service versions supported by the server can be checked at load time against plugin versions. Versioning protects against incompatibilities between the version of a service that the server provides and the version of the service expected or required by a plugin.
- For information about plugins for testing plugin services, see the [Plugins for Testing Plugin Services](#) section of the MySQL Server Doxygen documentation, available at <https://dev.mysql.com/doc/index-other.html>.

The plugin services interface differs from the plugin API as follows:

- The plugin API enables plugins to be used by the server. The calling initiative lies with the server to invoke plugins. This enables plugins to extend server functionality or register to receive notifications about server processing.
- The plugin services interface enables plugins to call code inside the server. The calling initiative lies with plugins to invoke service functions. This enables functionality already implemented in the server to be used by many plugins; they need not individually implement it themselves.

To determine what services exist and what functions they provide, look in the `include/mysql` directory of a MySQL source distribution. The relevant files are:

- `plugin.h` includes `services.h`, which is the “umbrella” header that includes all available service-specific header files.
- Service-specific headers have names of the form `service_xxx.h`.

Each service-specific header should contain comments that provide full usage documentation for a given service, including what service functions are available, their calling sequences, and return values.

For developers who wish to modify the server to add a new service, see [MySQL Internals: MySQL Services for Plugins](#).

Available services include the following:

- `get_sysvar_source`: A service that enables plugins to retrieve the source of system variable settings.
- `locking_service`: A service that implements locks with three attributes: Lock namespace, lock name, and lock mode. This locking interface is available at two levels: 1) As a C language interface, callable as a plugin service from server plugins or user-defined functions; 2) At the SQL level, as a set of user-

defined functions that map onto calls to the service routines. For more information, see [Section 29.3.1, “The Locking Service”](#).

- `my_plugin_log_service`: A service that enables plugins to report errors and specify error messages. The server writes the messages to its error log.
- `status_variable_registration`: A service for registering status variables.
- `my_thd_scheduler`: A service for plugins to select a thread scheduler.
- `mysql_keyring`: A service for keyring storage. For more information, see [Section 29.3.2, “The Keyring Service”](#).
- `mysql_password_policy`: A service for password validation and strength checking.
- `plugin_registry_service`: MySQL Server includes a component-based infrastructure for improving server extensibility; see [Section 5.5, “MySQL Server Components”](#). However, MySQL plugins use an interface that predates the component interface. The `plugin_registry_service` enables plugins to access the component registry and its services.
- `security_context`: A service that enables plugins to examine or manipulate thread security contexts. This service provides setter and getter routines to access attributes of the server `Security_context` class, which includes attributes such as operating system user and host, authenticated user and host, and client IP address.
- `thd_alloc`: A memory-allocation service.
- `thd_wait`: A service for plugins to report when they are going to sleep or stall.

The remainder of this section describes how a plugin uses server functionality that is available as a service. See also the source for the “daemon” example plugin, which uses the `my_snprintf` service. Within a MySQL source distribution, that plugin is located in the `plugin/daemon_example` directory.

To use a service or services from within a plugin, the plugin source file must include the `plugin.h` header file to access service-related information:

```
#include <mysql/plugin.h>
```

This does not represent any additional setup cost. A plugin must include that file anyway because it contains definitions and structures that every plugin needs.

To access a service, a plugin calls service functions like any other function.

To report an error that the server will write to its error log, first choose an error level. `mysql/service_my_plugin_log.h` defines these levels:

```
enum plugin_log_level
{
    MY_ERROR_LEVEL,
    MY_WARNING_LEVEL,
    MY_INFORMATION_LEVEL
};
```

Then invoke `my_plugin_log_message()`:

```
int my_plugin_log_message(MYSQL_PLUGIN *plugin, enum plugin_log_level level,
                        const char *format, ...);
```

For example:

```
my_plugin_log_message(plugin_ptr, MY_ERROR_LEVEL, "Cannot initialize plugin");
```

Some services *for* plugins may be provided *by* plugins and thus are available only if the service-providing plugin is loaded. Any MySQL component that uses such a service should check whether the service is available.

When you build your plugin, use the `-lmysqlservices` flag at link time to link in the `libmysqlservices` library. For example, for CMake, put this in the top-level `CMakeLists.txt` file:

```
FIND_LIBRARY(MYSQLSERVICES_LIB mysqlservices
PATHS "${MYSQL_SRCDIR}/libservices" NO_DEFAULT_PATH)
```

Put this in the `CMakeLists.txt` file in the directory containing the plugin source:

```
# the plugin needs the mysql services library for error logging
TARGET_LINK_LIBRARIES (your_plugin_library_name ${MYSQLSERVICES_LIB})
```

29.3.1 The Locking Service

MySQL distributions provide a locking interface that is available at two levels:

- As a C language interface, callable as a plugin service from server plugins or user-defined functions
- At the SQL level, as a set of user-defined functions that map onto calls to the service routines

For general information about plugin services, see [Section 29.3, “MySQL Services for Plugins”](#). For general information about user-defined functions, see [Section 29.4.2, “Adding a User-Defined Function”](#).

The locking interface has these characteristics:

- Locks have three attributes: Lock namespace, lock name, and lock mode:
 - Locks are identified by the combination of namespace and lock name. The namespace enables different applications to use the same lock names without colliding by creating locks in separate namespaces. For example, if applications A and B use namespaces of `ns1` and `ns2`, respectively, each application can use lock names `lock1` and `lock2` without interfering with the other application.
 - A lock mode is either read or write. Read locks are shared: If a session has a read lock on a given lock identifier, other sessions can acquire a read lock on the same identifier. Write locks are exclusive: If a session has a write lock on a given lock identifier, other sessions cannot acquire a read or write lock on the same identifier.
- Namespace and lock names must be non-`NULL`, nonempty, and have a maximum length of 64 characters. A namespace or lock name specified as `NULL`, the empty string, or a string longer than 64 characters results in an `ER_LOCKING_SERVICE_WRONG_NAME` error.
- The locking interface treats namespace and lock names as binary strings, so comparisons are case-sensitive.
- The locking interface provides functions to acquire locks and release locks. No special privilege is required to call these functions. Privilege checking is the responsibility of the calling application.
- Locks can be waited for if not immediately available. Lock acquisition calls take an integer timeout value that indicates how many seconds to wait to acquire locks before giving up. If the timeout is reached without successful lock acquisition, an `ER_LOCKING_SERVICE_TIMEOUT` error occurs. If the timeout is 0, there is no waiting and the call produces an error if locks cannot be acquired immediately.
- The locking interface detects deadlock between lock-acquisition calls in different sessions. In this case, the locking service chooses a caller and terminates its lock-acquisition request with an `ER_LOCKING_SERVICE_DEADLOCK` error. This error does not cause transactions to roll back. To

choose a session in case of deadlock, the locking service prefers sessions that hold read locks over sessions that hold write locks.

- A session can acquire multiple locks with a single lock-acquisition call. For a given call, lock acquisition is atomic: The call succeeds if all locks are acquired. If acquisition of any lock fails, the call acquires no locks and fails, typically with an `ER_LOCKING_SERVICE_TIMEOUT` or `ER_LOCKING_SERVICE_DEADLOCK` error.
- A session can acquire multiple locks for the same lock identifier (namespace and lock name combination). These lock instances can be read locks, write locks, or a mix of both.
- Locks acquired within a session are released explicitly by calling a release-locks function, or implicitly when the session terminates (either normally or abnormally). Locks are not released when transactions commit or roll back.
- Within a session, all locks for a given namespace when released are released together.

The interface provided by the locking service is distinct from that provided by `GET_LOCK()` and related SQL functions (see [Section 12.14, “Locking Functions”](#)). For example, `GET_LOCK()` does not implement namespaces and provides only exclusive locks, not distinct read and write locks.

29.3.1.1 The Locking Service C Interface

This section describes how to use the locking service C language interface. To use the UDF interface instead, see [Section 29.3.1.2, “The Locking Service UDF Interface”](#). For general characteristics of the locking service interface, see [Section 29.3.1, “The Locking Service”](#). For general information about plugin services, see [Section 29.3, “MySQL Services for Plugins”](#).

Source files that use the locking service should include this header file:

```
#include <mysql/service_locking.h>
```

To acquire one or more locks, call this function:

```
int mysql_acquire_locking_service_locks(MYSQL_THD opaque_thd,
                                       const char* lock_namespace,
                                       const char**lock_names,
                                       size_t lock_num,
                                       enum enum_locking_service_lock_type lock_type,
                                       unsigned long lock_timeout);
```

The arguments have these meanings:

- `opaque_thd`: A thread handle. If specified as `NULL`, the handle for the current thread is used.
- `lock_namespace`: A null-terminated string that indicates the lock namespace.
- `lock_names`: An array of null-terminated strings that provides the names of the locks to acquire.
- `lock_num`: The number of names in the `lock_names` array.
- `lock_type`: The lock mode, either `LOCKING_SERVICE_READ` or `LOCKING_SERVICE_WRITE` to acquire read locks or write locks, respectively.
- `lock_timeout`: An integer number of seconds to wait to acquire the locks before giving up.

To release locks acquired for a given namespace, call this function:

```
int mysql_release_locking_service_locks(MYSQL_THD opaque_thd,
                                       const char* lock_namespace);
```

The arguments have these meanings:

- `opaque_thd`: A thread handle. If specified as `NULL`, the handle for the current thread is used.
- `lock_namespace`: A null-terminated string that indicates the lock namespace.

Locks acquired or waited for by the locking service can be monitored at the SQL level using the Performance Schema. For details, see [Locking Service Monitoring](#).

29.3.1.2 The Locking Service UDF Interface

This section describes how to use the locking service user-defined function (UDF) interface. To use the C language interface instead, see [Section 29.3.1.1, “The Locking Service C Interface”](#). For general characteristics of the locking service interface, see [Section 29.3.1, “The Locking Service”](#). For general information about user-defined functions, see [Section 29.4.2, “Adding a User-Defined Function”](#).

Installing or Uninstalling the UDF Locking Interface

The locking service routines described in [Section 29.3.1.1, “The Locking Service C Interface”](#) need not be installed because they are built into the server. The same is not true of the user-defined functions (UDFs) that map onto calls to the service routines: The UDFs must be installed before use. This section describes how to do that. For general information about UDF installation, see [Section 5.7.1, “Installing and Uninstalling User-Defined Functions”](#).

The locking service UDFs are implemented in a plugin library file located in the directory named by the `plugin_dir` system variable. The file base name is `locking_service`. The file name suffix differs per platform (for example, `.so` for Unix and Unix-like systems, `.dll` for Windows).

To install the locking service UDFs, use the `CREATE FUNCTION` statement (adjust the `.so` suffix for your platform as necessary):

```
CREATE FUNCTION service_get_read_locks RETURNS INT
  SONAME 'locking_service.so';
CREATE FUNCTION service_get_write_locks RETURNS INT
  SONAME 'locking_service.so';
CREATE FUNCTION service_release_locks RETURNS INT
  SONAME 'locking_service.so';
```

If the UDFs are used on a master replication server, install them on all slave servers as well to avoid replication problems.

Once installed, the UDFs remain installed until uninstalled. To remove them, use the `DROP FUNCTION` statement:

```
DROP FUNCTION service_get_read_locks;
DROP FUNCTION service_get_write_locks;
DROP FUNCTION service_release_locks;
```

Using the UDF Locking Interface

Before using the locking service UDFs, install them according to the instructions provided at [Installing or Uninstalling the UDF Locking Interface](#).

To acquire one or more read locks, call this function:

```
mysql> SELECT service_get_read_locks('mynamespace', 'rlock1', 'rlock2', 10);
+-----+
| service_get_read_locks('mynamespace', 'rlock1', 'rlock2', 10) |
+-----+
| 1 |
```

The first argument is the lock namespace. The final argument is an integer timeout indicating how many seconds to wait to acquire the locks before giving up. The arguments in between are the lock names.

For the example just shown, the function acquires locks with lock identifiers `(mynamespace, rlock1)` and `(mynamespace, rlock2)`.

To acquire write locks rather than read locks, call this function:

```
mysql> SELECT service_get_write_locks('myspace', 'wlock1', 'wlock2', 10);
+-----+
| service_get_write_locks('myspace', 'wlock1', 'wlock2', 10) |
+-----+
| 1 |
```

In this case, the lock identifiers are `(myspace, wlock1)` and `(myspace, wlock2)`.

To release all locks for a namespace, use this function:

```
mysql> SELECT service_release_locks('myspace');
+-----+
| service_release_locks('myspace') |
+-----+
| 1 |
```

Each locking function returns nonzero for success. If the function fails, an error occurs. For example, the following error occurs because lock names cannot be empty:

```
mysql> SELECT service_get_read_locks('myspace', '', 10);
ERROR 3131 (42000): Incorrect locking service lock name ''.
```

A session can acquire multiple locks for the same lock identifier. As long as a different session does not have a write lock for an identifier, the session can acquire any number of read or write locks. Each lock request for the identifier acquires a new lock. The following statements acquire three write locks with the same identifier, then three read locks for the same identifier:

```
SELECT service_get_write_locks('ns', 'lock1', 'lock1', 'lock1', 0);
SELECT service_get_read_locks('ns', 'lock1', 'lock1', 'lock1', 0);
```

If you examine the Performance Schema `metadata_locks` table at this point, you will find that the session holds six distinct locks with the same `(ns, lock1)` identifier. (For details, see [Locking Service Monitoring](#).)

Because the session holds at least one write lock on `(ns, lock1)`, no other session can acquire a lock for it, either read or write. If the session held only read locks for the identifier, other sessions could acquire read locks for it, but not write locks.

Locks for a single lock-acquisition call are acquired atomically, but atomicity does not hold across calls. Thus, for a statement such as the following, where `service_get_write_locks()` is called once per row of the result set, atomicity holds for each individual call, but not for the statement as a whole:

```
SELECT service_get_write_locks('ns', 'lock1', 'lock2', 0) FROM t1 WHERE ... ;
```

Caution

Because the locking service returns a separate lock for each successful request for a given lock identifier, it is possible for a single statement to acquire a large number of locks. For example:

```
INSERT INTO ... SELECT service_get_write_locks('ns', t1.col_name, 0) FROM t1;
```

These types of statements may have certain adverse effects. For example, if the statement fails part way through and rolls back, locks acquired up to the point of failure will still exist. If the intent is for there to be a correspondence between rows inserted and locks acquired, that intent will not be satisfied. Also, if it is important that locks are granted in a certain order, be aware that result set order may differ depending on which execution plan the optimizer chooses. For these reasons, it may be best to limit applications to a single lock-acquisition call per statement.

Locking Service Monitoring

The locking service is implemented using the MySQL Server metadata locks framework, so you monitor locking service locks acquired or waited for by examining the Performance Schema `metadata_locks` table.

First, enable the metadata lock instrument:

```
mysql> UPDATE performance_schema.setup_instruments SET ENABLED = 'YES'
-> WHERE NAME = 'wait/lock/metadata/sql/mdl';
```

Then acquire some locks and check the contents of the `metadata_locks` table:

```
mysql> SELECT service_get_write_locks('mynamespace', 'lock1', 0);
+-----+
| service_get_write_locks('mynamespace', 'lock1', 0) |
+-----+
| 1 |
+-----+
mysql> SELECT service_get_read_locks('mynamespace', 'lock2', 0);
+-----+
| service_get_read_locks('mynamespace', 'lock2', 0) |
+-----+
| 1 |
+-----+
mysql> SELECT OBJECT_TYPE, OBJECT_SCHEMA, OBJECT_NAME, LOCK_TYPE, LOCK_STATUS
-> FROM performance_schema.metadata_locks
-> WHERE OBJECT_TYPE = 'LOCKING SERVICE'\G
***** 1. row *****
OBJECT_TYPE: LOCKING SERVICE
OBJECT_SCHEMA: mynamespace
OBJECT_NAME: lock1
LOCK_TYPE: EXCLUSIVE
LOCK_STATUS: GRANTED
***** 2. row *****
OBJECT_TYPE: LOCKING SERVICE
OBJECT_SCHEMA: mynamespace
OBJECT_NAME: lock2
LOCK_TYPE: SHARED
LOCK_STATUS: GRANTED
```

Locking service locks have an `OBJECT_TYPE` value of `LOCKING SERVICE`. This is distinct from, for example, locks acquired with the `GET_LOCK()` function, which have an `OBJECT_TYPE` of `USER LEVEL LOCK`.

The lock namespace, name, and mode appear in the `OBJECT_SCHEMA`, `OBJECT_NAME`, and `LOCK_TYPE` columns. Read and write locks have `LOCK_TYPE` values of `SHARED` and `EXCLUSIVE`, respectively.

The `LOCK_STATUS` value is `GRANTED` for an acquired lock, `PENDING` for a lock that is being waited for. You will see `PENDING` if one session holds a write lock and another session is attempting to acquire a lock having the same identifier.

Locking Service UDF Interface Reference

The SQL interface to the locking service implements the user-defined functions described in this section. For usage examples, see [Using the UDF Locking Interface](#).

The functions share these characteristics:

- The return value is nonzero for success. Otherwise, an error occurs.
- Namespace and lock names must be non-`NULL`, nonempty, and have a maximum length of 64 characters.
- Timeout values must be integers indicating how many seconds to wait to acquire locks before giving up with an error. If the timeout is 0, there is no waiting and the function produces an error if locks cannot be acquired immediately.

These locking service UDFs are available:

- `service_get_read_locks(namespace, lock_name[, lock_name] ..., timeout)`

Acquires one or more read (shared) locks in the given namespace using the given lock names, timing out with an error if the locks are not acquired within the given timeout value.

- `service_get_write_locks(namespace, lock_name[, lock_name] ..., timeout)`

Acquires one or more write (exclusive) locks in the given namespace using the given lock names, timing out with an error if the locks are not acquired within the given timeout value.

- `service_release_locks(namespace)`

For the given namespace, releases all locks that were acquired within the current session using `service_get_read_locks()` and `service_get_write_locks()`.

It is not an error for there to be no locks in the namespace.

29.3.2 The Keyring Service

MySQL Server supports a keyring service that enables internal server components and plugins to securely store sensitive information for later retrieval. This section describes how to use the keyring service functions to store, retrieve, and remove keys in the MySQL keyring keystore. An SQL interface to the keyring service functions is also available as a set of user-defined functions (UDFs); see [Section 6.4.4.9, “General-Purpose Keyring Key-Management Functions”](#). For general keyring information, see [Section 6.4.4, “The MySQL Keyring”](#).

The keyring service uses whatever underlying keyring plugin is enabled, if any. If no keyring plugin is enabled, keyring service calls fail.

A “record” in the keystore consists of data (the key itself) and a unique identifier through which the key is accessed. The identifier has two parts:

- `key_id`: The key ID or name. `key_id` values that begin with `mysql_` are reserved by MySQL Server.
- `user_id`: The session effective user ID. If there is no user context, this value can be `NULL`. The value need not actually be a “user”; the meaning depends on the application.

Functions that implement the keyring UDF interface pass the value of `CURRENT_USER()` as the `user_id` value to keyring service functions.

The keyring service functions have these characteristics in common:

- Each function returns 0 for success, 1 for failure.
- The `key_id` and `user_id` arguments form a unique combination indicating which key in the keyring to use.
- The `key_type` argument provides additional information about the key, such as its encryption method or intended use.
- Keyring service functions treat key IDs, user names, types, and values as binary strings, so comparisons are case sensitive. For example, IDs of `MyKey` and `mykey` refer to different keys.

These keyring service functions are available:

- `my_key_fetch()`

Deobfuscates and retrieves a key from the keyring, along with its type. The function allocates the memory for the buffers used to store the returned key and key type. The caller should zero or obfuscate the memory when it is no longer needed, then free it.

Syntax:

```
bool my_key_fetch(const char *key_id, const char **key_type,
                  const char* user_id, void **key, size_t *key_len)
```

Arguments:

- `key_id`, `user_id`: Null-terminated strings that as a pair form a unique identifier indicating which key to fetch.
- `key_type`: The address of a buffer pointer. The function stores into it a pointer to a null-terminated string that provides additional information about the key (stored when the key was added).
- `key`: The address of a buffer pointer. The function stores into it a pointer to the buffer containing the fetched key data.
- `key_len`: The address of a variable into which the function stores the size in bytes of the `*key` buffer.

Return value:

Returns 0 for success, 1 for failure.

- `my_key_generate()`

Generates a new random key of a given type and length and stores it in the keyring. The key has a length of `key_len` and is associated with the identifier formed from `key_id` and `user_id`. The type and length values must be consistent with the values supported by the underlying keyring plugin. See [Section 6.4.4.8, “Supported Keyring Key Types and Lengths”](#).

Syntax:

```
bool my_key_generate(const char *key_id, const char *key_type,
                     const char *user_id, size_t key_len)
```

Arguments:

- `key_id`, `user_id`: Null-terminated strings that as a pair form a unique identifier for the key to be generated.

- `key_type`: A null-terminated string that provides additional information about the key.
- `key_len`: The size in bytes of the key to be generated.

Return value:

Returns 0 for success, 1 for failure.

- `my_key_remove()`

Removes a key from the keyring.

Syntax:

```
bool my_key_remove(const char *key_id, const char* user_id)
```

Arguments:

- `key_id`, `user_id`: Null-terminated strings that as a pair form a unique identifier for the key to be removed.

Return value:

Returns 0 for success, 1 for failure.

- `my_key_store()`

Obfuscates and stores a key in the keyring.

Syntax:

```
bool my_key_store(const char *key_id, const char *key_type,  
                 const char* user_id, void *key, size_t key_len)
```

Arguments:

- `key_id`, `user_id`: Null-terminated strings that as a pair form a unique identifier for the key to be stored.
- `key_type`: A null-terminated string that provides additional information about the key.
- `key`: The buffer containing the key data to be stored.
- `key_len`: The size in bytes of the `key` buffer.

Return value:

Returns 0 for success, 1 for failure.

29.4 Adding Functions to MySQL

There are three ways to add functions to MySQL:

- Through the user-defined function (UDF) interface. User-defined functions are compiled as library files and then added to and removed from the server dynamically using the `CREATE FUNCTION` and `DROP FUNCTION` statements. See [Section 13.7.4.1, “CREATE FUNCTION Syntax for User-Defined Functions”](#). In some cases, UDFs are included in plugin or component library files and are loaded and unloaded automatically when the plugin or component is installed or uninstalled.

- By creating native (built-in) MySQL functions. Native functions are compiled into the `mysqld` server and become available on a permanent basis.
- By creating stored functions. These are written using SQL statements rather than by compiling object code. The syntax for writing stored functions is not covered here. See [Section 24.2, “Using Stored Routines”](#).

Each method of creating compiled functions has advantages and disadvantages:

- If you write user-defined functions, you must install object files in addition to the server itself. If you compile your function into the server, you need not do that.
- Native functions require you to modify a source distribution. UDFs do not. You can add UDFs to a binary MySQL distribution. No access to MySQL source is necessary.
- If you upgrade your MySQL distribution, you can continue to use your previously installed UDFs, unless you upgrade to a newer version for which the UDF interface changes. For native functions, you must repeat your modifications each time you upgrade.

Whichever method you use to add functions, they can be invoked in SQL statements just like native functions such as `ABS()` or `SOUNDEX()`.

For the rules describing how the server interprets references to different kinds of functions see [Section 9.2.5, “Function Name Parsing and Resolution”](#).

The following sections describe features of the UDF interface, provide instructions for writing UDFs, discuss security precautions that MySQL takes to prevent UDF misuse, and describe how to add native MySQL functions.

For example source code that illustrates how to write UDFs, take a look at the `sql/udf_example.cc` file that is provided in MySQL source distributions.

**Note**

The MySQL source code contains internal documentation written using Doxygen. This documentation is useful for understanding how MySQL works from a developer perspective. The generated Doxygen content is available at <https://dev.mysql.com/doc/index-other.html>. It is also possible to generate this content locally from a MySQL source distribution using the instructions at [Section 2.9.10, “Generating MySQL Doxygen Documentation Content”](#).

29.4.1 Features of the User-Defined Function Interface

The MySQL interface for user-defined functions provides the following features and capabilities:

- Functions can return string, integer, or real values and can accept arguments of those same types.
- You can define simple functions that operate on a single row at a time, or aggregate functions that operate on groups of rows.
- Information is provided to functions that enables them to check the number, types, and names of the arguments passed to them.
- You can tell MySQL to coerce arguments to a given type before passing them to a function.
- You can indicate that a function returns `NULL` or that an error occurred.

29.4.2 Adding a User-Defined Function

For the UDF mechanism to work, functions must be written in C++ and your operating system must support dynamic loading. MySQL source distributions include a file `sql/udf_example.cc` that defines five UDF functions. Consult this file to see how UDF calling conventions work. The `include/mysql_com.h` header file defines UDF-related symbols and data structures, although you need not include this header file directly; it is included by `mysql.h`.

A UDF contains code that becomes part of the running server, so when you write a UDF, you are bound by any and all constraints that apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to UDFs that were originally written for older servers. For information about these constraints, see [Section 2.9.7, “MySQL Source-Configuration Options”](#), and [Section 2.9.8, “Dealing with Problems Compiling MySQL”](#).

To be able to use UDFs, you must link `mysqld` dynamically. If you want to use a UDF that needs to access symbols from `mysqld` (for example, the `metaphone` function in `sql/udf_example.cc` uses `default_charset_info`), you must link the program with `-rdynamic` (see `man dlopen`).

For each function that you want to use in SQL statements, you should define corresponding C++ functions. In the following discussion, the name “xxx” is used for an example function name. To distinguish between SQL and C++ usage, `XXX()` (uppercase) indicates an SQL function call, and `xxx()` (lowercase) indicates a C++ function call.

Note

When using C++, encapsulate your C functions within this construct:

```
extern "C" { ... }
```

This ensures that your C++ function names remain readable in the completed UDF.

- [User-Defined Function Interface Functions](#)
- [UDF Calling Sequences for Simple Functions](#)
- [UDF Calling Sequences for Aggregate Functions](#)
- [UDF Argument Processing](#)
- [UDF Return Values and Error Handling](#)
- [User-Defined Function Character Set Handling](#)
- [UDF Compiling and Installing](#)
- [UDF Security Precautions](#)

User-Defined Function Interface Functions

The following list describes the C++ functions that you write to implement the interface for a function named `xxx()`. The main function, `xxx()`, is required. In addition, a UDF requires at least one of the other functions described here, for reasons discussed in [UDF Security Precautions](#).

- `xxx()`

The main function. This is where the function result is computed. The correspondence between the SQL function data type and the return type of your C++ function is shown here.

SQL Type	C++ Type
STRING	char *
INTEGER	long long
REAL	double

It is also possible to declare a `DECIMAL` function, but the value is returned as a string, so you should write the UDF as though it were a `STRING` function. `ROW` functions are not implemented.

- `xxx_init()`

The initialization function for `xxx()`. If present, it can be used for the following purposes:

- To check the number of arguments to `xxx()`.
- To verify that the arguments are of a required type or, alternatively, to tell MySQL to coerce arguments to the required types when the main function is called.
- To allocate any memory required by the main function.
- To specify the maximum length of the result.
- To specify (for `REAL` functions) the maximum number of decimal places in the result.
- To specify whether the result can be `NULL`.

- `xxx_deinit()`

The deinitialization function for `xxx()`. If present, it should deallocate any memory allocated by the initialization function.

When an SQL statement invokes `xxx()`, MySQL calls the initialization function `xxx_init()` to let it perform any required setup, such as argument checking or memory allocation. If `xxx_init()` returns an error, MySQL aborts the SQL statement with an error message and does not call the main or deinitialization functions. Otherwise, MySQL calls the main function `xxx()` once for each row. After all rows have been processed, MySQL calls the deinitialization function `xxx_deinit()` so that it can perform any required cleanup.

For aggregate functions that work like `SUM()`, you must also provide the following functions:

- `xxx_clear()`

Reset the current aggregate value but do not insert the argument as the initial aggregate value for a new group.

- `xxx_add()`

Add the argument to the current aggregate value.

MySQL handles aggregate UDFs as follows:

1. Call `xxx_init()` to let the aggregate function allocate any memory it needs for storing results.
2. Sort the table according to the `GROUP BY` expression.
3. Call `xxx_clear()` for the first row in each new group.
4. Call `xxx_add()` for each row that belongs in the same group.

5. Call `xxx()` to get the result for the aggregate when the group changes or after the last row has been processed.
6. Repeat steps 3 to 5 until all rows has been processed
7. Call `xxx_deinit()` to let the UDF free any memory it has allocated.

All functions must be thread-safe. This includes not just the main function, but the initialization and deinitialization functions as well, and also the additional functions required by aggregate functions. A consequence of this requirement is that you are not permitted to allocate any global or static variables that change! If you need memory, you must it in `xxx_init()` and free it in `xxx_deinit()`.

UDF Calling Sequences for Simple Functions

This section describes the different functions that you must define to create a simple UDF. For information about the order in which MySQL calls these functions, see [User-Defined Function Interface Functions](#).

The main `xxx()` function should be declared as shown in this section. Note that the return type and parameters differ, depending on whether you declare the SQL function `xxx()` to return `STRING`, `INTEGER`, or `REAL` in the `CREATE FUNCTION` statement:

For `STRING` functions:

```
char *xxx(UDF_INIT *initid, UDF_ARGS *args,
          char *result, unsigned long *length,
          char *is_null, char *error);
```

For `INTEGER` functions:

```
long long xxx(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

For `REAL` functions:

```
double xxx(UDF_INIT *initid, UDF_ARGS *args,
            char *is_null, char *error);
```

`DECIMAL` functions return string values and are declared the same way as `STRING` functions. `ROW` functions are not implemented.

Declare the initialization and deinitialization functions like this:

```
bool xxx_init(UDF_INIT *initid, UDF_ARGS *args, char *message);

void xxx_deinit(UDF_INIT *initid);
```

The `initid` parameter is passed to all three functions. It points to a `UDF_INIT` structure that is used to communicate information between functions. The `UDF_INIT` structure members follow. The initialization function should fill in any members that it wishes to change. (To use the default for a member, leave it unchanged.)

- `bool maybe_null`

`xxx_init()` should set `maybe_null` to 1 if `xxx()` can return `NULL`. The default value is 1 if any of the arguments are declared `maybe_null`.

- `unsigned int decimals`

The number of decimal digits to the right of the decimal point. The default value is the maximum number of decimal digits in the arguments passed to the main function. For example, if the function is passed 1.34, 1.345, and 1.3, the default would be 3, because 1.345 has 3 decimal digits.

For arguments that have no fixed number of decimals, the `decimals` value is set to 31, which is 1 more than the maximum number of decimals permitted for the `DECIMAL`, `FLOAT`, and `DOUBLE` data types. This value is available as the constant `NOT_FIXED_DEC` in the `mysql_com.h` header file.

A `decimals` value of 31 is used for arguments in cases such as a `FLOAT` or `DOUBLE` column declared without an explicit number of decimals (for example, `FLOAT` rather than `FLOAT(10,3)`) and for floating-point constants such as `1345E-3`. It is also used for string and other nonnumber arguments that might be converted within the function to numeric form.

The value to which the `decimals` member is initialized is only a default. It can be changed within the function to reflect the actual calculation performed. The default is determined such that the largest number of decimals of the arguments is used. If the number of decimals is `NOT_FIXED_DEC` for even one of the arguments, that is the value used for `decimals`.

- `unsigned int max_length`

The maximum length of the result. The default `max_length` value differs depending on the result type of the function. For string functions, the default is the length of the longest argument. For integer functions, the default is 21 digits. For real functions, the default is 13 plus the number of decimal digits indicated by `initid->decimals`. (For numeric functions, the length includes any sign or decimal point characters.)

If you want to return a blob value, you can set `max_length` to 65KB or 16MB. This memory is not allocated, but the value is used to decide which data type to use if there is a need to temporarily store the data.

- `char *ptr`

A pointer that the function can use for its own purposes. For example, functions can use `initid->ptr` to communicate allocated memory among themselves. `xxx_init()` should allocate the memory and assign it to this pointer:

```
initid->ptr = allocated_memory;
```

In `xxx()` and `xxx_deinit()`, refer to `initid->ptr` to use or deallocate the memory.

- `bool const_item`

`xxx_init()` should set `const_item` to 1 if `xxx()` always returns the same value and to 0 otherwise.

UDF Calling Sequences for Aggregate Functions

This section describes the different functions that you need to define when you create an aggregate UDF. For information about the order in which MySQL calls these functions, see [User-Defined Function Interface Functions](#).

- `xxx_reset()`

This function is called when MySQL finds the first row in a new group. It should reset any internal summary variables and then use the given `UDF_ARGS` argument as the first value in your internal summary value for the group. Declare `xxx_reset()` as follows:

```
void xxx_reset(UDF_INIT *initid, UDF_ARGS *args,
               char *is_null, char *error);
```

`xxx_reset()` is not needed or used in MySQL 8.0, in which the UDF interface uses `xxx_clear()` instead. However, you can define both `xxx_reset()` and `xxx_clear()` if you want to have your UDF work with older versions of the server. (If you do include both functions, the `xxx_reset()` function in

many cases can be implemented internally by calling `xxx_clear()` to reset all variables, and then calling `xxx_add()` to add the `UDF_ARGS` argument as the first value in the group.)

- `xxx_clear()`

This function is called when MySQL needs to reset the summary results. It is called at the beginning for each new group but can also be called to reset the values for a query where there were no matching rows. Declare `xxx_clear()` as follows:

```
void xxx_clear(UDF_INIT *initid, char *is_null, char *error);
```

`is_null` is set to point to `CHAR(0)` before calling `xxx_clear()`.

If something went wrong, you can store a value in the variable to which the `error` argument points. `error` points to a single-byte variable, not to a string buffer.

`xxx_clear()` is required by MySQL 8.0.

- `xxx_add()`

This function is called for all rows that belong to the same group. You should use it to add the value in the `UDF_ARGS` argument to your internal summary variable.

```
void xxx_add(UDF_INIT *initid, UDF_ARGS *args,
             char *is_null, char *error);
```

The `xxx()` function for an aggregate UDF should be declared the same way as for a nonaggregate UDF. See [UDF Calling Sequences for Simple Functions](#).

For an aggregate UDF, MySQL calls the `xxx()` function after all rows in the group have been processed. You should normally never access its `UDF_ARGS` argument here but instead return a value based on your internal summary variables.

Return value handling in `xxx()` should be done the same way as for a nonaggregate UDF. See [UDF Return Values and Error Handling](#).

The `xxx_reset()` and `xxx_add()` functions handle their `UDF_ARGS` argument the same way as functions for nonaggregate UDFs. See [UDF Argument Processing](#).

The pointer arguments to `is_null` and `error` are the same for all calls to `xxx_reset()`, `xxx_clear()`, `xxx_add()` and `xxx()`. You can use this to remember that you got an error or whether the `xxx()` function should return `NULL`. You should not store a string into `*error`! `error` points to a single-byte variable, not to a string buffer.

`*is_null` is reset for each group (before calling `xxx_clear()`). `*error` is never reset.

If `*is_null` or `*error` are set when `xxx()` returns, MySQL returns `NULL` as the result for the group function.

UDF Argument Processing

The `args` parameter points to a `UDF_ARGS` structure that has the members listed here:

- `unsigned int arg_count`

The number of arguments. Check this value in the initialization function if you require your function to be called with a particular number of arguments. For example:

```
if (args->arg_count != 2)
{
```

```
strcpy(message, "XXX() requires two arguments");
return 1;
}
```

For other `UDF_ARGS` member values that are arrays, array references are zero-based. That is, refer to array members using index values from 0 to `args->arg_count - 1`.

- `enum Item_result *arg_type`

A pointer to an array containing the types for each argument. The possible type values are `STRING_RESULT`, `INT_RESULT`, `REAL_RESULT`, and `DECIMAL_RESULT`.

To make sure that arguments are of a given type and return an error if they are not, check the `arg_type` array in the initialization function. For example:

```
if (args->arg_type[0] != STRING_RESULT ||
    args->arg_type[1] != INT_RESULT)
{
    strcpy(message, "XXX() requires a string and an integer");
    return 1;
}
```

Arguments of type `DECIMAL_RESULT` are passed as strings, so you handle them the same way as `STRING_RESULT` values.

As an alternative to requiring your function's arguments to be of particular types, you can use the initialization function to set the `arg_type` elements to the types you want. This causes MySQL to coerce arguments to those types for each call to `xxx()`. For example, to specify that the first two arguments should be coerced to string and integer, respectively, do this in `xxx_init()`:

```
args->arg_type[0] = STRING_RESULT;
args->arg_type[1] = INT_RESULT;
```

Exact-value decimal arguments such as `1.3` or `DECIMAL` column values are passed with a type of `DECIMAL_RESULT`. However, the values are passed as strings. To receive a number, use the initialization function to specify that the argument should be coerced to a `REAL_RESULT` value:

```
args->arg_type[2] = REAL_RESULT;
```

- `char **args`

`args->args` communicates information to the initialization function about the general nature of the arguments passed to your function. For a constant argument `i`, `args->args[i]` points to the argument value. (See later for instructions on how to access the value properly.) For a nonconstant argument, `args->args[i]` is 0. A constant argument is an expression that uses only constants, such as `3` or `4*7-2` or `SIN(3.14)`. A nonconstant argument is an expression that refers to values that may change from row to row, such as column names or functions that are called with nonconstant arguments.

For each invocation of the main function, `args->args` contains the actual arguments that are passed for the row currently being processed.

If argument `i` represents `NULL`, `args->args[i]` is a null pointer (0). If the argument is not `NULL`, functions can refer to it as follows:

- An argument of type `STRING_RESULT` is given as a string pointer plus a length, to enable handling of binary data or data of arbitrary length. The string contents are available as `args->args[i]` and the string length is `args->lengths[i]`. Do not assume that the string is null-terminated.

For additional information about string arguments, see [User-Defined Function Character Set Handling](#).

- For an argument of type `INT_RESULT`, you must cast `args->args[i]` to a `long long` value:

```
long long int_val;
int_val = *((long long*) args->args[i]);
```

- For an argument of type `REAL_RESULT`, you must cast `args->args[i]` to a `double` value:

```
double real_val;
real_val = *((double*) args->args[i]);
```

- For an argument of type `DECIMAL_RESULT`, the value is passed as a string and should be handled like a `STRING_RESULT` value.
- `ROW_RESULT` arguments are not implemented.

- `unsigned long *lengths`

For the initialization function, the `lengths` array indicates the maximum string length for each argument. You should not change these. For each invocation of the main function, `lengths` contains the actual lengths of any string arguments that are passed for the row currently being processed. For arguments of types `INT_RESULT` or `REAL_RESULT`, `lengths` still contains the maximum length of the argument (as for the initialization function).

- `char *maybe_null`

For the initialization function, the `maybe_null` array indicates for each argument whether the argument value might be null (0 if no, 1 if yes).

- `char **attributes`

`args->attributes` communicates information about the names of the UDF arguments. For argument `i`, the attribute name is available as a string in `args->attributes[i]` and the attribute length is `args->attribute_lengths[i]`. Do not assume that the string is null-terminated.

By default, the name of a UDF argument is the text of the expression used to specify the argument. For UDFs, an argument may also have an optional `[AS] alias_name` clause, in which case the argument name is `alias_name`. The `attributes` value for each argument thus depends on whether an alias was given.

Suppose that a UDF `my_udf()` is invoked as follows:

```
SELECT my_udf(expr1, expr2 AS alias1, expr3 alias2);
```

In this case, the `attributes` and `attribute_lengths` arrays will have these values:

```
args->attributes[0] = "expr1"
args->attribute_lengths[0] = 5

args->attributes[1] = "alias1"
args->attribute_lengths[1] = 6

args->attributes[2] = "alias2"
args->attribute_lengths[2] = 6
```

- `unsigned long *attribute_lengths`

The `attribute_lengths` array indicates the length of each argument name.

UDF Return Values and Error Handling

The initialization function should return `0` if no error occurred and `1` otherwise. If an error occurs, `xxx_init()` should store a null-terminated error message in the `message` parameter. The message is returned to the client. The message buffer is `MYSQL_ERRMSG_SIZE` characters long. Try to keep the message to less than 80 characters so that it fits the width of a standard terminal screen.

The return value of the main function `xxx()` is the function value, for `long long` and `double` functions. A string function should return a pointer to the result and set `*length` to the length (in bytes) of the return value. For example:

```
memcpy(result, "result string", 13);
*length = 13;
```

MySQL passes a buffer to the `xxx()` function using the `result` parameter. This buffer is sufficiently long to hold 255 characters, which can be multibyte characters. The `xxx()` function can store the result in this buffer if it fits, in which case the return value should be a pointer to the buffer. If the function stores the result in a different buffer, it should return a pointer to that buffer.

If your string function does not use the supplied buffer (for example, if it needs to return a string longer than 255 characters), you must allocate the space for your own buffer with `malloc()` in the `xxx_init()` function or the `xxx()` function and free it in your `xxx_deinit()` function. You can store the allocated memory in the `ptr` slot in the `UDF_INIT` structure for reuse by future `xxx()` calls. See [UDF Calling Sequences for Simple Functions](#).

For additional information about string arguments, see [User-Defined Function Character Set Handling](#).

To indicate a return value of `NULL` in the main function, set `*is_null` to `1`:

```
*is_null = 1;
```

To indicate an error return in the main function, set `*error` to `1`:

```
*error = 1;
```

If `xxx()` sets `*error` to `1` for any row, the function value is `NULL` for the current row and for any subsequent rows processed by the statement in which `xxx()` was invoked. (`xxx()` is not even called for subsequent rows.)

User-Defined Function Character Set Handling

Prior to MySQL 8.0.19, user-defined functions (UDFs) take no account of the character set or collation of string arguments or return values. In effect, string arguments and return values are treated as binary strings, with the implication that only string arguments containing single-byte characters can be handled reliably.

As of MySQL 8.0.19, UDF behavior is still the same by default, but the interface for writing UDFs has been extended to enable UDFs to determine the character set and collation of string arguments, and to return strings that have a particular character set and collation. These capabilities are optional for UDF writers, who may take advantage of them as desired.

Of the UDFs distributed with MySQL, those associated with the following features and extensions have been modified to take advantage of the character-set capabilities: MySQL Enterprise Audit, MySQL Enterprise Firewall, MySQL Enterprise Data Masking and De-Identification, MySQL Keyring (the general-purpose keyring UDFs only), and Group Replication. The modification applies only where it make sense. For example, a UDF that returns encrypted data is *intended* to return a binary string, not a character string.

Character-set capabilities for UDFs are implemented using the `mysql_udf_metadata` server component service. For information about this service, see the MySQL Server Doxygen documentation, available at <https://dev.mysql.com/doc/index-other.html> (search for `s_mysql_mysql_udf_metadata` and

`udf_metadata_imp`). Source code for the MySQL Keyring UDFs is available in Community source distributions and may be examined as examples for third-party UDF writers who wish to modify their own UDFs to be character set-aware.

If a UDF takes string arguments or returns a string value and is modified to be character set-aware, the following compatibility considerations apply:

- With respect to the arguments they pass to the UDF, applications will continue to work because the UDF is now capable of handling string arguments in any character set, including binary strings.
- If a UDF is to return a string result in a character set different from the character set of its arguments, the UDF must perform the character set conversion internally. For example, this is the case if a UDF accepts `latin1` arguments but returns a `utf8mb4` result.

UDF Compiling and Installing

Files implementing UDFs must be compiled and installed on the host where the server runs. The process is described here for the example UDF file `sql/udf_example.cc` that is included in MySQL source distributions. For additional information about UDF installation, see [Section 5.7.1, “Installing and Uninstalling User-Defined Functions”](#).

If a UDF will be referred to in statements that will be replicated to slave servers, you must ensure that every slave also has the function available. Otherwise, replication fails on the slaves when they attempt to invoke the function.

The `udf_example.cc` file contains the following functions:

- `metaphon()` returns a metaphon string of the string argument. This is something like a soundex string, but it is more tuned for English.
- `myfunc_double()` returns the sum of the ASCII values of the characters in its arguments, divided by the sum of the length of its arguments.
- `myfunc_int()` returns the sum of the length of its arguments.
- `sequence([const int])` returns a sequence starting from the given number or 1 if no number has been given.
- `lookup()` returns the IP address for a host name.
- `reverse_lookup()` returns the host name for an IP address. The function may be called either with a single string argument of the form `'xxx.xxx.xxx.xxx'` or with four numbers.
- `avgcost()` returns an average cost. This is an aggregate function.

On Unix and Unix-like systems, compile user-defined functions using the following procedure:

A dynamically loadable file should be compiled as a sharable library file, using a command something like this:

```
gcc -shared -o udf_example.so udf_example.cc
```

If you are using `gcc` with `CMake` (which is how MySQL itself is configured), you should be able to create `udf_example.so` with a simpler command:

```
make udf_example
```

After compiling a shared object containing UDFs, you must install it and tell MySQL about it. Compiling a shared object from `udf_example.cc` using `gcc` directly produces a file named `udf_example.so`. Copy

the shared object to the server's plugin directory and name it `udf_example.so`. This directory is given by the value of the `plugin_dir` system variable.

On some systems, the `ldconfig` program that configures the dynamic linker does not recognize a shared object unless its name begins with `lib`. In this case you should rename a file such as `udf_example.so` to `libudf_example.so`.

On Windows, compile user-defined functions using the following procedure:

1. Obtain a MySQL source distribution. See [Section 2.1.2, "How to Get MySQL"](#).
2. Obtain the `CMake` build utility, if necessary, from <http://www.cmake.org>. (Version 2.6 or later is required).
3. In the source tree, look in the `sql` directory for files named `udf_example.def` and `udf_example.cc`. Copy both files from this directory to your working directory.
4. Create a `CMake` makefile (`CMakeLists.txt`) with these contents:

```
PROJECT(udf_example)

# Path for MySQL include directory
INCLUDE_DIRECTORIES("c:/mysql/include")

ADD_DEFINITIONS("-DHAVE_DLOPEN")
ADD_LIBRARY(udf_example MODULE udf_example.cc udf_example.def)
TARGET_LINK_LIBRARIES(udf_example wsock32)
```

5. Create the VC project and solution files, substituting an appropriate *generator* value:

```
cmake -G "generator"
```

Invoking `cmake --help` shows you a list of valid generators.

6. Create `udf_example.dll`:

```
devenv udf_example.sln /build Release
```

On all platforms, after the shared library file has been copied to the `plugin_dir` directory, notify `mysqld` about the new functions with the following statements. The file name suffix differs per platform (for example, `.so` for Unix and Unix-like systems, `.dll` for Windows), so adjust the `.so` suffix for your platform as necessary.

```
CREATE FUNCTION metaphor RETURNS STRING
  SONAME 'udf_example.so';
CREATE FUNCTION myfunc_double RETURNS REAL
  SONAME 'udf_example.so';
CREATE FUNCTION myfunc_int RETURNS INTEGER
  SONAME 'udf_example.so';
CREATE FUNCTION sequence RETURNS INTEGER
  SONAME 'udf_example.so';
CREATE FUNCTION lookup RETURNS STRING
  SONAME 'udf_example.so';
CREATE FUNCTION reverse_lookup RETURNS STRING
  SONAME 'udf_example.so';
CREATE AGGREGATE FUNCTION avgcost RETURNS REAL
  SONAME 'udf_example.so';
```

Once installed, a function remains installed until it is uninstalled.

To remove functions, use `DROP FUNCTION`:

```

DROP FUNCTION metaphon;
DROP FUNCTION myfunc_double;
DROP FUNCTION myfunc_int;
DROP FUNCTION sequence;
DROP FUNCTION lookup;
DROP FUNCTION reverse_lookup;
DROP FUNCTION avgcost;

```

The `CREATE FUNCTION` and `DROP FUNCTION` statements update the `func` table in the `mysql` system database that serves as a UDF registry. The function's name, type and shared library name are saved in the `mysql.func` table. To create functions, you must have the `INSERT` privilege for the `mysql` database. To drop functions, you must have the `DELETE` privilege for the `mysql` database.

You cannot use `CREATE FUNCTION` to reinstall a function that has previously been installed. To reinstall a function, first remove it with `DROP FUNCTION`, then install it with `CREATE FUNCTION`. You would need to do this, for example, if you upgrade to a new version of MySQL that provides an updated implementation of the function, or you recompile a new version of a function that you have written. Otherwise, the server continues to use the old version.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, the server does not load UDFs during startup and UDFs are unavailable.

UDF Security Precautions

MySQL takes several measures to prevent misuse of user-defined functions.

UDF library files cannot be placed in arbitrary directories. They must be located in the server's plugin directory. This directory is given by the value of the `plugin_dir` system variable.

To use `CREATE FUNCTION` or `DROP FUNCTION`, you must have the `INSERT` or `DELETE` privilege, respectively, for the `mysql` database. This is necessary because those statements add and delete rows from the `mysql.func` table.

UDFs should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. `mysqld` also supports an `--allow-suspicious-udfs` option that controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is disabled, to prevent attempts at loading functions from shared library files other than those containing legitimate UDFs. If you have older UDFs that contain only the `xxx` symbol and that cannot be recompiled to include an auxiliary symbol, it may be necessary to specify the `--allow-suspicious-udfs` option. Otherwise, you should avoid enabling it.

29.4.3 Adding a Native Function

To add a native MySQL function, use the procedure described here, which requires that you use a source distribution. You cannot add native functions to a binary distribution because it is necessary to modify MySQL source code and compile MySQL from the modified source. If you migrate to another version of MySQL (for example, when a new version is released), you must repeat the procedure with the new version.

If the native function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

To add a native function, follow these steps to modify source files in the `sql` directory:

1. Create a subclass for the function in `item_create.cc`:
 - If the function takes a fixed number of arguments, create a subclass of `Create_func_arg0`, `Create_func_arg1`, `Create_func_arg2`, or `Create_func_arg3`, respectively, depending on whether the function takes zero, one, two, or three arguments. For examples, see the `Create_func_uuid`, `Create_func_abs`, `Create_func_pow`, and `Create_func_lpad` classes.
 - If the function takes a variable number of arguments, create a subclass of `Create_native_func`. For an example, see `Create_func_concat`.
2. To provide a name by which the function can be referred to in SQL statements, register the name in `item_create.cc` by adding a line to this array:

```
static Native_func_registry func_array[]
```

You can register several names for the same function. For example, see the lines for `"LCASE"` and `"LOWER"`, which are aliases for `Create_func_lcase`.

3. In `item_func.h`, declare a class inheriting from `Item_num_func` or `Item_str_func`, depending on whether your function returns a number or a string.
4. In `item_func.cc`, add one of the following declarations, depending on whether you are defining a numeric or string function:

```
double    Item_func_newname::val()  
longlong Item_func_newname::val_int()  
String    *Item_func_newname::Str(String *str)
```

If you inherit your object from any of the standard items (like `Item_num_func`), you probably only have to define one of these functions and let the parent object take care of the other functions. For example, the `Item_str_func` class defines a `val()` function that executes `atof()` on the value returned by `::str()`.

5. If the function is nondeterministic, include the following statement in the item constructor to indicate that function results should not be cached:

```
current_thd->lex->safe_to_cache_query=0;
```

A function is nondeterministic if, given fixed values for its arguments, it can return different results for different invocations.

6. You should probably also define the following object function:

```
void Item_func_newname::fix_length_and_dec()
```

This function should at least calculate `max_length` based on the given arguments. `max_length` is the maximum number of characters the function may return. This function should also set `maybe_null = 0` if the main function cannot return a `NULL` value. The function can check whether any of the function arguments can return `NULL` by checking the arguments' `maybe_null` variable. Look at `Item_func_mod::fix_length_and_dec` for a typical example of how to do this.

All functions must be thread-safe. In other words, do not use any global or static variables in the functions without protecting them with mutexes.

If you want to return `NULL` from `::val()`, `::val_int()`, or `::str()`, you should set `null_value` to 1 and return 0.

For `::str()` object functions, these additional considerations apply:

- The `String *str` argument provides a string buffer that may be used to hold the result. (For more information about the `String` type, take a look at the `sql_string.h` file.)
- The `::str()` function should return the string that holds the result, or `(char*) 0` if the result is `NULL`.
- All current string functions try to avoid allocating any memory unless absolutely necessary!

29.5 Debugging and Porting MySQL

This section helps you port MySQL to other operating systems. Do check the list of currently supported operating systems first. See <https://www.mysql.com/support/supportedplatforms/database.html>. If you have created a new port of MySQL, please let us know so that we can list it here and on our website (<http://www.mysql.com/>), recommending it to other users.

Note

If you create a new port of MySQL, you are free to copy and distribute it under the GPL license, but it does not make you a copyright holder of MySQL.

A working POSIX thread library is needed for the server.

To build MySQL from source, your system must satisfy the tool requirements listed at [Section 2.9](#), “Installing MySQL from Source”.

If you run into problems with a new port, you may have to do some debugging of MySQL! See [Section 29.5.1](#), “Debugging a MySQL Server”.

Note

Before you start debugging `mysqld`, first get the test program `mysys/thr_lock` to work. This ensures that your thread installation has even a remote chance to work!

Note

The MySQL source code contains internal documentation written using Doxygen. This documentation is useful for understanding how MySQL works from a developer perspective. The generated Doxygen content is available at <https://dev.mysql.com/doc/index-other.html>. It is also possible to generate this content locally from a MySQL source distribution using the instructions at [Section 2.9.10](#), “Generating MySQL Doxygen Documentation Content”.

29.5.1 Debugging a MySQL Server

If you are using some functionality that is very new in MySQL, you can try to run `mysqld` with the `--skip-new` option (which disables all new, potentially unsafe functionality). See [Section B.4.3.3](#), “What to Do If MySQL Keeps Crashing”.

If `mysqld` does not want to start, verify that you have no `my.cnf` files that interfere with your setup! You can check your `my.cnf` arguments with `mysqld --print-defaults` and avoid using them by starting with `mysqld --no-defaults`

If `mysqld` starts to eat up CPU or memory or if it “hangs,” you can use `mysqladmin processlist status` to find out if someone is executing a query that takes a long time. It may be a good idea to run `mysqladmin -i10 processlist status` in some window if you are experiencing performance problems or problems when new clients cannot connect.

The command `mysqladmin debug` dumps some information about locks in use, used memory and query usage to the MySQL log file. This may help solve some problems. This command also provides some useful information even if you have not compiled MySQL for debugging!

If the problem is that some tables are getting slower and slower you should try to optimize the table with `OPTIMIZE TABLE` or `myisamchk`. See [Chapter 5, MySQL Server Administration](#). You should also check the slow queries with `EXPLAIN`.

You should also read the OS-specific section in this manual for problems that may be unique to your environment. See [Section 2.1, “General Installation Guidance”](#).

29.5.1.1 Compiling MySQL for Debugging

If you have some very specific problem, you can always try to debug MySQL. To do this you must configure MySQL with the `-DWITH_DEBUG=1` option. You can check whether MySQL was compiled with debugging by doing: `mysqld --help`. If the `--debug` flag is listed with the options then you have debugging enabled. `mysqladmin ver` also lists the `mysqld` version as `mysql ... --debug` in this case.

If `mysqld` stops crashing when you configure it with the `-DWITH_DEBUG=1` CMake option, you probably have found a compiler bug or a timing bug within MySQL. In this case, you can try to add `-g` using the `CMAKE_C_FLAGS` and `CMAKE_CXX_FLAGS` CMake options and not use `-DWITH_DEBUG=1`. If `mysqld` dies, you can at least attach to it with `gdb` or use `gdb` on the core file to find out what happened.

When you configure MySQL for debugging you automatically enable a lot of extra safety check functions that monitor the health of `mysqld`. If they find something “unexpected,” an entry is written to `stderr`, which `mysqld_safe` directs to the error log! This also means that if you are having some unexpected problems with MySQL and are using a source distribution, the first thing you should do is to configure MySQL for debugging. If you believe that you have found a bug, please use the instructions at [Section 1.7, “How to Report Bugs or Problems”](#).

In the Windows MySQL distribution, `mysqld.exe` is by default compiled with support for trace files.

29.5.1.2 Creating Trace Files

If the `mysqld` server does not start or it crashes easily, you can try to create a trace file to find the problem.

To do this, you must have a `mysqld` that has been compiled with debugging support. You can check this by executing `mysqld -V`. If the version number ends with `-debug`, it is compiled with support for trace files. (On Windows, the debugging server is named `mysqld-debug` rather than `mysqld`.)

Start the `mysqld` server with a trace log in `/tmp/mysqld.trace` on Unix or `\mysqld.trace` on Windows:

```
shell> mysqld --debug
```

On Windows, you should also use the `--standalone` flag to not start `mysqld` as a service. In a console window, use this command:

```
C:\> mysqld-debug --debug --standalone
```

After this, you can use the `mysql.exe` command-line tool in a second console window to reproduce the problem. You can stop the `mysqld` server with `mysqladmin shutdown`.

The trace file can become **very large**! To generate a smaller trace file, you can use debugging options something like this:

```
mysqld --debug=d,info,error,query,general,where:0,/tmp/mysqld.trace
```

This only prints information with the most interesting tags to the trace file.

If you file a bug, please add only those lines from the trace file to the bug report that indicate where something seems to go wrong. If you cannot locate the wrong place, open a bug report and upload the whole trace file to the report, so that a MySQL developer can take a look at it. For instructions, see [Section 1.7, “How to Report Bugs or Problems”](#).

The trace file is made with the **DEBUG** package by Fred Fish. See [Section 29.5.4, “The DEBUG Package”](#).

29.5.1.3 Using WER with PDB to create a Windows crashdump

Program Database files (with suffix `.pdb`) are included in the **ZIP Archive Debug Binaries & Test Suite** distribution of MySQL. These files provide information for debugging your MySQL installation in the event of a problem. This is a separate download from the standard MSI or Zip file.

Note

The PDB files are available in a separate file labeled "ZIP Archive Debug Binaries & Test Suite".

The PDB file contains more detailed information about `mysqld` and other tools that enables more detailed trace and dump files to be created. You can use these with `WinDbg` or Visual Studio to debug `mysqld`.

For more information on PDB files, see [Microsoft Knowledge Base Article 121366](#). For more information on the debugging options available, see [Debugging Tools for Windows](#).

To use `WinDbg`, either install the full Windows Driver Kit (WDK) or install the standalone version.

Important

The `.exe` and `.pdb` files must be an exact match (both version number and MySQL server edition) or `WinDBG` will complain while attempting to load the symbols.

1. To generate a minidump `mysqld.dmp`, enable the `core-file` option under the `[mysqld]` section in `my.ini`. Restart the MySQL server after making these changes.
2. Create a directory to store the generated files, such as `c:\symbols`
3. Determine the path to your `windbg.exe` executable using the Find GUI or from the command line, for example: `dir /s /b windbg.exe` -- a common default is `C:\Program Files\Debugging Tools for Windows (x64)\windbg.exe`
4. Launch `windbg.exe` giving it the paths to `mysqld.exe`, `mysqld.pdb`, `mysqld.dmp`, and the source code. Alternatively, pass in each path from the `WinDbg` GUI. For example:

```
windbg.exe -i "C:\mysql-8.0.20-win64\bin\" ^
-z "C:\mysql-8.0.20-win64\data\mysqld.dmp" ^
-srcpath "E:\ade\mysql_archives\8.0\8.0.20\mysql-8.0.20" ^
-y "C:\mysql-8.0.20-win64\bin;SRV*c:\symbols*http://msdl.microsoft.com/download/symbols" ^
-v -n -c "!analyze -vvvvv"
```

Note

The `^` character and newline are removed by the Windows command line processor, so be sure the spaces remain intact.

29.5.1.4 Debugging `mysqld` under `gdb`

On most systems you can also start `mysqld` from `gdb` to get more information if `mysqld` crashes.

With some older `gdb` versions on Linux you must use `run --one-thread` if you want to be able to debug `mysqld` threads. In this case, you can only have one thread active at a time.

NPTL threads (the new thread library on Linux) may cause problems while running `mysqld` under `gdb`. Some symptoms are:

- `mysqld` hangs during startup (before it writes `ready for connections`).
- `mysqld` crashes during a `pthread_mutex_lock()` or `pthread_mutex_unlock()` call.

In this case, you should set the following environment variable in the shell before starting `gdb`:

```
LD_ASSUME_KERNEL=2.4.1
export LD_ASSUME_KERNEL
```

When running `mysqld` under `gdb`, you should disable the stack trace with `--skip-stack-trace` to be able to catch segfaults within `gdb`.

Use the `--gdb` option to `mysqld` to install an interrupt handler for `SIGINT` (needed to stop `mysqld` with `^C` to set breakpoints) and disable stack tracing and core file handling.

It is very hard to debug MySQL under `gdb` if you do a lot of new connections the whole time as `gdb` does not free the memory for old threads. You can avoid this problem by starting `mysqld` with `thread_cache_size` set to a value equal to `max_connections + 1`. In most cases just using `--thread_cache_size=5` helps a lot!

If you want to get a core dump on Linux if `mysqld` dies with a `SIGSEGV` signal, you can start `mysqld` with the `--core-file` option. This core file can be used to make a backtrace that may help you find out why `mysqld` died:

```
shell> gdb mysqld core
gdb> backtrace full
gdb> quit
```

See [Section B.4.3.3, “What to Do If MySQL Keeps Crashing”](#).

If you are using `gdb` on Linux, you should install a `.gdb` file, with the following information, in your current directory:

```
set print sevenbit off
handle SIGUSR1 nostop noprint
handle SIGUSR2 nostop noprint
handle SIGWAITING nostop noprint
handle SIGLWP nostop noprint
handle SIGPIPE nostop
handle SIGALRM nostop
handle SIGHUP nostop
handle SIGTERM nostop noprint
```

Here is an example how to debug `mysqld`:

```
shell> gdb /usr/local/libexec/mysqld
gdb> run
...
backtrace full # Do this when mysqld crashes
```

Include the preceding output in a bug report, which you can file using the instructions in [Section 1.7, “How to Report Bugs or Problems”](#).

If `mysqld` hangs, you can try to use some system tools like `strace` or `/usr/proc/bin/pstack` to examine where `mysqld` has hung.

```
strace /tmp/log libexec/mysqld
```

If you are using the Perl [DBI](#) interface, you can turn on debugging information by using the `trace` method or by setting the `DBI_TRACE` environment variable.

29.5.1.5 Using a Stack Trace

On some operating systems, the error log contains a stack trace if `mysqld` dies unexpectedly. You can use this to find out where (and maybe why) `mysqld` died. See [Section 5.4.2, “The Error Log”](#). To get a stack trace, you must not compile `mysqld` with the `-fomit-frame-pointer` option to gcc. See [Section 29.5.1.1, “Compiling MySQL for Debugging”](#).

A stack trace in the error log looks something like this:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
mysqld(my_print_stacktrace+0x32)[0x9da402]
mysqld(handle_segfault+0x28a)[0x6648e9]
/lib/libpthread.so.0[0x7f1a5af000f0]
/lib/libc.so.6(strcmp+0x2)[0x7f1a5a10f0f2]
mysqld(_Z21check_change_passwordP3THDPKcS2_Pcj+0x7c)[0x7412cb]
mysqld(_ZN16set_var_password5checkEP3THD+0xd0)[0x688354]
mysqld(_Z17sql_set_variablesP3THDP4ListI12set_var_baseE+0x68)[0x688494]
mysqld(_Z21mysql_execute_commandP3THD+0x41a0)[0x67a170]
mysqld(_Z11mysql_parseP3THDPKc_jPS2_+0x282)[0x67f0ad]
mysqld(_Z16dispatch_commandl9enum_server_commandP3THDPcj+0xbb7[0x67fdf8]
mysqld(_Z10do_commandP3THD+0x24d)[0x6811b6]
mysqld(handle_one_connection+0x11c)[0x66e05e]
```

If resolution of function names for the trace fails, the trace contains less information:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
[0x9da402]
[0x6648e9]
[0x7f1a5af000f0]
[0x7f1a5a10f0f2]
[0x7412cb]
[0x688354]
[0x688494]
[0x67a170]
[0x67f0ad]
[0x67fdf8]
[0x6811b6]
[0x66e05e]
```

Newer versions of [glibc](#) stack trace functions also print the address as relative to the object. On [glibc](#)-based systems (Linux), the trace for a crash within a plugin looks something like:

```
plugin/auth/auth_test_plugin.so(+0x9a6)[0x7ff4d11c29a6]
```

To translate the relative address (`+0x9a6`) into a file name and line number, use this command:

```
shell> addr2line -file auth_test_plugin.so 0x9a6
auth_test_plugin
mysql-trunk/plugin/auth/test_plugin.c:65
```

The `addr2line` utility is part of the `binutils` package on Linux.

On Solaris, the procedure is similar. The Solaris `printstack()` already prints relative addresses:

```
plugin/auth/auth_test_plugin.so:0x1510
```

To translate, use this command:

```
shell> gaddr2line -fie auth_test_plugin.so 0x1510
mysql-trunk/plugin/auth/test_plugin.c:88
```

Windows already prints the address, function name and line:

```
000007FEF07E10A4 auth_test_plugin.dll!auth_test_plugin()[test_plugin.c:72]
```

29.5.1.6 Using Server Logs to Find Causes of Errors in mysqld

Note that before starting `mysqld` with the general query log enabled, you should check all your tables with `myisamchk`. See [Chapter 5, MySQL Server Administration](#).

If `mysqld` dies or hangs, you should start `mysqld` with the general query log enabled. See [Section 5.4.3, “The General Query Log”](#). When `mysqld` dies again, you can examine the end of the log file for the query that killed `mysqld`.

If you use the default general query log file, the log is stored in the database directory as `host_name.log`. In most cases it is the last query in the log file that killed `mysqld`, but if possible you should verify this by restarting `mysqld` and executing the found query from the `mysql` command-line tools. If this works, you should also test all complicated queries that did not complete.

You can also try the command `EXPLAIN` on all `SELECT` statements that takes a long time to ensure that `mysqld` is using indexes properly. See [Section 13.8.2, “EXPLAIN Statement”](#).

You can find the queries that take a long time to execute by starting `mysqld` with the slow query log enabled. See [Section 5.4.5, “The Slow Query Log”](#).

If you find the text `mysqld restarted` in the error log (normally a file named `host_name.err`) you probably have found a query that causes `mysqld` to fail. If this happens, you should check all your tables with `myisamchk` (see [Chapter 5, MySQL Server Administration](#)), and test the queries in the MySQL log files to see whether one fails. If you find such a query, try first upgrading to the newest MySQL version. If this does not help, report a bug, see [Section 1.7, “How to Report Bugs or Problems”](#).

If you have started `mysqld` with the `myisam_recover_options` system variable set, MySQL automatically checks and tries to repair MyISAM tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file 'Warning: Checking table ...' which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further. See [Section 5.1.7, “Server Command Options”](#).

When the server detects MyISAM table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: `Got an error from thread_id=1, mi_dynrec.c:368`. This is useful information to include in bug reports.

It is not a good sign if `mysqld` did die unexpectedly, but in this case, you should not investigate the `Checking table...` messages, but instead try to find out why `mysqld` died.

29.5.1.7 Making a Test Case If You Experience Table Corruption

The following procedure applies to MyISAM tables. For information about steps to take when encountering InnoDB table corruption, see [Section 1.7, “How to Report Bugs or Problems”](#).

If you encounter corrupted `MyISAM` tables or if `mysqld` always fails after some update statements, you can test whether the issue is reproducible by doing the following:

1. Stop the MySQL daemon with `mysqladmin shutdown`.
2. Make a backup of the tables to guard against the very unlikely case that the repair does something bad.
3. Check all tables with `myisamchk -s database/*.MYI`. Repair any corrupted tables with `myisamchk -r database/table.MYI`.
4. Make a second backup of the tables.
5. Remove (or move away) any old log files from the MySQL data directory if you need more space.
6. Start `mysqld` with the binary log enabled. If you want to find a statement that crashes `mysqld`, you should start the server with the general query log enabled as well. See [Section 5.4.3, “The General Query Log”](#), and [Section 5.4.4, “The Binary Log”](#).
7. When you have gotten a crashed table, stop the `mysqld` server.
8. Restore the backup.
9. Restart the `mysqld` server *without* the binary log enabled.
10. Re-execute the statements with `mysqlbinlog binary-log-file | mysql`. The binary log is saved in the MySQL database directory with the name `hostname-bin.NNNNNN`.
11. If the tables are corrupted again or you can get `mysqld` to die with the above command, you have found a reproducible bug. FTP the tables and the binary log to our bugs database using the instructions given in [Section 1.7, “How to Report Bugs or Problems”](#). If you are a support customer, you can use the MySQL Customer Support Center (<https://www.mysql.com/support/>) to alert the MySQL team about the problem and have it fixed as soon as possible.

29.5.2 Debugging a MySQL Client

To be able to debug a MySQL client with the integrated debug package, you should configure MySQL with `-DWITH_DEBUG=1`. See [Section 2.9.7, “MySQL Source-Configuration Options”](#).

Before running a client, you should set the `MYSQL_DEBUG` environment variable:

```
shell> MYSQL_DEBUG=d:t:0,/tmp/client.trace
shell> export MYSQL_DEBUG
```

This causes clients to generate a trace file in `/tmp/client.trace`.

If you have problems with your own client code, you should attempt to connect to the server and run your query using a client that is known to work. Do this by running `mysql` in debugging mode (assuming that you have compiled MySQL with debugging on):

```
shell> mysql --debug=d:t:0,/tmp/client.trace
```

This provides useful information in case you mail a bug report. See [Section 1.7, “How to Report Bugs or Problems”](#).

If your client crashes at some 'legal' looking code, you should check that your `mysql.h` include file matches your MySQL library file. A very common mistake is to use an old `mysql.h` file from an old MySQL installation with new MySQL library.

29.5.3 The LOCK_ORDER Tool

The MySQL server is a multithreaded application that uses numerous internal locking and lock-related primitives, such as mutexes, rwlocks (including prlocks and sxlocks), conditions, and files. Within the server, the set of lock-related objects changes with implementation of new features and code refactoring for performance improvements. As with any multithreaded application that uses locking primitives, there is always a risk of encountering a deadlock during execution when multiple locks are held at once. For MySQL, the effect of a deadlock is catastrophic, causing a complete loss of service.

As of MySQL 8.0.17, to enable detection of lock-acquisition deadlocks and enforcement that runtime execution is free of them, MySQL supports LOCK_ORDER tooling. This enables a lock-order dependency graph to be defined as part of server design, and server runtime checking to ensure that lock acquisition is acyclic and that execution paths comply with the graph.

This section provides information about using the LOCK_ORDER tool, but only at a basic level. For complete details, see the Lock Order section of the MySQL Server Doxygen documentation, available at <https://dev.mysql.com/doc/index-other.html>.

The LOCK_ORDER tool is intended for debugging the server, not for production use.

To use the LOCK_ORDER tool, follow this procedure:

1. Build MySQL from source, configuring it with the `-DWITH_LOCK_ORDER=ON` CMake option so that the build includes LOCK_ORDER tooling.

**Note**

With the `WITH_LOCK_ORDER` option enabled, MySQL builds require the `flex` program.

2. To run the server with the LOCK_ORDER tool enabled, enable the `lock_order` system variable at server startup. Several other system variables for LOCK_ORDER configuration are available as well.
3. For MySQL test suite operation, `mysql-test-run.pl` has a `--lock-order` option that controls whether to enable the LOCK_ORDER tool during test case execution.

The system variables described following configure operation of the LOCK_ORDER tool, assuming that MySQL has been built to include LOCK_ORDER tooling. The primary variable is `lock_order`, which indicates whether to enable the LOCK_ORDER tool at runtime:

- If `lock_order` is disabled (the default), no other LOCK_ORDER system variables have any effect.
- If `lock_order` is enabled, the other system variables configure which LOCK_ORDER features to enable.

**Note**

In general, it is intended that the LOCK_ORDER tool be configured by executing `mysql-test-run.pl` with the `--lock-order` option, and for `mysql-test-run.pl` to set LOCK_ORDER system variables to appropriate values.

All LOCK_ORDER system variables must be set at server startup. At runtime, their values are visible but cannot be changed.

Some system variables exist in pairs, such as `lock_order_debug_loop` and `lock_order_trace_loop`. For such pairs, the variables are distinguished as follows when the condition occurs with which they are associated:

- If the `_debug_` variable is enabled, a debug assertion is raised.

- If the `_trace_` variable is enabled, an error is printed to the logs.

Table 29.4 LOCK_ORDER System Variable Summary

Variable Name	Variable Type	Variable Scope
<code>lock_order</code>	Boolean	Global
<code>lock_order_debug_loop</code>	Boolean	Global
<code>lock_order_debug_missing_arc</code>	Boolean	Global
<code>lock_order_debug_missing_key</code>	Boolean	Global
<code>lock_order_debug_missing_unlock</code>	Boolean	Global
<code>lock_order_dependencies</code>	File name	Global
<code>lock_order_extra_dependencies</code>	File name	Global
<code>lock_order_output_directory</code>	Directory name	Global
<code>lock_order_print_txt</code>	Boolean	Global
<code>lock_order_trace_loop</code>	Boolean	Global
<code>lock_order_trace_missing_arc</code>	Boolean	Global
<code>lock_order_trace_missing_key</code>	Boolean	Global
<code>lock_order_trace_missing_unlock</code>	Boolean	Global

- `lock_order`

Property	Value
Command-Line Format	<code>--lock-order[={OFF ON}]</code>
Introduced	8.0.17
System Variable	<code>lock_order</code>
Scope	Global
Dynamic	No
SET_VAR Hint Applies	No
Type	Boolean
Default Value	<code>OFF</code>

Whether to enable the LOCK_ORDER tool at runtime. If `lock_order` is disabled (the default), no other LOCK_ORDER system variables have any effect. If `lock_order` is enabled, the other system variables configure which LOCK_ORDER features to enable.

If `lock_order` is enabled, an error is raised if the server encounters a lock-acquisition sequence that is not declared in the lock-order graph.

- `lock_order_debug_loop`

Property	Value
Command-Line Format	<code>--lock-order-debug-loop[={OFF ON}]</code>
Introduced	8.0.17
System Variable	<code>lock_order_debug_loop</code>
Scope	Global

Property	Value
Dynamic	No
SET_VAR Hint Applies	No
Type	Boolean
Default Value	OFF

Whether the LOCK_ORDER tool causes a debug assertion failure when it encounters a dependency that is flagged as a loop in the lock-order graph.

- [lock_order_debug_missing_arc](#)

Property	Value
Command-Line Format	<code>--lock-order-debug-missing-arc[={OFF ON}]</code>
Introduced	8.0.17
System Variable	lock_order_debug_missing_arc
Scope	Global
Dynamic	No
SET_VAR Hint Applies	No
Type	Boolean
Default Value	OFF

Whether the LOCK_ORDER tool causes a debug assertion failure when it encounters a dependency that is not declared in the lock-order graph.

- [lock_order_debug_missing_key](#)

Property	Value
Command-Line Format	<code>--lock-order-debug-missing-key[={OFF ON}]</code>
Introduced	8.0.17
System Variable	lock_order_debug_missing_key
Scope	Global
Dynamic	No
SET_VAR Hint Applies	No
Type	Boolean
Default Value	OFF

Whether the LOCK_ORDER tool causes a debug assertion failure when it encounters an object that is not properly instrumented with the Performance Schema.

- [lock_order_debug_missing_unlock](#)

Property	Value
Command-Line Format	<code>--lock-order-debug-missing-unlock[={OFF ON}]</code>
Introduced	8.0.17
System Variable	lock_order_debug_missing_unlock

Property	Value
Scope	Global
Dynamic	No
SET_VAR Hint Applies	No
Type	Boolean
Default Value	OFF

Whether the LOCK_ORDER tool causes a debug assertion failure when it encounters a lock that is destroyed while still held.

- [lock_order_dependencies](#)

Property	Value
Command-Line Format	--lock-order-dependencies=file_name
Introduced	8.0.17
System Variable	lock_order_dependencies
Scope	Global
Dynamic	No
SET_VAR Hint Applies	No
Type	File name
Default Value	empty string

The path to the [lock_order_dependencies.txt](#) file that defines the server lock-order dependency graph.

It is permitted to specify no dependencies. An empty dependency graph is used in this case.

- [lock_order_extra_dependencies](#)

Property	Value
Command-Line Format	--lock-order-extra-dependencies=file_name
Introduced	8.0.17
System Variable	lock_order_extra_dependencies
Scope	Global
Dynamic	No
SET_VAR Hint Applies	No
Type	File name
Default Value	empty string

The path to a file containing additional dependencies for the lock-order dependency graph. This is useful to amend the primary server dependency graph, defined in the [lock_order_dependencies.txt](#) file, with additional dependencies describing the behavior of third party code. (The alternative is to modify [lock_order_dependencies.txt](#) itself, which is not encouraged.)

If this variable is not set, no secondary file is used.

- [lock_order_output_directory](#)

Property	Value
Command-Line Format	<code>--lock-order-output-directory=dir_name</code>
Introduced	8.0.17
System Variable	<code>lock_order_output_directory</code>
Scope	Global
Dynamic	No
SET_VAR Hint Applies	No
Type	Directory name
Default Value	<code>empty string</code>

The directory where the LOCK_ORDER tool writes its logs. If this variable is not set, the default is the current directory.

- `lock_order_print_txt`

Property	Value
Command-Line Format	<code>--lock-order-print-txt[={OFF ON}]</code>
Introduced	8.0.17
System Variable	<code>lock_order_print_txt</code>
Scope	Global
Dynamic	No
SET_VAR Hint Applies	No
Type	Boolean
Default Value	<code>OFF</code>

Whether the LOCK_ORDER tool performs a lock-order graph analysis and prints a textual report. The report includes any lock-acquisition cycles detected.

- `lock_order_trace_loop`

Property	Value
Command-Line Format	<code>--lock-order-trace-loop[={OFF ON}]</code>
Introduced	8.0.17
System Variable	<code>lock_order_trace_loop</code>
Scope	Global
Dynamic	No
SET_VAR Hint Applies	No
Type	Boolean
Default Value	<code>OFF</code>

Whether the LOCK_ORDER tool prints a trace in the log file when it encounters a dependency that is flagged as a loop in the lock-order graph.

- `lock_order_trace_missing_arc`

Property	Value
Command-Line Format	<code>--lock-order-trace-missing-arc[={OFF ON}]</code>
Introduced	8.0.17
System Variable	<code>lock_order_trace_missing_arc</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Boolean
Default Value	<code>ON</code>

Whether the LOCK_ORDER tool prints a trace in the log file when it encounters a dependency that is not declared in the lock-order graph.

- `lock_order_trace_missing_key`

Property	Value
Command-Line Format	<code>--lock-order-trace-missing-key[={OFF ON}]</code>
Introduced	8.0.17
System Variable	<code>lock_order_trace_missing_key</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Boolean
Default Value	<code>OFF</code>

Whether the LOCK_ORDER tool prints a trace in the log file when it encounters an object that is not properly instrumented with the Performance Schema.

- `lock_order_trace_missing_unlock`

Property	Value
Command-Line Format	<code>--lock-order-trace-missing-unlock[={OFF ON}]</code>
Introduced	8.0.17
System Variable	<code>lock_order_trace_missing_unlock</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Boolean
Default Value	<code>ON</code>

Whether the LOCK_ORDER tool prints a trace in the log file when it encounters a lock that is destroyed while still held.

29.5.4 The DBUG Package

The MySQL server and most MySQL clients are compiled with the DBUG package originally created by Fred Fish. When you have configured MySQL for debugging, this package makes it possible to get a trace file of what the program is doing. See [Section 29.5.1.2, “Creating Trace Files”](#).

This section summarizes the argument values that you can specify in debug options on the command line for MySQL programs that have been built with debugging support.

The DBUG package can be used by invoking a program with the `--debug[=debug_options]` or `-# [debug_options]` option. If you specify the `--debug` or `-#` option without a `debug_options` value, most MySQL programs use a default value. The server default is `d:t:i:o,/tmp/mysqlld.trace` on Unix and `d:t:i:O,\mysqlld.trace` on Windows. The effect of this default is:

- `d`: Enable output for all debug macros
- `t`: Trace function calls and exits
- `i`: Add PID to output lines
- `o,/tmp/mysqlld.trace,O,\mysqlld.trace`: Set the debug output file.

Most client programs use a default `debug_options` value of `d:t:o,/tmp/program_name.trace`, regardless of platform.

Here are some example debug control strings as they might be specified on a shell command line:

```
--debug=d:t
--debug=d:f,main,subr1:F:L:t,20
--debug=d,input,output,files:n
--debug=d:t:i:O,\mysqlld.trace
```

For `mysqlld`, it is also possible to change DBUG settings at runtime by setting the `debug` system variable. This variable has global and session values:

```
mysql> SET GLOBAL debug = 'debug_options';
mysql> SET SESSION debug = 'debug_options';
```

Changing the global `debug` value requires privileges sufficient to set global system variables. Changing the session `debug` value requires privileges sufficient to set restricted session system variables. See [Section 5.1.9.1, “System Variable Privileges”](#).

The `debug_options` value is a sequence of colon-separated fields:

```
field_1:field_2:...:field_N
```

Each field within the value consists of a mandatory flag character, optionally preceded by a `+` or `-` character, and optionally followed by a comma-separated list of modifiers:

```
[+|-]flag[,modifier,modifier,...,modifier]
```

The following table describes the permitted flag characters. Unrecognized flag characters are silently ignored.

Flag	Description
<code>d</code>	Enable output from <code>DEBUG_XXX</code> macros for the current state. May be followed by a list of keywords, which enables output only for the DBUG macros with that keyword. An empty list of keywords enables output for all macros.

Flag	Description
	In MySQL, common debug macro keywords to enable are <code>enter</code> , <code>exit</code> , <code>error</code> , <code>warning</code> , <code>info</code> , and <code>loop</code> .
<code>D</code>	Delay after each debugger output line. The argument is the delay, in tenths of seconds, subject to machine capabilities. For example, <code>D,20</code> specifies a delay of two seconds.
<code>f</code>	Limit debugging, tracing, and profiling to the list of named functions. An empty list enables all functions. The appropriate <code>d</code> or <code>t</code> flags must still be given; this flag only limits their actions if they are enabled.
<code>F</code>	Identify the source file name for each line of debug or trace output.
<code>i</code>	Identify the process with the PID or thread ID for each line of debug or trace output.
<code>L</code>	Identify the source file line number for each line of debug or trace output.
<code>n</code>	Print the current function nesting depth for each line of debug or trace output.
<code>N</code>	Number each line of debug output.
<code>o</code>	Redirect the debugger output stream to the specified file. The default output is <code>stderr</code> .
<code>O</code>	Like <code>o</code> , but the file is really flushed between each write. When needed, the file is closed and reopened between each write.
<code>p</code>	Limit debugger actions to specified processes. A process must be identified with the <code>DEBUG_PROCESS</code> macro and match one in the list for debugger actions to occur.
<code>P</code>	Print the current process name for each line of debug or trace output.
<code>r</code>	When pushing a new state, do not inherit the previous state's function nesting level. Useful when the output is to start at the left margin.
<code>S</code>	Do function <code>_sanity(_file_,_line_)</code> at each debugged function until <code>_sanity()</code> returns something that differs from 0.
<code>t</code>	Enable function call/exit trace lines. May be followed by a list (containing only one modifier) giving a numeric maximum trace level, beyond which no output occurs for either debugging or tracing macros. The default is a compile time option.

The leading `+` or `-` character and trailing list of modifiers are used for flag characters such as `d` or `f` that can enable a debug operation for all applicable modifiers or just some of them:

- With no leading `+` or `-`, the flag value is set to exactly the modifier list as given.
- With a leading `+` or `-`, the modifiers in the list are added to or subtracted from the current modifier list.

The following examples show how this works for the `d` flag. An empty `d` list enabled output for all debug macros. A nonempty list enables output only for the macro keywords in the list.

These statements set the `d` value to the modifier list as given:

```
mysql> SET debug = 'd';
mysql> SELECT @@debug;
+-----+
| @@debug |
+-----+
| d       |
+-----+
mysql> SET debug = 'd,error,warning';
mysql> SELECT @@debug;
+-----+
| @@debug |
+-----+
| d,error,warning |
```

```
+-----+
```

A leading + or - adds to or subtracts from the current `d` value:

```
mysql> SET debug = '+d,loop';
mysql> SELECT @@debug;
+-----+
| @@debug |
+-----+
| d,error,warning,loop |
+-----+

mysql> SET debug = '-d,error,loop';
mysql> SELECT @@debug;
+-----+
| @@debug |
+-----+
| d,warning |
+-----+
```

Adding to “all macros enabled” results in no change:

```
mysql> SET debug = 'd';
mysql> SELECT @@debug;
+-----+
| @@debug |
+-----+
| d |
+-----+

mysql> SET debug = '+d,loop';
mysql> SELECT @@debug;
+-----+
| @@debug |
+-----+
| d |
+-----+
```

Disabling all enabled macros disables the `d` flag entirely:

```
mysql> SET debug = 'd,error,loop';
mysql> SELECT @@debug;
+-----+
| @@debug |
+-----+
| d,error,loop |
+-----+

mysql> SET debug = '-d,error,loop';
mysql> SELECT @@debug;
+-----+
| @@debug |
+-----+
| |
+-----+
```

Chapter 30 MySQL Enterprise Edition

30.1 MySQL Enterprise Monitor Overview	5029
30.2 MySQL Enterprise Backup Overview	5030
30.3 MySQL Enterprise Security Overview	5031
30.4 MySQL Enterprise Encryption Overview	5031
30.5 MySQL Enterprise Audit Overview	5031
30.6 MySQL Enterprise Firewall Overview	5032
30.7 MySQL Enterprise Thread Pool Overview	5032
30.8 MySQL Enterprise Data Masking and De-Identification Overview	5032

MySQL Enterprise Edition is a commercial product. Like MySQL Community Edition, MySQL Enterprise Edition includes MySQL Server, a fully integrated transaction-safe, ACID-compliant database with full commit, rollback, crash-recovery, and row-level locking capabilities. In addition, MySQL Enterprise Edition includes the following components designed to provide monitoring and online backup, as well as improved security and scalability:

The following sections briefly discuss each of these components and indicate where to find more detailed information. To learn more about commercial products, see <https://www.mysql.com/products/>.

- [MySQL Enterprise Backup](#)
- [MySQL Enterprise Security](#)
- [MySQL Enterprise Encryption](#)
- [MySQL Enterprise Audit](#)
- [MySQL Enterprise Firewall](#)
- [MySQL Enterprise Thread Pool](#)
- [MySQL Enterprise Data Masking and De-Identification](#)

30.1 MySQL Enterprise Monitor Overview

MySQL Enterprise Monitor is an enterprise monitoring system for MySQL that keeps an eye on your MySQL servers, notifies you of potential issues and problems, and advises you how to fix the issues. MySQL Enterprise Monitor can monitor all kinds of configurations, from a single MySQL server that is important to your business, all the way up to a huge farm of MySQL servers powering a busy website.

The following discussion briefly summarizes the basic components that make up the MySQL Enterprise Monitor product. For more information, see the MySQL Enterprise Monitor manual, available at <https://dev.mysql.com/doc/mysql-monitor/en/>.

MySQL Enterprise Monitor components can be installed in various configurations depending on your database and network topology, to give you the best combination of reliable and responsive monitoring data, with minimal overhead on the database server machines. A typical MySQL Enterprise Monitor installation consists of:

- One or more MySQL servers to monitor. MySQL Enterprise Monitor can monitor both Community and Enterprise MySQL server releases.
- A MySQL Enterprise Monitor Agent for each monitored host.
- A single MySQL Enterprise Service Manager, which collates information from the agents and provides the user interface to the collected data.

MySQL Enterprise Monitor is designed to monitor one or more MySQL servers. The monitoring information is collected by using an agent, *MySQL Enterprise Monitor Agent*. The agent communicates with the hosts and MySQL servers that it monitors, collecting variables, status and health information, and sending this information to the MySQL Enterprise Service Manager.

The information collected by the agent about each MySQL server and host you are monitoring is sent to the *MySQL Enterprise Service Manager*. This server collates all of the information from the agents. As it collates the information sent by the agents, the MySQL Enterprise Service Manager continually tests the collected data, comparing the status of the server to reasonable values. When thresholds are reached, the server can trigger an event (including an alarm and notification) to highlight a potential issue, such as low memory, high CPU usage, or more complex conditions such as insufficient buffer sizes and status information. We call each test, with its associated threshold value, a *rule*.

These rules, and the alarms and notifications, are each known as a *MySQL Enterprise Advisors*. Advisors form a critical part of the MySQL Enterprise Service Manager, as they provide warning information and troubleshooting advice about potential problems.

The MySQL Enterprise Service Manager includes a web server, and you interact with it through any web browser. This interface, the MySQL Enterprise Monitor User Interface, displays all of the information collected by the agents, and lets you view all of your servers and their current status as a group or individually. You control and configure all aspects of the service using the MySQL Enterprise Monitor User Interface.

The information supplied by the MySQL Enterprise Monitor Agent processes also includes statistical and query information, which you can view in the form of graphs. For example, you can view aspects such as server load, query numbers, or index usage information as a graph over time. The graph lets you pinpoint problems or potential issues on your server, and can help diagnose the impact from database or external problems (such as external system or network failure) by examining the data from a specific time interval.

The MySQL Enterprise Monitor Agent can also be configured to collect detailed information about the queries executed on your server, including the row counts and performance times for executing each query. You can correlate the detailed query data with the graphical information to identify which queries were executing when you experienced a particularly high load, index or other issue. The query data is supported by a system called Query Analyzer, and the data can be presented in different ways depending on your needs.

30.2 MySQL Enterprise Backup Overview

MySQL Enterprise Backup performs hot backup operations for MySQL databases. The product is architected for efficient and reliable backups of tables created by the InnoDB storage engine. For completeness, it can also back up tables from MyISAM and other storage engines.

The following discussion briefly summarizes MySQL Enterprise Backup. For more information, see the MySQL Enterprise Backup manual, available at <https://dev.mysql.com/doc/mysql-enterprise-backup/en/>.

Hot backups are performed while the database is running and applications are reading and writing to it. This type of backup does not block normal database operations, and it captures even changes that occur while the backup is happening. For these reasons, hot backups are desirable when your database

“grows up” -- when the data is large enough that the backup takes significant time, and when your data is important enough to your business that you must capture every last change, without taking your application, website, or web service offline.

MySQL Enterprise Backup does a hot backup of all tables that use the InnoDB storage engine. For tables using MyISAM or other non-InnoDB storage engines, it does a “warm” backup, where the database continues to run, but those tables cannot be modified while being backed up. For efficient backup operations, you can designate InnoDB as the default storage engine for new tables, or convert existing tables to use the InnoDB storage engine.

30.3 MySQL Enterprise Security Overview

MySQL Enterprise Edition provides plugins that implement security features using external services:

- MySQL Enterprise Edition includes an authentication plugin that enables MySQL Server to use PAM (Pluggable Authentication Modules) to authenticate MySQL users. PAM enables a system to use a standard interface to access various kinds of authentication methods, such as Unix passwords or an LDAP directory. For more information, see [Section 6.4.1.5, “PAM Pluggable Authentication”](#).
- MySQL Enterprise Edition includes an authentication plugin that performs external authentication on Windows, enabling MySQL Server to use native Windows services to authenticate client connections. Users who have logged in to Windows can connect from MySQL client programs to the server based on the information in their environment without specifying an additional password. For more information, see [Section 6.4.1.6, “Windows Pluggable Authentication”](#).
- MySQL Enterprise Edition 5.6 and higher includes a set of encryption functions based on the OpenSSL library that expose OpenSSL capabilities at the SQL level. These functions enable masking existing data using several methods such as obfuscation (removing identifying characteristics), generation of formatted random data, and data replacement or substitution. For more information, see [Section 30.4, “MySQL Enterprise Encryption Overview”](#).
- MySQL Enterprise Edition 5.7 and higher includes a keyring plugin that uses Oracle Key Vault as a back end for keyring storage. For more information, see [Section 6.4.4, “The MySQL Keyring”](#).

For other related Enterprise security features, see [Section 30.4, “MySQL Enterprise Encryption Overview”](#).

30.4 MySQL Enterprise Encryption Overview

MySQL Enterprise Edition 5.6 and higher includes a set of encryption functions based on the OpenSSL library that expose OpenSSL capabilities at the SQL level. These functions enable Enterprise applications to perform the following operations:

- Implement added data protection using public-key asymmetric cryptography
- Create public and private keys and digital signatures
- Perform asymmetric encryption and decryption
- Use cryptographic hashing for digital signing and data verification and validation

For more information, see [Section 12.19, “MySQL Enterprise Encryption Functions”](#).

For other related Enterprise security features, see [Section 30.3, “MySQL Enterprise Security Overview”](#).

30.5 MySQL Enterprise Audit Overview

MySQL Enterprise Edition includes MySQL Enterprise Audit, implemented using a server plugin. MySQL Enterprise Audit uses the open MySQL Audit API to enable standard, policy-based monitoring and logging of connection and query activity executed on specific MySQL servers. Designed to meet the Oracle audit specification, MySQL Enterprise Audit provides an out of box, easy to use auditing and compliance solution for applications that are governed by both internal and external regulatory guidelines.

When installed, the audit plugin enables MySQL Server to produce a log file containing an audit record of server activity. The log contents include when clients connect and disconnect, and what actions they perform while connected, such as which databases and tables they access.

For more information, see [Section 6.4.5, “MySQL Enterprise Audit”](#).

30.6 MySQL Enterprise Firewall Overview

MySQL Enterprise Edition 5.6 and higher includes MySQL Enterprise Firewall, an application-level firewall that enables database administrators to permit or deny SQL statement execution based on matching against whitelists of accepted statement patterns. This helps harden MySQL Server against attacks such as SQL injection or attempts to exploit applications by using them outside of their legitimate query workload characteristics.

Each MySQL account registered with the firewall has its own statement whitelist, enabling protection to be tailored per account. For a given account, the firewall can operate in recording or protecting mode, for training in the accepted statement patterns or protection against unacceptable statements.

For more information, see [Section 6.4.7, “MySQL Enterprise Firewall”](#).

30.7 MySQL Enterprise Thread Pool Overview

MySQL Enterprise Edition includes MySQL Enterprise Thread Pool, implemented using a server plugin. The default thread-handling model in MySQL Server executes statements using one thread per client connection. As more clients connect to the server and execute statements, overall performance degrades. In MySQL Enterprise Edition, a thread pool plugin provides an alternative thread-handling model designed to reduce overhead and improve performance. The plugin implements a thread pool that increases server performance by efficiently managing statement execution threads for large numbers of client connections.

For more information, see [Section 5.6.3, “MySQL Enterprise Thread Pool”](#).

30.8 MySQL Enterprise Data Masking and De-Identification Overview

MySQL Enterprise Edition 5.7 and higher includes MySQL Enterprise Data Masking and De-Identification, implemented as a plugin library containing a plugin and a set of user-defined functions. Data masking hides sensitive information by replacing real values with substitutes. MySQL Enterprise Data Masking and De-Identification functions enable masking existing data using several methods such as obfuscation (removing identifying characteristics), generation of formatted random data, and data replacement or substitution.

For more information, see [Section 6.4.8, “MySQL Enterprise Data Masking and De-Identification”](#).

Chapter 31 MySQL Workbench

MySQL Workbench provides a graphical tool for working with MySQL servers and databases. MySQL Workbench fully supports MySQL versions 5.5 and higher.

The following discussion briefly describes MySQL Workbench capabilities. For more information, see the MySQL Workbench manual, available at <https://dev.mysql.com/doc/workbench/en/>.

MySQL Workbench provides five main areas of functionality:

- **SQL Development:** Enables you to create and manage connections to database servers. As well as enabling you to configure connection parameters, MySQL Workbench provides the capability to execute SQL queries on the database connections using the built-in SQL Editor. This functionality replaces that previously provided by the Query Browser standalone application.
- **Data Modeling:** Enables you to create models of your database schema graphically, reverse and forward engineer between a schema and a live database, and edit all aspects of your database using the comprehensive Table Editor. The Table Editor provides easy-to-use facilities for editing Tables, Columns, Indexes, Triggers, Partitioning, Options, Inserts and Privileges, Routines and Views.
- **Server Administration:** Enables you to create and administer server instances.
- **Data Migration:** Allows you to migrate from Microsoft SQL Server, Sybase ASE, SQLite, SQL Anywhere, PostgreSQL, and other RDBMS tables, objects and data to MySQL. Migration also supports migrating from earlier versions of MySQL to the latest releases.
- **MySQL Enterprise Support:** Support for Enterprise products such as MySQL Enterprise Backup and MySQL Audit.

MySQL Workbench is available in two editions, the Community Edition and the Commercial Edition. The Community Edition is available free of charge. The Commercial Edition provides additional Enterprise features, such as database documentation generation, at low cost.

Appendix A MySQL 8.0 Frequently Asked Questions

A.18 MySQL 8.0 FAQ: Virtualization Support	5070

A.1 MySQL 8.0 FAQ: General

A.1.1 Which version of MySQL is production-ready (GA)?	5035
A.1.2 Why did MySQL version numbering skip versions 6 and 7 and go straight to 8.0?	5036
A.1.3 Can MySQL 8.0 do subqueries?	5036
A.1.4 Can MySQL 8.0 perform multiple-table inserts, updates, and deletes?	5036
A.1.5 Does MySQL 8.0 have Sequences?	5036
A.1.6 Does MySQL 8.0 have a NOW() function with fractions of seconds?	5036
A.1.7 Does MySQL 8.0 work with multi-core processors?	5036
A.1.8 Why do I see multiple processes for mysqld ?	5036
A.1.9 Can MySQL 8.0 perform ACID transactions?	5036

A.1.1. Which version of MySQL is production-ready (GA)?

MySQL 8.0, 5.7, and MySQL 5.6 are supported for production use.

MySQL 8.0 achieved General Availability (GA) status with MySQL 8.0.11, which was released for production use on 19 April 2018.

MySQL 5.7 achieved General Availability (GA) status with MySQL 5.7.9, which was released for production use on 21 October 2015.

MySQL 5.6 achieved General Availability (GA) status with MySQL 5.6.10, which was released for production use on 5 February 2013.

MySQL 5.5 achieved General Availability (GA) status with MySQL 5.5.8, which was released for production use on 3 December 2010. The MySQL 5.5 series is no longer current, but still supported in production.

MySQL 5.1 achieved General Availability (GA) status with MySQL 5.1.30, which was released for production use on 14 November 2008. Active development for MySQL 5.1 has ended.

MySQL 5.0 achieved General Availability (GA) status with MySQL 5.0.15, which was released for production use on 19 October 2005. Active development for MySQL 5.0 has ended.

A.1.2. Why did MySQL version numbering skip versions 6 and 7 and go straight to 8.0?

Due to the many new and important features we were introducing in this MySQL version, we decided to start a fresh new series. As the series numbers 6 and 7 had actually been used before by MySQL, we went to 8.0.

A.1.3. Can MySQL 8.0 do subqueries?

Yes. See [Section 13.2.11, “Subqueries”](#).

A.1.4. Can MySQL 8.0 perform multiple-table inserts, updates, and deletes?

Yes. For the syntax required to perform multiple-table updates, see [Section 13.2.12, “UPDATE Statement”](#); for that required to perform multiple-table deletes, see [Section 13.2.2, “DELETE Statement”](#).

A multiple-table insert can be accomplished using a trigger whose `FOR EACH ROW` clause contains multiple `INSERT` statements within a `BEGIN . . . END` block. See [Section 24.3, “Using Triggers”](#).

A.1.5. Does MySQL 8.0 have Sequences?

No. However, MySQL has an `AUTO_INCREMENT` system, which in MySQL 8.0 can also handle inserts in a multi-master replication setup. With the `auto_increment_increment` and `auto_increment_offset` system variables, you can set each server to generate auto-increment values that don't conflict with other servers. The `auto_increment_increment` value should be greater than the number of servers, and each server should have a unique offset.

A.1.6. Does MySQL 8.0 have a `NOW()` function with fractions of seconds?

Yes, see [Section 11.3.5, “Fractional Seconds in Time Values”](#).

A.1.7. Does MySQL 8.0 work with multi-core processors?

Yes. MySQL is fully multithreaded, and will make use of multiple CPUs, provided that the operating system supports them.

A.1.8. Why do I see multiple processes for `mysqld`?

When using LinuxThreads, you should see a minimum of three `mysqld` processes running. These are in fact threads. There is one thread for the LinuxThreads manager, one thread to handle connections, and one thread to handle alarms and signals.

A.1.9. Can MySQL 8.0 perform ACID transactions?

Yes. All current MySQL versions support transactions. The `InnoDB` storage engine offers full ACID transactions with row-level locking, multi-versioning, nonlocking repeatable reads, and all four SQL standard isolation levels.

The `NDB` storage engine supports the `READ COMMITTED` transaction isolation level only.

A.2 MySQL 8.0 FAQ: Storage Engines

A.2.1 Where can I obtain complete documentation for MySQL storage engines?	5037
A.2.2 Are there any new storage engines in MySQL 8.0?	5037

A.2.3 Have any storage engines been removed in MySQL 8.0?	5037
A.2.4 Can I prevent the use of a particular storage engine?	5037
A.2.5 Is there an advantage to using the InnoDB storage engine exclusively, as opposed to a combination of InnoDB and non- InnoDB storage engines?	5037
A.2.6 What are the unique benefits of the ARCHIVE storage engine?	5037

A.2.1. Where can I obtain complete documentation for MySQL storage engines?

See [Chapter 16, *Alternative Storage Engines*](#). That chapter contains information about all MySQL storage engines except for the [InnoDB](#) storage engine and the [NDB](#) storage engine (used for MySQL Cluster). [InnoDB](#) is covered in [Chapter 15, *The InnoDB Storage Engine*](#). [NDB](#) is covered in [Chapter 22, *MySQL NDB Cluster 8.0*](#).

A.2.2. Are there any new storage engines in MySQL 8.0?

No. [InnoDB](#) is the default storage engine for new tables. See [Section 15.1, “Introduction to InnoDB”](#) for details.

A.2.3. Have any storage engines been removed in MySQL 8.0?

The [PARTITION](#) storage engine plugin which provided partitioning support is replaced by a native partitioning handler. As part of this change, the server can no longer be built using [-DWITH_PARTITION_STORAGE_ENGINE](#). [partition](#) is also no longer displayed in the output of [SHOW PLUGINS](#), or shown in the [INFORMATION_SCHEMA.PLUGINS](#) table.

In order to support partitioning of a given table, the storage engine used for the table must now provide its own (“native”) partitioning handler. [InnoDB](#) is the only storage engine supported in MySQL 8.0 that includes a native partitioning handler. An attempt to create partitioned tables in MySQL 8.0 using any other storage engine fails. (The [NDB](#) storage engine used by MySQL Cluster also provides its own partitioning handler, but is currently not supported by MySQL 8.0.)

A.2.4. Can I prevent the use of a particular storage engine?

Yes. The [disabled_storage_engines](#) configuration option defines which storage engines cannot be used to create tables or tablespaces. By default, [disabled_storage_engines](#) is empty (no engines disabled), but it can be set to a comma-separated list of one or more engines.

A.2.5. Is there an advantage to using the [InnoDB](#) storage engine exclusively, as opposed to a combination of [InnoDB](#) and non-[InnoDB](#) storage engines?

Yes. Using [InnoDB](#) tables exclusively can simplify backup and recovery operations. MySQL Enterprise Backup does a [hot backup](#) of all tables that use the [InnoDB](#) storage engine. For tables using [MyISAM](#) or other non-[InnoDB](#) storage engines, it does a “warm” backup, where the database continues to run, but those tables cannot be modified while being backed up. See [Section 30.2, “MySQL Enterprise Backup Overview”](#).

A.2.6. What are the unique benefits of the [ARCHIVE](#) storage engine?

The [ARCHIVE](#) storage engine stores large amounts of data without indexes; it has a small footprint, and performs selects using table scans. See [Section 16.5, “The ARCHIVE Storage Engine”](#), for details.

A.3 MySQL 8.0 FAQ: Server SQL Mode

A.3.1 What are server SQL modes?	5038
A.3.2 How many server SQL modes are there?	5038
A.3.3 How do you determine the server SQL mode?	5038

A.3.4 Is the mode dependent on the database or connection?	5038
A.3.5 Can the rules for strict mode be extended?	5038
A.3.6 Does strict mode impact performance?	5038
A.3.7 What is the default server SQL mode when MySQL 8.0 is installed?	5038

A.3.1. What are server SQL modes?

Server SQL modes define what SQL syntax MySQL should support and what kind of data validation checks it should perform. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers. The MySQL Server apply these modes individually to different clients. For more information, see [Section 5.1.11, “Server SQL Modes”](#).

A.3.2. How many server SQL modes are there?

Each mode can be independently switched on and off. See [Section 5.1.11, “Server SQL Modes”](#), for a complete list of available modes.

A.3.3. How do you determine the server SQL mode?

You can set the default SQL mode (for `mysqld` startup) with the `--sql-mode` option. Using the statement `SET [GLOBAL|SESSION] sql_mode='modes'`, you can change the settings from within a connection, either locally to the connection, or to take effect globally. You can retrieve the current mode by issuing a `SELECT @@sql_mode` statement.

A.3.4. Is the mode dependent on the database or connection?

A mode is not linked to a particular database. Modes can be set locally to the session (connection), or globally for the server. you can change these settings using `SET [GLOBAL|SESSION] sql_mode='modes'`.

A.3.5. Can the rules for strict mode be extended?

When we refer to *strict mode*, we mean a mode where at least one of the modes `TRADITIONAL`, `STRICT_TRANS_TABLES`, or `STRICT_ALL_TABLES` is enabled. Options can be combined, so you can add restrictions to a mode. See [Section 5.1.11, “Server SQL Modes”](#), for more information.

A.3.6. Does strict mode impact performance?

The intensive validation of input data that some settings requires more time than if the validation is not done. While the performance impact is not that great, if you do not require such validation (perhaps your application already handles all of this), then MySQL gives you the option of leaving strict mode disabled. However, if you do require it, strict mode can provide such validation.

A.3.7. What is the default server SQL mode when MySQL 8.0 is installed?

The default SQL mode in MySQL 8.0 includes these modes: `ONLY_FULL_GROUP_BY`, `STRICT_TRANS_TABLES`, `NO_ZERO_IN_DATE`, `NO_ZERO_DATE`, `ERROR_FOR_DIVISION_BY_ZERO`, and `NO_ENGINE_SUBSTITUTION`.

For information about all available modes and default MySQL behavior, see [Section 5.1.11, “Server SQL Modes”](#).

A.4 MySQL 8.0 FAQ: Stored Procedures and Functions

A.4.1 Does MySQL 8.0 support stored procedures and functions?	5039
A.4.2 Where can I find documentation for MySQL stored procedures and stored functions?	5039
A.4.3 Is there a discussion forum for MySQL stored procedures?	5039
A.4.4 Where can I find the ANSI SQL 2003 specification for stored procedures?	5039

A.4.5 How do you manage stored routines?	5039
A.4.6 Is there a way to view all stored procedures and stored functions in a given database?	5039
A.4.7 Where are stored procedures stored?	5040
A.4.8 Is it possible to group stored procedures or stored functions into packages?	5040
A.4.9 Can a stored procedure call another stored procedure?	5040
A.4.10 Can a stored procedure call a trigger?	5040
A.4.11 Can a stored procedure access tables?	5040
A.4.12 Do stored procedures have a statement for raising application errors?	5040
A.4.13 Do stored procedures provide exception handling?	5040
A.4.14 Can MySQL 8.0 stored routines return result sets?	5040
A.4.15 Is <code>WITH RECOMPILE</code> supported for stored procedures?	5040
A.4.16 Is there a MySQL equivalent to using <code>mod_plsql</code> as a gateway on Apache to talk directly to a stored procedure in the database?	5041
A.4.17 Can I pass an array as input to a stored procedure?	5041
A.4.18 Can I pass a cursor as an <code>IN</code> parameter to a stored procedure?	5041
A.4.19 Can I return a cursor as an <code>OUT</code> parameter from a stored procedure?	5041
A.4.20 Can I print out a variable's value within a stored routine for debugging purposes?	5041
A.4.21 Can I commit or roll back transactions inside a stored procedure?	5041
A.4.22 Do MySQL 8.0 stored procedures and functions work with replication?	5041
A.4.23 Are stored procedures and functions created on a master server replicated to a slave?	5041
A.4.24 How are actions that take place inside stored procedures and functions replicated?	5041
A.4.25 Are there special security requirements for using stored procedures and functions together with replication?	5041
A.4.26 What limitations exist for replicating stored procedure and function actions?	5042
A.4.27 Do the preceding limitations affect the ability of MySQL to do point-in-time recovery?	5042
A.4.28 What is being done to correct the aforementioned limitations?	5042

A.4.1. Does MySQL 8.0 support stored procedures and functions?

Yes. MySQL 8.0 supports two types of stored routines, stored procedures and stored functions.

A.4.2. Where can I find documentation for MySQL stored procedures and stored functions?

See [Section 24.2, “Using Stored Routines”](#).

A.4.3. Is there a discussion forum for MySQL stored procedures?

Yes. See <https://forums.mysql.com/list.php?98>.

A.4.4. Where can I find the ANSI SQL 2003 specification for stored procedures?

Unfortunately, the official specifications are not freely available (ANSI makes them available for purchase). However, there are books, such as *SQL-99 Complete, Really* by Peter Gultzan and Trudy Pelzer, that provide a comprehensive overview of the standard, including coverage of stored procedures.

A.4.5. How do you manage stored routines?

It is always good practice to use a clear naming scheme for your stored routines. You can manage stored procedures with `CREATE [FUNCTION|PROCEDURE]`, `ALTER [FUNCTION|PROCEDURE]`, `DROP [FUNCTION|PROCEDURE]`, and `SHOW CREATE [FUNCTION|PROCEDURE]`. You can obtain information about existing stored procedures using the `ROUTINES` table in the `INFORMATION_SCHEMA` database (see [Section 25.29, “The INFORMATION_SCHEMA ROUTINES Table”](#)).

A.4.6. Is there a way to view all stored procedures and stored functions in a given database?

Yes. For a database named *dbname*, use this query on the `INFORMATION_SCHEMA.ROUTINES` table:

```
SELECT ROUTINE_TYPE, ROUTINE_NAME
FROM INFORMATION_SCHEMA.ROUTINES
WHERE ROUTINE_SCHEMA='dbname' ;
```

For more information, see [Section 25.29, “The INFORMATION_SCHEMA ROUTINES Table”](#).

The body of a stored routine can be viewed using `SHOW CREATE FUNCTION` (for a stored function) or `SHOW CREATE PROCEDURE` (for a stored procedure). See [Section 13.7.7.9, “SHOW CREATE PROCEDURE Statement”](#), for more information.

A.4.7. Where are stored procedures stored?

Stored procedures are stored in the `mysql.routines` and `mysql.parameters` tables, which are part of the data dictionary. You cannot access these tables directly. Instead, query the `INFORMATION_SCHEMA.ROUTINES` and `PARAMETERS` tables. See [Section 25.29, “The INFORMATION_SCHEMA ROUTINES Table”](#), and [Section 25.19, “The INFORMATION_SCHEMA PARAMETERS Table”](#).

You can also use `SHOW CREATE FUNCTION` to obtain information about stored functions, and `SHOW CREATE PROCEDURE` to obtain information about stored procedures. See [Section 13.7.7.9, “SHOW CREATE PROCEDURE Statement”](#).

A.4.8. Is it possible to group stored procedures or stored functions into packages?

No. This is not supported in MySQL 8.0.

A.4.9. Can a stored procedure call another stored procedure?

Yes.

A.4.10. Can a stored procedure call a trigger?

A stored procedure can execute an SQL statement, such as an `UPDATE`, that causes a trigger to activate.

A.4.11. Can a stored procedure access tables?

Yes. A stored procedure can access one or more tables as required.

A.4.12. Do stored procedures have a statement for raising application errors?

Yes. MySQL 8.0 implements the SQL standard `SIGNAL` and `RESIGNAL` statements. See [Section 13.6.7, “Condition Handling”](#).

A.4.13. Do stored procedures provide exception handling?

MySQL implements `HANDLER` definitions according to the SQL standard. See [Section 13.6.7.2, “DECLARE ... HANDLER Statement”](#), for details.

A.4.14. Can MySQL 8.0 stored routines return result sets?

Stored procedures can, but *stored functions* cannot. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You need to use the MySQL 4.1 (or higher) client/server protocol for this to work. This means that, for example, in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

A.4.15. Is `WITH RECOMPILE` supported for stored procedures?

Not in MySQL 8.0.

A.4.16Is there a MySQL equivalent to using `mod_php` as a gateway on Apache to talk directly to a stored procedure in the database?

There is no equivalent in MySQL 8.0.

A.4.17Can I pass an array as input to a stored procedure?

Not in MySQL 8.0.

A.4.18Can I pass a cursor as an `IN` parameter to a stored procedure?

In MySQL 8.0, cursors are available inside stored procedures only.

A.4.19Can I return a cursor as an `OUT` parameter from a stored procedure?

In MySQL 8.0, cursors are available inside stored procedures only. However, if you do not open a cursor on a `SELECT`, the result will be sent directly to the client. You can also `SELECT INTO` variables. See [Section 13.2.10, “SELECT Statement”](#).

A.4.20Can I print out a variable's value within a stored routine for debugging purposes?

Yes, you can do this in a *stored procedure*, but not in a stored function. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You will need to use the MySQL 4.1 (or above) client/server protocol for this to work. This means that, for example, in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

A.4.21Can I commit or roll back transactions inside a stored procedure?

Yes. However, you cannot perform transactional operations within a stored function.

A.4.22Do MySQL 8.0 stored procedures and functions work with replication?

Yes, standard actions carried out in stored procedures and functions are replicated from a master MySQL server to a slave server. There are a few limitations that are described in detail in [Section 24.7, “Stored Program Binary Logging”](#).

A.4.23Are stored procedures and functions created on a master server replicated to a slave?

Yes, creation of stored procedures and functions carried out through normal DDL statements on a master server are replicated to a slave, so the objects will exist on both servers. `ALTER` and `DROP` statements for stored procedures and functions are also replicated.

A.4.24How are actions that take place inside stored procedures and functions replicated?

MySQL records each DML event that occurs in a stored procedure and replicates those individual actions to a slave server. The actual calls made to execute stored procedures are not replicated.

Stored functions that change data are logged as function invocations, not as the DML events that occur inside each function.

A.4.25Are there special security requirements for using stored procedures and functions together with replication?

Yes. Because a slave server has authority to execute any statement read from a master's binary log, special security constraints exist for using stored functions with replication. If replication or binary logging in general (for the purpose of point-in-time recovery) is active, then MySQL DBAs have two security options open to them:

1. Any user wishing to create stored functions must be granted the [SUPER](#) privilege.
2. Alternatively, a DBA can set the [log_bin_trust_function_creators](#) system variable to 1, which enables anyone with the standard [CREATE ROUTINE](#) privilege to create stored functions.

A.4.26What limitations exist for replicating stored procedure and function actions?

Nondeterministic (random) or time-based actions embedded in stored procedures may not replicate properly. By their very nature, randomly produced results are not predictable and cannot be exactly reproduced, and therefore, random actions replicated to a slave will not mirror those performed on a master. Declaring stored functions to be [DETERMINISTIC](#) or setting the [log_bin_trust_function_creators](#) system variable to 0 will not allow random-valued operations to be invoked.

In addition, time-based actions cannot be reproduced on a slave because the timing of such actions in a stored procedure is not reproducible through the binary log used for replication. It records only DML events and does not factor in timing constraints.

Finally, nontransactional tables for which errors occur during large DML actions (such as bulk inserts) may experience replication issues in that a master may be partially updated from DML activity, but no updates are done to the slave because of the errors that occurred. A workaround is for a function's DML actions to be carried out with the [IGNORE](#) keyword so that updates on the master that cause errors are ignored and updates that do not cause errors are replicated to the slave.

A.4.27Do the preceding limitations affect the ability of MySQL to do point-in-time recovery?

The same limitations that affect replication do affect point-in-time recovery.

A.4.28What is being done to correct the aforementioned limitations?

You can choose either statement-based replication or row-based replication. The original replication implementation is based on statement-based binary logging. Row-based binary logging resolves the limitations mentioned earlier.

Mixed replication is also available (by starting the server with [--binlog-format=mixed](#)). This hybrid form of replication “knows” whether statement-level replication can safely be used, or row-level replication is required.

For additional information, see [Section 17.2.1, “Replication Formats”](#).

A.5 MySQL 8.0 FAQ: Triggers

A.5.1 Where can I find the documentation for MySQL 8.0 triggers?	5043
A.5.2 Is there a discussion forum for MySQL Triggers?	5043
A.5.3 Does MySQL 8.0 have statement-level or row-level triggers?	5043
A.5.4 Are there any default triggers?	5043
A.5.5 How are triggers managed in MySQL?	5043
A.5.6 Is there a way to view all triggers in a given database?	5043
A.5.7 Where are triggers stored?	5043
A.5.8 Can a trigger call a stored procedure?	5043
A.5.9 Can triggers access tables?	5043
A.5.10 Can a table have multiple triggers with the same trigger event and action time?	5043
A.5.11 Can triggers call an external application through a UDF?	5044
A.5.12 Is it possible for a trigger to update tables on a remote server?	5044

A.5.13 Do triggers work with replication?	5044
A.5.14 How are actions carried out through triggers on a master replicated to a slave?	5044

A.5.1. Where can I find the documentation for MySQL 8.0 triggers?

See [Section 24.3, “Using Triggers”](#).

A.5.2. Is there a discussion forum for MySQL Triggers?

Yes. It is available at <https://forums.mysql.com/list.php?99>.

A.5.3. Does MySQL 8.0 have statement-level or row-level triggers?

In MySQL 8.0, all triggers are `FOR EACH ROW`; that is, the trigger is activated for each row that is inserted, updated, or deleted. MySQL 8.0 does not support triggers using `FOR EACH STATEMENT`.

A.5.4. Are there any default triggers?

Not explicitly. MySQL does have specific special behavior for some `TIMESTAMP` columns, as well as for columns which are defined using `AUTO_INCREMENT`.

A.5.5. How are triggers managed in MySQL?

In MySQL 8.0, triggers can be created using the `CREATE TRIGGER` statement, and dropped using `DROP TRIGGER`. See [Section 13.1.22, “CREATE TRIGGER Statement”](#), and [Section 13.1.34, “DROP TRIGGER Statement”](#), for more about these statements.

Information about triggers can be obtained by querying the `INFORMATION_SCHEMA.TRIGGERS` table. See [Section 25.40, “The INFORMATION_SCHEMA TRIGGERS Table”](#).

A.5.6. Is there a way to view all triggers in a given database?

Yes. You can obtain a listing of all triggers defined on database `dbname` using a query on the `INFORMATION_SCHEMA.TRIGGERS` table such as the one shown here:

```
SELECT TRIGGER_NAME, EVENT_MANIPULATION, EVENT_OBJECT_TABLE, ACTION_STATEMENT
FROM INFORMATION_SCHEMA.TRIGGERS
WHERE TRIGGER_SCHEMA= 'dbname' ;
```

For more information about this table, see [Section 25.40, “The INFORMATION_SCHEMA TRIGGERS Table”](#).

You can also use the `SHOW TRIGGERS` statement, which is specific to MySQL. See [Section 13.7.7.38, “SHOW TRIGGERS Statement”](#).

A.5.7. Where are triggers stored?

Triggers are stored in the `mysql.triggers` system table, which is part of the data dictionary.

A.5.8. Can a trigger call a stored procedure?

Yes.

A.5.9. Can triggers access tables?

A trigger can access both old and new data in its own table. A trigger can also affect other tables, but it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.

A.5.10 Can a table have multiple triggers with the same trigger event and action time?

In MySQL 8.0, it is possible to define multiple triggers for a given table that have the same trigger event and action time. For example, you can have two `BEFORE UPDATE` triggers for a table. By default, triggers that have the same trigger event and action time activate in the order they were created. To affect trigger order, specify a clause after `FOR EACH ROW` that indicates `FOLLOWS` or `PRECEDES` and the name of an existing trigger that also has the same trigger event and action time. With `FOLLOWS`, the new trigger activates after the existing trigger. With `PRECEDES`, the new trigger activates before the existing trigger.

A.5.11 Can triggers call an external application through a UDF?

Yes. For example, a trigger could invoke the `sys_exec()` UDF.

A.5.12 Is it possible for a trigger to update tables on a remote server?

Yes. A table on a remote server could be updated using the `FEDERATED` storage engine. (See [Section 16.8, “The FEDERATED Storage Engine”](#)).

A.5.13 Do triggers work with replication?

Yes. However, the way in which they work depends whether you are using MySQL's “classic” statement-based or row-based replication format.

When using statement-based replication, triggers on the slave are executed by statements that are executed on the master (and replicated to the slave).

When using row-based replication, triggers are not executed on the slave due to statements that were run on the master and then replicated to the slave. Instead, when using row-based replication, the changes caused by executing the trigger on the master are applied on the slave.

For more information, see [Section 17.5.1.35, “Replication and Triggers”](#).

A.5.14 How are actions carried out through triggers on a master replicated to a slave?

Again, this depends on whether you are using statement-based or row-based replication.

Statement-based replication. First, the triggers that exist on a master must be re-created on the slave server. Once this is done, the replication flow works as any other standard DML statement that participates in replication. For example, consider a table `EMP` that has an `AFTER` insert trigger, which exists on a master MySQL server. The same `EMP` table and `AFTER` insert trigger exist on the slave server as well. The replication flow would be:

1. An `INSERT` statement is made to `EMP`.
2. The `AFTER` trigger on `EMP` activates.
3. The `INSERT` statement is written to the binary log.
4. The replication slave picks up the `INSERT` statement to `EMP` and executes it.
5. The `AFTER` trigger on `EMP` that exists on the slave activates.

Row-based replication. When you use row-based replication, the changes caused by executing the trigger on the master are applied on the slave. However, the triggers themselves are not actually executed on the slave under row-based replication. This is because, if both the master and the slave applied the changes from the master and, in addition, the trigger causing these changes were applied on the slave, the changes would in effect be applied twice on the slave, leading to different data on the master and the slave.

In most cases, the outcome is the same for both row-based and statement-based replication. However, if you use different triggers on the master and slave, you cannot use row-based replication. (This is because the row-based format replicates the changes made by triggers executing on the master to the slaves, rather than the statements that caused the triggers to execute, and the corresponding triggers on the slave are not executed.) Instead, any statements causing such triggers to be executed must be replicated using statement-based replication.

For more information, see [Section 17.5.1.35, “Replication and Triggers”](#).

A.6 MySQL 8.0 FAQ: Views

A.6.1 Where can I find documentation covering MySQL Views?	5045
A.6.2 Is there a discussion forum for MySQL Views?	5045
A.6.3 What happens to a view if an underlying table is dropped or renamed?	5045
A.6.4 Does MySQL 8.0 have table snapshots?	5045
A.6.5 Does MySQL 8.0 have materialized views?	5045
A.6.6 Can you insert into views that are based on joins?	5045

A.6.1. Where can I find documentation covering MySQL Views?

See [Section 24.5, “Using Views”](#).

A.6.2. Is there a discussion forum for MySQL Views?

Yes. See <https://forums.mysql.com/list.php?100>

A.6.3. What happens to a view if an underlying table is dropped or renamed?

After a view has been created, it is possible to drop or alter a table or view to which the definition refers. To check a view definition for problems of this kind, use the `CHECK TABLE` statement. (See [Section 13.7.3.2, “CHECK TABLE Statement”](#).)

A.6.4. Does MySQL 8.0 have table snapshots?

No.

A.6.5. Does MySQL 8.0 have materialized views?

No.

A.6.6. Can you insert into views that are based on joins?

It is possible, provided that your `INSERT` statement has a column list that makes it clear there is only one table involved.

You *cannot* insert into multiple tables with a single insert on a view.

A.7 MySQL 8.0 FAQ: INFORMATION_SCHEMA

A.7.1 Where can I find documentation for the MySQL <code>INFORMATION_SCHEMA</code> database?	5046
A.7.2 Is there a discussion forum for <code>INFORMATION_SCHEMA</code> ?	5046
A.7.3 Where can I find the ANSI SQL 2003 specification for <code>INFORMATION_SCHEMA</code> ?	5046
A.7.4 What is the difference between the Oracle Data Dictionary and MySQL <code>INFORMATION_SCHEMA</code> ?	5046
A.7.5 Can I add to or otherwise modify the tables found in the <code>INFORMATION_SCHEMA</code> database?	5046

A.7.1. Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?

See [Chapter 25, `INFORMATION_SCHEMA` Tables](#)

A.7.2. Is there a discussion forum for `INFORMATION_SCHEMA`?

See <https://forums.mysql.com/list.php?101>.

A.7.3. Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available, such as *SQL-99 Complete, Really* by Peter Gultzan and Trudy Pelzer, that provide a comprehensive overview of the standard, including `INFORMATION_SCHEMA`.

A.7.4. What is the difference between the Oracle Data Dictionary and MySQL `INFORMATION_SCHEMA`?

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names. The MySQL implementation is more similar to those found in DB2 and SQL Server, which also support `INFORMATION_SCHEMA` as defined in the SQL standard.

A.7.5. Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, *we cannot support bugs or other issues which result from modifying `INFORMATION_SCHEMA` tables or data.*

A.8 MySQL 8.0 FAQ: Migration

A.8.1 Where can I find information on how to migrate from MySQL 5.7 to MySQL 8.0? 5046

A.8.2 How has storage engine (table type) support changed in MySQL 8.0 from previous versions? ... 5046

A.8.1. Where can I find information on how to migrate from MySQL 5.7 to MySQL 8.0?

For detailed upgrade information, see [Section 2.11, “Upgrading MySQL”](#). Do not skip a major version when upgrading, but rather complete the process in steps, upgrading from one major version to the next in each step. This may seem more complicated, but it will you save time and trouble. If you encounter problems during the upgrade, their origin will be easier to identify, either by you or, if you have a MySQL Enterprise subscription, by MySQL support.

A.8.2. How has storage engine (table type) support changed in MySQL 8.0 from previous versions?

Storage engine support has changed as follows:

- Support for `ISAM` tables was removed in MySQL 5.0 and you should now use the `MyISAM` storage engine in place of `ISAM`. To convert a table `tblname` from `ISAM` to `MyISAM`, simply issue a statement such as this one:

```
ALTER TABLE tblname ENGINE=MYISAM;
```

- Internal `RAID` for `MyISAM` tables was also removed in MySQL 5.0. This was formerly used to allow large tables in file systems that did not support file sizes greater than 2GB. All modern file systems allow for larger tables; in addition, there are now other solutions such as `MERGE` tables and views.
- The `VARCHAR` column type now retains trailing spaces in all storage engines.
- `MEMORY` tables (formerly known as `HEAP` tables) can also contain `VARCHAR` columns.

A.9 MySQL 8.0 FAQ: Security

A.9.1 Where can I find documentation that addresses security issues for MySQL?	5047
A.9.2 What is the default authentication plugin in MySQL 8.0?	5047
A.9.3 Does MySQL 8.0 have native support for SSL?	5047
A.9.4 Is SSL support built into MySQL binaries, or must I recompile the binary myself to enable it?	5047
A.9.5 Does MySQL 8.0 have built-in authentication against LDAP directories?	5048
A.9.6 Does MySQL 8.0 include support for Roles Based Access Control (RBAC)?	5048

A.9.1. Where can I find documentation that addresses security issues for MySQL?

The best place to start is [Chapter 6, Security](#).

Other portions of the MySQL Documentation which you may find useful with regard to specific security concerns include the following:

- [Section 6.1.1, “Security Guidelines”](#).
- [Section 6.1.3, “Making MySQL Secure Against Attackers”](#).
- [Section B.4.3.2, “How to Reset the Root Password”](#).
- [Section 6.1.5, “How to Run MySQL as a Normal User”](#).
- [UDF Security Precautions](#).
- [Section 6.1.4, “Security-Related mysqld Options and Variables”](#).
- [Section 6.1.6, “Security Issues with LOAD DATA LOCAL”](#).
- [Section 2.10, “Postinstallation Setup and Testing”](#).
- [Section 6.3, “Using Encrypted Connections”](#).

A.9.2. What is the default authentication plugin in MySQL 8.0?

The default authentication plugin in MySQL 8.0 is `caching_sha2_password`. For information about this plugin, see [Section 6.4.1.2, “Caching SHA-2 Pluggable Authentication”](#).

The `caching_sha2_password` plugin provides more secure password encryption than the `mysql_native_password` plugin (the default plugin in previous MySQL series). For information about the implications of this change of default plugin for server operation and compatibility of the server with clients and connectors, see [caching_sha2_password as the Preferred Authentication Plugin](#).

For general information about pluggable authentication and other available authentication plugins, see [Section 6.2.17, “Pluggable Authentication”](#), and [Section 6.4.1, “Authentication Plugins”](#).

A.9.3. Does MySQL 8.0 have native support for SSL?

Most 8.0 binaries have support for SSL connections between the client and server. See [Section 6.3, “Using Encrypted Connections”](#).

You can also tunnel a connection using SSH, if (for example) the client application does not support SSL connections. For an example, see [Section 6.3.4, “Connecting to MySQL Remotely from Windows with SSH”](#).

A.9.4. Is SSL support built into MySQL binaries, or must I recompile the binary myself to enable it?

Most 8.0 binaries have SSL enabled for client/server connections that are secured, authenticated, or both. See [Section 6.3, “Using Encrypted Connections”](#).

A.9.5. Does MySQL 8.0 have built-in authentication against LDAP directories?

The Enterprise edition includes a [PAM Authentication Plugin](#) that supports authentication against an LDAP directory.

A.9.6. Does MySQL 8.0 include support for Roles Based Access Control (RBAC)?

Not at this time.

A.10 MySQL 8.0 FAQ: NDB Cluster

In the following section, we answer questions that are frequently asked about MySQL NDB Cluster and the [NDB](#) storage engine.

A.10.1 Which versions of the MySQL software support NDB Cluster? Do I have to compile from source?	5048
A.10.2 What do “NDB” and “NDBCLUSTER” mean?	5048
A.10.3 How many computers do I need to run an NDB Cluster, and why?	5048

A.10.1 Which versions of the MySQL software support NDB Cluster? Do I have to compile from source?

NDB Cluster is not supported in MySQL Server 8.0 releases; it is released as a separate product. NDB Cluster 8.0 is now available as a Developer Preview release for evaluation and testing of new features in the [NDBCLUSTER](#) storage engine; for more information, see [Chapter 22, MySQL NDB Cluster 8.0](#). You are strongly advised to use NDB Cluster 7.6 for any new deployments; if you are using an older version of NDB Cluster, we recommend that you upgrade to this version soon as possible. For an overview of improvements made in NDB Cluster 7.6, see [What is New in NDB Cluster 7.6](#).

NDB Cluster 7.6, based on MySQL Server 5.7 and version 7.6 of the [NDB](#) storage engine, is the most recent General Availability (GA) version of NDB Cluster, based on version 7.6 of the [NDB](#) storage engine and MySQL Server 5.7. NDB Cluster 7.6 is available for production use; new deployments intended for production should use the latest GA release in this series, which is currently NDB Cluster 7.6.13. You can obtain the most recent NDB Cluster 7.6 release from <https://dev.mysql.com/downloads/cluster/>. For information about new features and other important changes in this series, see [What is New in NDB Cluster 7.6](#).

For detailed information about deploying and using NDB Cluster, see [Chapter 22, MySQL NDB Cluster 8.0](#).

A.10.2 What do “NDB” and “NDBCLUSTER” mean?

“NDB” stands for “**N**etwork **D**atabase”. [NDB](#) and [NDBCLUSTER](#) are both names for the storage engine that enables clustering support with MySQL. [NDB](#) is preferred, but either name is correct.

A.10.3 How many computers do I need to run an NDB Cluster, and why?

A minimum of three computers is required to run a viable cluster. However, the minimum *recommended* number of computers in an NDB Cluster is four: one each to run the management and SQL nodes, and two computers to serve as data nodes. The purpose of the two data nodes is to provide redundancy; the management node must run on a separate machine to guarantee continued arbitration services in the event that one of the data nodes fails.

To provide increased throughput and high availability, you should use multiple SQL nodes (MySQL Servers connected to the cluster). It is also possible (although not strictly necessary) to run multiple management servers.

A.11 MySQL 8.0 FAQ: MySQL Chinese, Japanese, and Korean Character Sets

This set of Frequently Asked Questions derives from the experience of MySQL's Support and Development groups in handling many inquiries about CJK (Chinese-Japanese-Korean) issues.

A.11.1 What CJK character sets are available in MySQL?	5049
A.11.2 I have inserted CJK characters into my table. Why does <code>SELECT</code> display them as “?” characters?	5050
A.11.3 What problems should I be aware of when working with the Big5 Chinese character set?	5052
A.11.4 Why do Japanese character set conversions fail?	5052
A.11.5 What should I do if I want to convert SJIS 81CA to cp932?	5053
A.11.6 How does MySQL represent the Yen (¥) sign?	5053
A.11.7 Of what issues should I be aware when working with Korean character sets in MySQL?	5054
A.11.8 Why do I get <code>Incorrect string value</code> error messages?	5054
A.11.9 Why does my GUI front end or browser display CJK characters incorrectly in my application using Access, PHP, or another API?	5054
A.11.10 I've upgraded to MySQL 8.0. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?	5055
A.11.11 Why do some <code>LIKE</code> and <code>FULLTEXT</code> searches with CJK characters fail?	5056
A.11.12 How do I know whether character <code>x</code> is available in all character sets?	5057
A.11.13 Why do CJK strings sort incorrectly in Unicode? (I)	5058
A.11.14 Why do CJK strings sort incorrectly in Unicode? (II)	5058
A.11.15 Why are my supplementary characters rejected by MySQL?	5058
A.11.16 Should “CJK” be “CJKV”?	5059
A.11.17 Does MySQL permit CJK characters to be used in database and table names?	5059
A.11.18 Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean? ...	5059
A.11.19 Where can I get help with CJK and related issues in MySQL?	5059

A.11.1 What CJK character sets are available in MySQL?

The list of CJK character sets may vary depending on your MySQL version. For example, the `gb18030` character set is not supported prior to MySQL 5.7.4. However, since the name of the applicable language appears in the `DESCRIPTION` column for every entry in the `INFORMATION_SCHEMA.CHARACTER_SETS` table, you can obtain a current list of all the non-Unicode CJK character sets using this query:

```
mysql> SELECT CHARACTER_SET_NAME, DESCRIPTION
FROM INFORMATION_SCHEMA.CHARACTER_SETS
WHERE DESCRIPTION LIKE '%Chin%'
OR DESCRIPTION LIKE '%Japanese%'
OR DESCRIPTION LIKE '%Korean%'
ORDER BY CHARACTER_SET_NAME;
```

CHARACTER_SET_NAME	DESCRIPTION
big5	Big5 Traditional Chinese
cp932	SJIS for Windows Japanese
eucjpms	UJIS for Windows Japanese
euckr	EUC-KR Korean
gb18030	China National Standard GB18030

gb2312	GB2312 Simplified Chinese
gbk	GBK Simplified Chinese
sjis	Shift-JIS Japanese
ujis	EUC-JP Japanese

(For more information, see [Section 25.4, “The INFORMATION_SCHEMA CHARACTER_SETS Table”](#).)

MySQL supports three variants of the *GB* (*Guojia Biaozhun*, or *National Standard*, or *Simplified Chinese*) character sets which are official in the People's Republic of China: [gb2312](#), [gbk](#), and (as of MySQL 5.7.4) [gb18030](#).

Sometimes people try to insert [gbk](#) characters into [gb2312](#), and it works most of the time because [gbk](#) is a superset of [gb2312](#). But eventually they try to insert a rarer Chinese character and it does not work. (For an example, see Bug #16072).

Here, we try to clarify exactly what characters are legitimate in [gb2312](#) or [gbk](#), with reference to the official documents. Please check these references before reporting [gb2312](#) or [gbk](#) bugs:

- The MySQL [gbk](#) character set is in reality “Microsoft code page 936”. This differs from the official [gbk](#) for characters [A1A4](#) (middle dot), [A1AA](#) (em dash), [A6E0–A6F5](#), and [A8BB–A8C0](#).
- For a listing of [gbk](#)/Unicode mappings, see <http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP936.TXT>.

It is also possible to store CJK characters in Unicode character sets, although the available collations may not sort characters quite as you expect:

- The [utf8](#) and [ucs2](#) character sets support the characters from Unicode Basic Multilingual Plane (BMP). These characters have code point values between [U+0000](#) and [U+FFFF](#).
- The [utf8mb4](#), [utf16](#), [utf16le](#), and [utf32](#) character sets support BMP characters, as well as supplementary characters that lie outside the BMP. Supplementary characters have code point values between [U+10000](#) and [U+10FFFF](#).

The collation used for a Unicode character set determines the ability to sort (that is, distinguish) characters in the set:

- Collations based on Unicode Collation Algorithm (UCA) 4.0.0 distinguish only BMP characters.
- Collations based on UCA 5.2.0 or 9.0.0 distinguish BMP and supplementary characters.
- Non-UCA collations may not distinguish all Unicode characters. For example, the [utf8mb4](#) default collation is [utf8mb4_general_ci](#), which distinguishes only BMP characters.

Moreover, distinguishing characters is not the same as ordering them per the conventions of a given CJK language. Currently, MySQL has only one CJK-specific UCA collation, [gb18030_unicode_520_ci](#) (which requires use of the non-Unicode [gb18030](#) character set).

For information about Unicode collations and their differentiating properties, including collation properties for supplementary characters, see [Section 10.10.1, “Unicode Character Sets”](#).

A.11.2I I have inserted CJK characters into my table. Why does [SELECT](#) display them as “?” characters?

This problem is usually due to a setting in MySQL that does not match the settings for the application program or the operating system. Here are some common steps for correcting these types of issues:

- *Be certain of what MySQL version you are using.*

Use the statement `SELECT VERSION();` to determine this.

- *Make sure that the database is actually using the desired character set.*

People often think that the client character set is always the same as either the server character set or the character set used for display purposes. However, both of these are false assumptions. You can make sure by checking the result of `SHOW CREATE TABLE tablename` or, better yet, by using this statement:

```
SELECT character_set_name, collation_name
FROM information_schema.columns
WHERE table_schema = your_database_name
AND table_name = your_table_name
AND column_name = your_column_name;
```

- *Determine the hexadecimal value of the character or characters that are not being displayed correctly.*

You can obtain this information for a column `column_name` in the table `table_name` using the following query:

```
SELECT HEX(column_name)
FROM table_name;
```

`3F` is the encoding for the `?` character; this means that `?` is the character actually stored in the column. This most often happens because of a problem converting a particular character from your client character set to the target character set.

- *Make sure that a round trip is possible. When you select `literal` (or `_introducer hexadecimal-value`), do you obtain `literal` as a result?*

For example, the Japanese Katakana character `Pe` (`#`) exists in all CJK character sets, and has the code point value (hexadecimal coding) `0x30da`. To test a round trip for this character, use this query:

```
SELECT '#' AS `#`;          /* or SELECT _ucs2 0x30da; */
```

If the result is not also `#`, the round trip failed.

For bug reports regarding such failures, we might ask you to follow up with `SELECT HEX('#');`. Then we can determine whether the client encoding is correct.

- *Make sure that the problem is not with the browser or other application, rather than with MySQL.*

Use the `mysql` client program to accomplish this task. If `mysql` displays characters correctly but your application does not, your problem is probably due to system settings.

To determine your settings, use the `SHOW VARIABLES` statement, whose output should resemble what is shown here:

```
mysql> SHOW VARIABLES LIKE 'char%';
```

Variable_name	Value
character_set_client	utf8
character_set_connection	utf8
character_set_database	latin1

character_set_filesystem	binary	
character_set_results	utf8	
character_set_server	latin1	
character_set_system	utf8	
character_sets_dir	/usr/local/mysql/share/mysqlCharsets/	

These are typical character-set settings for an international-oriented client (notice the use of `utf8` Unicode) connected to a server in the West (`latin1` is a West Europe character set).

Although Unicode (usually the `utf8` variant on Unix, and the `ucs2` variant on Windows) is preferable to Latin, it is often not what your operating system utilities support best. Many Windows users find that a Microsoft character set, such as `cp932` for Japanese Windows, is suitable.

If you cannot control the server settings, and you have no idea what setting your underlying computer uses, try changing to a common character set for the country that you're in (`euckr` = Korea; `gb18030`, `gb2312` or `gbk` = People's Republic of China; `big5` = Taiwan; `sjis`, `ujis`, `cp932`, or `eucjpms` = Japan; `ucs2` or `utf8` = anywhere). Usually it is necessary to change only the client and connection and results settings. The `SET NAMES` statement changes all three at once. For example:

```
SET NAMES 'big5';
```

Once the setting is correct, you can make it permanent by editing `my.cnf` or `my.ini`. For example you might add lines looking like these:

```
[mysqld]
character-set-server=big5
[client]
default-character-set=big5
```

It is also possible that there are issues with the API configuration setting being used in your application; see *Why does my GUI front end or browser not display CJK characters correctly...?* for more information.

A.11.3 What problems should I be aware of when working with the Big5 Chinese character set?

MySQL supports the Big5 character set which is common in Hong Kong and Taiwan (Republic of China). The MySQL `big5` character set is in reality Microsoft code page 950, which is very similar to the original `big5` character set.

A feature request for adding `HKSCS` extensions has been filed. People who need this extension may find the suggested patch for Bug #13577 to be of interest.

A.11.4 Why do Japanese character set conversions fail?

MySQL supports the `sjis`, `ujis`, `cp932`, and `eucjpms` character sets, as well as Unicode. A common need is to convert between character sets. For example, there might be a Unix server (typically with `sjis` or `ujis`) and a Windows client (typically with `cp932`).

In the following conversion table, the `ucs2` column represents the source, and the `sjis`, `cp932`, `ujis`, and `eucjpms` columns represent the destinations; that is, the last 4 columns provide the hexadecimal result when we use `CONVERT(ucs2)` or we assign a `ucs2` column containing the value to an `sjis`, `cp932`, `ujis`, or `eucjpms` column.

Character Name	ucs2	sjis	cp932	ujis	eucjpms
BROKEN BAR	00A6	3F	3F	8FA2C3	3F

Character Name	ucs2	sjis	cp932	ujis	eucjpms
FULLWIDTH BROKEN BAR	FFE4	3F	FA55	3F	8FA2
YEN SIGN	00A5	3F	3F	20	3F
FULLWIDTH YEN SIGN	FFE5	818F	818F	A1EF	3F
TILDE	007E	7E	7E	7E	7E
OVERLINE	203E	3F	3F	20	3F
HORIZONTAL BAR	2015	815C	815C	A1BD	A1BD
EM DASH	2014	3F	3F	3F	3F
REVERSE SOLIDUS	005C	815F	5C	5C	5C
FULLWIDTH ""	FF3C	3F	815F	3F	A1C0
WAVE DASH	301C	8160	3F	A1C1	3F
FULLWIDTH TILDE	FF5E	3F	8160	3F	A1C1
DOUBLE VERTICAL LINE	2016	8161	3F	A1C2	3F
PARALLEL TO	2225	3F	8161	3F	A1C2
MINUS SIGN	2212	817C	3F	A1DD	3F
FULLWIDTH HYPHEN-MINUS	FF0D	3F	817C	3F	A1DD
CENT SIGN	00A2	8191	3F	A1F1	3F
FULLWIDTH CENT SIGN	FFE0	3F	8191	3F	A1F1
POUND SIGN	00A3	8192	3F	A1F2	3F
FULLWIDTH POUND SIGN	FFE1	3F	8192	3F	A1F2
NOT SIGN	00AC	81CA	3F	A2CC	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA	3F	A2CC

Now consider the following portion of the table.

	ucs2	sjis	cp932
NOT SIGN	00AC	81CA	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA

This means that MySQL converts the `NOT SIGN` (Unicode `U+00AC`) to `sjis` code point `0x81CA` and to `cp932` code point `3F`. (`3F` is the question mark (“?”). This is what is always used when the conversion cannot be performed.)

A.11.5 What should I do if I want to convert SJIS `81CA` to `cp932`?

Our answer is: “?”. There are disadvantages to this, and many people would prefer a “loose” conversion, so that `81CA` (`NOT SIGN`) in `sjis` becomes `81CA` (`FULLWIDTH NOT SIGN`) in `cp932`.

A.11.6 How does MySQL represent the Yen (¥) sign?

A problem arises because some versions of Japanese character sets (both `sjis` and `euc`) treat `5C` as a *reverse solidus* (`\`, also known as a backslash), whereas others treat it as a yen sign (¥).

MySQL follows only one version of the JIS (Japanese Industrial Standards) standard description. In MySQL, `5C` is always the *reverse solidus* (`\`).

A.11.7Of what issues should I be aware when working with Korean character sets in MySQL?

In theory, while there have been several versions of the [euckr](#) (*Extended Unix Code Korea*) character set, only one problem has been noted. We use the “ASCII” variant of EUC-KR, in which the code point `0x5c` is REVERSE SOLIDUS, that is `\`, instead of the “KS-Roman” variant of EUC-KR, in which the code point `0x5c` is WON SIGN (`#`). This means that you cannot convert Unicode `U+20A9` to [euckr](#):

```
mysql> SELECT
        CONVERT('#' USING euckr) AS euckr,
        HEX(CONVERT('#' USING euckr)) AS hexeuckr;
+-----+-----+
| euckr | hexeuckr |
+-----+-----+
| ?     | 3F       |
+-----+-----+
```

A.11.8Why do I get [Incorrect string value](#) error messages?

To see the problem, create a table with one Unicode ([ucs2](#)) column and one Chinese ([gb2312](#)) column.

```
mysql> CREATE TABLE ch
        (ucs2 CHAR(3) CHARACTER SET ucs2,
         gb2312 CHAR(3) CHARACTER SET gb2312);
```

In nonstrict SQL mode, try to place the rare character `#` in both columns.

```
mysql> SET sql_mode = '';
mysql> INSERT INTO ch VALUES ('A#B','A#B');
Query OK, 1 row affected, 1 warning (0.00 sec)
```

The [INSERT](#) produces a warning. Use the following statement to see what it is:

```
mysql> SHOW WARNINGS\G
***** 1. row *****
Level: Warning
Code: 1366
Message: Incorrect string value: '\xE6\xB1\x8CB' for column 'gb2312' at row 1
```

So it is a warning about the [gb2312](#) column only.

```
mysql> SELECT ucs2,HEX(ucs2),gb2312,HEX(gb2312) FROM ch;
+-----+-----+-----+-----+
| ucs2  | HEX(ucs2) | gb2312 | HEX(gb2312) |
+-----+-----+-----+-----+
| A#B   | 00416C4C0042 | A?B    | 413F42      |
+-----+-----+-----+-----+
```

Several things need explanation here:

1. The `#` character is not in the [gb2312](#) character set, as described earlier.
2. If you are using an old version of MySQL, you may see a different message.
3. A warning occurs rather than an error because MySQL is not set to use strict SQL mode. In nonstrict mode, MySQL tries to do what it can, to get the best fit, rather than give up. With strict SQL mode, the [Incorrect string value](#) message occurs as an error rather than a warning, and the [INSERT](#) fails.

A.11.9Why does my GUI front end or browser display CJK characters incorrectly in my application using Access, PHP, or another API?

Obtain a direct connection to the server using the `mysql` client, and try the same query there. If `mysql` responds correctly, the trouble may be that your application interface requires initialization. Use `mysql` to tell you what character set or sets it uses with the statement `SHOW VARIABLES LIKE 'char%';`. If you are using Access, you are most likely connecting with Connector/ODBC. In this case, you should check [Configuring Connector/ODBC](#). If, for example, you use `big5`, you would enter `SET NAMES 'big5'`. (In this case, no `;` character is required.) If you are using ASP, you might need to add `SET NAMES` in the code. Here is an example that has worked in the past:

```
<%
Session.CodePage=0
Dim strConnection
Dim Conn
strConnection="driver={MySQL ODBC 3.51 Driver};server=server;uid=username;" \
    & "pwd=password;database=database;stmt=SET NAMES 'big5';"
Set Conn = Server.CreateObject("ADODB.Connection")
Conn.Open strConnection
%>
```

In much the same way, if you are using any character set other than `latin1` with Connector/NET, you must specify the character set in the connection string. See [Connecting to MySQL Using Connector/NET](#), for more information.

If you are using PHP, try this:

```
<?php
$link = new mysqli($host, $usr, $pwd, $db);

if( mysqli_connect_errno() )
{
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$link->query("SET NAMES 'utf8'");
?>
```

In this case, we used `SET NAMES` to change `character_set_client`, `character_set_connection`, and `character_set_results`.

Another issue often encountered in PHP applications has to do with assumptions made by the browser. Sometimes adding or changing a `<meta>` tag suffices to correct the problem: for example, to insure that the user agent interprets page content as UTF-8, include `<meta http-equiv="Content-Type" content="text/html; charset=utf-8">` in the `<head>` section of the HTML page.

If you are using Connector/J, see [Using Character Sets and Unicode](#).

A.11.10ve upgraded to MySQL 8.0. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?

In MySQL Version 4.0, there was a single “global” character set for both server and client, and the decision as to which character to use was made by the server administrator. This changed starting with MySQL Version 4.1. What happens now is a “handshake”, as described in [Section 10.4, “Connection Character Sets and Collations”](#):

When a client connects, it sends to the server the name of the character set that it wants to use. The server uses the name to set the `character_set_client`, `character_set_results`, and `character_set_connection` system variables. In effect, the server performs a `SET NAMES` operation using the character set name.

The effect of this is that you cannot control the client character set by starting `mysqld` with `--character-set-server=utf8`. However, some Asian customers prefer the MySQL 4.0 behavior. To make it possible to retain this behavior, we added a `mysqld` switch, `--character-set-client-handshake`, which can be turned off with `--skip-character-set-client-handshake`. If you start `mysqld` with `--skip-character-set-client-handshake`, then, when a client connects, it sends to the server the name of the character set that it wants to use. However, *the server ignores this request from the client*.

By way of example, suppose that your favorite server character set is `latin1`. Suppose further that the client uses `utf8` because this is what the client's operating system supports. Start the server with `latin1` as its default character set:

```
mysqld --character-set-server=latin1
```

And then start the client with the default character set `utf8`:

```
mysql --default-character-set=utf8
```

The resulting settings can be seen by viewing the output of `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'char%';
```

Variable_name	Value
character_set_client	utf8
character_set_connection	utf8
character_set_database	latin1
character_set_filesystem	binary
character_set_results	utf8
character_set_server	latin1
character_set_system	utf8
character_sets_dir	/usr/local/mysql/share/mysql/charsets/

Now stop the client, and stop the server using `mysqladmin`. Then start the server again, but this time tell it to skip the handshake like so:

```
mysqld --character-set-server=utf8 --skip-character-set-client-handshake
```

Start the client with `utf8` once again as the default character set, then display the resulting settings:

```
mysql> SHOW VARIABLES LIKE 'char%';
```

Variable_name	Value
character_set_client	latin1
character_set_connection	latin1
character_set_database	latin1
character_set_filesystem	binary
character_set_results	latin1
character_set_server	latin1
character_set_system	utf8
character_sets_dir	/usr/local/mysql/share/mysql/charsets/

As you can see by comparing the differing results from `SHOW VARIABLES`, the server ignores the client's initial settings if the `--skip-character-set-client-handshake` option is used.

A.11.1 Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?

For `LIKE` searches, there is a very simple problem with binary string column types such as `BINARY` and `BLOB`: we must know where characters end. With multibyte character sets, different characters might have different octet lengths. For example, in `utf8`, `A` requires one byte but `#` requires three bytes, as shown here:

```
+-----+-----+
| OCTET_LENGTH(_utf8 'A') | OCTET_LENGTH(_utf8 '#') |
+-----+-----+
|                1 |                3 |
+-----+-----+
```

If we do not know where the first character in a string ends, we do not know where the second character begins, in which case even very simple searches such as `LIKE '_A%'` fail. The solution is to use a nonbinary string column type defined to have the proper CJK character set. For example: `mycol TEXT CHARACTER SET sjis`. Alternatively, convert to a CJK character set before comparing.

This is one reason why MySQL cannot permit encodings of nonexistent characters. If it is not strict about rejecting bad input, it has no way of knowing where characters end.

For `FULLTEXT` searches, we must know where words begin and end. With Western languages, this is rarely a problem because most (if not all) of these use an easy-to-identify word boundary: the space character. However, this is not usually the case with Asian writing. We could use arbitrary halfway measures, like assuming that all Han characters represent words, or (for Japanese) depending on changes from Katakana to Hiragana due to grammatical endings. However, the only sure solution requires a comprehensive word list, which means that we would have to include a dictionary in the server for each Asian language supported. This is simply not feasible.

A.11.12 How do I know whether character `x` is available in all character sets?

The majority of simplified Chinese and basic nonhalfwidth Japanese Kana characters appear in all CJK character sets. The following stored procedure accepts a `UCS-2` Unicode character, converts it to other character sets, and displays the results in hexadecimal.

```
DELIMITER //

CREATE PROCEDURE p_convert(ucs2_char CHAR(1) CHARACTER SET ucs2)
BEGIN

CREATE TABLE tj
(ucs2 CHAR(1) character set ucs2,
 utf8 CHAR(1) character set utf8,
 big5 CHAR(1) character set big5,
 cp932 CHAR(1) character set cp932,
 eucjpms CHAR(1) character set eucjpms,
 euckr CHAR(1) character set euckr,
 gb2312 CHAR(1) character set gb2312,
 gbk CHAR(1) character set gbk,
 sjis CHAR(1) character set sjis,
 ujis CHAR(1) character set ujis);

INSERT INTO tj (ucs2) VALUES (ucs2_char);

UPDATE tj SET utf8=ucs2,
             big5=ucs2,
             cp932=ucs2,
             eucjpms=ucs2,
             euckr=ucs2,
             gb2312=ucs2,
             gbk=ucs2,
             sjis=ucs2,
             ujis=ucs2;
```

```

/* If there are conversion problems, UPDATE produces warnings. */

SELECT hex(ucs2) AS ucs2,
       hex(utf8) AS utf8,
       hex(big5) AS big5,
       hex(cp932) AS cp932,
       hex(eucjpms) AS eucjpms,
       hex(euckr) AS euckr,
       hex(gb2312) AS gb2312,
       hex(gbk) AS gbk,
       hex(sjis) AS sjis,
       hex(ujis) AS ujis
FROM tj;

DROP TABLE tj;

END//

DELIMITER ;

```

The input can be any single `ucs2` character, or it can be the code value (hexadecimal representation) of that character. For example, from Unicode's list of `ucs2` encodings and names (<http://www.unicode.org/Public/UNIDATA/UnicodeData.txt>), we know that the Katakana character *Pe* appears in all CJK character sets, and that its code value is `X'30DA'`. If we use this value as the argument to `p_convert()`, the result is as shown here:

```

mysql> CALL p_convert(X'30DA');
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| ucs2 | utf8 | big5 | cp932 | eucjpms | euckr | gb2312 | gbk | sjis | ujis |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 30DA | E3839A | C772 | 8379 | A5DA | ABDA | A5DA | A5DA | 8379 | A5DA |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+

```

Since none of the column values is `3F` (that is, the question mark character, `?`), we know that every conversion worked.

A.11.13 Why do CJK strings sort incorrectly in Unicode? (I)

CJK sorting problems that occurred in older MySQL versions can be solved as of MySQL 8.0 by using the `utf8mb4` character set and the `utf8mb4_ja_0900_as_cs` collation.

A.11.14 Why do CJK strings sort incorrectly in Unicode? (II)

CJK sorting problems that occurred in older MySQL versions can be solved as of MySQL 8.0 by using the `utf8mb4` character set and the `utf8mb4_ja_0900_as_cs` collation.

A.11.15 Why are my supplementary characters rejected by MySQL?

Supplementary characters lie outside the Unicode *Basic Multilingual Plane* / *Plane 0*. BMP characters have code point values between `U+0000` and `U+FFFF`. Supplementary characters have code point values between `U+10000` and `U+10FFFF`.

To store supplementary characters, you must use a character set that permits them:

- The `utf8` and `ucs2` character sets support BMP characters only.

The `utf8` character set permits only `UTF-8` characters that take up to three bytes. This has led to reports such as that found in Bug #12600, which we rejected as “not a bug”. With `utf8`, MySQL

must truncate an input string when it encounters bytes that it does not understand. Otherwise, it is unknown how long the bad multibyte character is.

One possible workaround is to use `ucs2` instead of `utf8`, in which case the “bad” characters are changed to question marks. However, no truncation takes place. You can also change the data type to `BLOB` or `BINARY`, which perform no validity checking.

- The `utf8mb4`, `utf16`, `utf16le`, and `utf32` character sets support BMP characters, as well as supplementary characters outside the BMP.

A.11.16 Should “CJK” be “CJKV”?

No. The term “CJKV” (*Chinese Japanese Korean Vietnamese*) refers to Vietnamese character sets which contain Han (originally Chinese) characters. MySQL supports the modern Vietnamese script with Western characters, but does not support the old Vietnamese script using Han characters.

As of MySQL 5.6, there are Vietnamese collations for Unicode character sets, as described in [Section 10.10.1, “Unicode Character Sets”](#).

A.11.17 Does MySQL permit CJK characters to be used in database and table names?

Yes.

A.11.18 Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?

The Japanese translation of the MySQL 5.6 manual can be downloaded from <https://dev.mysql.com/doc/>.

A.11.19 Where can I get help with CJK and related issues in MySQL?

The following resources are available:

- A listing of MySQL user groups can be found at <https://wikis.oracle.com/display/mysql/List+of+MySQL+User+Groups>.
- View feature requests relating to character set issues at <http://tinyurl.com/y6xcuf>.
- Visit the MySQL [Character Sets, Collation, Unicode Forum](#). <http://forums.mysql.com/> also provides foreign-language forums.

A.12 MySQL 8.0 FAQ: Connectors & APIs

For common questions, issues, and answers relating to the MySQL Connectors and other APIs, see the following areas of the Manual:

- [Section 28.6.28, “C API Common Issues”](#)
- [Common Problems with MySQL and PHP](#)
- [Connector/ODBC Notes and Tips](#)
- [Connector/NET Programming](#)
- [MySQL Connector/J 8.0 Developer Guide](#)

A.13 MySQL 8.0 FAQ: C API, libmysql

Frequently asked questions about MySQL C API and libmysql.

A.13.1 What is “MySQL Native C API”? What are typical benefits and use cases?	5060
A.13.2 Which version of libmysql should I use?	5060
A.13.3 What if I want to use the “NoSQL” X DevAPI?	5060
A.13.4 How to I download libmysql?	5060
A.13.5 Where is the documentation?	5060
A.13.6 How do I report bugs?	5060
A.13.7 Is it possible to compile the library myself?	5060

A.13.1 What is “MySQL Native C API”? What are typical benefits and use cases?

libmysql is a C-based API that you can use in C applications to connect with the MySQL database server. It is also itself used as the foundation for drivers for standard database APIs like ODBC, Perl's DBI, and Python's DB API.

A.13.2 Which version of libmysql should I use?

For MySQL 8.0, 5.7, 5.6, and 5.5, we recommend libmysql 8.0.

A.13.3 What if I want to use the “NoSQL” X DevAPI?

For C-language and X DevApi Document Store for MySQL 8.0, we recommend MySQL Connector/C++. Connector/C++ 8.0 has compatible C headers. (This is not applicable to MySQL 5.7 or before.)

A.13.4 How to I download libmysql?

- Linux: The Client Utilities Package is available from the [MySQL Community Server](#) download page.
- Repos: The Client Utilities Package is available from the [Yum](#), [APT](#), [SuSE repositories](#).
- Windows: The Client Utilities Package is available from [Windows Installer](#).

A.13.5 Where is the documentation?

See [Section 28.6, “MySQL C API”](#).

A.13.6 How do I report bugs?

Please report any bugs or inconsistencies you observe to our [Bugs Database](#). Select the C API Client as shown.

A.13.7 Is it possible to compile the library myself?

Yes, you can download the libmysqlclient source code and compile it on your own. Here's an example:

```
$ git clone --depth 1 https://github.com/mysql/mysql-server
$ cd mysql-server
$ mkdir build
$ cd build
$ cmake .. -GNinja -DDOWNLOAD_BOOST=1 \
-DWITH_BOOST=/tmp -DCMAKE_BUILD_TYPE=Release -DWITHOUT_SERVER=ON \
-DWITH_SSL=system
$ ninja libmysqlclient.a
$ ls -la archive_output_directory/libmysqlclient.a
-rw-rw-r-- 1 kg kg 8,5M wrz 5 04:57 archive_output_directory/libmysqlclient.a
```

Note

This example uses <https://ninja-build.org/> as a build system instead of make.

A.14 MySQL 8.0 FAQ: Replication

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication.

A.14.1 Must the slave be connected to the master all the time?	5061
A.14.2 Must I enable networking on my master and slave to enable replication?	5061
A.14.3 How do I know how late a slave is compared to the master? In other words, how do I know the date of the last statement replicated by the slave?	5061
A.14.4 How do I force the master to block updates until the slave catches up?	5062
A.14.5 What issues should I be aware of when setting up two-way replication?	5062
A.14.6 How can I use replication to improve performance of my system?	5062
A.14.7 What should I do to prepare client code in my own applications to use performance-enhancing replication?	5062
A.14.8 When and how much can MySQL replication improve the performance of my system?	5063
A.14.9 How can I use replication to provide redundancy or high availability?	5064
A.14.10 How do I tell whether a master server is using statement-based or row-based binary logging format?	5064
A.14.11 How do I tell a slave to use row-based replication?	5064
A.14.12 How do I prevent <code>GRANT</code> and <code>REVOKE</code> statements from replicating to slave machines?	5064
A.14.13 Does replication work on mixed operating systems (for example, the master runs on Linux while slaves run on OS X and Windows)?	5064
A.14.14 Does replication work on mixed hardware architectures (for example, the master runs on a 64-bit machine while slaves run on 32-bit machines)?	5064

A.14.1 Must the slave be connected to the master all the time?

No, it does not. The slave can go down or stay disconnected for hours or even days, and then reconnect and catch up on updates. For example, you can set up a master/slave relationship over a dial-up link where the link is up only sporadically and for short periods of time. The implication of this is that, at any given time, the slave is not guaranteed to be in synchrony with the master unless you take some special measures.

To ensure that catchup can occur for a slave that has been disconnected, you must not remove binary log files from the master that contain information that has not yet been replicated to the slaves. Asynchronous replication can work only if the slave is able to continue reading the binary log from the point where it last read events.

A.14.2 Must I enable networking on my master and slave to enable replication?

Yes, networking must be enabled on the master and slave. If networking is not enabled, the slave cannot connect to the master and transfer the binary log. Verify that the `skip_networking` system variable has not been enabled in the configuration file for either server.

A.14.3 How do I know how late a slave is compared to the master? In other words, how do I know the date of the last statement replicated by the slave?

Check the `Seconds_Behind_Master` column in the output from `SHOW SLAVE STATUS`. See [Section 17.1.7.1, “Checking Replication Status”](#).

When the slave SQL thread executes an event read from the master, it modifies its own time to the event timestamp. (This is why `TIMESTAMP` is well replicated.) In the `Time` column in the output of `SHOW PROCESSLIST`, the number of seconds displayed for the slave SQL thread is the number of seconds between the timestamp of the last replicated event and the real time of the slave machine. You can use this to determine the date of the last replicated event. Note that if your slave has been disconnected from the master for one hour, and then reconnects, you may immediately

see large `Time` values such as 3600 for the slave SQL thread in `SHOW PROCESSLIST`. This is because the slave is executing statements that are one hour old. See [Section 17.2.2, “Replication Implementation Details”](#).

A.14.4 How do I force the master to block updates until the slave catches up?

Use the following procedure:

1. On the master, execute these statements:

```
mysql> FLUSH TABLES WITH READ LOCK;
mysql> SHOW MASTER STATUS;
```

Record the replication coordinates (the current binary log file name and position) from the output of the `SHOW` statement.

2. On the slave, issue the following statement, where the arguments to the `MASTER_POS_WAIT()` function are the replication coordinate values obtained in the previous step:

```
mysql> SELECT MASTER_POS_WAIT('log_name', log_pos);
```

The `SELECT` statement blocks until the slave reaches the specified log file and position. At that point, the slave is in synchrony with the master and the statement returns.

3. On the master, issue the following statement to enable the master to begin processing updates again:

```
mysql> UNLOCK TABLES;
```

A.14.5 What issues should I be aware of when setting up two-way replication?

MySQL replication currently does not support any locking protocol between master and slave to guarantee the atomicity of a distributed (cross-server) update. In other words, it is possible for client A to make an update to co-master 1, and in the meantime, before it propagates to co-master 2, client B could make an update to co-master 2 that makes the update of client A work differently than it did on co-master 1. Thus, when the update of client A makes it to co-master 2, it produces tables that are different from what you have on co-master 1, even after all the updates from co-master 2 have also propagated. This means that you should not chain two servers together in a two-way replication relationship unless you are sure that your updates can safely happen in any order, or unless you take care of mis-ordered updates somehow in the client code.

You should also realize that two-way replication actually does not improve performance very much (if at all) as far as updates are concerned. Each server must do the same number of updates, just as you would have a single server do. The only difference is that there is a little less lock contention because the updates originating on another server are serialized in one slave thread. Even this benefit might be offset by network delays.

A.14.6 How can I use replication to improve performance of my system?

Set up one server as the master and direct all writes to it. Then configure as many slaves as you have the budget and rackspace for, and distribute the reads among the master and the slaves. You can also start the slaves with the `--skip-innodb` option, enable the `low_priority_updates` system variable, and set the `delay_key_write` system variable to `ALL` to get speed improvements on the slave end. In this case, the slave uses nontransactional `MyISAM` tables instead of `InnoDB` tables to get more speed by eliminating transactional overhead.

A.14.7 What should I do to prepare client code in my own applications to use performance-enhancing replication?

See the guide to using replication as a scale-out solution, [Section 17.4.5, “Using Replication for Scale-Out”](#).

A.14.8 When and how much can MySQL replication improve the performance of my system?

MySQL replication is most beneficial for a system that processes frequent reads and infrequent writes. In theory, by using a single-master/multiple-slave setup, you can scale the system by adding more slaves until you either run out of network bandwidth, or your update load grows to the point that the master cannot handle it.

To determine how many slaves you can use before the added benefits begin to level out, and how much you can improve performance of your site, you must know your query patterns, and determine empirically by benchmarking the relationship between the throughput for reads and writes on a typical master and a typical slave. The example here shows a rather simplified calculation of what you can get with replication for a hypothetical system. Let `reads` and `writes` denote the number of reads and writes per second, respectively.

Let's say that system load consists of 10% writes and 90% reads, and we have determined by benchmarking that `reads` is $1200 - 2 * \text{writes}$. In other words, the system can do 1,200 reads per second with no writes, the average write is twice as slow as the average read, and the relationship is linear. Suppose that the master and each slave have the same capacity, and that we have one master and N slaves. Then we have for each server (master or slave):

$$\text{reads} = 1200 - 2 * \text{writes}$$

$$\text{reads} = 9 * \text{writes} / (N + 1) \text{ (reads are split, but writes replicated to all slaves)}$$

$$9 * \text{writes} / (N + 1) + 2 * \text{writes} = 1200$$

$$\text{writes} = 1200 / (2 + 9/(N + 1))$$

The last equation indicates the maximum number of writes for N slaves, given a maximum possible read rate of 1,200 per second and a ratio of nine reads per write.

This analysis yields the following conclusions:

- If $N = 0$ (which means we have no replication), our system can handle about $1200/11 = 109$ writes per second.
- If $N = 1$, we get up to 184 writes per second.
- If $N = 8$, we get up to 400 writes per second.
- If $N = 17$, we get up to 480 writes per second.
- Eventually, as N approaches infinity (and our budget negative infinity), we can get very close to 600 writes per second, increasing system throughput about 5.5 times. However, with only eight servers, we increase it nearly four times.

These computations assume infinite network bandwidth and neglect several other factors that could be significant on your system. In many cases, you may not be able to perform a computation similar to the one just shown that accurately predicts what will happen on your system if you add N replication slaves. However, answering the following questions should help you decide whether and by how much replication will improve the performance of your system:

- What is the read/write ratio on your system?

- How much more write load can one server handle if you reduce the reads?
- For how many slaves do you have bandwidth available on your network?

A.14.9How can I use replication to provide redundancy or high availability?

How you implement redundancy is entirely dependent on your application and circumstances. High-availability solutions (with automatic failover) require active monitoring and either custom scripts or third party tools to provide the failover support from the original MySQL server to the slave.

To handle the process manually, you should be able to switch from a failed master to a pre-configured slave by altering your application to talk to the new server or by adjusting the DNS for the MySQL server from the failed server to the new server.

For more information and some example solutions, see [Section 17.4.8, “Switching Masters During Failover”](#).

A.14.10How do I tell whether a master server is using statement-based or row-based binary logging format?

Check the value of the `binlog_format` system variable:

```
mysql> SHOW VARIABLES LIKE 'binlog_format';
```

The value shown will be one of `STATEMENT`, `ROW`, or `MIXED`. For `MIXED` mode, statement-based logging is used by default but replication switches automatically to row-based logging under certain conditions, such as unsafe statements. For information about when this may occur, see [Section 5.4.4.3, “Mixed Binary Logging Format”](#).

A.14.11How do I tell a slave to use row-based replication?

Slaves automatically know which format to use.

A.14.12How do I prevent `GRANT` and `REVOKE` statements from replicating to slave machines?

Start the server with the `--replicate-wild-ignore-table=mysql.%` option to ignore replication for tables in the `mysql` database.

A.14.13Does replication work on mixed operating systems (for example, the master runs on Linux while slaves run on OS X and Windows)?

Yes.

A.14.14Does replication work on mixed hardware architectures (for example, the master runs on a 64-bit machine while slaves run on 32-bit machines)?

Yes.

A.15 MySQL 8.0 FAQ: MySQL Enterprise Thread Pool

A.15.1 What is the Thread Pool and what problem does it solve?	5064
A.15.2 How does the Thread Pool limit and manage concurrent sessions and transactions for optimal performance and throughput?	5065
A.15.3 How is the Thread Pool different from the client side Connection Pool?	5065
A.15.4 When should I use the Thread Pool?	5065
A.15.5 Are there recommended Thread Pool configurations?	5066

A.15.1What is the Thread Pool and what problem does it solve?

The MySQL Thread Pool is a MySQL server plugin that extends the default connection-handling capabilities of the MySQL server to limit the number of concurrently executing statements/queries and transactions to ensure that each has sufficient CPU and memory resources to fulfill its task. For MySQL 8.0, the Thread Pool plugin is included in MySQL Enterprise Edition, a commercial product.

The default thread-handling model in MySQL Server executes statements using one thread per client connection. As more clients connect to the server and execute statements, overall performance degrades. The Thread Pool plugin provides an alternative thread-handling model designed to reduce overhead and improve performance. The Thread Pool plugin increases server performance by efficiently managing statement execution threads for large numbers of client connections, especially on modern multi-CPU/Core systems.

For more information, see [Section 5.6.3, “MySQL Enterprise Thread Pool”](#).

A.15.2How does the Thread Pool limit and manage concurrent sessions and transactions for optimal performance and throughput?

The Thread Pool uses a “divide and conquer” approach to limiting and balancing concurrency. Unlike the default connection handling of the MySQL Server, the Thread Pool separates connections and threads, so there is no fixed relationship between connections and the threads that execute statements received from those connections. The Thread Pool then manages client connections within configurable thread groups, where they are prioritized and queued based on the nature of the work they were submitted to accomplish.

For more information, see [Section 5.6.3.3, “Thread Pool Operation”](#).

A.15.3How is the Thread Pool different from the client side Connection Pool?

The MySQL Connection Pool operates on the client side to ensure that a MySQL client does not constantly connect to and disconnect from the MySQL server. It is designed to cache idle connections in the MySQL client for use by other users as they are needed. This minimizes the overhead and expense of establishing and tearing down connections as queries are submitted to the MySQL server. The MySQL Connection Pool has no visibility as to the query handling capabilities or load of the back-end MySQL server. By contrast, the Thread Pool operates on the MySQL server side and is designed to manage the execution of inbound concurrent connections and queries as they are received from the client connections accessing the back-end MySQL database. Because of the separation of duties, the MySQL Connection Pool and Thread Pool are orthogonal and can be used independent of each other.

MySQL Connection Pooling via the MySQL Connectors is covered in [Chapter 28, Connectors and APIs](#).

A.15.4When should I use the Thread Pool?

There are a few rules of thumb to consider for optimal Thread Pool use cases:

The MySQL `Threads_running` variable keeps track of the number of concurrent statements currently executing in the MySQL Server. If this variable consistently exceeds a region where the server won't operate optimally (usually going beyond 40 for InnoDB workloads), the Thread Pool will be beneficial, especially in extreme parallel overload situations.

If you are using the `innodb_thread_concurrency` to limit the number of concurrently executing statements, you will find the Thread Pool solves the same problem, only better, by assigning connections to thread groups, then queuing executions based on transactional content, user defined designations, and so forth.

Lastly, if your workload comprises mainly short queries, the Thread Pool will be beneficial.

To learn more, see [Section 5.6.3.4, “Thread Pool Tuning”](#).

A.15.5 Are there recommended Thread Pool configurations?

The Thread Pool has a number of user case driven configuration parameters that affect its performance. To learn about these and tips on tuning, see [Section 5.6.3.4, “Thread Pool Tuning”](#).

A.16 MySQL 8.0 FAQ: InnoDB Change Buffer

A.16.1 What types of operations modify secondary indexes and result in change buffering?	5066
A.16.2 What is the benefit of the InnoDB change buffer?	5066
A.16.3 Does the change buffer support other types of indexes?	5066
A.16.4 How much space does InnoDB use for the change buffer?	5066
A.16.5 How do I determine the current size of the change buffer?	5066
A.16.6 When does change buffer merging occur?	5067
A.16.7 When is the change buffer flushed?	5067
A.16.8 When should the change buffer be used?	5067
A.16.9 When should the change buffer not be used?	5067
A.16.10 Where can I find additional information about the change buffer?	5067

A.16.1 What types of operations modify secondary indexes and result in change buffering?

[INSERT](#), [UPDATE](#), and [DELETE](#) operations can modify secondary indexes. If an affected index page is not in the buffer pool, the changes can be buffered in the change buffer.

A.16.2 What is the benefit of the [InnoDB](#) change buffer?

Buffering secondary index changes when secondary index pages are not in the buffer pool avoids expensive random access I/O operations that would be required to immediately read in affected index pages from disk. Buffered changes can be applied later, in batches, as pages are read into the buffer pool by other read operations.

A.16.3 Does the change buffer support other types of indexes?

No. The change buffer only supports secondary indexes. Clustered indexes, full-text indexes, and spatial indexes are not supported. Full-text indexes have their own caching mechanism.

A.16.4 How much space does [InnoDB](#) use for the change buffer?

Prior to the introduction of the [innodb_change_buffer_max_size](#) configuration option in MySQL 5.6, the maximum size of the on-disk change buffer in the system tablespace was 1/3 of the [InnoDB](#) buffer pool size.

In MySQL 5.6 and later, the [innodb_change_buffer_max_size](#) configuration option defines the maximum size of the change buffer as a percentage of the total buffer pool size. By default, [innodb_change_buffer_max_size](#) is set to 25. The maximum setting is 50.

[InnoDB](#) does not buffer an operation if it would cause the on-disk change buffer to exceed the defined limit.

Change buffer pages are not required to persist in the buffer pool and may be evicted by LRU operations.

A.16.5 How do I determine the current size of the change buffer?

The current size of the change buffer is reported by [SHOW ENGINE INNODB STATUS \G](#), under the [INSERT BUFFER AND ADAPTIVE HASH INDEX](#) heading. For example:

```
-----  
INSERT BUFFER AND ADAPTIVE HASH INDEX  
-----  
Ibuf: size 1, free list len 0, seg size 2, 0 merges
```

Relevant data points include:

- `size`: The number of pages used within the change buffer. Change buffer size is equal to `seg size - (1 + free list len)`. The `1 +` value represents the change buffer header page.
- `seg size`: The size of the change buffer, in pages.

For information about monitoring change buffer status, see [Section 15.5.2, “Change Buffer”](#).

A.16.6 When does change buffer merging occur?

- When a page is read into the buffer pool, buffered changes are merged upon completion of the read, before the page is made available.
- Change buffer merging is performed as a background task. The `innodb_io_capacity` parameter sets an upper limit on the I/O activity performed by InnoDB background tasks such as merging data from the change buffer.
- A change buffer merge is performed during crash recovery. Changes are applied from the change buffer (in the system tablespace) to leaf pages of secondary indexes as index pages are read into the buffer pool.
- The change buffer is fully durable and will survive a system crash. Upon restart, change buffer merge operations resume as part of normal operations.
- A full merge of the change buffer can be forced as part of a slow server shutdown using `--innodb-fast-shutdown=0`.

A.16.7 When is the change buffer flushed?

Updated pages are flushed by the same flushing mechanism that flushes the other pages that occupy the buffer pool.

A.16.8 When should the change buffer be used?

The change buffer is a feature designed to reduce random I/O to secondary indexes as indexes grow larger and no longer fit in the InnoDB buffer pool. Generally, the change buffer should be used when the entire data set does not fit into the buffer pool, when there is substantial DML activity that modifies secondary index pages, or when there are lots of secondary indexes that are regularly changed by DML activity.

A.16.9 When should the change buffer not be used?

You might consider disabling the change buffer if the entire data set fits within the InnoDB buffer pool, if you have relatively few secondary indexes, or if you are using solid-state storage, where random reads are about as fast as sequential reads. Before making configuration changes, it is recommended that you run tests using a representative workload to determine if disabling the change buffer provides any benefit.

A.16.10 Where can I find additional information about the change buffer?

See [Section 15.5.2, “Change Buffer”](#).

A.17 MySQL 8.0 FAQ: InnoDB Data-at-Rest Encryption

A.17.1 Is data decrypted for users who are authorized to see it?	5068
A.17.2 What is the overhead associated with InnoDB data-at-rest encryption?	5068
A.17.3 What are the encryption algorithms used with InnoDB data-at-rest encryption?	5068
A.17.4 Is it possible to use 3rd party encryption algorithms in place of the one provided by the InnoDB data-at-rest encryption feature?	5068
A.17.5 Can indexed columns be encrypted?	5068
A.17.6 What data types and data lengths does InnoDB data-at-rest encryption support?	5068
A.17.7 Does data remain encrypted on the network?	5068
A.17.8 Does database memory contain cleartext or encrypted data?	5069
A.17.9 How do I know which data to encrypt?	5069
A.17.10 How is InnoDB data-at-rest encryption different from encryption functions MySQL already provides?	5069
A.17.11 Does the transportable tablespaces feature work with InnoDB data-at-rest encryption?	5069
A.17.12 Does compression work with InnoDB data-at-rest encryption?	5069
A.17.13 Can I use mysqldump or mysqlpump with encrypted tables?	5069
A.17.14 How do I change (rotate, re-key) the master encryption key?	5069
A.17.15 How do I migrate data from a cleartext InnoDB tablespace to an encrypted InnoDB tablespace?	5069

A.17.1 Is data decrypted for users who are authorized to see it?

Yes. [InnoDB](#) data-at-rest encryption is designed to transparently apply encryption within the database without impacting existing applications. Returning data in encrypted format would break most existing applications. [InnoDB](#) data-at-rest encryption provides the benefit of encryption without the overhead associated with traditional database encryption solutions, which would typically require expensive and substantial changes to applications, database triggers, and views.

A.17.2 What is the overhead associated with [InnoDB](#) data-at-rest encryption?

There is no additional storage overhead. According to internal benchmarks, performance overhead amounts to a single digit percentage difference.

A.17.3 What are the encryption algorithms used with [InnoDB](#) data-at-rest encryption?

[InnoDB](#) data-at-rest encryption supports the Advanced Encryption Standard (AES256) block-based encryption algorithm. It uses Electronic Codebook (ECB) block encryption mode for tablespace key encryption and Cipher Block Chaining (CBC) block encryption mode for data encryption.

A.17.4 Is it possible to use 3rd party encryption algorithms in place of the one provided by the [InnoDB](#) data-at-rest encryption feature?

No, it is not possible to use other encryption algorithms. The provided encryption algorithm is broadly accepted.

A.17.5 Can indexed columns be encrypted?

[InnoDB](#) data-at-rest encryption supports all indexes transparently.

A.17.6 What data types and data lengths does [InnoDB](#) data-at-rest encryption support?

[InnoDB](#) data-at-rest encryption supports all supported data types. There is no data length limitation.

A.17.7 Does data remain encrypted on the network?

Data encrypted by the [InnoDB](#) data-at-rest feature is decrypted when it is read from the tablespace file. Thus, if the data is on the network, it is in cleartext form. However, data on the network can be

encrypted using MySQL network encryption, which encrypts data traveling to and from a database using SSL/TLS.

A.17.8 Does database memory contain cleartext or encrypted data?

With [InnoDB](#) data-at-rest encryption, in-memory data is decrypted, which provides complete transparency.

A.17.9 How do I know which data to encrypt?

Compliance with the PCI-DSS standard requires that credit card numbers (Primary Account Number, or 'PAN') be stored in encrypted form. Breach Notification Laws (for example, CA SB 1386, CA AB 1950, and similar laws in 43+ more US states) require encryption of first name, last name, driver license number, and other PII data. In early 2008, CA AB 1298 added medical and health insurance information to PII data. Additionally, industry specific privacy and security standards may require encryption of certain assets. For example, assets such as pharmaceutical research results, oil field exploration results, financial contracts, or personal data of law enforcement informants may require encryption. In the health care industry, the privacy of patient data, health records and X-ray images is of the highest importance.

A.17.10 How is [InnoDB](#) data-at-rest encryption different from encryption functions MySQL already provides?

There are symmetric and asymmetric encryption APIs in MySQL that can be used to manually encrypt data within the database. However, the application must manage encryption keys and perform required encryption and decryption operations by calling API functions. [InnoDB](#) data-at-rest encryption requires no application changes, is transparent to end users, and provides automated, built-in key management.

A.17.11 Does the transportable tablespaces feature work with [InnoDB](#) data-at-rest encryption?

Yes. It is supported for encrypted file-per-table tablespaces. For more information, see [Exporting Encrypted Tablespaces](#).

A.17.12 Does compression work with [InnoDB](#) data-at-rest encryption?

Customers using [InnoDB](#) data-at-rest encryption receive the full benefit of compression because compression is applied before data blocks are encrypted.

A.17.13 Can I use [mysqlpump](#) or [mysqldump](#) with encrypted tables?

Yes. Because these utilities create logical backups, the data dumped from encrypted tables is not encrypted.

A.17.14 How do I change (rotate, re-key) the master encryption key?

[InnoDB](#) data-at-rest encryption uses a two tier key mechanism. When data-at-rest encryption is used, individual tablespace keys are stored in the header of the underlying tablespace data file. Tablespace keys are encrypted using the master encryption key. The master encryption key is generated when tablespace encryption is enabled, and is stored outside the database. The master encryption key is rotated using the `ALTER INSTANCE ROTATE INNODB MASTER KEY` statement, which generates a new master encryption key, stores the key, and rotates the key into use.

A.17.15 How do I migrate data from a cleartext [InnoDB](#) tablespace to an encrypted [InnoDB](#) tablespace?

Transferring data from one tablespace to another is not required. To encrypt data in an [InnoDB](#) file-per-table tablespace, run `ALTER TABLE tbl_name ENCRYPTION = 'Y'`. To encrypt a general tablespace or the `mysql` tablespace, run `ALTER TABLESPACE tablespace_name ENCRYPTION`

= 'Y'. Encryption support for general tablespaces was introduced in MySQL 8.0.13. Encryption support for the [mysql](#) system tablespace is available as of MySQL 8.0.16.

A.18 MySQL 8.0 FAQ: Virtualization Support

A.18.1 Is MySQL supported on virtualized environments such as Oracle VM, VMWare, Docker, Microsoft Hyper-V, or others? 5070

A.18.1Is MySQL supported on virtualized environments such as Oracle VM, VMWare, Docker, Microsoft Hyper-V, or others?

MySQL is supported on virtualized environments, but is certified only for [Oracle VM](#). Contact Oracle Support for more information.

Be aware of potential problems when using virtualization software. The usual ones are related to performance, performance degradations, slowness, or unpredictability of disk, I/O, network, and memory.

Appendix B Errors, Error Codes, and Common Problems

Table of Contents

B.1 Error Message Sources and Components	5071
B.2 Error Information Interfaces	5074
B.3 Error Message Reference	5075

B.4.3 Administration-Related Issues	5617
B.4.4 Query-Related Issues	5625
B.4.5 Optimizer-Related Issues	5632
B.4.6 Table Definition-Related Issues	5632
B.4.7 Known Issues in MySQL	5633

This appendix describes the types of error information MySQL provides and how to obtain information about them. It also lists the error messages that the MySQL server and MySQL client programs generate. The final section is for troubleshooting. It describes common problems and errors that may occur and potential resolutions.

Additional Resources

Other sections that discuss error-related topics include:

- Information about configuring where and how the server writes the error log: [Section 5.4.2, “The Error Log”](#)
- Information about the character set used for error messages: [Section 10.6, “Error Message Character Set”](#)
- Information about the language used for error messages: [Section 10.12, “Setting the Error Message Language”](#)
- Information about errors related to [InnoDB](#): [Section 15.21.4, “InnoDB Error Handling”](#)

B.1 Error Message Sources and Components

This section discusses how error messages originate within MySQL and the components they contain.

- [Error Message Sources](#)
- [Error Message Components](#)
- [Error Code Ranges](#)

Error Message Sources

Error messages can originate on the server side or the client side:

- On the server side, error messages may occur during the startup and shutdown processes, as a result of issues that occur during SQL statement execution, and so forth.
- The MySQL server writes some error messages to its error log. These indicate issues of interest to database administrators or that require DBA action.
- The server sends other error messages to client programs. These indicate issues pertaining only to a particular client. The MySQL client library takes errors received from the server and makes them available to the host client program.
- Client-side error messages are generated from within the MySQL client library, usually involving problems communicating with the server.

Example server-side error messages written to the error log:

- This message produced during the startup process provides a status or progress indicator:

```
2018-10-28T13:01:32.735983Z 0 [Note] [MY-010303] [Server] Skipping
generation of SSL certificates as options related to SSL are specified.
```

- This message indicates an issue that requires DBA action:

```
2018-10-02T03:20:39.410387Z 768 [ERROR] [MY-010045] [Server] Event Scheduler:
[evtuser@localhost][myschema.e_daily] Unknown database 'mydb'
```

Example server-side error message sent to client programs, as displayed by the `mysql` client:

```
mysql> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Example client-side error message originating from within the client library, as displayed by the `mysql` client:

```
shell> mysql -h no-such-host
ERROR 2005 (HY000): Unknown MySQL server host 'no-such-host' (0)
```

Whether an error originates from within the client library or is received from the server, a MySQL client program may respond in varying ways. As just illustrated, the client may display the error message so the user can take corrective measures. The client may instead internally attempt to resolve or retry a failed operation, or take other action.

Error Message Components

When an error occurs, error information includes several components: an error code, SQLSTATE value, and message string. These components have the following characteristics:

- Error code: This value is numeric. It is MySQL-specific and is not portable to other database systems.

Each error number has a corresponding symbolic value. Examples:

- The symbol for server error number 1146 is `ER_NO_SUCH_TABLE`.
- The symbol for client error number 2005 is `CR_UNKNOWN_HOST`.

The set of error codes used in error messages is partitioned into distinct ranges; see [Error Code Ranges](#).

Error codes are stable across General Availability (GA) releases of a given MySQL series. Before a series reaches GA status, new codes may still be under development and are subject to change.

- **SQLSTATE value:** This value is a five-character string (for example, `'42S02'`). SQLSTATE values are taken from ANSI SQL and ODBC and are more standardized than the numeric error codes. The first two characters of an SQLSTATE value indicate the error class:
 - Class = `'00'` indicates success.
 - Class = `'01'` indicates a warning.
 - Class = `'02'` indicates “not found.” This is relevant within the context of cursors and is used to control what happens when a cursor reaches the end of a data set. This condition also occurs for `SELECT ... INTO var_list` statements that retrieve no rows.
 - Class > `'02'` indicates an exception.
- For server-side errors, not all MySQL error numbers have corresponding SQLSTATE values. In these cases, `'HY000'` (general error) is used.
- For client-side errors, the SQLSTATE value is always `'HY000'` (general error), so it is not meaningful for distinguishing one client error from another.
- **Message string:** This string provides a textual description of the error.

Error Code Ranges

The set of error codes used in error messages is partitioned into distinct ranges, each with its own purpose:

- 1 to 999: Global error codes. This error code range is called “global” because it is a shared range that is used by the server as well as by clients.

When an error in this range originates on the server side, the server writes it to the error log, padding the error code with leading zeros to six digits and adding a prefix of `MY-`.

When an error in this range originates on the client side, the client library makes it available to the client program with no zero-padding or prefix.

- 1,000 to 1,999: Server error codes reserved for messages sent to clients.
- 2,000 to 2,999: Client error codes reserved for use by the client library.
- 3,000 to 4,999: Server error codes reserved for messages sent to clients.
- 5,000 to 5,999: Error codes reserved for use by X Plugin for messages sent to clients.
- 10,000 to 49,999: Server error codes reserved for messages to be written to the error log (not sent to clients).

When an error in this range occurs, the server writes it to the error log, padding the error code with leading zeros to six digits and adding a prefix of `MY-`.

- 50,000 to 51,999: Error codes reserved for use by third parties.

The server handles error messages written to the error log differently from error messages sent to clients:

- When the server writes a message to the error log, it pads the error code with leading zeros to six digits and adds a prefix of `MY-` (examples: `MY-000022`, `MY-010048`).
- When the server sends a message to a client program, it adds no zero-padding or prefix to the error code (examples: `1036`, `3013`).

B.2 Error Information Interfaces

Error messages can originate on the server side or the client side, and each error message includes an error code, SQLSTATE value, and message string, as described in [Section B.1, “Error Message Sources and Components”](#). For lists of server-side, client-side, and global (shared between server and clients) errors, see [Section B.3, “Error Message Reference”](#).

For error checking from within programs, use error code numbers or symbols, not error message strings. Message strings do not change often, but it is possible. Also, if the database administrator changes the language setting, that affects the language of message strings; see [Section 10.12, “Setting the Error Message Language”](#).

Error information in MySQL is available in the server error log, at the SQL level, from within client programs, and at the command line.

- [Error Log](#)
- [SQL Error Message Interface](#)
- [Client Error Message Interface](#)
- [Command-Line Error Message Interface](#)

Error Log

On the server side, some messages are intended for the error log. For information about configuring where and how the server writes the log, see [Section 5.4.2, “The Error Log”](#).

Other server error messages are intended to be sent to client programs and are available as described in [Client Error Message Interface](#).

The range within which a particular error code lies determines whether the server writes an error message to the error log or sends it to clients. For information about these ranges, see [Error Code Ranges](#).

SQL Error Message Interface

At the SQL level, there are several sources of error information in MySQL:

- SQL statement warning and error information is available through the `SHOW WARNINGS` and `SHOW ERRORS` statements. The `warning_count` system variable indicates the number of errors, warnings, and notes (with notes excluded if the `sql_notes` system variable is disabled). The `error_count` system variable indicates the number of errors. Its value excludes warnings and notes.
- The `GET DIAGNOSTICS` statement may be used to inspect the diagnostic information in the diagnostics area. See [Section 13.6.7.3, “GET DIAGNOSTICS Statement”](#).
- `SHOW SLAVE STATUS` statement output includes information about replication errors occurring on replication slave servers.
- `SHOW ENGINE INNODB STATUS` statement output includes information about the most recent foreign key error if a `CREATE TABLE` statement for an InnoDB table fails.

Client Error Message Interface

Client programs receive errors from two sources:

- Errors that originate on the client side from within the MySQL client library.

- Errors that originate on the server side and are sent to the client by the server. These are received within the client library, which makes them available to the host client program.

The range within which a particular error code lies determines whether it originated from within the client library or was received by the client from the server. For information about these ranges, see [Error Code Ranges](#).

Regardless of whether an error originates from within the client library or is received from the server, a MySQL client program obtains the error code, SQLSTATE value, message string, and other related information by calling C API functions in the client library:

- `mysql_errno()` returns the MySQL error code.
- `mysql_sqlstate()` returns the SQLSTATE value.
- `mysql_error()` returns the message string.
- `mysql_stmt_errno()`, `mysql_stmt_sqlstate()`, and `mysql_stmt_error()` are the corresponding error functions for prepared statements.
- `mysql_warning_count()` returns the number of errors, warnings, and notes for the most recent statement.

For descriptions of the client library error functions, see [Section 28.6, “MySQL C API”](#).

A MySQL client program may respond to an error in varying ways. The client may display the error message so the user can take corrective measures, internally attempt to resolve or retry a failed operation, or take other action. For example, (using the `mysql` client), a failure to connect to the server might result in this message:

```
shell> mysql -h no-such-host
ERROR 2005 (HY000): Unknown MySQL server host 'no-such-host' (0)
```

Command-Line Error Message Interface

The `pererror` program provides information from the command line about error numbers. See [Section 4.8.2, “pererror — Display MySQL Error Message Information”](#).

```
shell> pererror 1231
MySQL error code MY-001231 (ER_WRONG_VALUE_FOR_VAR): Variable '%-.64s'
can't be set to the value of '%-.200s'
```

For MySQL NDB Cluster errors, use `ndb_pererror`. See [Section 22.4.16, “ndb_pererror — Obtain NDB Error Message Information”](#).

```
shell> ndb_pererror 323
NDB error code 323: Invalid nodegroup id, nodegroup already existing:
Permanent error: Application error
```

B.3 Error Message Reference

This section provides a reference for the various types of error messages in MySQL:

- Error messages produced only by the server: [Section B.3.1, “Server Error Message Reference”](#)
- Error messages that originate only from within the MySQL client library: [Section B.3.2, “Client Error Message Reference”](#)
- Error messages that are shared between the server and the client library: [Section B.3.3, “Global Error Message Reference”](#)

B.3.1 Server Error Message Reference

The MySQL server writes some error messages to its error log, and sends others to client programs.

Example server-side error messages written to the error log:

```
2018-10-28T13:01:32.735983Z 0 [Note] [MY-010303] [Server] Skipping
generation of SSL certificates as options related to SSL are specified.

2018-10-02T03:20:39.410387Z 768 [ERROR] [MY-010045] [Server] Event Scheduler:
[evtuser@localhost][myschema.e_daily] Unknown database 'mydb'
```

Example server-side error message sent to client programs, as displayed by the `mysql` client:

```
mysql> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Each server error message includes an error code, SQLSTATE value, and message string, as described in [Section B.1, “Error Message Sources and Components”](#). These components are available as described in [Section B.2, “Error Information Interfaces”](#).

In addition to the errors in the following list, the server can also produce error messages that have error codes in the range from 1 to 999. See [Section B.3.3, “Global Error Message Reference”](#)

- Error number: [1002](#); Symbol: [ER_NO](#); SQLSTATE: [HY000](#)

Message: NO

Used in the construction of other messages.

- Error number: [1003](#); Symbol: [ER_YES](#); SQLSTATE: [HY000](#)

Message: YES

Used in the construction of other messages.

Extended [EXPLAIN](#) format generates Note messages. [ER_YES](#) is used in the [Code](#) column for these messages in subsequent [SHOW WARNINGS](#) output.

- Error number: [1004](#); Symbol: [ER_CANT_CREATE_FILE](#); SQLSTATE: [HY000](#)

Message: Can't create file '%s' (errno: %d - %s)

Occurs for failure to create or copy a file needed for some operation.

Possible causes: Permissions problem for source file; destination file already exists but is not writeable.

- Error number: [1005](#); Symbol: [ER_CANT_CREATE_TABLE](#); SQLSTATE: [HY000](#)

Message: Can't create table '%s' (errno: %d - %s)

[InnoDB](#) reports this error when a table cannot be created. If the error message refers to error 150, table creation failed because a [foreign key constraint](#) was not correctly formed. If the error message refers to error `_1`, table creation probably failed because the table includes a column name that matched the name of an internal [InnoDB](#) table.

- Error number: [1006](#); Symbol: [ER_CANT_CREATE_DB](#); SQLSTATE: [HY000](#)

Message: Can't create database '%s' (errno: %d - %s)

- Error number: [1007](#); Symbol: [ER_DB_CREATE_EXISTS](#); SQLSTATE: [HY000](#)

Message: Can't create database '%s'; database exists

An attempt to create a database failed because the database already exists.

Drop the database first if you really want to replace an existing database, or add an [IF NOT EXISTS](#) clause to the [CREATE DATABASE](#) statement if to retain an existing database without having the statement produce an error.

- Error number: [1008](#); Symbol: [ER_DB_DROP_EXISTS](#); SQLSTATE: [HY000](#)

Message: Can't drop database '%s'; database doesn't exist

- Error number: [1010](#); Symbol: [ER_DB_DROP_RMDIR](#); SQLSTATE: [HY000](#)

Message: Error dropping database (can't rmdir '%s', errno: %d - %s)

- Error number: [1012](#); Symbol: [ER_CANT_FIND_SYSTEM_REC](#); SQLSTATE: [HY000](#)

Message: Can't read record in system table

Returned by [InnoDB](#) for attempts to access [InnoDB INFORMATION_SCHEMA](#) tables when [InnoDB](#) is unavailable.

- Error number: [1013](#); Symbol: [ER_CANT_GET_STAT](#); SQLSTATE: [HY000](#)

Message: Can't get status of '%s' (errno: %d - %s)

- Error number: [1015](#); Symbol: [ER_CANT_LOCK](#); SQLSTATE: [HY000](#)

Message: Can't lock file (errno: %d - %s)

- Error number: [1016](#); Symbol: [ER_CANT_OPEN_FILE](#); SQLSTATE: [HY000](#)

Message: Can't open file: '%s' (errno: %d - %s)

[InnoDB](#) reports this error when the table from the [InnoDB data files](#) cannot be found.

- Error number: [1017](#); Symbol: [ER_FILE_NOT_FOUND](#); SQLSTATE: [HY000](#)

Message: Can't find file: '%s' (errno: %d - %s)

- Error number: [1018](#); Symbol: [ER_CANT_READ_DIR](#); SQLSTATE: [HY000](#)

Message: Can't read dir of '%s' (errno: %d - %s)

- Error number: [1020](#); Symbol: [ER_CHECKREAD](#); SQLSTATE: [HY000](#)

Message: Record has changed since last read in table '%s'

- Error number: [1022](#); Symbol: [ER_DUP_KEY](#); SQLSTATE: [23000](#)

Message: Can't write; duplicate key in table '%s'

- Error number: [1024](#); Symbol: [ER_ERROR_ON_READ](#); SQLSTATE: [HY000](#)

Message: Error reading file '%s' (errno: %d - %s)

- Error number: [1025](#); Symbol: [ER_ERROR_ON_RENAME](#); SQLSTATE: [HY000](#)

Message: Error on rename of '%s' to '%s' (errno: %d - %s)

- Error number: 1026; Symbol: [ER_ERROR_ON_WRITE](#); SQLSTATE: [HY000](#)

Message: Error writing file '%s' (errno: %d - %s)

- Error number: 1027; Symbol: [ER_FILE_USED](#); SQLSTATE: [HY000](#)

Message: '%s' is locked against change

- Error number: 1028; Symbol: [ER_FILSORT_ABORT](#); SQLSTATE: [HY000](#)

Message: Sort aborted

[ER_FILSORT_ABORT](#) was removed after 8.0.18.

- Error number: 1030; Symbol: [ER_GET_ERRNO](#); SQLSTATE: [HY000](#)

Message: Got error %d - '%s' from storage engine

Check the %d value to see what the OS error means. For example, 28 indicates that you have run out of disk space.

- Error number: 1031; Symbol: [ER_ILLEGAL HA](#); SQLSTATE: [HY000](#)

Message: Table storage engine for '%s' doesn't have this option

- Error number: 1032; Symbol: [ER_KEY_NOT_FOUND](#); SQLSTATE: [HY000](#)

Message: Can't find record in '%s'

- Error number: 1033; Symbol: [ER_NOT FORM FILE](#); SQLSTATE: [HY000](#)

Message: Incorrect information in file: '%s'

- Error number: 1034; Symbol: [ER_NOT_KEYFILE](#); SQLSTATE: [HY000](#)

Message: Incorrect key file for table '%s'; try to repair it

- Error number: 1035; Symbol: [ER_OLD_KEYFILE](#); SQLSTATE: [HY000](#)

Message: Old key file for table '%s'; repair it!

- Error number: 1036; Symbol: [ER_OPEN_AS_READONLY](#); SQLSTATE: [HY000](#)

Message: Table '%s' is read only

- Error number: 1037; Symbol: [ER_OUTOFMEMORY](#); SQLSTATE: [HY001](#)

Message: Out of memory; restart server and try again (needed %d bytes)

- Error number: 1038; Symbol: [ER_OUT_OF_SORTMEMORY](#); SQLSTATE: [HY001](#)

Message: Out of sort memory, consider increasing server sort buffer size

- Error number: 1040; Symbol: [ER_CON_COUNT_ERROR](#); SQLSTATE: [08004](#)

Message: Too many connections

- Error number: 1041; Symbol: `ER_OUT_OF_RESOURCES`; SQLSTATE: `HY000`

Message: Out of memory; check if mysqld or some other process uses all available memory; if not, you may have to use 'ulimit' to allow mysqld to use more memory or you can add more swap space

- Error number: 1042; Symbol: `ER_BAD_HOST_ERROR`; SQLSTATE: `08S01`

Message: Can't get hostname for your address

- Error number: 1043; Symbol: `ER_HANDSHAKE_ERROR`; SQLSTATE: `08S01`

Message: Bad handshake

- Error number: 1044; Symbol: `ER_DBACCESS_DENIED_ERROR`; SQLSTATE: `42000`

Message: Access denied for user '%s'@'%s' to database '%s'

- Error number: 1045; Symbol: `ER_ACCESS_DENIED_ERROR`; SQLSTATE: `28000`

Message: Access denied for user '%s'@'%s' (using password: %s)

- Error number: 1046; Symbol: `ER_NO_DB_ERROR`; SQLSTATE: `3D000`

Message: No database selected

- Error number: 1047; Symbol: `ER_UNKNOWN_COM_ERROR`; SQLSTATE: `08S01`

Message: Unknown command

- Error number: 1048; Symbol: `ER_BAD_NULL_ERROR`; SQLSTATE: `23000`

Message: Column '%s' cannot be null

- Error number: 1049; Symbol: `ER_BAD_DB_ERROR`; SQLSTATE: `42000`

Message: Unknown database '%s'

- Error number: 1050; Symbol: `ER_TABLE_EXISTS_ERROR`; SQLSTATE: `42S01`

Message: Table '%s' already exists

- Error number: 1051; Symbol: `ER_BAD_TABLE_ERROR`; SQLSTATE: `42S02`

Message: Unknown table '%s'

- Error number: 1052; Symbol: `ER_NON_UNIQ_ERROR`; SQLSTATE: `23000`

Message: Column '%s' in %s is ambiguous

%s = column name
%s = location of column (for example, "field list")

Likely cause: A column appears in a query without appropriate qualification, such as in a select list or ON clause.

Examples:

```
mysql> SELECT i FROM t INNER JOIN t AS t2;
ERROR 1052 (23000): Column 'i' in field list is ambiguous
```

```
mysql> SELECT * FROM t LEFT JOIN t AS t2 ON i = i;  
ERROR 1052 (23000): Column 'i' in on clause is ambiguous
```

Resolution:

- Qualify the column with the appropriate table name:

```
mysql> SELECT t2.i FROM t INNER JOIN t AS t2;
```

- Modify the query to avoid the need for qualification:

```
mysql> SELECT * FROM t LEFT JOIN t AS t2 USING (i);
```

- Error number: [1053](#); Symbol: [ER_SERVER_SHUTDOWN](#); SQLSTATE: [08S01](#)

Message: Server shutdown in progress

- Error number: [1054](#); Symbol: [ER_BAD_FIELD_ERROR](#); SQLSTATE: [42S22](#)

Message: Unknown column '%s' in '%s'

- Error number: [1055](#); Symbol: [ER_WRONG_FIELD_WITH_GROUP](#); SQLSTATE: [42000](#)

Message: '%s' isn't in GROUP BY

- Error number: [1056](#); Symbol: [ER_WRONG_GROUP_FIELD](#); SQLSTATE: [42000](#)

Message: Can't group on '%s'

- Error number: [1057](#); Symbol: [ER_WRONG_SUM_SELECT](#); SQLSTATE: [42000](#)

Message: Statement has sum functions and columns in same statement

- Error number: [1058](#); Symbol: [ER_WRONG_VALUE_COUNT](#); SQLSTATE: [21S01](#)

Message: Column count doesn't match value count

- Error number: [1059](#); Symbol: [ER_TOO_LONG_IDENT](#); SQLSTATE: [42000](#)

Message: Identifier name '%s' is too long

- Error number: [1060](#); Symbol: [ER_DUP_FIELDNAME](#); SQLSTATE: [42S21](#)

Message: Duplicate column name '%s'

- Error number: [1061](#); Symbol: [ER_DUP_KEYNAME](#); SQLSTATE: [42000](#)

Message: Duplicate key name '%s'

- Error number: [1062](#); Symbol: [ER_DUP_ENTRY](#); SQLSTATE: [23000](#)

Message: Duplicate entry '%s' for key %d

The message returned with this error uses the format string for [ER_DUP_ENTRY_WITH_KEY_NAME](#).

- Error number: [1063](#); Symbol: [ER_WRONG_FIELD_SPEC](#); SQLSTATE: [42000](#)

Message: Incorrect column specifier for column '%s'

- Error number: [1064](#); Symbol: [ER_PARSE_ERROR](#); SQLSTATE: [42000](#)

Message: %s near '%s' at line %d

- Error number: 1065; Symbol: [ER_EMPTY_QUERY](#); SQLSTATE: 42000

Message: Query was empty

- Error number: 1066; Symbol: [ER_NONUNIQ_TABLE](#); SQLSTATE: 42000

Message: Not unique table/alias: '%s'

- Error number: 1067; Symbol: [ER_INVALID_DEFAULT](#); SQLSTATE: 42000

Message: Invalid default value for '%s'

- Error number: 1068; Symbol: [ER_MULTIPLE_PRI_KEY](#); SQLSTATE: 42000

Message: Multiple primary key defined

- Error number: 1069; Symbol: [ER_TOO_MANY_KEYS](#); SQLSTATE: 42000

Message: Too many keys specified; max %d keys allowed

- Error number: 1070; Symbol: [ER_TOO_MANY_KEY_PARTS](#); SQLSTATE: 42000

Message: Too many key parts specified; max %d parts allowed

- Error number: 1071; Symbol: [ER_TOO_LONG_KEY](#); SQLSTATE: 42000

Message: Specified key was too long; max key length is %d bytes

- Error number: 1072; Symbol: [ER_KEY_COLUMN_DOES_NOT_EXISTS](#); SQLSTATE: 42000

Message: Key column '%s' doesn't exist in table

- Error number: 1073; Symbol: [ER_BLOB_USED_AS_KEY](#); SQLSTATE: 42000

Message: BLOB column '%s' can't be used in key specification with the used table type

- Error number: 1074; Symbol: [ER_TOO_BIG_FIELDLENGTH](#); SQLSTATE: 42000

Message: Column length too big for column '%s' (max = %lu); use BLOB or TEXT instead

- Error number: 1075; Symbol: [ER_WRONG_AUTO_KEY](#); SQLSTATE: 42000

Message: Incorrect table definition; there can be only one auto column and it must be defined as a key

- Error number: 1076; Symbol: [ER_READY](#); SQLSTATE: HY000

Message: %s: ready for connections. Version: '%s' socket: '%s' port: %d

- Error number: 1077; Symbol: [ER_NORMAL_SHUTDOWN](#); SQLSTATE: HY000

Message: %s: Normal shutdown

[ER_NORMAL_SHUTDOWN](#) was removed after 8.0.4.

- Error number: 1079; Symbol: [ER_SHUTDOWN_COMPLETE](#); SQLSTATE: HY000

Message: %s: Shutdown complete

- Error number: [1080](#); Symbol: [ER_FORCING_CLOSE](#); SQLSTATE: [08S01](#)
 Message: %s: Forcing close of thread %ld user: '%s'
- Error number: [1081](#); Symbol: [ER_IPSOCK_ERROR](#); SQLSTATE: [08S01](#)
 Message: Can't create IP socket
- Error number: [1082](#); Symbol: [ER_NO_SUCH_INDEX](#); SQLSTATE: [42S12](#)
 Message: Table '%s' has no index like the one used in CREATE INDEX; recreate the table
- Error number: [1083](#); Symbol: [ER_WRONG_FIELD_TERMINATORS](#); SQLSTATE: [42000](#)
 Message: Field separator argument is not what is expected; check the manual
- Error number: [1084](#); Symbol: [ER_BLOBS_AND_NO_TERMINATED](#); SQLSTATE: [42000](#)
 Message: You can't use fixed rowlength with BLOBs; please use 'fields terminated by'
- Error number: [1085](#); Symbol: [ER_TEXTFILE_NOT_READABLE](#); SQLSTATE: [HY000](#)
 Message: The file '%s' must be in the database directory or be readable by all
- Error number: [1086](#); Symbol: [ER_FILE_EXISTS_ERROR](#); SQLSTATE: [HY000](#)
 Message: File '%s' already exists
- Error number: [1087](#); Symbol: [ER_LOAD_INFO](#); SQLSTATE: [HY000](#)
 Message: Records: %ld Deleted: %ld Skipped: %ld Warnings: %ld
- Error number: [1088](#); Symbol: [ER_ALTER_INFO](#); SQLSTATE: [HY000](#)
 Message: Records: %ld Duplicates: %ld
- Error number: [1089](#); Symbol: [ER_WRONG_SUB_KEY](#); SQLSTATE: [HY000](#)
 Message: Incorrect prefix key; the used key part isn't a string, the used length is longer than the key part, or the storage engine doesn't support unique prefix keys
- Error number: [1090](#); Symbol: [ER_CANT_REMOVE_ALL_FIELDS](#); SQLSTATE: [42000](#)
 Message: You can't delete all columns with ALTER TABLE; use DROP TABLE instead
- Error number: [1091](#); Symbol: [ER_CANT_DROP_FIELD_OR_KEY](#); SQLSTATE: [42000](#)
 Message: Can't DROP '%s'; check that column/key exists
- Error number: [1092](#); Symbol: [ER_INSERT_INFO](#); SQLSTATE: [HY000](#)
 Message: Records: %ld Duplicates: %ld Warnings: %ld
- Error number: [1093](#); Symbol: [ER_UPDATE_TABLE_USED](#); SQLSTATE: [HY000](#)
 Message: You can't specify target table '%s' for update in FROM clause

 This error occurs for attempts to select from and modify the same table within a single statement. If the select attempt occurs within a derived table, you can avoid this error by setting the [derived_merge](#) flag of the [optimizer_switch](#) system variable to force the subquery to be materialized into a temporary

table, which effectively causes it to be a different table from the one modified. See [Section 8.2.2.4, “Optimizing Derived Tables, View References, and Common Table Expressions with Merging or Materialization”](#).

Message: User %s already has more than 'max_user_connections' active connections

- Error number: [1204](#); Symbol: [ER_SET_CONSTANTS_ONLY](#); SQLSTATE: [HY000](#)

Message: You may only use constant expressions with SET

- Error number: [1205](#); Symbol: [ER_LOCK_WAIT_TIMEOUT](#); SQLSTATE: [HY000](#)

Message: Lock wait timeout exceeded; try restarting transaction

[InnoDB](#) reports this error when lock wait timeout expires. The statement that waited too long was [rolled back](#) (not the entire [transaction](#)). You can increase the value of the [innodb_lock_wait_timeout](#) configuration option if SQL statements should wait longer for other transactions to complete, or decrease it if too many long-running transactions are causing [locking](#) problems and reducing [concurrency](#) on a busy system.

- Error number: [1206](#); Symbol: [ER_LOCK_TABLE_FULL](#); SQLSTATE: [HY000](#)

Message: The total number of locks exceeds the lock table size

[InnoDB](#) reports this error when the total number of locks exceeds the amount of memory devoted to managing locks. To avoid this error, increase the value of [innodb_buffer_pool_size](#). Within an individual application, a workaround may be to break a large operation into smaller pieces. For example, if the error occurs for a large [INSERT](#), perform several smaller [INSERT](#) operations.

- Error number: [1207](#); Symbol: [ER_READ_ONLY_TRANSACTION](#); SQLSTATE: [25000](#)

Message: Update locks cannot be acquired during a READ UNCOMMITTED transaction

- Error number: [1210](#); Symbol: [ER_WRONG_ARGUMENTS](#); SQLSTATE: [HY000](#)

Message: Incorrect arguments to %s

- Error number: [1211](#); Symbol: [ER_NO_PERMISSION_TO_CREATE_USER](#); SQLSTATE: [42000](#)

Message: '%s'@'%s' is not allowed to create new users

- Error number: [1213](#); Symbol: [ER_LOCK_DEADLOCK](#); SQLSTATE: [40001](#)

Message: Deadlock found when trying to get lock; try restarting transaction

[InnoDB](#) reports this error when a [transaction](#) encounters a [deadlock](#) and is automatically [rolled back](#) so that your application can take corrective action. To recover from this error, run all the operations in this transaction again. A deadlock occurs when requests for locks arrive in inconsistent order between

transactions. The transaction that was rolled back released all its locks, and the other transaction can now get all the locks it requested. Thus, when you re-run the transaction that was rolled back, it might have to wait for other transactions to complete, but typically the deadlock does not recur. If you encounter frequent deadlocks, make the sequence of locking operations ([LOCK TABLES](#), [SELECT ... FOR UPDATE](#), and so on) consistent between the different transactions or applications that experience the issue. See [Section 15.7.5, “Deadlocks in InnoDB”](#) for details.

- Error number: [1214](#); Symbol: [ER_TABLE_CANT_HANDLE_FT](#); SQLSTATE: [HY000](#)
Message: The used table type doesn't support FULLTEXT indexes
- Error number: [1215](#); Symbol: [ER_CANNOT_ADD_FOREIGN](#); SQLSTATE: [HY000](#)
Message: Cannot add foreign key constraint
- Error number: [1216](#); Symbol: [ER_NO_REFERENCED_ROW](#); SQLSTATE: [23000](#)
Message: Cannot add or update a child row: a foreign key constraint fails
[InnoDB](#) reports this error when you try to add a row but there is no parent row, and a [foreign key constraint](#) fails. Add the parent row first.
- Error number: [1217](#); Symbol: [ER_ROW_IS_REFERENCED](#); SQLSTATE: [23000](#)
Message: Cannot delete or update a parent row: a foreign key constraint fails
[InnoDB](#) reports this error when you try to delete a parent row that has children, and a [foreign key constraint](#) fails. Delete the children first.

Message: Same old and new event name
- Error number: [1553](#); Symbol: [ER_DROP_INDEX_FK](#); SQLSTATE: [HY000](#)
Message: Cannot drop index '%s': needed in a foreign key constraint

[InnoDB](#) reports this error when you attempt to drop the last index that can enforce a particular referential constraint.

For optimal performance with DML statements, [InnoDB](#) requires an index to exist on [foreign key](#) columns, so that [UPDATE](#) and [DELETE](#) operations on a [parent table](#) can easily check whether corresponding rows exist in the [child table](#). MySQL creates or drops such indexes automatically when needed, as a side-effect of [CREATE TABLE](#), [CREATE INDEX](#), and [ALTER TABLE](#) statements.

When you drop an index, [InnoDB](#) checks if the index is used for checking a foreign key constraint. It is still OK to drop the index if there is another index that can be used to enforce the same constraint. [InnoDB](#) prevents you from dropping the last index that can enforce a particular referential constraint.

- Error number: [1554](#); Symbol: [ER_WARN_DEPRECATED_SYNTAX_WITH_VER](#); SQLSTATE: [HY000](#)

Message: Expression #%u of ORDER BY clause is not in SELECT list, contains aggregate function; this is incompatible with %s

- Error number: 3067; Symbol: `ER_INVALID_RPL_WILD_TABLE_FILTER_PATTERN`; SQLSTATE: `HY000`

Message: Supplied filter list contains a value which is not in the required format 'db_pattern.table_pattern'

- Error number: 3068; Symbol: `ER_NET_OK_PACKET_TOO_LARGE`; SQLSTATE: `08S01`

Message: OK packet too large

- Error number: 3069; Symbol: `ER_INVALID_JSON_DATA`; SQLSTATE: `HY000`

Message: Invalid JSON data provided to function %s: %s

- Error number: 3070; Symbol: `ER_INVALID_GEOJSON_MISSING_MEMBER`; SQLSTATE: `HY000`

Message: Invalid GeoJSON data provided to function %s: Missing required member '%s'

- Error number: 3071; Symbol: `ER_INVALID_GEOJSON_WRONG_TYPE`; SQLSTATE: `HY000`

Message: Invalid GeoJSON data provided to function %s: Member '%s' must be of type '%s'

- Error number: 3072; Symbol: `ER_INVALID_GEOJSON_UNSPECIFIED`; SQLSTATE: `HY000`

Message: Invalid GeoJSON data provided to function %s
- Error number: 3073; Symbol: `ER_DIMENSION_UNSUPPORTED`; SQLSTATE: `HY000`

Message: Unsupported number of coordinate dimensions in function %s: Found %u, expected %u
- Error number: 3074; Symbol: `ER_SLAVE_CHANNEL_DOES_NOT_EXIST`; SQLSTATE: `HY000`

Message: Slave channel '%s' does not exist.
- Error number: 3076; Symbol: `ER_SLAVE_CHANNEL_NAME_INVALID_OR_TOO_LONG`; SQLSTATE: `HY000`

Message: Couldn't create channel: Channel name is either invalid or too long.
- Error number: 3077; Symbol: `ER_SLAVE_NEW_CHANNEL_WRONG_REPOSITORY`; SQLSTATE: `HY000`

Message: To have multiple channels, repository cannot be of type FILE; Please check the repository configuration and convert them to TABLE.
- Error number: 3079; Symbol: `ER_SLAVE_MULTIPLE_CHANNELS_CMD`; SQLSTATE: `HY000`

Message: Multiple channels exist on the slave. Please provide channel name as an argument.
- Error number: 3080; Symbol: `ER_SLAVE_MAX_CHANNELS_EXCEEDED`; SQLSTATE: `HY000`

Message: Maximum number of replication channels allowed exceeded.
- Error number: 3081; Symbol: `ER_SLAVE_CHANNEL_MUST_STOP`; SQLSTATE: `HY000`

Message: This operation cannot be performed with running replication threads; run STOP SLAVE FOR CHANNEL '%s' first
- Error number: 3082; Symbol: `ER_SLAVE_CHANNEL_NOT_RUNNING`; SQLSTATE: `HY000`

Message: This operation requires running replication threads; configure slave and run START SLAVE FOR CHANNEL '%s'
- Error number: 3083; Symbol: `ER_SLAVE_CHANNEL_WAS_RUNNING`; SQLSTATE: `HY000`

Message: Replication thread(s) for channel '%s' are already running.
- Error number: 3084; Symbol: `ER_SLAVE_CHANNEL_WAS_NOT_RUNNING`; SQLSTATE: `HY000`

Message: Replication thread(s) for channel '%s' are already stopped.
- Error number: 3085; Symbol: `ER_SLAVE_CHANNEL_SQL_THREAD_MUST_STOP`; SQLSTATE: `HY000`

Message: This operation cannot be performed with a running slave sql thread; run STOP SLAVE SQL_THREAD FOR CHANNEL '%s' first.
- Error number: 3086; Symbol: `ER_SLAVE_CHANNEL_SQL_SKIP_COUNTER`; SQLSTATE: `HY000`

Message: When sql_slave_skip_counter > 0, it is not allowed to start more than one SQL thread by using 'START SLAVE [SQL_THREAD]'. Value of sql_slave_skip_counter can only be used by one SQL thread at a time. Please use 'START SLAVE [SQL_THREAD] FOR CHANNEL' to start the SQL thread which will use the value of sql_slave_skip_counter.

- Error number: [3087](#); Symbol: [ER_WRONG_FIELD_WITH_GROUP_V2](#); SQLSTATE: [HY000](#)

Message: Expression #%u of %s is not in GROUP BY clause and contains nonaggregated column '%s' which is not functionally dependent on columns in GROUP BY clause; this is incompatible with sql_mode=only_full_group_by
- Error number: [3088](#); Symbol: [ER_MIX_OF_GROUP_FUNC_AND_FIELDS_V2](#); SQLSTATE: [HY000](#)

Message: In aggregated query without GROUP BY, expression #%u of %s contains nonaggregated column '%s'; this is incompatible with sql_mode=only_full_group_by
- Error number: [3089](#); Symbol: [ER_WARN_DEPRECATED_SYSVAR_UPDATE](#); SQLSTATE: [HY000](#)

Message: Updating '%s' is deprecated. It will be made read-only in a future release.
- Error number: [3090](#); Symbol: [ER_WARN_DEPRECATED_SQLMODE](#); SQLSTATE: [HY000](#)

Message: Changing sql mode '%s' is deprecated. It will be removed in a future release.
- Error number: [3091](#); Symbol: [ER_CANNOT_LOG_PARTIAL_DROP_DATABASE_WITH_GTID](#); SQLSTATE: [HY000](#)

Message: DROP DATABASE failed; some tables may have been dropped but the database directory remains. The GTID has not been added to GTID_EXECUTED and the statement was not written to the binary log. Fix this as follows: (1) remove all files from the database directory %s; (2) SET GTID_NEXT='%s'; (3) DROP DATABASE `%s`.
- Error number: [3092](#); Symbol: [ER_GROUP_REPLICATION_CONFIGURATION](#); SQLSTATE: [HY000](#)

Message: The server is not configured properly to be an active member of the group. Please see more details on error log.
- Error number: [3093](#); Symbol: [ER_GROUP_REPLICATION_RUNNING](#); SQLSTATE: [HY000](#)

Message: The START GROUP_REPLICATION command failed since the group is already running.
- Error number: [3094](#); Symbol: [ER_GROUP_REPLICATION_APPLIER_INIT_ERROR](#); SQLSTATE: [HY000](#)

Message: The START GROUP_REPLICATION command failed as the applier module failed to start.
- Error number: [3095](#); Symbol: [ER_GROUP_REPLICATION_STOP_APPLIER_THREAD_TIMEOUT](#); SQLSTATE: [HY000](#)

Message: The STOP GROUP_REPLICATION command execution is incomplete: The applier thread got the stop signal while it was busy. The applier thread will stop once the current task is complete.
- Error number: [3096](#); Symbol: [ER_GROUP_REPLICATION_COMMUNICATION_LAYER_SESSION_ERROR](#); SQLSTATE: [HY000](#)

Message: The START GROUP_REPLICATION command failed as there was an error when initializing the group communication layer.
- Error number: [3097](#); Symbol: [ER_GROUP_REPLICATION_COMMUNICATION_LAYER_JOIN_ERROR](#); SQLSTATE: [HY000](#)

Message: The START GROUP_REPLICATION command failed as there was an error when joining the communication group.

- Error number: [3098](#); Symbol: [ER_BEFORE_DML_VALIDATION_ERROR](#); SQLSTATE: [HY000](#)

Message: The table does not comply with the requirements by an external plugin.
- Error number: [3099](#); Symbol: [ER_PREVENTS_VARIABLE_WITHOUT_RBR](#); SQLSTATE: [HY000](#)

Message: Cannot change the value of variable %s without binary log format as ROW.

[transaction_write_set_extraction](#) option value is set and [binlog_format](#) is not ROW.
- Error number: [3100](#); Symbol: [ER_RUN_HOOK_ERROR](#); SQLSTATE: [HY000](#)

Message: Error on observer while running replication hook '%s'.
- Error number: [3101](#); Symbol: [ER_TRANSACTION_ROLLBACK_DURING_COMMIT](#); SQLSTATE: [40000](#)

Message: Plugin instructed the server to rollback the current transaction.

When using Group Replication, this means that a transaction failed the group certification process, due to one or more members detecting a potential conflict, and was thus rolled back. See [Chapter 18, Group Replication](#).
- Error number: [3102](#); Symbol: [ER_GENERATED_COLUMN_FUNCTION_IS_NOT_ALLOWED](#); SQLSTATE: [HY000](#)

Message: Expression of generated column '%s' contains a disallowed function.
- Error number: [3103](#); Symbol: [ER_UNSUPPORTED_ALTER_INPLACE_ON_VIRTUAL_COLUMN](#); SQLSTATE: [HY000](#)

Message: INPLACE ADD or DROP of virtual columns cannot be combined with other ALTER TABLE actions
- Error number: [3104](#); Symbol: [ER_WRONG_FK_OPTION_FOR_GENERATED_COLUMN](#); SQLSTATE: [HY000](#)

Message: Cannot define foreign key with %s clause on a generated column.
- Error number: [3105](#); Symbol: [ER_NON_DEFAULT_VALUE_FOR_GENERATED_COLUMN](#); SQLSTATE: [HY000](#)

Message: The value specified for generated column '%s' in table '%s' is not allowed.
- Error number: [3106](#); Symbol: [ER_UNSUPPORTED_ACTION_ON_GENERATED_COLUMN](#); SQLSTATE: [HY000](#)

Message: '%s' is not supported for generated columns.
- Error number: [3107](#); Symbol: [ER_GENERATED_COLUMN_NON_PRIOR](#); SQLSTATE: [HY000](#)

Message: Generated column can refer only to generated columns defined prior to it.

To address this issue, change the table definition to define each generated column later than any generated columns to which it refers.
- Error number: [3108](#); Symbol: [ER_DEPENDENT_BY_GENERATED_COLUMN](#); SQLSTATE: [HY000](#)

Message: Column '%s' has a generated column dependency.

You cannot drop or rename a generated column if another column refers to it. You must either drop those columns as well, or redefine them not to refer to the generated column.

- Error number: 3109; Symbol: `ER_GENERATED_COLUMN_REF_AUTO_INC`; SQLSTATE: `HY000`

Message: Generated column '%s' cannot refer to auto-increment column.

- Error number: 3110; Symbol: `ER_FEATURE_NOT_AVAILABLE`; SQLSTATE: `HY000`

Message: The '%s' feature is not available; you need to remove '%s' or use MySQL built with '%s'

- Error number: 3111; Symbol: `ER_CANT_SET_GTID_MODE`; SQLSTATE: `HY000`

Message: SET @@GLOBAL.GTID_MODE = %s is not allowed because %s.

- Error number: 3112; Symbol: `ER_CANT_USE_AUTO_POSITION_WITH_GTID_MODE_OFF`; SQLSTATE: `HY000`

Message: The replication receiver thread%s cannot start in AUTO_POSITION mode: this server uses @@GLOBAL.GTID_MODE = OFF.

- Error number: 3116; Symbol: `ER_CANT_ENFORCE_GTID_CONSISTENCY_WITH_ONGOING_GTID_VIOLATING_TX`; SQLSTATE: `HY000`

Message: Cannot set ENFORCE_GTID_CONSISTENCY = ON because there are ongoing transactions that violate GTID consistency.

`ER_CANT_SET_ENFORCE_GTID_CONSISTENCY_ON_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS` was renamed to `ER_CANT_ENFORCE_GTID_CONSISTENCY_WITH_ONGOING_GTID_VIOLATING_TX`.

- Error number: 3117; Symbol: `ER_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TX`; SQLSTATE: `HY000`

Message: There are ongoing transactions that violate GTID consistency.

`ER_SET_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS` was renamed to `ER_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TX`.

- Error number: 3118; Symbol: `ER_ACCOUNT_HAS_BEEN_LOCKED`; SQLSTATE: `HY000`

Message: Access denied for user '%s'@'%s'. Account is locked.

The account was locked with `CREATE USER ... ACCOUNT LOCK` or `ALTER USER ... ACCOUNT LOCK`. An administrator can unlock it with `ALTER USER ... ACCOUNT UNLOCK`.

- Error number: 3119; Symbol: `ER_WRONG_TABLESPACE_NAME`; SQLSTATE: `42000`

Message: Incorrect tablespace name '%s'

- Error number: 3120; Symbol: `ER_TABLESPACE_IS_NOT_EMPTY`; SQLSTATE: `HY000`

Message: Tablespace '%s' is not empty.

- Error number: 3121; Symbol: `ER_WRONG_FILE_NAME`; SQLSTATE: `HY000`

Message: Incorrect File Name '%s'.

- Error number: 3122; Symbol: `ER_BOOST_GEOMETRY_INCONSISTENT_TURNS_EXCEPTION`; SQLSTATE: `HY000`

Message: Inconsistent intersection points.
- Error number: 3123; Symbol: `ER_WARN_OPTIMIZER_HINT_SYNTAX_ERROR`; SQLSTATE: `HY000`

Message: Optimizer hint syntax error
- Error number: 3124; Symbol: `ER_WARN_BAD_MAX_EXECUTION_TIME`; SQLSTATE: `HY000`

Message: Unsupported MAX_EXECUTION_TIME
- Error number: 3125; Symbol: `ER_WARN_UNSUPPORTED_MAX_EXECUTION_TIME`; SQLSTATE: `HY000`

Message: MAX_EXECUTION_TIME hint is supported by top-level standalone SELECT statements only

The `MAX_EXECUTION_TIME` optimizer hint is supported only for `SELECT` statements.
- Error number: 3126; Symbol: `ER_WARN_CONFLICTING_HINT`; SQLSTATE: `HY000`

Message: Hint %s is ignored as conflicting/duplicated
- Error number: 3127; Symbol: `ER_WARN_UNKNOWN_QB_NAME`; SQLSTATE: `HY000`

Message: Query block name %s is not found for %s hint
- Error number: 3128; Symbol: `ER_UNRESOLVED_HINT_NAME`; SQLSTATE: `HY000`

Message: Unresolved name %s for %s hint
- Error number: 3129; Symbol: `ER_WARN_ON_MODIFYING_GTID_EXECUTED_TABLE`; SQLSTATE: `HY000`

Message: Please do not modify the %s table. This is a mysql internal system table to store GTIDs for committed transactions. Modifying it can lead to an inconsistent GTID state.
- Error number: 3130; Symbol: `ER_PLUGGABLE_PROTOCOL_COMMAND_NOT_SUPPORTED`; SQLSTATE: `HY000`

Message: Command not supported by pluggable protocols
- Error number: 3131; Symbol: `ER_LOCKING_SERVICE_WRONG_NAME`; SQLSTATE: `42000`

Message: Incorrect locking service lock name '%s'.

A locking service name was specified as `NULL`, the empty string, or a string longer than 64 characters. Namespace and lock names must be non-`NULL`, nonempty, and no more than 64 characters long.
- Error number: 3132; Symbol: `ER_LOCKING_SERVICE_DEADLOCK`; SQLSTATE: `HY000`

Message: Deadlock found when trying to get locking service lock; try releasing locks and restarting lock acquisition.
- Error number: 3133; Symbol: `ER_LOCKING_SERVICE_TIMEOUT`; SQLSTATE: `HY000`

Message: Service lock wait timeout exceeded.
- Error number: 3134; Symbol: `ER_GIS_MAX_POINTS_IN_GEOMETRY_OVERFLOWED`; SQLSTATE: `HY000`

Message: Parameter %s exceeds the maximum number of points in a geometry (%lu) in function %s.

- Error number: 3135; Symbol: `ER_SQL_MODE_MERGED`; SQLSTATE: `HY000`

Message: 'NO_ZERO_DATE', 'NO_ZERO_IN_DATE' and 'ERROR_FOR_DIVISION_BY_ZERO' sql modes should be used with strict mode. They will be merged with strict mode in a future release.

- Error number: 3136; Symbol: `ER_VTOKEN_PLUGIN_TOKEN_MISMATCH`; SQLSTATE: `HY000`

Message: Version token mismatch for %.*s. Correct value %.*s

The client has set its `version_tokens_session` system variable to the list of tokens it requires the server to match, but the server token list has at least one matching token name that has a value different from what the client requires. See [Section 5.6.6, “Version Tokens”](#).

- Error number: 3137; Symbol: `ER_VTOKEN_PLUGIN_TOKEN_NOT_FOUND`; SQLSTATE: `HY000`

Message: Version token %.*s not found.

The client has set its `version_tokens_session` system variable to the list of tokens it requires the server to match, but the server token list is missing at least one of those tokens. See [Section 5.6.6, “Version Tokens”](#).

- Error number: 3138; Symbol: `ER_CANT_SET_VARIABLE_WHEN_OWNING_GTID`; SQLSTATE: `HY000`

Message: Variable %s cannot be changed by a client that owns a GTID. The client owns %s. Ownership is released on COMMIT or ROLLBACK.

- Error number: 3139; Symbol: `ER_SLAVE_CHANNEL_OPERATION_NOT_ALLOWED`; SQLSTATE: `HY000`

Message: %s cannot be performed on channel '%s'.

- Error number: 3140; Symbol: `ER_INVALID_JSON_TEXT`; SQLSTATE: `22032`

Message: Invalid JSON text: "%s" at position %u in value for column '%s'.

- Error number: 3141; Symbol: `ER_INVALID_JSON_TEXT_IN_PARAM`; SQLSTATE: `22032`

Message: Invalid JSON text in argument %u to function %s: "%s" at position %u.%s

- Error number: 3142; Symbol: `ER_INVALID_JSON_BINARY_DATA`; SQLSTATE: `HY000`

Message: The JSON binary value contains invalid data.

- Error number: 3143; Symbol: `ER_INVALID_JSON_PATH`; SQLSTATE: `42000`

Message: Invalid JSON path expression. The error is around character position %u.%s

- Error number: 3144; Symbol: `ER_INVALID_JSON_CHARSET`; SQLSTATE: `22032`

Message: Cannot create a JSON value from a string with CHARACTER SET '%s'.

- Error number: 3145; Symbol: `ER_INVALID_JSON_CHARSET_IN_FUNCTION`; SQLSTATE: `22032`

Message: Invalid JSON character data provided to function %s: '%s'; utf8 is required.

- Error number: [3146](#); Symbol: [ER_INVALID_TYPE_FOR_JSON](#); SQLSTATE: [22032](#)

Message: Invalid data type for JSON data in argument %u to function %s; a JSON string or JSON type is required.
- Error number: [3147](#); Symbol: [ER_INVALID_CAST_TO_JSON](#); SQLSTATE: [22032](#)

Message: Cannot CAST value to JSON.
- Error number: [3148](#); Symbol: [ER_INVALID_JSON_PATH_CHARSET](#); SQLSTATE: [42000](#)

Message: A path expression must be encoded in the utf8 character set. The path expression '%s' is encoded in character set '%s'.
- Error number: [3149](#); Symbol: [ER_INVALID_JSON_PATH_WILDCARD](#); SQLSTATE: [42000](#)

Message: In this situation, path expressions may not contain the * and ** tokens or an array range.
- Error number: [3150](#); Symbol: [ER_JSON_VALUE_TOO_BIG](#); SQLSTATE: [22032](#)

Message: The JSON value is too big to be stored in a JSON column.
- Error number: [3151](#); Symbol: [ER_JSON_KEY_TOO_BIG](#); SQLSTATE: [22032](#)

Message: The JSON object contains a key name that is too long.
- Error number: [3152](#); Symbol: [ER_JSON_USED_AS_KEY](#); SQLSTATE: [42000](#)

Message: JSON column '%s' supports indexing only via generated columns on a specified JSON path.
- Error number: [3153](#); Symbol: [ER_JSON_VACUOUS_PATH](#); SQLSTATE: [42000](#)

Message: The path expression '\$' is not allowed in this context.
- Error number: [3154](#); Symbol: [ER_JSON_BAD_ONE_OR_ALL_ARG](#); SQLSTATE: [42000](#)

Message: The oneOrAll argument to %s may take these values: 'one' or 'all'.
- Error number: [3155](#); Symbol: [ER_NUMERIC_JSON_VALUE_OUT_OF_RANGE](#); SQLSTATE: [22003](#)

Message: Out of range JSON value for CAST to %s%s from column %s at row %ld
- Error number: [3156](#); Symbol: [ER_INVALID_JSON_VALUE_FOR_CAST](#); SQLSTATE: [22018](#)

Message: Invalid JSON value for CAST to %s%s from column %s at row %ld
- Error number: [3157](#); Symbol: [ER_JSON_DOCUMENT_TOO_DEEP](#); SQLSTATE: [22032](#)

Message: The JSON document exceeds the maximum depth.
- Error number: [3158](#); Symbol: [ER_JSON_DOCUMENT_NULL_KEY](#); SQLSTATE: [22032](#)

Message: JSON documents may not contain NULL member names.
- Error number: [3159](#); Symbol: [ER_SECURE_TRANSPORT_REQUIRED](#); SQLSTATE: [HY000](#)

Message: Connections using insecure transport are prohibited while --require_secure_transport=ON.

With the [require_secure_transport](#) system variable, clients can connect only using secure transports. Qualifying connections are those using SSL, a Unix socket file, or shared memory.

- Error number: 3160; Symbol: [ER_NO_SECURE_TRANSPORTS_CONFIGURED](#); SQLSTATE: HY000

Message: No secure transports (SSL or Shared Memory) are configured, unable to set --require_secure_transport=ON.

The [require_secure_transport](#) system variable cannot be enabled if the server does not support at least one secure transport. Configure the server with the required SSL keys/certificates to enable SSL connections, or enable the [shared_memory](#) system variable to enable shared-memory connections.

- Error number: 3161; Symbol: [ER_DISABLED_STORAGE_ENGINE](#); SQLSTATE: HY000

Message: Storage engine %s is disabled (Table creation is disallowed).

An attempt was made to create a table or tablespace using a storage engine listed in the value of the [disabled_storage_engines](#) system variable, or to change an existing table or tablespace to such an engine. Choose a different storage engine.

- Error number: 3162; Symbol: [ER_USER_DOES_NOT_EXIST](#); SQLSTATE: HY000

Message: Authorization ID %s does not exist.

- Error number: 3163; Symbol: [ER_USER_ALREADY_EXISTS](#); SQLSTATE: HY000

Message: Authorization ID %s already exists.

- Error number: 3164; Symbol: [ER_AUDIT_API_ABORT](#); SQLSTATE: HY000

Message: Aborted by Audit API ('%s';%d).

This error indicates that an audit plugin terminated execution of an event. The message typically indicates the event subclass name and a numeric status value.

- Error number: 3165; Symbol: [ER_INVALID_JSON_PATH_ARRAY_CELL](#); SQLSTATE: 42000

Message: A path expression is not a path to a cell in an array.

- Error number: 3166; Symbol: [ER_BUFPOOL_RESIZE_INPROGRESS](#); SQLSTATE: HY000

Message: Another buffer pool resize is already in progress.

- Error number: 3167; Symbol: [ER_FEATURE_DISABLED_SEE_DOC](#); SQLSTATE: HY000

Message: The '%s' feature is disabled; see the documentation for '%s'

- Error number: 3168; Symbol: [ER_SERVER_ISNT_AVAILABLE](#); SQLSTATE: HY000

Message: Server isn't available

- Error number: 3169; Symbol: [ER_SESSION_WAS_KILLED](#); SQLSTATE: HY000

Message: Session was killed

- Error number: 3170; Symbol: [ER_CAPACITY_EXCEEDED](#); SQLSTATE: HY000

Message: Memory capacity of %llu bytes for '%s' exceeded. %s

- Error number: 3171; Symbol: [ER_CAPACITY_EXCEEDED_IN_RANGE_OPTIMIZER](#); SQLSTATE: HY000

Message: Range optimization was not done for this query.

- Error number: 3173; Symbol: `ER_CANT_WAIT_FOR_EXECUTED_GTID_SET_WHILE_OWNING_A_GTID`; SQLSTATE: HY000

Message: The client holds ownership of the GTID %s. Therefore, WAIT_FOR_EXECUTED_GTID_SET cannot wait for this GTID.
- Error number: 3174; Symbol: `ER_CANNOT_ADD_FOREIGN_BASE_COL_VIRTUAL`; SQLSTATE: HY000

Message: Cannot add foreign key on the base column of indexed virtual column.
- Error number: 3175; Symbol: `ER_CANNOT_CREATE_VIRTUAL_INDEX_CONSTRAINT`; SQLSTATE: HY000

Message: Cannot create index on virtual column whose base column has foreign constraint.
- Error number: 3176; Symbol: `ER_ERROR_ON_MODIFYING_GTID_EXECUTED_TABLE`; SQLSTATE: HY000

Message: Please do not modify the %s table with an XA transaction. This is an internal system table used to store GTIDs for committed transactions. Although modifying it can lead to an inconsistent GTID state, if necessary you can modify it with a non-XA transaction.
- Error number: 3177; Symbol: `ER_LOCK_REFUSED_BY_ENGINE`; SQLSTATE: HY000

Message: Lock acquisition refused by storage engine.
- Error number: 3178; Symbol: `ER_UNSUPPORTED_ALTER_ONLINE_ON_VIRTUAL_COLUMN`; SQLSTATE: HY000

Message: ADD COLUMN col...VIRTUAL, ADD INDEX(col)
- Error number: 3179; Symbol: `ER_MASTER_KEY_ROTATION_NOT_SUPPORTED_BY_SE`; SQLSTATE: HY000

Message: Master key rotation is not supported by storage engine.
- Error number: 3181; Symbol: `ER_MASTER_KEY_ROTATION_BINLOG_FAILED`; SQLSTATE: HY000

Message: Write to binlog failed. However, master key rotation has been completed successfully.
- Error number: 3182; Symbol: `ER_MASTER_KEY_ROTATION_SE_UNAVAILABLE`; SQLSTATE: HY000

Message: Storage engine is not available.
- Error number: 3183; Symbol: `ER_TABLESPACE_CANNOT_ENCRYPT`; SQLSTATE: HY000

Message: This tablespace can't be encrypted.
- Error number: 3184; Symbol: `ER_INVALID_ENCRYPTION_OPTION`; SQLSTATE: HY000

Message: Invalid encryption option.
- Error number: 3185; Symbol: `ER_CANNOT_FIND_KEY_IN_KEYRING`; SQLSTATE: HY000

Message: Can't find master key from keyring, please check in the server log if a keyring plugin is loaded and initialized successfully.
- Error number: 3186; Symbol: `ER_CAPACITY_EXCEEDED_IN_PARSER`; SQLSTATE: HY000

Message: Parser bailed out for this query.

- Error number: 3187; Symbol: [ER_UNSUPPORTED_ALTER_ENCRYPTION_INPLACE](#); SQLSTATE: [HY000](#)

Message: Cannot alter encryption attribute by inplace algorithm.

- Error number: 3188; Symbol: [ER_KEYRING_UDF_KEYRING_SERVICE_ERROR](#); SQLSTATE: [HY000](#)

Message: Function '%s' failed because underlying keyring service returned an error. Please check if a keyring plugin is installed and that provided arguments are valid for the keyring you are using.

- Error number: 3189; Symbol: [ER_USER_COLUMN_OLD_LENGTH](#); SQLSTATE: [HY000](#)

Message: It seems that your db schema is old. The %s column is 77 characters long and should be 93 characters long. Please perform the MySQL upgrade procedure.

- Error number: 3190; Symbol: [ER_CANT_RESET_MASTER](#); SQLSTATE: [HY000](#)

Message: RESET MASTER is not allowed because %s.

- Error number: 3191; Symbol: [ER_GROUP_REPLICATION_MAX_GROUP_SIZE](#); SQLSTATE: [HY000](#)

Message: The START GROUP_REPLICATION command failed since the group already has 9 members.

- Error number: 3192; Symbol: [ER_CANNOT_ADD_FOREIGN_BASE_COL_STORED](#); SQLSTATE: [HY000](#)

Message: Cannot add foreign key on the base column of stored column.

- Error number: 3193; Symbol: [ER_TABLE_REFERENCED](#); SQLSTATE: [HY000](#)

Message: Cannot complete the operation because table is referenced by another connection.

- Error number: 3197; Symbol: [ER_XA_RETRY](#); SQLSTATE: [HY000](#)

Message: The resource manager is not able to commit the transaction branch at this time. Please retry later.

[ER_XA_RETRY](#) was added in 8.0.2.

- Error number: 3198; Symbol: [ER_KEYRING_AWS_UDF_AWS_KMS_ERROR](#); SQLSTATE: [HY000](#)

Message: Function %s failed due to: %s.

[ER_KEYRING_AWS_UDF_AWS_KMS_ERROR](#) was added in 8.0.2.

- Error number: 3199; Symbol: [ER_BINLOG_UNSAFE_XA](#); SQLSTATE: [HY000](#)

Message: Statement is unsafe because it is being used inside a XA transaction. Concurrent XA transactions may deadlock on slaves when replicated using statements.

[ER_BINLOG_UNSAFE_XA](#) was added in 8.0.2.

- Error number: 3200; Symbol: [ER_UDF_ERROR](#); SQLSTATE: [HY000](#)

Message: %s UDF failed; %s

[ER_UDF_ERROR](#) was added in 8.0.4.

- Error number: 3201; Symbol: [ER_KEYRING_MIGRATION_FAILURE](#); SQLSTATE: HY000
Message: Can not perform keyring migration : %s
[ER_KEYRING_MIGRATION_FAILURE](#) was added in 8.0.4.
- Error number: 3202; Symbol: [ER_KEYRING_ACCESS_DENIED_ERROR](#); SQLSTATE: 42000
Message: Access denied; you need %s privileges for this operation
[ER_KEYRING_ACCESS_DENIED_ERROR](#) was added in 8.0.4.
- Error number: 3203; Symbol: [ER_KEYRING_MIGRATION_STATUS](#); SQLSTATE: HY000
Message: Keyring migration %s.
[ER_KEYRING_MIGRATION_STATUS](#) was added in 8.0.4.
- Error number: 3218; Symbol: [ER_AUDIT_LOG_UDF_READ_INVALID_MAX_ARRAY_LENGTH_ARG_VALUE](#); SQLSTATE: HY000
Message: Invalid "max_array_length" argument value.
[ER_AUDIT_LOG_UDF_READ_INVALID_MAX_ARRAY_LENGTH_ARG_VALUE](#) was added in 8.0.11.
- Error number: 3500; Symbol: [ER_UNUNSUPPORT_COMPRESSED_TEMPORARY_TABLE](#); SQLSTATE: HY000
Message: CREATE TEMPORARY TABLE is not allowed with ROW_FORMAT=COMPRESSED or KEY_BLOCK_SIZE.
- Error number: 3501; Symbol: [ER_ACL_OPERATION_FAILED](#); SQLSTATE: HY000
Message: The ACL operation failed due to the following error from SE: errcode %d - %s
- Error number: 3502; Symbol: [ER_UNUNSUPPORTED_INDEX_ALGORITHM](#); SQLSTATE: HY000
Message: This storage engine does not support the %s index algorithm, storage engine default was used instead.
- Error number: 3503; Symbol: [ER_NO_SUCH_DB](#); SQLSTATE: 42Y07
Message: Database '%s' doesn't exist
- Error number: 3504; Symbol: [ER_TOO_BIG_ENUM](#); SQLSTATE: HY000
Message: Too many enumeration values for column %s.
- Error number: 3505; Symbol: [ER_TOO_LONG_SET_ENUM_VALUE](#); SQLSTATE: HY000
Message: Too long enumeration/set value for column %s.
- Error number: 3506; Symbol: [ER_INVALID_DD_OBJECT](#); SQLSTATE: HY000
Message: %s dictionary object is invalid. (%s)
- Error number: 3507; Symbol: [ER_UPDATING_DD_TABLE](#); SQLSTATE: HY000
Message: Failed to update %s dictionary object.

- Error number: 3508; Symbol: [ER_INVALID_DD_OBJECT_ID](#); SQLSTATE: [HY000](#)
Message: Dictionary object id (%lu) does not exist.
- Error number: 3509; Symbol: [ER_INVALID_DD_OBJECT_NAME](#); SQLSTATE: [HY000](#)
Message: Dictionary object name '%s' is invalid. (%s)
- Error number: 3510; Symbol: [ER_TABLESPACE_MISSING_WITH_NAME](#); SQLSTATE: [HY000](#)
Message: Tablespace %s doesn't exist.
- Error number: 3511; Symbol: [ER_TOO_LONG_ROUTINE_COMMENT](#); SQLSTATE: [HY000](#)
Message: Comment for routine '%s' is too long (max = %lu)
- Error number: 3512; Symbol: [ER_SP_LOAD_FAILED](#); SQLSTATE: [HY000](#)
Message: Failed to load routine '%s'.
- Error number: 3513; Symbol: [ER_INVALID_BITWISE_OPERANDS_SIZE](#); SQLSTATE: [HY000](#)
Message: Binary operands of bitwise operators must be of equal length
- Error number: 3514; Symbol: [ER_INVALID_BITWISE_AGGREGATE_OPERANDS_SIZE](#); SQLSTATE: [HY000](#)
Message: Aggregate bitwise functions cannot accept arguments longer than 511 bytes; consider using the SUBSTRING() function
- Error number: 3515; Symbol: [ER_WARN_UNSUPPORTED_HINT](#); SQLSTATE: [HY000](#)
Message: Hints aren't supported in %s
- Error number: 3516; Symbol: [ER_UNEXPECTED_GEOMETRY_TYPE](#); SQLSTATE: [22S01](#)
Message: %s value is a geometry of unexpected type %s in %s.
- Error number: 3517; Symbol: [ER_SRS_PARSE_ERROR](#); SQLSTATE: [SR002](#)
Message: Can't parse the spatial reference system definition of SRID %u.
- Error number: 3518; Symbol: [ER_SRS_PROJ_PARAMETER_MISSING](#); SQLSTATE: [SR003](#)
Message: The spatial reference system definition for SRID %u does not specify the mandatory %s (EPSG %u) projection parameter.
- Error number: 3519; Symbol: [ER_WARN_SRS_NOT_FOUND](#); SQLSTATE: [01000](#)
Message: There's no spatial reference system with SRID %u.
- Error number: 3520; Symbol: [ER_SRS_NOT_CARTESIAN](#); SQLSTATE: [22S00](#)
Message: Function %s is only defined for Cartesian spatial reference systems, but one of its arguments is in SRID %u, which is not Cartesian.
- Error number: 3521; Symbol: [ER_SRS_NOT_CARTESIAN_UNDEFINED](#); SQLSTATE: [SR001](#)
Message: Function %s is only defined for Cartesian spatial reference systems, but one of its arguments is in SRID %u, which has not been defined.

- Error number: 3522; Symbol: [ER_PK_INDEX_CANT_BE_INVISIBLE](#); SQLSTATE: HY000
Message: A primary key index cannot be invisible
- Error number: 3523; Symbol: [ER_UNKNOWN_AUTHID](#); SQLSTATE: HY000
Message: Unknown authorization ID '%s'@'%s'

Message: Failed to grant '%s' to %s
- Error number: 3525; Symbol: [ER_OPEN_ROLE_TABLES](#); SQLSTATE: HY000
Message: Failed to open the security system tables
- Error number: 3526; Symbol: [ER_FAILED_DEFAULT_ROLES](#); SQLSTATE: HY000
Message: Failed to set default roles
- Error number: 3527; Symbol: [ER_COMPONENTS_NO_SCHEME](#); SQLSTATE: HY000
Message: Cannot find schema in specified URN: '%s'.
- Error number: 3528; Symbol: [ER_COMPONENTS_NO_SCHEME_SERVICE](#); SQLSTATE: HY000
Message: Cannot acquire scheme load service implementation for schema '%s' in specified URN: '%s'.
- Error number: 3529; Symbol: [ER_COMPONENTS_CANT_LOAD](#); SQLSTATE: HY000
Message: Cannot load component from specified URN: '%s'.
- Error number: 3530; Symbol: [ER_ROLE_NOT_GRANTED](#); SQLSTATE: HY000
Message: '%s'@'%s' is not granted to '%s'@'%s'
- Error number: 3531; Symbol: [ER_FAILED_REVOKE_ROLE](#); SQLSTATE: HY000
Message: Could not revoke role from '%s'@'%s'
- Error number: 3532; Symbol: [ER_RENAME_ROLE](#); SQLSTATE: HY000
Message: Renaming of a role identifier is forbidden
- Error number: 3533; Symbol: [ER_COMPONENTS_CANT_ACQUIRE_SERVICE_IMPLEMENTATION](#); SQLSTATE: HY000
Message: Cannot acquire specified service implementation: '%s'.
- Error number: 3534; Symbol: [ER_COMPONENTS_CANT_SATISFY_DEPENDENCY](#); SQLSTATE: HY000
Message: Cannot satisfy dependency for service '%s' required by component '%s'.
- Error number: 3535; Symbol: [ER_COMPONENTS_LOAD_CANT_REGISTER_SERVICE_IMPLEMENTATION](#); SQLSTATE: HY000
Message: Cannot register service implementation '%s' provided by component '%s'.
- Error number: 3536; Symbol: [ER_COMPONENTS_LOAD_CANT_INITIALIZE](#); SQLSTATE: HY000

Message: Initialization method provided by component '%s' failed.

- Error number: 3537; Symbol: [ER_COMPONENTS_UNLOAD_NOT_LOADED](#); SQLSTATE: [HY000](#)

Message: Component specified by URN '%s' to unload has not been loaded before.

- Error number: 3538; Symbol: [ER_COMPONENTS_UNLOAD_CANT_DEINITIALIZE](#); SQLSTATE: [HY000](#)

Message: De-initialization method provided by component '%s' failed.

- Error number: 3539; Symbol: [ER_COMPONENTS_CANT_RELEASE_SERVICE](#); SQLSTATE: [HY000](#)

Message: Release of previously acquired service implementation failed.

- Error number: 3540; Symbol: [ER_COMPONENTS_UNLOAD_CANT_UNREGISTER_SERVICE](#); SQLSTATE: [HY000](#)

Message: Unregistration of service implementation '%s' provided by component '%s' failed during unloading of the component.

- Error number: 3541; Symbol: [ER_COMPONENTS_CANT_UNLOAD](#); SQLSTATE: [HY000](#)

Message: Cannot unload component from specified URN: '%s'.

- Error number: 3542; Symbol: [ER_WARN_UNLOAD_THE_NOT_PERSISTED](#); SQLSTATE: [HY000](#)

Message: The Persistent Dynamic Loader was used to unload a component '%s', but it was not used to load that component before.

- Error number: 3543; Symbol: [ER_COMPONENT_TABLE_INCORRECT](#); SQLSTATE: [HY000](#)

Message: The mysql.component table is missing or has an incorrect definition.

- Error number: 3544; Symbol: [ER_COMPONENT_MANIPULATE_ROW_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to manipulate component '%s' persistence data. Error code %d from storage engine.

- Error number: 3545; Symbol: [ER_COMPONENTS_UNLOAD_DUPLICATE_IN_GROUP](#); SQLSTATE: [HY000](#)

Message: The component with specified URN: '%s' was specified in group more than once.

- Error number: 3546; Symbol: [ER_CANT_SET_GTID_PURGED_DUE_SETS_CONSTRAINTS](#); SQLSTATE: [HY000](#)

Message: @@GLOBAL.GTID_PURGED cannot be changed: %s

- Error number: 3547; Symbol: [ER_CANNOT_LOCK_USER_MANAGEMENT_CACHES](#); SQLSTATE: [HY000](#)

Message: Can not lock user management caches for processing.

- Error number: 3548; Symbol: [ER_SRS_NOT_FOUND](#); SQLSTATE: [SR001](#)

Message: There's no spatial reference system with SRID %u.

- Error number: 3549; Symbol: [ER_VARIABLE_NOT_PERSISTED](#); SQLSTATE: [HY000](#)

Message: Variables cannot be persisted. Please retry.

- Error number: 3550; Symbol: [ER_IS_QUERY_INVALID_CLAUSE](#); SQLSTATE: [HY000](#)

Message: Information schema queries do not support the '%s' clause.

- Error number: 3551; Symbol: [ER_UNABLE_TO_STORE_STATISTICS](#); SQLSTATE: [HY000](#)

Message: Unable to store dynamic %s statistics into data dictionary.

- Error number: 3552; Symbol: [ER_NO_SYSTEM_SCHEMA_ACCESS](#); SQLSTATE: [HY000](#)

Message: Access to system schema '%s' is rejected.

- Error number: 3553; Symbol: [ER_NO_SYSTEM_TABLESPACE_ACCESS](#); SQLSTATE: [HY000](#)

Message: Access to system tablespace '%s' is rejected.

- Error number: 3554; Symbol: [ER_NO_SYSTEM_TABLE_ACCESS](#); SQLSTATE: [HY000](#)

Message: Access to %s '%s.%s' is rejected.

Message: The requested value '%llu' for the next binary log index is out of range. Please use a value between '1' and '%lu'.

[ER_RESET_MASTER_TO_VALUE_OUT_OF_RANGE](#) was added in 8.0.1.

- Error number: [3568](#); Symbol: [ER_UNRESOLVED_TABLE_LOCK](#); SQLSTATE: [HY000](#)

Message: Unresolved table name %s in locking clause.

[ER_UNRESOLVED_TABLE_LOCK](#) was added in 8.0.1.

- Error number: [3569](#); Symbol: [ER_DUPLICATE_TABLE_LOCK](#); SQLSTATE: [HY000](#)

Message: Table %s appears in multiple locking clauses.

[ER_DUPLICATE_TABLE_LOCK](#) was added in 8.0.1.

- Error number: [3570](#); Symbol: [ER_BINLOG_UNSAFE_SKIP_LOCKED](#); SQLSTATE: [HY000](#)

Message: Statement is unsafe because it uses SKIP LOCKED. The set of inserted values is non-deterministic.

[ER_BINLOG_UNSAFE_SKIP_LOCKED](#) was added in 8.0.1.

- Error number: [3571](#); Symbol: [ER_BINLOG_UNSAFE_NOWAIT](#); SQLSTATE: [HY000](#)

Message: Statement is unsafe because it uses NOWAIT. Whether the command will succeed or fail is not deterministic.

[ER_BINLOG_UNSAFE_NOWAIT](#) was added in 8.0.1.

- Error number: [3572](#); Symbol: [ER_LOCK_NOWAIT](#); SQLSTATE: [HY000](#)

Message: Statement aborted because lock(s) could not be acquired immediately and NOWAIT is set.

[ER_LOCK_NOWAIT](#) was added in 8.0.1.

- Error number: [3573](#); Symbol: [ER_CTE_RECURSIVE_REQUIRES_UNION](#); SQLSTATE: [HY000](#)

Message: Recursive Common Table Expression '%s' should contain a UNION

[ER_CTE_RECURSIVE_REQUIRES_UNION](#) was added in 8.0.1.

- Error number: [3574](#); Symbol: [ER_CTE_RECURSIVE_REQUIRES_NONRECURSIVE_FIRST](#); SQLSTATE: [HY000](#)

Message: Recursive Common Table Expression '%s' should have one or more non-recursive query blocks followed by one or more recursive ones

[ER_CTE_RECURSIVE_REQUIRES_NONRECURSIVE_FIRST](#) was added in 8.0.1.

- Error number: [3575](#); Symbol: [ER_CTE_RECURSIVE_FORBIDS_AGGREGATION](#); SQLSTATE: [HY000](#)

Message: Recursive Common Table Expression '%s' can contain neither aggregation nor window functions in recursive query block

[ER_CTE_RECURSIVE_FORBIDS_AGGREGATION](#) was added in 8.0.1.

- Error number: [3576](#); Symbol: [ER_CTE_RECURSIVE_FORBIDDEN_JOIN_ORDER](#); SQLSTATE: [HY000](#)

Message: In recursive query block of Recursive Common Table Expression '%s', the recursive table must neither be in the right argument of a LEFT JOIN, nor be forced to be non-first with join order hints

[ER_CTE_RECURSIVE_FORBIDDEN_JOIN_ORDER](#) was added in 8.0.1.

- Error number: [3577](#); Symbol: [ER_CTE_RECURSIVE_REQUIRES_SINGLE_REFERENCE](#); SQLSTATE: [HY000](#)

Message: In recursive query block of Recursive Common Table Expression '%s', the recursive table must be referenced only once, and not in any subquery

[ER_CTE_RECURSIVE_REQUIRES_SINGLE_REFERENCE](#) was added in 8.0.1.

- Error number: [3578](#); Symbol: [ER_SWITCH_TMP_ENGINE](#); SQLSTATE: [HY000](#)

Message: '%s' requires @@internal_tmp_disk_storage_engine=InnoDB

[ER_SWITCH_TMP_ENGINE](#) was added in 8.0.1.

- Error number: [3579](#); Symbol: [ER_WINDOW_NO_SUCH_WINDOW](#); SQLSTATE: [HY000](#)

Message: Window name '%s' is not defined.

[ER_WINDOW_NO_SUCH_WINDOW](#) was added in 8.0.2.

- Error number: 3580; Symbol: [ER_WINDOW_CIRCULARITY_IN_WINDOW_GRAPH](#); SQLSTATE: HY000
Message: There is a circularity in the window dependency graph.
[ER_WINDOW_CIRCULARITY_IN_WINDOW_GRAPH](#) was added in 8.0.2.
- Error number: 3581; Symbol: [ER_WINDOW_NO_CHILD_PARTITIONING](#); SQLSTATE: HY000
Message: A window which depends on another cannot define partitioning.
[ER_WINDOW_NO_CHILD_PARTITIONING](#) was added in 8.0.2.
- Error number: 3582; Symbol: [ER_WINDOW_NO_INHERIT_FRAME](#); SQLSTATE: HY000
Message: Window '%s' has a frame definition, so cannot be referenced by another window.
[ER_WINDOW_NO_INHERIT_FRAME](#) was added in 8.0.2.
- Error number: 3583; Symbol: [ER_WINDOW_NO_REDEFINE_ORDER_BY](#); SQLSTATE: HY000
Message: Window '%s' cannot inherit '%s' since both contain an ORDER BY clause.
[ER_WINDOW_NO_REDEFINE_ORDER_BY](#) was added in 8.0.2.
- Error number: 3584; Symbol: [ER_WINDOW_FRAME_START_ILLEGAL](#); SQLSTATE: HY000
Message: Window '%s': frame start cannot be UNBOUNDED FOLLOWING.
[ER_WINDOW_FRAME_START_ILLEGAL](#) was added in 8.0.2.
- Error number: 3585; Symbol: [ER_WINDOW_FRAME_END_ILLEGAL](#); SQLSTATE: HY000
Message: Window '%s': frame end cannot be UNBOUNDED PRECEDING.
[ER_WINDOW_FRAME_END_ILLEGAL](#) was added in 8.0.2.
- Error number: 3586; Symbol: [ER_WINDOW_FRAME_ILLEGAL](#); SQLSTATE: HY000
Message: Window '%s': frame start or end is negative, NULL or of non-integral type
[ER_WINDOW_FRAME_ILLEGAL](#) was added in 8.0.2.
- Error number: 3587; Symbol: [ER_WINDOW_RANGE_FRAME_ORDER_TYPE](#); SQLSTATE: HY000
Message: Window '%s' with RANGE N PRECEDING/FOLLOWING frame requires exactly one ORDER BY expression, of numeric or temporal type
[ER_WINDOW_RANGE_FRAME_ORDER_TYPE](#) was added in 8.0.2.
- Error number: 3588; Symbol: [ER_WINDOW_RANGE_FRAME_TEMPORAL_TYPE](#); SQLSTATE: HY000
Message: Window '%s' with RANGE frame has ORDER BY expression of datetime type. Only INTERVAL bound value allowed.
[ER_WINDOW_RANGE_FRAME_TEMPORAL_TYPE](#) was added in 8.0.2.
- Error number: 3589; Symbol: [ER_WINDOW_RANGE_FRAME_NUMERIC_TYPE](#); SQLSTATE: HY000
Message: Window '%s' with RANGE frame has ORDER BY expression of numeric type, INTERVAL bound value not allowed.

[ER_WINDOW_RANGE_FRAME_NUMERIC_TYPE](#) was added in 8.0.2.

- Error number: [3590](#); Symbol: [ER_WINDOW_RANGE_BOUND_NOT_CONSTANT](#); SQLSTATE: [HY000](#)
Message: Window '%s' has a non-constant frame bound.

[ER_WINDOW_RANGE_BOUND_NOT_CONSTANT](#) was added in 8.0.2.

- Error number: [3591](#); Symbol: [ER_WINDOW_DUPLICATE_NAME](#); SQLSTATE: [HY000](#)
Message: Window '%s' is defined twice.

[ER_WINDOW_DUPLICATE_NAME](#) was added in 8.0.2.

- Error number: [3592](#); Symbol: [ER_WINDOW_ILLEGAL_ORDER_BY](#); SQLSTATE: [HY000](#)
Message: Window '%s': ORDER BY or PARTITION BY uses legacy position indication which is not supported, use expression.

[ER_WINDOW_ILLEGAL_ORDER_BY](#) was added in 8.0.2.

- Error number: [3593](#); Symbol: [ER_WINDOW_INVALID_WINDOW_FUNC_USE](#); SQLSTATE: [HY000](#)
Message: You cannot use the window function '%s' in this context.'

[ER_WINDOW_INVALID_WINDOW_FUNC_USE](#) was added in 8.0.2.

- Error number: [3594](#); Symbol: [ER_WINDOW_INVALID_WINDOW_FUNC_ALIAS_USE](#); SQLSTATE: [HY000](#)
Message: You cannot use the alias '%s' of an expression containing a window function in this context.'

[ER_WINDOW_INVALID_WINDOW_FUNC_ALIAS_USE](#) was added in 8.0.2.

- Error number: [3595](#); Symbol: [ER_WINDOW_NESTED_WINDOW_FUNC_USE_IN_WINDOW_SPEC](#); SQLSTATE: [HY000](#)
Message: You cannot nest a window function in the specification of window '%s'.

[ER_WINDOW_NESTED_WINDOW_FUNC_USE_IN_WINDOW_SPEC](#) was added in 8.0.2.

- Error number: [3596](#); Symbol: [ER_WINDOW_ROWS_INTERVAL_USE](#); SQLSTATE: [HY000](#)
Message: Window '%s': INTERVAL can only be used with RANGE frames.

[ER_WINDOW_ROWS_INTERVAL_USE](#) was added in 8.0.2.

- Error number: [3597](#); Symbol: [ER_WINDOW_NO_GROUP_ORDER](#); SQLSTATE: [HY000](#)
Message: ASC or DESC with GROUP BY isn't allowed with window functions; put ASC or DESC in ORDER BY

[ER_WINDOW_NO_GROUP_ORDER](#) was added in 8.0.2, removed after 8.0.12.

- Error number: [3597](#); Symbol: [ER_WINDOW_NO_GROUP_ORDER_UNUSED](#); SQLSTATE: [HY000](#)
Message: ASC or DESC with GROUP BY isn't allowed with window functions; put ASC or DESC in ORDER BY

[ER_WINDOW_NO_GROUP_ORDER_UNUSED](#) was added in 8.0.13.

- Error number: [3598](#); Symbol: [ER_WINDOW_EXPLAIN_JSON](#); SQLSTATE: [HY000](#)

Message: To get information about window functions use EXPLAIN FORMAT=JSON

[ER_WINDOW_EXPLAIN_JSON](#) was added in 8.0.2.

- Error number: [3599](#); Symbol: [ER_WINDOW_FUNCTION_IGNORES_FRAME](#); SQLSTATE: [HY000](#)

Message: Window function '%s' ignores the frame clause of window '%s' and aggregates over the whole partition

[ER_WINDOW_FUNCTION_IGNORES_FRAME](#) was added in 8.0.2.

- Error number: [3600](#); Symbol: [ER_WINDOW_SE_NOT_ACCEPTABLE](#); SQLSTATE: [HY000](#)

Message: Windowing requires @@internal_tmp_mem_storage_engine=TempTable.

[ER_WINDOW_SE_NOT_ACCEPTABLE](#) was added in 8.0.2, removed after 8.0.3.

- Error number: [3600](#); Symbol: [ER_WL9236_NOW_UNUSED](#); SQLSTATE: [HY000](#)

Message: Windowing requires @@internal_tmp_mem_storage_engine=TempTable.

[ER_WL9236_NOW_UNUSED](#) was added in 8.0.4.

- Error number: [3601](#); Symbol: [ER_INVALID_NO_OF_ARGS](#); SQLSTATE: [HY000](#)

Message: Too many arguments for function %s: %lu; maximum allowed is %s.

[ER_INVALID_NO_OF_ARGS](#) was added in 8.0.1.

- Error number: [3602](#); Symbol: [ER_FIELD_IN_GROUPING_NOT_GROUP_BY](#); SQLSTATE: [HY000](#)

Message: Argument #%u of GROUPING function is not in GROUP BY

[ER_FIELD_IN_GROUPING_NOT_GROUP_BY](#) was added in 8.0.1.

- Error number: [3603](#); Symbol: [ER_TOO_LONG_TABLESPACE_COMMENT](#); SQLSTATE: [HY000](#)

Message: Comment for tablespace '%s' is too long (max = %lu)

[ER_TOO_LONG_TABLESPACE_COMMENT](#) was added in 8.0.1.

- Error number: [3604](#); Symbol: [ER_ENGINE_CANT_DROP_TABLE](#); SQLSTATE: [HY000](#)

Message: Storage engine can't drop table '%s'

[ER_ENGINE_CANT_DROP_TABLE](#) was added in 8.0.1.

- Error number: [3605](#); Symbol: [ER_ENGINE_CANT_DROP_MISSING_TABLE](#); SQLSTATE: [HY000](#)

Message: Storage engine can't drop table '%s' because it is missing. Use DROP TABLE IF EXISTS to remove it from data-dictionary.

[ER_ENGINE_CANT_DROP_MISSING_TABLE](#) was added in 8.0.1.

- Error number: [3606](#); Symbol: [ER_TABLESPACE_DUP_FILENAME](#); SQLSTATE: [HY000](#)

Message: Duplicate file name for tablespace '%s'

[ER_TABLESPACE_DUP_FILENAME](#) was added in 8.0.1.

- Error number: [3607](#); Symbol: [ER_DB_DROP_RMDIR2](#); SQLSTATE: [HY000](#)

Message: Problem while dropping database. Can't remove database directory (%s). Please remove it manually.

[ER_DB_DROP_RMDIR2](#) was added in 8.0.1.

- Error number: [3608](#); Symbol: [ER_IMP_NO_FILES_MATCHED](#); SQLSTATE: [HY000](#)

Message: No SDI files matched the pattern '%s'

[ER_IMP_NO_FILES_MATCHED](#) was added in 8.0.1.

- Error number: [3609](#); Symbol: [ER_IMP_SCHEMA_DOES_NOT_EXIST](#); SQLSTATE: [HY000](#)

Message: Schema '%s', referenced in SDI, does not exist.

[ER_IMP_SCHEMA_DOES_NOT_EXIST](#) was added in 8.0.1.

- Error number: [3610](#); Symbol: [ER_IMP_TABLE_ALREADY_EXISTS](#); SQLSTATE: [HY000](#)

Message: Table '%s.%s', referenced in SDI, already exists.

[ER_IMP_TABLE_ALREADY_EXISTS](#) was added in 8.0.1.

- Error number: [3611](#); Symbol: [ER_IMP_INCOMPATIBLE_MYSQLD_VERSION](#); SQLSTATE: [HY000](#)

Message: Imported mysqld_version (%llu) is not compatible with current (%llu)

[ER_IMP_INCOMPATIBLE_MYSQLD_VERSION](#) was added in 8.0.1.

- Error number: [3612](#); Symbol: [ER_IMP_INCOMPATIBLE_DD_VERSION](#); SQLSTATE: [HY000](#)

Message: Imported dd version (%u) is not compatible with current (%u)

[ER_IMP_INCOMPATIBLE_DD_VERSION](#) was added in 8.0.1.

- Error number: [3613](#); Symbol: [ER_IMP_INCOMPATIBLE_SDI_VERSION](#); SQLSTATE: [HY000](#)

Message: Imported sdi version (%llu) is not compatible with current (%llu)

[ER_IMP_INCOMPATIBLE_SDI_VERSION](#) was added in 8.0.1.

- Error number: [3614](#); Symbol: [ER_WARN_INVALID_HINT](#); SQLSTATE: [HY000](#)

Message: Invalid number of arguments for hint %s

[ER_WARN_INVALID_HINT](#) was added in 8.0.1.

Message: Can't store an array or an object in the scalar JSON_TABLE column '%s'

[ER_WRONG_JSON_TABLE_VALUE](#) was added in 8.0.4.

- Error number: [3667](#); Symbol: [ER_TF_MUST_HAVE_ALIAS](#); SQLSTATE: [42000](#)
Message: Every table function must have an alias

[ER_TF_MUST_HAVE_ALIAS](#) was added in 8.0.4.

- Error number: [3668](#); Symbol: [ER_TF_FORBIDDEN_JOIN_TYPE](#); SQLSTATE: [HY000](#)
Message: INNER or LEFT JOIN must be used for LATERAL references made by '%s'

[ER_TF_FORBIDDEN_JOIN_TYPE](#) was added in 8.0.4.

- Error number: [3669](#); Symbol: [ER_JT_VALUE_OUT_OF_RANGE](#); SQLSTATE: [22003](#)
Message: Value is out of range for JSON_TABLE's column '%s'

[ER_JT_VALUE_OUT_OF_RANGE](#) was added in 8.0.4.

- Error number: [3670](#); Symbol: [ER_JT_MAX_NESTED_PATH](#); SQLSTATE: [42000](#)
Message: More than supported %u NESTED PATHs were found in JSON_TABLE '%s'

[ER_JT_MAX_NESTED_PATH](#) was added in 8.0.4.

- Error number: [3671](#); Symbol: [ER_PASSWORD_EXPIRATION_NOT_SUPPORTED_BY_AUTH_METHOD](#); SQLSTATE: [HY000](#)

Message: The selected authentication method %.*s does not support password expiration

[ER_PASSWORD_EXPIRATION_NOT_SUPPORTED_BY_AUTH_METHOD](#) was added in 8.0.4.

- Error number: [3672](#); Symbol: [ER_INVALID_GEOJSON CRS NOT TOP LEVEL](#); SQLSTATE: [HY000](#)

Message: Invalid GeoJSON data provided to function %s: Member 'crs' must be specified in the top level object.

[ER_INVALID_GEOJSON CRS NOT TOP LEVEL](#) was added in 8.0.4.

- Error number: [3673](#); Symbol: [ER_BAD_NULL_ERROR_NOT_IGNORED](#); SQLSTATE: [23000](#)

Message: Column '%s' cannot be null

[ER_BAD_NULL_ERROR_NOT_IGNORED](#) was added in 8.0.4.

- Error number: [3674](#); Symbol: [WARN_USELESS_SPATIAL_INDEX](#); SQLSTATE: [HY000](#)

Message: The spatial index on column '%s' will not be used by the query optimizer since the column does not have an SRID attribute. Consider adding an SRID attribute to the column.

[WARN_USELESS_SPATIAL_INDEX](#) was added in 8.0.4.

- Error number: [3675](#); Symbol: [ER_DISK_FULL_NOWAIT](#); SQLSTATE: [HY000](#)

Message: Create table/tablespace '%s' failed, as disk is full

[ER_DISK_FULL_NOWAIT](#) was added in 8.0.4.

- Error number: [3676](#); Symbol: [ER_PARSE_ERROR_IN_DIGEST_FN](#); SQLSTATE: [HY000](#)

Message: Could not parse argument to digest function: "%s".

[ER_PARSE_ERROR_IN_DIGEST_FN](#) was added in 8.0.4.

- Error number: [3677](#); Symbol: [ER_UNDISCLOSED_PARSE_ERROR_IN_DIGEST_FN](#); SQLSTATE: [HY000](#)

Message: Could not parse argument to digest function.

[ER_UNDISCLOSED_PARSE_ERROR_IN_DIGEST_FN](#) was added in 8.0.4.

- Error number: [3678](#); Symbol: [ER_SCHEMA_DIR_EXISTS](#); SQLSTATE: [HY000](#)

Message: Schema directory '%s' already exists. This must be resolved manually (e.g. by moving the schema directory to another location).

[ER_SCHEMA_DIR_EXISTS](#) was added in 8.0.4.

- Error number: [3679](#); Symbol: [ER_SCHEMA_DIR_MISSING](#); SQLSTATE: [HY000](#)

Message: Schema directory '%s' does not exist

[ER_SCHEMA_DIR_MISSING](#) was added in 8.0.4.

- Error number: [3680](#); Symbol: [ER_SCHEMA_DIR_CREATE_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to create schema directory '%s' (errno: %d - %s)

[ER_SCHEMA_DIR_CREATE_FAILED](#) was added in 8.0.4.

- Error number: 3681; Symbol: [ER_SCHEMA_DIR_UNKNOWN](#); SQLSTATE: [HY000](#)

Message: Schema '%s' does not exist, but schema directory '%s' was found. This must be resolved manually (e.g. by moving the schema directory to another location).

[ER_SCHEMA_DIR_UNKNOWN](#) was added in 8.0.4.

- Error number: 3682; Symbol: [ER_ONLY_IMPLEMENTED_FOR_SRID_0_AND_4326](#); SQLSTATE: [22S00](#)

Message: Function %s is only defined for SRID 0 and SRID 4326.

[ER_ONLY_IMPLEMENTED_FOR_SRID_0_AND_4326](#) was added in 8.0.4.

- Error number: 3683; Symbol: [ER_BINLOG_EXPIRE_LOG_DAYS_AND_SECS_USED_TOGETHER](#); SQLSTATE: [HY000](#)

Message: The option expire_logs_days and binlog_expire_logs_seconds cannot be used together. Please use binlog_expire_logs_seconds to set the expire time (expire_logs_days is deprecated)

[ER_BINLOG_EXPIRE_LOG_DAYS_AND_SECS_USED_TOGETHER](#) was added in 8.0.11.

- Error number: 3684; Symbol: [ER_REGEX_STRING_NOT_TERMINATED](#); SQLSTATE: [HY000](#)

Message: An output string could not be zero-terminated because the length exceeds the buffer capacity.

[ER_REGEX_STRING_NOT_TERMINATED](#) was added in 8.0.4, removed after 8.0.4.

- Error number: 3684; Symbol: [ER_REGEX_BUFFER_OVERFLOW](#); SQLSTATE: [HY000](#)

Message: The result string is larger than the result buffer.

[ER_REGEX_BUFFER_OVERFLOW](#) was added in 8.0.4.

- Error number: 3685; Symbol: [ER_REGEX_ILLEGAL_ARGUMENT](#); SQLSTATE: [HY000](#)

Message: Illegal argument to a regular expression.

[ER_REGEX_ILLEGAL_ARGUMENT](#) was added in 8.0.4.

- Error number: 3686; Symbol: [ER_REGEX_INDEX_OUTOFBOUNDS_ERROR](#); SQLSTATE: [HY000](#)

Message: Index out of bounds in regular expression search.

[ER_REGEX_INDEX_OUTOFBOUNDS_ERROR](#) was added in 8.0.4.

- Error number: 3687; Symbol: [ER_REGEX_INTERNAL_ERROR](#); SQLSTATE: [HY000](#)

Message: Internal error in the regular expression library.

[ER_REGEX_INTERNAL_ERROR](#) was added in 8.0.4.

- Error number: 3688; Symbol: [ER_REGEX_RULE_SYNTAX](#); SQLSTATE: [HY000](#)

Message: Syntax error in regular expression on line %u, character %u.

[ER_REGEX_RULE_SYNTAX](#) was added in 8.0.4.

- Error number: 3689; Symbol: [ER_REGEXP_BAD_ESCAPE_SEQUENCE](#); SQLSTATE: HY000
Message: Unrecognized escape sequence in regular expression.
[ER_REGEXP_BAD_ESCAPE_SEQUENCE](#) was added in 8.0.4.
- Error number: 3690; Symbol: [ER_REGEXP_UNIMPLEMENTED](#); SQLSTATE: HY000
Message: The regular expression contains a feature that is not implemented in this library version.
[ER_REGEXP_UNIMPLEMENTED](#) was added in 8.0.4.
- Error number: 3691; Symbol: [ER_REGEXP_MISMATCHED_PAREN](#); SQLSTATE: HY000
Message: Mismatched parenthesis in regular expression.
[ER_REGEXP_MISMATCHED_PAREN](#) was added in 8.0.4.
- Error number: 3692; Symbol: [ER_REGEXP_BAD_INTERVAL](#); SQLSTATE: HY000
Message: Incorrect description of a {min,max} interval.
[ER_REGEXP_BAD_INTERVAL](#) was added in 8.0.4.
- Error number: 3693; Symbol: [ER_REGEXP_MAX_LT_MIN](#); SQLSTATE: HY000
Message: The maximum is less than the minumum in a {min,max} interval.
[ER_REGEXP_MAX_LT_MIN](#) was added in 8.0.4.
- Error number: 3694; Symbol: [ER_REGEXP_INVALID_BACK_REF](#); SQLSTATE: HY000
Message: Invalid back-reference in regular expression.
[ER_REGEXP_INVALID_BACK_REF](#) was added in 8.0.4.
- Error number: 3695; Symbol: [ER_REGEXP_LOOK_BEHIND_LIMIT](#); SQLSTATE: HY000
Message: The look-behind assertion exceeds the limit in regular expression.
[ER_REGEXP_LOOK_BEHIND_LIMIT](#) was added in 8.0.4.
- Error number: 3696; Symbol: [ER_REGEXP_MISSING_CLOSE_BRACKET](#); SQLSTATE: HY000
Message: The regular expression contains an unclosed bracket expression.
[ER_REGEXP_MISSING_CLOSE_BRACKET](#) was added in 8.0.4.
- Error number: 3697; Symbol: [ER_REGEXP_INVALID_RANGE](#); SQLSTATE: HY000
Message: The regular expression contains an [x-y] character range where x comes after y.
[ER_REGEXP_INVALID_RANGE](#) was added in 8.0.4.
- Error number: 3698; Symbol: [ER_REGEXP_STACK_OVERFLOW](#); SQLSTATE: HY000
Message: Overflow in the regular expression backtrack stack.
[ER_REGEXP_STACK_OVERFLOW](#) was added in 8.0.4.

- Error number: 3699; Symbol: [ER_REGEXPTIMEOUT](#); SQLSTATE: HY000
Message: Timeout exceeded in regular expression match.
[ER_REGEXPTIMEOUT](#) was added in 8.0.4.
- Error number: 3700; Symbol: [ER_REGEXPTOOLBIG](#); SQLSTATE: HY000
Message: The regular expression pattern exceeds limits on size or complexity.
[ER_REGEXPTOOLBIG](#) was added in 8.0.4.
- Error number: 3701; Symbol: [ER_CANT_SET_ERROR_LOG_SERVICE](#); SQLSTATE: HY000
Message: Value for %s got confusing at or around "%s". Syntax may be wrong, component may not be INSTALLED, or a component that does not support instances may be listed more than once.
[ER_CANT_SET_ERROR_LOG_SERVICE](#) was added in 8.0.4.
- Error number: 3702; Symbol: [ER_EMPTY_PIPELINE_FOR_ERROR_LOG_SERVICE](#); SQLSTATE: HY000
Message: Setting an empty %s pipeline disables error logging!
[ER_EMPTY_PIPELINE_FOR_ERROR_LOG_SERVICE](#) was added in 8.0.4.
- Error number: 3703; Symbol: [ER_COMPONENT_FILTER_DIAGNOSTICS](#); SQLSTATE: HY000
Message: filter %s: %s
[ER_COMPONENT_FILTER_DIAGNOSTICS](#) was added in 8.0.4.
- Error number: 3704; Symbol: [ER_INNODB_CANNOT_BE_IGNORED](#); SQLSTATE: HY000
Message: ignore-builtin-innodb is ignored and will be removed in future releases.
[ER_INNODB_CANNOT_BE_IGNORED](#) was added in 8.0.2, removed after 8.0.2.
- Error number: 3704; Symbol: [ER_NOT_IMPLEMENTED_FOR_CARTESIAN_SRS](#); SQLSTATE: 22S00
Message: %s(%s) has not been implemented for Cartesian spatial reference systems.
[ER_NOT_IMPLEMENTED_FOR_CARTESIAN_SRS](#) was added in 8.0.4.
- Error number: 3705; Symbol: [ER_NOT_IMPLEMENTED_FOR_PROJECTED_SRS](#); SQLSTATE: 22S00
Message: %s(%s) has not been implemented for projected spatial reference systems.
[ER_NOT_IMPLEMENTED_FOR_PROJECTED_SRS](#) was added in 8.0.4.
- Error number: 3706; Symbol: [ER_NONPOSITIVE_RADIUS](#); SQLSTATE: 22003
Message: Invalid radius provided to function %s: Radius must be greater than zero.
[ER_NONPOSITIVE_RADIUS](#) was added in 8.0.4.
- Error number: 3707; Symbol: [ER_RESTART_SERVER_FAILED](#); SQLSTATE: HY000
Message: Restart server failed (%s).

[ER_RESTART_SERVER_FAILED](#) was added in 8.0.4.

- Error number: [3708](#); Symbol: [ER_SRS_MISSING_MANDATORY_ATTRIBUTE](#); SQLSTATE: [SR006](#)

Message: Missing mandatory attribute %s.

[ER_SRS_MISSING_MANDATORY_ATTRIBUTE](#) was added in 8.0.4.

- Error number: [3709](#); Symbol: [ER_SRS_MULTIPLE_ATTRIBUTE_DEFINITIONS](#); SQLSTATE: [SR006](#)

Message: Multiple definitions of attribute %s.

[ER_SRS_MULTIPLE_ATTRIBUTE_DEFINITIONS](#) was added in 8.0.4.

- Error number: [3710](#); Symbol: [ER_SRS_NAME_CANT_BE_EMPTY_OR_WHITESPACE](#); SQLSTATE: [SR006](#)

Message: The spatial reference system name can't be an empty string or start or end with whitespace.

[ER_SRS_NAME_CANT_BE_EMPTY_OR_WHITESPACE](#) was added in 8.0.4.

- Error number: [3711](#); Symbol: [ER_SRS_ORGANIZATION_CANT_BE_EMPTY_OR_WHITESPACE](#); SQLSTATE: [SR006](#)

Message: The organization name can't be an empty string or start or end with whitespace.

[ER_SRS_ORGANIZATION_CANT_BE_EMPTY_OR_WHITESPACE](#) was added in 8.0.4.

- Error number: [3712](#); Symbol: [ER_SRS_ID_ALREADY_EXISTS](#); SQLSTATE: [SR004](#)

Message: There is already a spatial reference system with SRID %u.

[ER_SRS_ID_ALREADY_EXISTS](#) was added in 8.0.4.

- Error number: [3713](#); Symbol: [ER_WARN_SRS_ID_ALREADY_EXISTS](#); SQLSTATE: [01S00](#)

Message: There is already a spatial reference system with SRID %u.

[ER_WARN_SRS_ID_ALREADY_EXISTS](#) was added in 8.0.4.

- Error number: [3714](#); Symbol: [ER_CANT_MODIFY_SRID_0](#); SQLSTATE: [SR000](#)

Message: SRID 0 is not modifiable.

[ER_CANT_MODIFY_SRID_0](#) was added in 8.0.4.

- Error number: [3715](#); Symbol: [ER_WARN_RESERVED_SRID_RANGE](#); SQLSTATE: [01S01](#)

Message: The SRID range [%u, %u] has been reserved for system use. SRSs in this range may be added, modified or removed without warning during upgrade.

[ER_WARN_RESERVED_SRID_RANGE](#) was added in 8.0.4.

- Error number: [3716](#); Symbol: [ER_CANT_MODIFY_SRS_USED_BY_COLUMN](#); SQLSTATE: [SR005](#)

Message: Can't modify SRID %u. There is at least one column depending on it.

[ER_CANT_MODIFY_SRS_USED_BY_COLUMN](#) was added in 8.0.4.

- Error number: 3717; Symbol: [ER_SRS_INVALID_CHARACTER_IN_ATTRIBUTE](#); SQLSTATE: [SR006](#)
Message: Invalid character in attribute %s.
[ER_SRS_INVALID_CHARACTER_IN_ATTRIBUTE](#) was added in 8.0.4.
- Error number: 3718; Symbol: [ER_SRS_ATTRIBUTE_STRING_TOO_LONG](#); SQLSTATE: [SR006](#)
Message: Attribute %s is too long. The maximum length is %u characters.
[ER_SRS_ATTRIBUTE_STRING_TOO_LONG](#) was added in 8.0.4.
- Error number: 3719; Symbol: [ER_DEPRECATED_UTF8_ALIAS](#); SQLSTATE: [HY000](#)
Message: 'utf8' is currently an alias for the character set UTF8MB3, but will be an alias for UTF8MB4 in a future release. Please consider using UTF8MB4 in order to be unambiguous.
[ER_DEPRECATED_UTF8_ALIAS](#) was added in 8.0.11.
- Error number: 3720; Symbol: [ER_DEPRECATED_NATIONAL](#); SQLSTATE: [HY000](#)
Message: NATIONAL/NCHAR/NVARCHAR implies the character set UTF8MB3, which will be replaced by UTF8MB4 in a future release. Please consider using CHAR(x) CHARACTER SET UTF8MB4 in order to be unambiguous.
[ER_DEPRECATED_NATIONAL](#) was added in 8.0.11.
- Error number: 3721; Symbol: [ER_INVALID_DEFAULT_UTF8MB4_COLLATION](#); SQLSTATE: [HY000](#)
Message: Invalid default collation %s: utf8mb4_0900_ai_ci or utf8mb4_general_ci expected
[ER_INVALID_DEFAULT_UTF8MB4_COLLATION](#) was added in 8.0.11.
- Error number: 3722; Symbol: [ER_UNABLE_TO_COLLECT_LOG_STATUS](#); SQLSTATE: [HY000](#)
Message: Unable to collect information for column '%s': %s.
[ER_UNABLE_TO_COLLECT_LOG_STATUS](#) was added in 8.0.11.
- Error number: 3723; Symbol: [ER_RESERVED_TABLESPACE_NAME](#); SQLSTATE: [HY000](#)
Message: The table '%s' may not be created in the reserved tablespace '%s'.
[ER_RESERVED_TABLESPACE_NAME](#) was added in 8.0.11.
- Error number: 3724; Symbol: [ER_UNABLE_TO_SET_OPTION](#); SQLSTATE: [HY000](#)
Message: This option cannot be set %s.
[ER_UNABLE_TO_SET_OPTION](#) was added in 8.0.11.
- Error number: 3725; Symbol: [ER_SLAVE_POSSIBLY_DIVERGED_AFTER_DDL](#); SQLSTATE: [HY000](#)
Message: A commit for an atomic DDL statement was unsuccessful on the master and the slave. The slave supports atomic DDL statements but the master does not, so the action taken by the slave and master might differ. Check that their states have not diverged before proceeding.
[ER_SLAVE_POSSIBLY_DIVERGED_AFTER_DDL](#) was added in 8.0.11.
- Error number: 3726; Symbol: [ER_SRS_NOT_GEOGRAPHIC](#); SQLSTATE: [22S00](#)

Message: Function %s is only defined for geographic spatial reference systems, but one of its arguments is in SRID %u, which is not geographic.

[ER_SRS_NOT_GEOGRAPHIC](#) was added in 8.0.12.

- Error number: [3727](#); Symbol: [ER_POLYGON_TOO_LARGE](#); SQLSTATE: [22023](#)

Message: Function %s encountered a polygon that was too large. Polygons must cover less than half the planet.

[ER_POLYGON_TOO_LARGE](#) was added in 8.0.12.

- Error number: [3728](#); Symbol: [ER_SPATIAL_UNIQUE_INDEX](#); SQLSTATE: [HY000](#)

Message: Spatial indexes can't be primary or unique indexes.

[ER_SPATIAL_UNIQUE_INDEX](#) was added in 8.0.12.

- Error number: [3729](#); Symbol: [ER_INDEX_TYPE_NOT_SUPPORTEDED_FOR_SPATIAL_INDEX](#); SQLSTATE: [HY000](#)

Message: The index type %s is not supported for spatial indexes.

[ER_INDEX_TYPE_NOT_SUPPORTEDED_FOR_SPATIAL_INDEX](#) was added in 8.0.12.

- Error number: [3730](#); Symbol: [ER_FK_CANNOT_DROP_PARENT](#); SQLSTATE: [HY000](#)

Message: Cannot drop table '%s' referenced by a foreign key constraint '%s' on table '%s'.

[ER_FK_CANNOT_DROP_PARENT](#) was added in 8.0.12.

- Error number: [3731](#); Symbol: [ER_GEOMETRY_PARAM_LONGITUDE_OUT_OF_RANGE](#); SQLSTATE: [22S02](#)

Message: A parameter of function %s contains a geometry with longitude %f, which is out of range. It must be within (%f, %f].

[ER_GEOMETRY_PARAM_LONGITUDE_OUT_OF_RANGE](#) was added in 8.0.12.

- Error number: [3732](#); Symbol: [ER_GEOMETRY_PARAM_LATITUDE_OUT_OF_RANGE](#); SQLSTATE: [22S03](#)

Message: A parameter of function %s contains a geometry with latitude %f, which is out of range. It must be within [%f, %f].

[ER_GEOMETRY_PARAM_LATITUDE_OUT_OF_RANGE](#) was added in 8.0.12.

- Error number: [3733](#); Symbol: [ER_FK_CANNOT_USE_VIRTUAL_COLUMN](#); SQLSTATE: [HY000](#)

Message: Foreign key '%s' uses virtual column '%s' which is not supported.

[ER_FK_CANNOT_USE_VIRTUAL_COLUMN](#) was added in 8.0.12.

- Error number: 3734; Symbol: [ER_FK_NO_COLUMN_PARENT](#); SQLSTATE: HY000

Message: Failed to add the foreign key constraint. Missing column '%s' for constraint '%s' in the referenced table '%s'

[ER_FK_NO_COLUMN_PARENT](#) was added in 8.0.12.

- Error number: 3735; Symbol: [ER_CANT_SET_ERROR_SUPPRESSION_LIST](#); SQLSTATE: HY000

Message: %s: Could not add suppression rule for code "%s". Rule-set may be full, or code may not correspond to an error-log message.

[ER_CANT_SET_ERROR_SUPPRESSION_LIST](#) was added in 8.0.13.

- Error number: 3736; Symbol: [ER_SRS_GEOGCS_INVALID_AXES](#); SQLSTATE: SR002

Message: The spatial reference system definition for SRID %u specifies invalid geographic axes '%s' and '%s'. One axis must be NORTH or SOUTH and the other must be EAST or WEST.

[ER_SRS_GEOGCS_INVALID_AXES](#) was added in 8.0.13.

- Error number: 3737; Symbol: [ER_SRS_INVALID_SEMI_MAJOR_AXIS](#); SQLSTATE: SR002

Message: The length of the semi-major axis must be a positive number.

[ER_SRS_INVALID_SEMI_MAJOR_AXIS](#) was added in 8.0.13.

- Error number: 3738; Symbol: [ER_SRS_INVALID_INVERSE_FLATTENING](#); SQLSTATE: SR002

Message: The inverse flattening must be larger than 1.0, or 0.0 if the ellipsoid is a sphere.

[ER_SRS_INVALID_INVERSE_FLATTENING](#) was added in 8.0.13.

- Error number: 3739; Symbol: [ER_SRS_INVALID_ANGULAR_UNIT](#); SQLSTATE: SR002

Message: The angular unit conversion factor must be a positive number.

[ER_SRS_INVALID_ANGULAR_UNIT](#) was added in 8.0.13.

- Error number: 3740; Symbol: [ER_SRS_INVALID_PRIME_MERIDIAN](#); SQLSTATE: SR002

Message: The prime meridian must be within (-180, 180] degrees, specified in the SRS angular unit.

[ER_SRS_INVALID_PRIME_MERIDIAN](#) was added in 8.0.13.

- Error number: 3741; Symbol: [ER_TRANSFORM_SOURCE_SRS_NOT_SUPPORTED](#); SQLSTATE: 22S00

Message: Transformation from SRID %u is not supported.

[ER_TRANSFORM_SOURCE_SRS_NOT_SUPPORTED](#) was added in 8.0.13.

- Error number: 3742; Symbol: [ER_TRANSFORM_TARGET_SRS_NOT_SUPPORTED](#); SQLSTATE: 22S00

Message: Transformation to SRID %u is not supported.

[ER_TRANSFORM_TARGET_SRS_NOT_SUPPORTED](#) was added in 8.0.13.

- Error number: 3743; Symbol: [ER_TRANSFORM_SOURCE_SRS_MISSING_TOWGS84](#); SQLSTATE: 22S00

Message: Transformation from SRID %u is not supported. The spatial reference system has no TOWGS84 clause.

[ER_TRANSFORM_SOURCE_SRS_MISSING_TOWGS84](#) was added in 8.0.13.

- Error number: [3744](#); Symbol: [ER_TRANSFORM_TARGET_SRS_MISSING_TOWGS84](#); SQLSTATE: [22S00](#)

Message: Transformation to SRID %u is not supported. The spatial reference system has no TOWGS84 clause.

[ER_TRANSFORM_TARGET_SRS_MISSING_TOWGS84](#) was added in 8.0.13.

- Error number: [3745](#); Symbol: [ER_TEMP_TABLE_PREVENTS_SWITCH_SESSION_BINLOG_FORMAT](#); SQLSTATE: [HY000](#)

Message: Changing @@session.binlog_format is disallowed when the session has open temporary table(s). You could wait until these temporary table(s) are dropped and try again.

[ER_TEMP_TABLE_PREVENTS_SWITCH_SESSION_BINLOG_FORMAT](#) was added in 8.0.13.

- Error number: [3746](#); Symbol: [ER_TEMP_TABLE_PREVENTS_SWITCH_GLOBAL_BINLOG_FORMAT](#); SQLSTATE: [HY000](#)

Message: Changing @@global.binlog_format or @@persist.binlog_format is disallowed when any replication channel has open temporary table(s). You could wait until Slave_open_temp_tables = 0 and try again

[ER_TEMP_TABLE_PREVENTS_SWITCH_GLOBAL_BINLOG_FORMAT](#) was added in 8.0.13.

- Error number: [3747](#); Symbol: [ER_RUNNING_APPLIER_PREVENTS_SWITCH_GLOBAL_BINLOG_FORMAT](#); SQLSTATE: [HY000](#)

Message: Changing @@global.binlog_format or @@persist.binlog_format is disallowed when any replication channel applier thread is running. You could execute STOP SLAVE SQL_THREAD and try again.

[ER_RUNNING_APPLIER_PREVENTS_SWITCH_GLOBAL_BINLOG_FORMAT](#) was added in 8.0.13.

- Error number: [3748](#); Symbol: [ER_CLIENT_GTID_UNSAFE_CREATE_DROP_TEMP_TABLE_IN_TRX_IN_SBR](#); SQLSTATE: [HY000](#)

Message: Statement violates GTID consistency: CREATE TEMPORARY TABLE and DROP TEMPORARY TABLE are not allowed inside a transaction or inside a procedure in a transactional context when @@session.binlog_format=STATEMENT.

[ER_CLIENT_GTID_UNSAFE_CREATE_DROP_TEMP_TABLE_IN_TRX_IN_SBR](#) was added in 8.0.13.

- Error number: [3750](#); Symbol: [ER_TABLE_WITHOUT_PK](#); SQLSTATE: [HY000](#)

Message: Unable to create or change a table without a primary key, when the system variable 'sql_require_primary_key' is set. Add a primary key to the table or unset this variable to avoid this message. Note that tables without a primary key can cause performance problems in row-based replication, so please consult your DBA before changing this setting.

[ER_TABLE_WITHOUT_PK](#) was added in 8.0.13.

- Error number: 3751; Symbol: `WARN_DATA_TRUNCATED_FUNCTIONAL_INDEX`; SQLSTATE: 01000
Message: Data truncated for functional index '%s' at row %ld
`WARN_DATA_TRUNCATED_FUNCTIONAL_INDEX` was added in 8.0.13, removed after 8.0.16.
- Error number: 3751; Symbol: `ER_WARN_DATA_TRUNCATED_FUNCTIONAL_INDEX`; SQLSTATE: 01000
Message: Data truncated for functional index '%s' at row %ld
`ER_WARN_DATA_TRUNCATED_FUNCTIONAL_INDEX` was added in 8.0.17.
- Error number: 3752; Symbol: `ER_WARN_DATA_OUT_OF_RANGE_FUNCTIONAL_INDEX`; SQLSTATE: 22003
Message: Value is out of range for functional index '%s' at row %ld
`ER_WARN_DATA_OUT_OF_RANGE_FUNCTIONAL_INDEX` was added in 8.0.13.
- Error number: 3753; Symbol: `ER_FUNCTIONAL_INDEX_ON_JSON_OR_GEOMETRY_FUNCTION`; SQLSTATE: 42000
Message: Cannot create a functional index on a function that returns a JSON or GEOMETRY value.
`ER_FUNCTIONAL_INDEX_ON_JSON_OR_GEOMETRY_FUNCTION` was added in 8.0.13.
- Error number: 3754; Symbol: `ER_FUNCTIONAL_INDEX_REF_AUTO_INCREMENT`; SQLSTATE: HY000
Message: Functional index '%s' cannot refer to an auto-increment column.
`ER_FUNCTIONAL_INDEX_REF_AUTO_INCREMENT` was added in 8.0.13.
- Error number: 3755; Symbol: `ER_CANNOT_DROP_COLUMN_FUNCTIONAL_INDEX`; SQLSTATE: HY000
Message: Cannot drop column '%s' because it is used by a functional index. In order to drop the column, you must remove the functional index.
`ER_CANNOT_DROP_COLUMN_FUNCTIONAL_INDEX` was added in 8.0.13.
- Error number: 3756; Symbol: `ER_FUNCTIONAL_INDEX_PRIMARY_KEY`; SQLSTATE: HY000
Message: The primary key cannot be a functional index
`ER_FUNCTIONAL_INDEX_PRIMARY_KEY` was added in 8.0.13.
- Error number: 3757; Symbol: `ER_FUNCTIONAL_INDEX_ON_LOB`; SQLSTATE: HY000
Message: Cannot create a functional index on an expression that returns a BLOB or TEXT. Please consider using CAST.
`ER_FUNCTIONAL_INDEX_ON_LOB` was added in 8.0.13.
- Error number: 3758; Symbol: `ER_FUNCTIONAL_INDEX_FUNCTION_IS_NOT_ALLOWED`; SQLSTATE: HY000
Message: Expression of functional index '%s' contains a disallowed function.
`ER_FUNCTIONAL_INDEX_FUNCTION_IS_NOT_ALLOWED` was added in 8.0.13.

- Error number: 3759; Symbol: `ER_FULLTEXT_FUNCTIONAL_INDEX`; SQLSTATE: `HY000`
Message: Fulltext functional index is not supported.
`ER_FULLTEXT_FUNCTIONAL_INDEX` was added in 8.0.13.
- Error number: 3760; Symbol: `ER_SPATIAL_FUNCTIONAL_INDEX`; SQLSTATE: `HY000`
Message: Spatial functional index is not supported.
`ER_SPATIAL_FUNCTIONAL_INDEX` was added in 8.0.13.
- Error number: 3761; Symbol: `ER_WRONG_KEY_COLUMN_FUNCTIONAL_INDEX`; SQLSTATE: `HY000`
Message: The used storage engine cannot index the expression '%s'.
`ER_WRONG_KEY_COLUMN_FUNCTIONAL_INDEX` was added in 8.0.13.
- Error number: 3762; Symbol: `ER_FUNCTIONAL_INDEX_ON_FIELD`; SQLSTATE: `HY000`
Message: Functional index on a column is not supported. Consider using a regular index instead.
`ER_FUNCTIONAL_INDEX_ON_FIELD` was added in 8.0.13.
- Error number: 3763; Symbol: `ER_GENERATED_COLUMN_NAMED_FUNCTION_IS_NOT_ALLOWED`; SQLSTATE: `HY000`
Message: Expression of generated column '%s' contains a disallowed function: %s.
`ER_GENERATED_COLUMN_NAMED_FUNCTION_IS_NOT_ALLOWED` was added in 8.0.13.
- Error number: 3764; Symbol: `ER_GENERATED_COLUMN_ROW_VALUE`; SQLSTATE: `HY000`
Message: Expression of generated column '%s' cannot refer to a row value.
`ER_GENERATED_COLUMN_ROW_VALUE` was added in 8.0.13.
- Error number: 3765; Symbol: `ER_GENERATED_COLUMN_VARIABLES`; SQLSTATE: `HY000`
Message: Expression of generated column '%s' cannot refer user or system variables.
`ER_GENERATED_COLUMN_VARIABLES` was added in 8.0.13.
- Error number: 3766; Symbol: `ER_DEPENDENT_BY_DEFAULT_GENERATED_VALUE`; SQLSTATE: `HY000`
Message: Column '%s' of table '%s' has a default value expression dependency and cannot be dropped or renamed.
`ER_DEPENDENT_BY_DEFAULT_GENERATED_VALUE` was added in 8.0.13.
- Error number: 3767; Symbol: `ER_DEFAULT_VAL_GENERATED_NON_PRIOR`; SQLSTATE: `HY000`
Message: Default value expression of column '%s' cannot refer to a column defined after it if that column is a generated column or has an expression as default value.
`ER_DEFAULT_VAL_GENERATED_NON_PRIOR` was added in 8.0.13.
- Error number: 3768; Symbol: `ER_DEFAULT_VAL_GENERATED_REF_AUTO_INC`; SQLSTATE: `HY000`

Message: Default value expression of column '%s' cannot refer to an auto-increment column.

[ER_DEFAULT_VAL_GENERATED_REF_AUTO_INC](#) was added in 8.0.13.

Message: Default value expression of column '%s' contains a disallowed function: %s.

[ER_DEFAULT_VAL_GENERATED_NAMED_FUNCTION_IS_NOT_ALLOWED](#) was added in 8.0.13.

- Error number: 3771; Symbol: [ER_DEFAULT_VAL_GENERATED_ROW_VALUE](#); SQLSTATE: [HY000](#)

Message: Default value expression of column '%s' cannot refer to a row value.

[ER_DEFAULT_VAL_GENERATED_ROW_VALUE](#) was added in 8.0.13.

- Error number: 3772; Symbol: [ER_DEFAULT_VAL_GENERATED_VARIABLES](#); SQLSTATE: [HY000](#)

Message: Default value expression of column '%s' cannot refer user or system variables.

[ER_DEFAULT_VAL_GENERATED_VARIABLES](#) was added in 8.0.13.

- Error number: 3773; Symbol: [ER_DEFAULT_AS_VAL_GENERATED](#); SQLSTATE: [HY000](#)

Message: DEFAULT function cannot be used with default value expressions

[ER_DEFAULT_AS_VAL_GENERATED](#) was added in 8.0.13.

- Error number: 3774; Symbol: [ER_UNSUPPORTED_ACTION_ON_DEFAULT_VAL_GENERATED](#); SQLSTATE: [HY000](#)

Message: '%s' is not supported for default value expressions.

[ER_UNSUPPORTED_ACTION_ON_DEFAULT_VAL_GENERATED](#) was added in 8.0.13.

- Error number: 3775; Symbol: [ER_GTID_UNSAFE_ALTER_ADD_COL_WITH_DEFAULT_EXPRESSION](#); SQLSTATE: [HY000](#)

Message: Statement violates GTID consistency: ALTER TABLE ... ADD COLUMN .. with expression as DEFAULT.

[ER_GTID_UNSAFE_ALTER_ADD_COL_WITH_DEFAULT_EXPRESSION](#) was added in 8.0.13.

- Error number: 3776; Symbol: [ER_FK_CANNOT_CHANGE_ENGINE](#); SQLSTATE: [HY000](#)

Message: Cannot change table's storage engine because the table participates in a foreign key constraint.

[ER_FK_CANNOT_CHANGE_ENGINE](#) was added in 8.0.13.

- Error number: 3777; Symbol: [ER_WARN_DEPRECATED_USER_SET_EXPR](#); SQLSTATE: [HY000](#)

Message: Setting user variables within expressions is deprecated and will be removed in a future release. Consider alternatives: 'SET variable=expression, ...', or 'SELECT expression(s) INTO variables(s)'.

[ER_WARN_DEPRECATED_USER_SET_EXPR](#) was added in 8.0.13.

- Error number: [3778](#); Symbol: [ER_WARN_DEPRECATED_UTF8MB3_COLLATION](#); SQLSTATE: [HY000](#)

Message: '%s' is a collation of the deprecated character set UTF8MB3. Please consider using UTF8MB4 with an appropriate collation instead.

[ER_WARN_DEPRECATED_UTF8MB3_COLLATION](#) was added in 8.0.13.

- Error number: [3779](#); Symbol: [ER_WARN_DEPRECATED_NESTED_COMMENT_SYNTAX](#); SQLSTATE: [HY000](#)

Message: Nested comment syntax is deprecated and will be removed in a future release.

[ER_WARN_DEPRECATED_NESTED_COMMENT_SYNTAX](#) was added in 8.0.13.

- Error number: [3780](#); Symbol: [ER_FK_INCOMPATIBLE_COLUMNS](#); SQLSTATE: [HY000](#)

Message: Referencing column '%s' and referenced column '%s' in foreign key constraint '%s' are incompatible.

[ER_FK_INCOMPATIBLE_COLUMNS](#) was added in 8.0.14.

- Error number: [3781](#); Symbol: [ER_GR_HOLD_WAIT_TIMEOUT](#); SQLSTATE: [HY000](#)

Message: Timeout exceeded for held statement while new Group Replication primary member is applying backlog.

[ER_GR_HOLD_WAIT_TIMEOUT](#) was added in 8.0.14.

- Error number: [3782](#); Symbol: [ER_GR_HOLD_KILLED](#); SQLSTATE: [HY000](#)

Message: Held statement aborted because Group Replication plugin got shut down or thread was killed while new primary member was applying backlog.

[ER_GR_HOLD_KILLED](#) was added in 8.0.14.

- Error number: [3783](#); Symbol: [ER_GR_HOLD_MEMBER_STATUS_ERROR](#); SQLSTATE: [HY000](#)

Message: Held statement was aborted due to member being in error state, while backlog is being applied during Group Replication primary election.

[ER_GR_HOLD_MEMBER_STATUS_ERROR](#) was added in 8.0.14.

- Error number: [3784](#); Symbol: [ER_RPL_ENCRYPTION_FAILED_TO_FETCH_KEY](#); SQLSTATE: [HY000](#)

Message: Failed to fetch key from keyring, please check if keyring plugin is loaded.

[ER_RPL_ENCRYPTION_FAILED_TO_FETCH_KEY](#) was added in 8.0.14.

- Error number: [3785](#); Symbol: [ER_RPL_ENCRYPTION_KEY_NOT_FOUND](#); SQLSTATE: [HY000](#)

Message: Can't find key from keyring, please check in the server log if a keyring plugin is loaded and initialized successfully.

[ER_RPL_ENCRYPTION_KEY_NOT_FOUND](#) was added in 8.0.14.

- Error number: 3786; Symbol: [ER_RPL_ENCRYPTION_KEYRING_INVALID_KEY](#); SQLSTATE: HY000
Message: Fetched an invalid key from keyring.

[ER_RPL_ENCRYPTION_KEYRING_INVALID_KEY](#) was added in 8.0.14.

- Error number: 3787; Symbol: [ER_RPL_ENCRYPTION_HEADER_ERROR](#); SQLSTATE: HY000
Message: Error reading a replication log encryption header: %s.

[ER_RPL_ENCRYPTION_HEADER_ERROR](#) was added in 8.0.14.

- Error number: 3788; Symbol: [ER_RPL_ENCRYPTION_FAILED_TO_ROTATE_LOGS](#); SQLSTATE: HY000
Message: Failed to rotate some logs after changing binlog encryption settings. Please fix the problem and rotate the logs manually.

[ER_RPL_ENCRYPTION_FAILED_TO_ROTATE_LOGS](#) was added in 8.0.14.

- Error number: 3789; Symbol: [ER_RPL_ENCRYPTION_KEY_EXISTS_UNEXPECTED](#); SQLSTATE: HY000
Message: Key %s exists unexpected.

[ER_RPL_ENCRYPTION_KEY_EXISTS_UNEXPECTED](#) was added in 8.0.14.

- Error number: 3790; Symbol: [ER_RPL_ENCRYPTION_FAILED_TO_GENERATE_KEY](#); SQLSTATE: HY000
Message: Failed to generate key, please check if keyring plugin is loaded.

[ER_RPL_ENCRYPTION_FAILED_TO_GENERATE_KEY](#) was added in 8.0.14.

- Error number: 3791; Symbol: [ER_RPL_ENCRYPTION_FAILED_TO_STORE_KEY](#); SQLSTATE: HY000
Message: Failed to store key, please check if keyring plugin is loaded.

[ER_RPL_ENCRYPTION_FAILED_TO_STORE_KEY](#) was added in 8.0.14.

- Error number: 3792; Symbol: [ER_RPL_ENCRYPTION_FAILED_TO_REMOVE_KEY](#); SQLSTATE: HY000
Message: Failed to remove key, please check if keyring plugin is loaded.

[ER_RPL_ENCRYPTION_FAILED_TO_REMOVE_KEY](#) was added in 8.0.14.

- Error number: 3793; Symbol: [ER_RPL_ENCRYPTION_UNABLE_TO_CHANGE_OPTION](#); SQLSTATE: HY000
Message: Failed to change binlog_encryption value. %s.

[ER_RPL_ENCRYPTION_UNABLE_TO_CHANGE_OPTION](#) was added in 8.0.14.

- Error number: 3794; Symbol: [ER_RPL_ENCRYPTION_MASTER_KEY_RECOVERY_FAILED](#); SQLSTATE: HY000
Message: Unable to recover binlog encryption master key, please check if keyring plugin is loaded.

[ER_RPL_ENCRYPTION_MASTER_KEY_RECOVERY_FAILED](#) was added in 8.0.14.

- Error number: 3795; Symbol: [ER_SLOW_LOG_MODE_IGNORED_WHEN_NOT_LOGGING_TO_FILE](#); SQLSTATE: [HY000](#)

Message: slow query log file format changed as requested, but setting will have no effect when not actually logging to a file.

[ER_SLOW_LOG_MODE_IGNORED_WHEN_NOT_LOGGING_TO_FILE](#) was added in 8.0.14.

- Error number: 3796; Symbol: [ER_GRP_TRX_CONSISTENCY_NOT_ALLOWED](#); SQLSTATE: [HY000](#)

Message: The option group_replication_consistency cannot be used on the current member state.

[ER_GRP_TRX_CONSISTENCY_NOT_ALLOWED](#) was added in 8.0.14.

- Error number: 3797; Symbol: [ER_GRP_TRX_CONSISTENCY_BEFORE](#); SQLSTATE: [HY000](#)

Message: Error while waiting for group transactions commit on group_replication_consistency='BEFORE'.

[ER_GRP_TRX_CONSISTENCY_BEFORE](#) was added in 8.0.14.

- Error number: 3798; Symbol: [ER_GRP_TRX_CONSISTENCY_AFTER_ON_TRX_BEGIN](#); SQLSTATE: [HY000](#)

Message: Error while waiting for transactions with group_replication_consistency='AFTER' to commit.

[ER_GRP_TRX_CONSISTENCY_AFTER_ON_TRX_BEGIN](#) was added in 8.0.14.

- Error number: 3799; Symbol: [ER_GRP_TRX_CONSISTENCY_BEGIN_NOT_ALLOWED](#); SQLSTATE: [HY000](#)

Message: The Group Replication plugin is stopping, therefore new transactions are not allowed to start.

[ER_GRP_TRX_CONSISTENCY_BEGIN_NOT_ALLOWED](#) was added in 8.0.14.

- Error number: 3800; Symbol: [ER_FUNCTIONAL_INDEX_ROW_VALUE_IS_NOT_ALLOWED](#); SQLSTATE: [HY000](#)

Message: Expression of functional index '%s' cannot refer to a row value.

[ER_FUNCTIONAL_INDEX_ROW_VALUE_IS_NOT_ALLOWED](#) was added in 8.0.14.

- Error number: 3801; Symbol: [ER_RPL_ENCRYPTION_FAILED_TO_ENCRYPT](#); SQLSTATE: [HY000](#)

Message: Failed to encrypt content to write into binlog file: %s.

[ER_RPL_ENCRYPTION_FAILED_TO_ENCRYPT](#) was added in 8.0.14.

- Error number: 3802; Symbol: [ER_PAGE_TRACKING_NOT_STARTED](#); SQLSTATE: [HY000](#)

Message: Page Tracking is not started yet.

[ER_PAGE_TRACKING_NOT_STARTED](#) was added in 8.0.16.

- Error number: 3803; Symbol: [ER_PAGE_TRACKING_RANGE_NOT_TRACKED](#); SQLSTATE: [HY000](#)

Message: Tracking was not enabled for the LSN range specified

[ER_PAGE_TRACKING_RANGE_NOT_TRACKED](#) was added in 8.0.16.

- Error number: [3804](#); Symbol: [ER_PAGE_TRACKING_CANNOT_PURGE](#); SQLSTATE: [HY000](#)

Message: Cannot purge data when concurrent clone is in progress. Try later.

[ER_PAGE_TRACKING_CANNOT_PURGE](#) was added in 8.0.16.

- Error number: [3805](#); Symbol: [ER_RPL_ENCRYPTION_CANNOT_ROTATE_BINLOG_MASTER_KEY](#); SQLSTATE: [HY000](#)

Message: Cannot rotate binary log master key when 'binlog-encryption' is off.

[ER_RPL_ENCRYPTION_CANNOT_ROTATE_BINLOG_MASTER_KEY](#) was added in 8.0.16.

- Error number: [3806](#); Symbol: [ER_BINLOG_MASTER_KEY_RECOVERY_OUT_OF_COMBINATION](#); SQLSTATE: [HY000](#)

Message: Unable to recover binary log master key, the combination of new_master_key_seqno=%u, master_key_seqno=%u and old_master_key_seqno=%u are wrong.

[ER_BINLOG_MASTER_KEY_RECOVERY_OUT_OF_COMBINATION](#) was added in 8.0.16.

- Error number: [3807](#); Symbol: [ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_OPERATE_KEY](#); SQLSTATE: [HY000](#)

Message: Failed to operate binary log master key on keyring, please check if keyring plugin is loaded. The statement had no effect: the old binary log master key is still in use, the keyring, binary and relay log files are unchanged, and the server could not start using a new binary log master key for encrypting new binary and relay log files.

[ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_OPERATE_KEY](#) was added in 8.0.16.

- Error number: [3808](#); Symbol: [ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_ROTATE_LOGS](#); SQLSTATE: [HY000](#)

Message: Failed to rotate one or more binary or relay log files. A new binary log master key was generated and will be used to encrypt new binary and relay log files. There may still exist binary or relay log files using the previous binary log master key.

[ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_ROTATE_LOGS](#) was added in 8.0.16.

- Error number: [3809](#); Symbol: [ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_REENCRYPT_LOG](#); SQLSTATE: [HY000](#)

Message: %s. A new binary log master key was generated and will be used to encrypt new binary and relay log files. There may still exist binary or relay log files using the previous binary log master key.

[ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_REENCRYPT_LOG](#) was added in 8.0.16.

- Error number: 3810; Symbol: `ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_CLEANUP_UNUSED_KEYS`; SQLSTATE: HY000

Message: Failed to remove unused binary log encryption keys from the keyring, please check if keyring plugin is loaded. The unused binary log encryption keys may still exist in the keyring, and they will be removed upon server restart or next 'ALTER INSTANCE ROTATE BINLOG MASTER KEY' execution.

`ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_CLEANUP_UNUSED_KEYS` was added in 8.0.16.
- Error number: 3811; Symbol: `ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_CLEANUP_AUX_KEY`; SQLSTATE: HY000

Message: Failed to remove auxiliary binary log encryption key from keyring, please check if keyring plugin is loaded. The cleanup of the binary log master key rotation process did not finish as expected and the cleanup will take place upon server restart or next 'ALTER INSTANCE ROTATE BINLOG MASTER KEY' execution.

`ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_CLEANUP_AUX_KEY` was added in 8.0.16.
- Error number: 3812; Symbol: `ER_NON_BOOLEAN_EXPR_FOR_CHECK_CONSTRAINT`; SQLSTATE: HY000

Message: Redo log archive directory '%s' is accessible to all OS users

[ER_INNODB_REDO_LOG_ARCHIVE_DIR_PERMISSIONS](#) was added in 8.0.17.

- Error number: 3847; Symbol: [ER_INNODB_REDO_LOG_ARCHIVE_FILE_CREATE](#); SQLSTATE: HY000

Message: Cannot create redo log archive file '%s' (OS errno: %d - %s)

[ER_INNODB_REDO_LOG_ARCHIVE_FILE_CREATE](#) was added in 8.0.17.

- Error number: 3848; Symbol: [ER_INNODB_REDO_LOG_ARCHIVE_ACTIVE](#); SQLSTATE: HY000

Message: Redo log archiving has been started on '%s' - Call innodb_redo_log_archive_stop() first

[ER_INNODB_REDO_LOG_ARCHIVE_ACTIVE](#) was added in 8.0.17.

- Error number: 3849; Symbol: [ER_INNODB_REDO_LOG_ARCHIVE_INACTIVE](#); SQLSTATE: HY000

Message: Redo log archiving is not active

[ER_INNODB_REDO_LOG_ARCHIVE_INACTIVE](#) was added in 8.0.17.

- Error number: 3850; Symbol: [ER_INNODB_REDO_LOG_ARCHIVE_FAILED](#); SQLSTATE: HY000

Message: Redo log archiving failed: %s

[ER_INNODB_REDO_LOG_ARCHIVE_FAILED](#) was added in 8.0.17.

- Error number: 3851; Symbol: [ER_INNODB_REDO_LOG_ARCHIVE_SESSION](#); SQLSTATE: HY000

Message: Redo log archiving has not been started by this session

[ER_INNODB_REDO_LOG_ARCHIVE_SESSION](#) was added in 8.0.17.

- Error number: 3852; Symbol: [ER_STD_REGEX_ERROR](#); SQLSTATE: HY000

Message: Regex error: %s in function %s.

[ER_STD_REGEX_ERROR](#) was added in 8.0.17.

- Error number: 3853; Symbol: [ER_INVALID_JSON_TYPE](#); SQLSTATE: 22032

Message: Invalid JSON type in argument %u to function %s; an %s is required.

[ER_INVALID_JSON_TYPE](#) was added in 8.0.17.

- Error number: 3854; Symbol: [ER_CANNOT_CONVERT_STRING](#); SQLSTATE: HY000

Message: Cannot convert string '%s' from %s to %s

[ER_CANNOT_CONVERT_STRING](#) was added in 8.0.17.

- Error number: 3855; Symbol: [ER_DEPENDENT_BY_PARTITION_FUNC](#); SQLSTATE: [HY000](#)
Message: Column '%s' has a partitioning function dependency and cannot be dropped or renamed.
[ER_DEPENDENT_BY_PARTITION_FUNC](#) was added in 8.0.17.
- Error number: 3856; Symbol: [ER_WARN_DEPRECATED_FLOAT_AUTO_INCREMENT](#); SQLSTATE: [HY000](#)
Message: AUTO_INCREMENT support for FLOAT/DOUBLE columns is deprecated and will be removed in a future release. Consider removing AUTO_INCREMENT from column '%s'.
[ER_WARN_DEPRECATED_FLOAT_AUTO_INCREMENT](#) was added in 8.0.17.
- Error number: 3857; Symbol: [ER_RPL_CANT_STOP_SLAVE_WHILE_LOCKED_BACKUP](#); SQLSTATE: [HY000](#)
Message: Cannot stop the slave SQL thread while the instance is locked for backup. Try running `UNLOCK INSTANCE` first.
[ER_RPL_CANT_STOP_SLAVE_WHILE_LOCKED_BACKUP](#) was added in 8.0.17.
- Error number: 3858; Symbol: [ER_WARN_DEPRECATED_FLOAT_DIGITS](#); SQLSTATE: [HY000](#)
Message: Specifying number of digits for floating point data types is deprecated and will be removed in a future release.
[ER_WARN_DEPRECATED_FLOAT_DIGITS](#) was added in 8.0.17.
- Error number: 3859; Symbol: [ER_WARN_DEPRECATED_FLOAT_UNSIGNED](#); SQLSTATE: [HY000](#)
Message: UNSIGNED for decimal and floating point data types is deprecated and support for it will be removed in a future release.
[ER_WARN_DEPRECATED_FLOAT_UNSIGNED](#) was added in 8.0.17.
- Error number: 3860; Symbol: [ER_WARN_DEPRECATED_INTEGER_DISPLAY_WIDTH](#); SQLSTATE: [HY000](#)
Message: Integer display width is deprecated and will be removed in a future release.
[ER_WARN_DEPRECATED_INTEGER_DISPLAY_WIDTH](#) was added in 8.0.17.
- Error number: 3861; Symbol: [ER_WARN_DEPRECATED_ZEROFILL](#); SQLSTATE: [HY000](#)
Message: The ZEROFILL attribute is deprecated and will be removed in a future release. Use the LPAD function to zero-pad numbers, or store the formatted numbers in a CHAR column.
[ER_WARN_DEPRECATED_ZEROFILL](#) was added in 8.0.17.
- Error number: 3862; Symbol: [ER_CLONE_DONOR](#); SQLSTATE: [HY000](#)
Message: Clone Donor Error: %s.
[ER_CLONE_DONOR](#) was added in 8.0.17.
- Error number: 3863; Symbol: [ER_CLONE_PROTOCOL](#); SQLSTATE: [HY000](#)
Message: Clone received unexpected response from Donor : %s.

[ER_CLONE_PROTOCOL](#) was added in 8.0.17.

- Error number: [3864](#); Symbol: [ER_CLONE_DONOR_VERSION](#); SQLSTATE: [HY000](#)

Message: Clone Donor MySQL version: %s is different from Recipient MySQL version %s.

[ER_CLONE_DONOR_VERSION](#) was added in 8.0.17.

- Error number: [3865](#); Symbol: [ER_CLONE_OS](#); SQLSTATE: [HY000](#)

Message: Clone Donor OS: %s is different from Recipient OS: %s.

[ER_CLONE_OS](#) was added in 8.0.17.

- Error number: [3866](#); Symbol: [ER_CLONE_PLATFORM](#); SQLSTATE: [HY000](#)

Message: Clone Donor platform: %s is different from Recipient platform: %s.

[ER_CLONE_PLATFORM](#) was added in 8.0.17.

- Error number: [3867](#); Symbol: [ER_CLONE_CHARSET](#); SQLSTATE: [HY000](#)

Message: Clone Donor collation: %s is unavailable in Recipient.

[ER_CLONE_CHARSET](#) was added in 8.0.17.

- Error number: [3868](#); Symbol: [ER_CLONE_CONFIG](#); SQLSTATE: [HY000](#)

Message: Clone Configuration %s: Donor value: %s is different from Recipient value: %s.

[ER_CLONE_CONFIG](#) was added in 8.0.17.

- Error number: [3869](#); Symbol: [ER_CLONE_SYS_CONFIG](#); SQLSTATE: [HY000](#)

Message: Clone system configuration: %s

[ER_CLONE_SYS_CONFIG](#) was added in 8.0.17.

- Error number: [3870](#); Symbol: [ER_CLONE_PLUGIN_MATCH](#); SQLSTATE: [HY000](#)

Message: Clone Donor plugin %s is not active in Recipient.

[ER_CLONE_PLUGIN_MATCH](#) was added in 8.0.17.

- Error number: [3871](#); Symbol: [ER_CLONE_LOOPBACK](#); SQLSTATE: [HY000](#)

Message: Clone cannot use loop back connection while cloning into current data directory.

[ER_CLONE_LOOPBACK](#) was added in 8.0.17.

- Error number: [3872](#); Symbol: [ER_CLONE_ENCRYPTION](#); SQLSTATE: [HY000](#)

Message: Clone needs SSL connection for encrypted table.

[ER_CLONE_ENCRYPTION](#) was added in 8.0.17.

- Error number: [3873](#); Symbol: [ER_CLONE_DISK_SPACE](#); SQLSTATE: [HY000](#)

Message: Clone estimated database size is %s. Available space %s is not enough.

[ER_CLONE_DISK_SPACE](#) was added in 8.0.17.

- Error number: [3874](#); Symbol: [ER_CLONE_IN_PROGRESS](#); SQLSTATE: [HY000](#)

Message: Concurrent clone in progress. Please try after clone is complete.

[ER_CLONE_IN_PROGRESS](#) was added in 8.0.17.

- Error number: [3875](#); Symbol: [ER_CLONE_DISALLOWED](#); SQLSTATE: [HY000](#)

Message: The clone operation cannot be executed when %s.

[ER_CLONE_DISALLOWED](#) was added in 8.0.17.

- Error number: [3876](#); Symbol: [ER_CANNOT_GRANT_ROLES_TO_ANONYMOUS_USER](#); SQLSTATE: [HY000](#)

Message: Cannot grant roles to an anonymous user.

[ER_CANNOT_GRANT_ROLES_TO_ANONYMOUS_USER](#) was added in 8.0.16.

- Error number: [3877](#); Symbol: [ER_SECONDARY_ENGINE_PLUGIN](#); SQLSTATE: [HY000](#)

Message: %s

[ER_SECONDARY_ENGINE_PLUGIN](#) was added in 8.0.14.

- Error number: [3878](#); Symbol: [ER_SECOND_PASSWORD_CANNOT_BE_EMPTY](#); SQLSTATE: [HY000](#)

Message: Empty password can not be retained as second password for user '%s'@'%s'.

[ER_SECOND_PASSWORD_CANNOT_BE_EMPTY](#) was added in 8.0.14.

- Error number: [3879](#); Symbol: [ER_DB_ACCESS_DENIED](#); SQLSTATE: [HY000](#)

Message: Access denied for AuthId `%s`@`%s` to database '%s'.

[ER_DB_ACCESS_DENIED](#) was added in 8.0.16.

- Error number: [3880](#); Symbol: [ER_DA_AUTH_ID_WITH_SYSTEM_USER_PRIV_IN_MANDATORY_ROLES](#); SQLSTATE: [HY000](#)

Message: Cannot set mandatory_roles: AuthId `%s`@`%s` has '%s' privilege.

[ER_DA_AUTH_ID_WITH_SYSTEM_USER_PRIV_IN_MANDATORY_ROLES](#) was added in 8.0.17.

- Error number: [3881](#); Symbol: [ER_DA_RPL_GTID_TABLE_CANNOT_OPEN](#); SQLSTATE: [HY000](#)

Message: Gtid table is not ready to be used. Table '%s.%s' cannot be opened.

[ER_DA_RPL_GTID_TABLE_CANNOT_OPEN](#) was added in 8.0.17.

- Error number: [3882](#); Symbol: [ER_GEOMETRY_IN_UNKNOWN_LENGTH_UNIT](#); SQLSTATE: [SU001](#)

Message: The geometry passed to function %s is in SRID 0, which doesn't specify a length unit. Can't convert to '%s'.

[ER_GEOMETRY_IN_UNKNOWN_LENGTH_UNIT](#) was added in 8.0.14.

- Error number: 3883; Symbol: [ER_DA_PLUGIN_INSTALL_ERROR](#); SQLSTATE: HY000
Message: Error installing plugin '%s': %s
[ER_DA_PLUGIN_INSTALL_ERROR](#) was added in 8.0.17.
- Error number: 3884; Symbol: [ER_NO_SESSION_TEMP](#); SQLSTATE: HY000
Message: Storage engine could not allocate temporary tablespace for this session.
[ER_NO_SESSION_TEMP](#) was added in 8.0.13.
- Error number: 3885; Symbol: [ER_DA_UNKNOWN_ERROR_NUMBER](#); SQLSTATE: HY000
Message: Got unknown error: %d
[ER_DA_UNKNOWN_ERROR_NUMBER](#) was added in 8.0.17.
- Error number: 3886; Symbol: [ER_COLUMN_CHANGE_SIZE](#); SQLSTATE: HY000
Message: Could not change column '%s' of table '%s'. The resulting size of index '%s' would exceed the max key length of %d bytes.
[ER_COLUMN_CHANGE_SIZE](#) was added in 8.0.14.
- Error number: 3887; Symbol: [ER_REGEX_INVALID_CAPTURE_GROUP_NAME](#); SQLSTATE: HY000
Message: A capture group has an invalid name.
[ER_REGEX_INVALID_CAPTURE_GROUP_NAME](#) was added in 8.0.11.
- Error number: 3888; Symbol: [ER_DA_SSL_LIBRARY_ERROR](#); SQLSTATE: HY000
Message: Failed to set up SSL because of the following SSL library error: %s
[ER_DA_SSL_LIBRARY_ERROR](#) was added in 8.0.17.
- Error number: 3889; Symbol: [ER_SECONDARY_ENGINE](#); SQLSTATE: HY000
Message: Secondary engine operation failed. %s.
[ER_SECONDARY_ENGINE](#) was added in 8.0.13.
- Error number: 3890; Symbol: [ER_SECONDARY_ENGINE_DDL](#); SQLSTATE: HY000
Message: DDLs on a table with a secondary engine defined are not allowed.
[ER_SECONDARY_ENGINE_DDL](#) was added in 8.0.13.
- Error number: 3891; Symbol: [ER_INCORRECT_CURRENT_PASSWORD](#); SQLSTATE: HY000
Message: Incorrect current password. Specify the correct password which has to be replaced.
[ER_INCORRECT_CURRENT_PASSWORD](#) was added in 8.0.13.
- Error number: 3892; Symbol: [ER_MISSING_CURRENT_PASSWORD](#); SQLSTATE: HY000
Message: Current password needs to be specified in the REPLACE clause in order to change it.
[ER_MISSING_CURRENT_PASSWORD](#) was added in 8.0.13.

- Error number: 3893; Symbol: `ER_CURRENT_PASSWORD_NOT_REQUIRED`; SQLSTATE: `HY000`

Message: Do not specify the current password while changing it for other users.

`ER_CURRENT_PASSWORD_NOT_REQUIRED` was added in 8.0.13.

- Error number: 3894; Symbol: `ER_PASSWORD_CANNOT_BE_RETAINED_ON_PLUGIN_CHANGE`; SQLSTATE: `HY000`

Message: Current password can not be retained for user '%s'@'%s' because authentication plugin is being changed.

`ER_PASSWORD_CANNOT_BE_RETAINED_ON_PLUGIN_CHANGE` was added in 8.0.14.

- Error number: 3895; Symbol: `ER_CURRENT_PASSWORD_CANNOT_BE_RETAINED`; SQLSTATE: `HY000`

Message: Current password can not be retained for user '%s'@'%s' because new password is empty.

`ER_CURRENT_PASSWORD_CANNOT_BE_RETAINED` was added in 8.0.14.

- Error number: 3896; Symbol: `ER_PARTIAL_REVOKES_EXIST`; SQLSTATE: `HY000`

Message: At least one partial revoke exists on a database. The system variable '@@partial_revokes' must be set to ON.

`ER_PARTIAL_REVOKES_EXIST` was added in 8.0.16.

- Error number: 3897; Symbol: `ER_CANNOT_GRANT_SYSTEM_PRIV_TO_MANDATORY_ROLE`; SQLSTATE: `HY000`

Message: AuthId '%s'@'%s' is set as mandatory_roles. Cannot grant the '%s' privilege.

`ER_CANNOT_GRANT_SYSTEM_PRIV_TO_MANDATORY_ROLE` was added in 8.0.16.

- Error number: 3898; Symbol: `ER_XA_REPLICATION_FILTERS`; SQLSTATE: `HY000`

Message: The use of replication filters with XA transactions is not supported, and can lead to an undefined state in the replication slave.

`ER_XA_REPLICATION_FILTERS` was added in 8.0.12.

- Error number: 3899; Symbol: `ER_UNSUPPORTED_SQL_MODE`; SQLSTATE: `HY000`

Message: sql_mode=0x%08x is not supported.

`ER_UNSUPPORTED_SQL_MODE` was added in 8.0.11.

- Error number: 3900; Symbol: `ER_REGEX_INVALID_FLAG`; SQLSTATE: `HY000`

Message: Invalid match mode flag in regular expression.

`ER_REGEX_INVALID_FLAG` was added in 8.0.12.

- Error number: 3901; Symbol: `ER_PARTIAL_REVOKE_AND_DB_GRANT_BOTH_EXISTS`; SQLSTATE: HY000
Message: '%s' privilege for database '%s' exists both as partial revoke and mysql.db simultaneously. It could mean that the 'mysql' schema is corrupted.
`ER_PARTIAL_REVOKE_AND_DB_GRANT_BOTH_EXISTS` was added in 8.0.16.
- Error number: 3902; Symbol: `ER_UNIT_NOT_FOUND`; SQLSTATE: SU001
Message: There's no unit of measure named '%s'.
`ER_UNIT_NOT_FOUND` was added in 8.0.14.
- Error number: 3903; Symbol: `ER_INVALID_JSON_VALUE_FOR_FUNC_INDEX`; SQLSTATE: 22018
Message: Invalid JSON value for CAST for functional index '%s'.
`ER_INVALID_JSON_VALUE_FOR_FUNC_INDEX` was added in 8.0.16.
- Error number: 3904; Symbol: `ER_JSON_VALUE_OUT_OF_RANGE_FOR_FUNC_INDEX`; SQLSTATE: 22003
Message: Out of range JSON value for CAST for functional index '%s'.
`ER_JSON_VALUE_OUT_OF_RANGE_FOR_FUNC_INDEX` was added in 8.0.16.
- Error number: 3905; Symbol: `ER_EXCEEDED_MV_KEYS_NUM`; SQLSTATE: HY000
Message: Exceeded max number of values per record for multi-valued index '%s' by %u value(s).
`ER_EXCEEDED_MV_KEYS_NUM` was added in 8.0.16.
- Error number: 3906; Symbol: `ER_EXCEEDED_MV_KEYS_SPACE`; SQLSTATE: HY000
Message: Exceeded max total length of values per record for multi-valued index '%s' by %u bytes.
`ER_EXCEEDED_MV_KEYS_SPACE` was added in 8.0.16.
- Error number: 3907; Symbol: `ER_FUNCTIONAL_INDEX_DATA_IS_TOO_LONG`; SQLSTATE: 22001
Message: Data too long for functional index '%s'.
`ER_FUNCTIONAL_INDEX_DATA_IS_TOO_LONG` was added in 8.0.16.
- Error number: 3908; Symbol: `ER_WRONG_MVI_VALUE`; SQLSTATE: HY000
Message: Cannot store an array or an object in a scalar key part of the index '%s'.
`ER_WRONG_MVI_VALUE` was added in 8.0.16.
- Error number: 3909; Symbol: `ER_WARN_FUNC_INDEX_NOT_APPLICABLE`; SQLSTATE: HY000
Message: Cannot use functional index '%s' due to type or collation conversion.
`ER_WARN_FUNC_INDEX_NOT_APPLICABLE` was added in 8.0.16.
- Error number: 3910; Symbol: `ER_GRP_RPL_UDF_ERROR`; SQLSTATE: HY000
Message: The function '%s' failed. %s

[ER_GRP_RPL_UDF_ERROR](#) was added in 8.0.13.

- Error number: [3911](#); Symbol: [ER_UPDATE_GTID_PURGED_WITH_GR](#); SQLSTATE: [HY000](#)

Message: Cannot update GTID_PURGED with the Group Replication plugin running

[ER_UPDATE_GTID_PURGED_WITH_GR](#) was added in 8.0.12.

- Error number: [3912](#); Symbol: [ER_GROUPING_ON_TIMESTAMP_IN_DST](#); SQLSTATE: [HY000](#)

Message: Grouping on temporal is non-deterministic for timezones having DST. Please consider switching to UTC for this query.

[ER_GROUPING_ON_TIMESTAMP_IN_DST](#) was added in 8.0.17.

- Error number: [3913](#); Symbol: [ER_TABLE_NAME_CAUSES_TOO_LONG_PATH](#); SQLSTATE: [HY000](#)

Message: Long database name and identifier for object resulted in a path length too long for table '%s'. Please check the path limit for your OS.

[ER_TABLE_NAME_CAUSES_TOO_LONG_PATH](#) was added in 8.0.4.

- Error number: [3914](#); Symbol: [ER_AUDIT_LOG_INSUFFICIENT_PRIVILEGE](#); SQLSTATE: [HY000](#)

Message: Request ignored for '%s'@'%s'. Role needed to perform operation: '%s'

[ER_AUDIT_LOG_INSUFFICIENT_PRIVILEGE](#) was added in 8.0.16.

- Error number: [3916](#); Symbol: [ER_DA_GRP_RPL_STARTED_AUTO_REJOIN](#); SQLSTATE: [HY000](#)

Message: Started auto-rejoin procedure attempt %lu of %lu

[ER_DA_GRP_RPL_STARTED_AUTO_REJOIN](#) was added in 8.0.17.

- Error number: [3917](#); Symbol: [ER_SYSVAR_CHANGE_DURING_QUERY](#); SQLSTATE: [HY000](#)

Message: A plugin was loaded or unloaded during a query, a system variable table was changed.

[ER_SYSVAR_CHANGE_DURING_QUERY](#) was added in 8.0.18.

- Error number: [3918](#); Symbol: [ER_GLOBSTAT_CHANGE_DURING_QUERY](#); SQLSTATE: [HY000](#)

Message: A plugin was loaded or unloaded during a query, a global status variable was changed.

[ER_GLOBSTAT_CHANGE_DURING_QUERY](#) was added in 8.0.18.

- Error number: [3919](#); Symbol: [ER_GRP_RPL_MESSAGE_SERVICE_INIT_FAILURE](#); SQLSTATE: [HY000](#)

Message: The START GROUP_REPLICATION command failed to start its message service.

[ER_GRP_RPL_MESSAGE_SERVICE_INIT_FAILURE](#) was added in 8.0.18.

- Error number: [3920](#); Symbol: [ER_CHANGE_MASTER_WRONG_COMPRESSION_ALGORITHM_CLIENT](#); SQLSTATE: [HY000](#)

Message: Invalid MASTER_COMPRESSION_ALGORITHMS '%s' for channel '%s'.

[ER_CHANGE_MASTER_WRONG_COMPRESSION_ALGORITHM_CLIENT](#) was added in 8.0.18.

- Error number: 3921; Symbol: `ER_CHANGE_MASTER_WRONG_COMPRESSION_LEVEL_CLIENT`; SQLSTATE: HY000

Message: Invalid MASTER_ZSTD_COMPRESSION_LEVEL %u for channel '%s'.

`ER_CHANGE_MASTER_WRONG_COMPRESSION_LEVEL_CLIENT` was added in 8.0.18.
- Error number: 3922; Symbol: `ER_WRONG_COMPRESSION_ALGORITHM_CLIENT`; SQLSTATE: HY000

Message: Invalid compression algorithm '%s'.

`ER_WRONG_COMPRESSION_ALGORITHM_CLIENT` was added in 8.0.18.
- Error number: 3923; Symbol: `ER_WRONG_COMPRESSION_LEVEL_CLIENT`; SQLSTATE: HY000

Message: Invalid zstd compression level for algorithm '%s'.

`ER_WRONG_COMPRESSION_LEVEL_CLIENT` was added in 8.0.18.
- Error number: 3924; Symbol: `ER_CHANGE_MASTER_WRONG_COMPRESSION_ALGORITHM_LIST_CLIENT`; SQLSTATE: HY000

Message: Specified compression algorithm list '%s' exceeds total count of 3 for channel '%s'.

`ER_CHANGE_MASTER_WRONG_COMPRESSION_ALGORITHM_LIST_CLIENT` was added in 8.0.18.
- Error number: 3925; Symbol: `ER_CLIENT_PRIVILEGE_CHECKS_USER_CANNOT_BE_ANONYMOUS`; SQLSTATE: HY000

Message: PRIVILEGE_CHECKS_USER for replication channel '%s' was set to ``@`%s`, but anonymous users are disallowed for PRIVILEGE_CHECKS_USER.

`ER_CLIENT_PRIVILEGE_CHECKS_USER_CANNOT_BE_ANONYMOUS` was added in 8.0.18.
- Error number: 3926; Symbol: `ER_CLIENT_PRIVILEGE_CHECKS_USER_DOES_NOT_EXIST`; SQLSTATE: HY000

Message: PRIVILEGE_CHECKS_USER for replication channel '%s' was set to `%s`@`%s`, but this is not an existing user.

`ER_CLIENT_PRIVILEGE_CHECKS_USER_DOES_NOT_EXIST` was added in 8.0.18.
- Error number: 3927; Symbol: `ER_CLIENT_PRIVILEGE_CHECKS_USER_CORRUPT`; SQLSTATE: HY000

Message: Invalid, corrupted PRIVILEGE_CHECKS_USER was found in the replication configuration repository for channel '%s'. Use CHANGE MASTER TO PRIVILEGE_CHECKS_USER to correct the configuration.

`ER_CLIENT_PRIVILEGE_CHECKS_USER_CORRUPT` was added in 8.0.18.
- Error number: 3928; Symbol: `ER_CLIENT_PRIVILEGE_CHECKS_USER_NEEDS_RPL_APPLIER_PRIV`; SQLSTATE: HY000

Message: PRIVILEGE_CHECKS_USER for replication channel '%s' was set to `%s`@`%s`, but this user does not have REPLICATION_APPLIER privilege.

`ER_CLIENT_PRIVILEGE_CHECKS_USER_NEEDS_RPL_APPLIER_PRIV` was added in 8.0.18.

- Error number: 3929; Symbol: [ER_WARN_DA_PRIVILEGE_NOT_REGISTERED](#); SQLSTATE: HY000
Message: Dynamic privilege '%s' is not registered with the server.
[ER_WARN_DA_PRIVILEGE_NOT_REGISTERED](#) was added in 8.0.18.
- Error number: 3930; Symbol: [ER_CLIENT_KEYRING_UDF_KEY_INVALID](#); SQLSTATE: HY000
Message: Function '%s' failed because key is invalid.
[ER_CLIENT_KEYRING_UDF_KEY_INVALID](#) was added in 8.0.19.
- Error number: 3931; Symbol: [ER_CLIENT_KEYRING_UDF_KEY_TYPE_INVALID](#); SQLSTATE: HY000
Message: Function '%s' failed because key type is invalid.
[ER_CLIENT_KEYRING_UDF_KEY_TYPE_INVALID](#) was added in 8.0.19.
- Error number: 3932; Symbol: [ER_CLIENT_KEYRING_UDF_KEY_TOO_LONG](#); SQLSTATE: HY000
Message: Function '%s' failed because key length is too long.
[ER_CLIENT_KEYRING_UDF_KEY_TOO_LONG](#) was added in 8.0.19.
- Error number: 3933; Symbol: [ER_CLIENT_KEYRING_UDF_KEY_TYPE_TOO_LONG](#); SQLSTATE: HY000
Message: Function '%s' failed because key type is too long.
[ER_CLIENT_KEYRING_UDF_KEY_TYPE_TOO_LONG](#) was added in 8.0.19.
- Error number: 3934; Symbol: [ER_JSON_SCHEMA_VALIDATION_ERROR_WITH_DETAILED_REPORT](#); SQLSTATE: HY000
Message: %s.
[ER_JSON_SCHEMA_VALIDATION_ERROR_WITH_DETAILED_REPORT](#) was added in 8.0.19.
- Error number: 3935; Symbol: [ER_DA_UDF_INVALID_CHARSET_SPECIFIED](#); SQLSTATE: HY000
Message: Invalid character set '%s' was specified. It must be either character set name or collation name as supported by server.
[ER_DA_UDF_INVALID_CHARSET_SPECIFIED](#) was added in 8.0.19.
- Error number: 3936; Symbol: [ER_DA_UDF_INVALID_CHARSET](#); SQLSTATE: HY000
Message: Invalid character set '%s' was specified. It must be a character set name as supported by server.
[ER_DA_UDF_INVALID_CHARSET](#) was added in 8.0.19.
- Error number: 3937; Symbol: [ER_DA_UDF_INVALID_COLLATION](#); SQLSTATE: HY000
Message: Invalid collation '%s' was specified. It must be a collation name as supported by server.
[ER_DA_UDF_INVALID_COLLATION](#) was added in 8.0.19.
- Error number: 3938; Symbol: [ER_DA_UDF_INVALID_EXTENSION_ARGUMENT_TYPE](#); SQLSTATE: HY000

Message: Invalid extension argument type '%s' was specified. Refer the MySQL manual for the valid UDF extension arguments type.

[ER_DA_UDF_INVALID_EXTENSION_ARGUMENT_TYPE](#) was added in 8.0.19.

- Error number: [3939](#); Symbol: [ER_MULTIPLE_CONSTRAINTS_WITH_SAME_NAME](#); SQLSTATE: [HY000](#)

Message: Table has multiple constraints with the name '%s'. Please use constraint specific '%s' clause.

[ER_MULTIPLE_CONSTRAINTS_WITH_SAME_NAME](#) was added in 8.0.19.

- Error number: [3940](#); Symbol: [ER_CONSTRAINT_NOT_FOUND](#); SQLSTATE: [HY000](#)

Message: Constraint '%s' does not exist.

[ER_CONSTRAINT_NOT_FOUND](#) was added in 8.0.19.

- Error number: [3941](#); Symbol: [ER_ALTER_CONSTRAINT_ENFORCEMENT_NOT_SUPPORTED](#); SQLSTATE: [HY000](#)

Message: Altering constraint enforcement is not supported for the constraint '%s'. Enforcement state alter is not supported for the PRIMARY, UNIQUE and FOREIGN KEY type constraints.

[ER_ALTER_CONSTRAINT_ENFORCEMENT_NOT_SUPPORTED](#) was added in 8.0.19.

- Error number: [3942](#); Symbol: [ER_TABLE_VALUE_CONSTRUCTOR_MUST_HAVE_COLUMNS](#); SQLSTATE: [HY000](#)

Message: Each row of a VALUES clause must have at least one column, unless when used as source in an INSERT statement.

[ER_TABLE_VALUE_CONSTRUCTOR_MUST_HAVE_COLUMNS](#) was added in 8.0.19.

- Error number: [3943](#); Symbol: [ER_TABLE_VALUE_CONSTRUCTOR_CANNOT_HAVE_DEFAULT](#); SQLSTATE: [HY000](#)

Message: A VALUES clause cannot use DEFAULT values, unless used as a source in an INSERT statement.

[ER_TABLE_VALUE_CONSTRUCTOR_CANNOT_HAVE_DEFAULT](#) was added in 8.0.19.

- Error number: [3944](#); Symbol: [ER_CLIENT_QUERY_FAILURE_INVALID_NON_ROW_FORMAT](#); SQLSTATE: [HY000](#)

Message: The query does not comply with variable `require_row_format` restrictions.

[ER_CLIENT_QUERY_FAILURE_INVALID_NON_ROW_FORMAT](#) was added in 8.0.19.

- Error number: [3945](#); Symbol: [ER_REQUIRE_ROW_FORMAT_INVALID_VALUE](#); SQLSTATE: [HY000](#)

Message: The requested value %s is invalid for `REQUIRE_ROW_FORMAT`, must be either 0 or 1.

[ER_REQUIRE_ROW_FORMAT_INVALID_VALUE](#) was added in 8.0.19.

- Error number: 3946; Symbol: [ER_FAILED_TO_DETERMINE_IF_ROLE_IS_MANDATORY](#); SQLSTATE: HY000

Message: Failed to acquire lock on user management service, unable to determine if role `%s`@`%s` is mandatory

[ER_FAILED_TO_DETERMINE_IF_ROLE_IS_MANDATORY](#) was added in 8.0.19.
- Error number: 3947; Symbol: [ER_FAILED_TO_FETCH_MANDATORY_ROLE_LIST](#); SQLSTATE: HY000

Message: Failed to acquire lock on user management service, unable to fetch mandatory role list

[ER_FAILED_TO_FETCH_MANDATORY_ROLE_LIST](#) was added in 8.0.19.
- Error number: 3948; Symbol: [ER_CLIENT_LOCAL_FILES_DISABLED](#); SQLSTATE: 42000

Message: Loading local data is disabled; this must be enabled on both the client and server sides

[ER_CLIENT_LOCAL_FILES_DISABLED](#) was added in 8.0.19.
- Error number: 3949; Symbol: [ER_IMP_INCOMPATIBLE_CFG_VERSION](#); SQLSTATE: HY000

Message: Failed to import %s because the CFG file version (%u) is not compatible with the current version (%u)

[ER_IMP_INCOMPATIBLE_CFG_VERSION](#) was added in 8.0.19.
- Error number: 3950; Symbol: [ER_DA_OOM](#); SQLSTATE: HY000

Message: Out of memory

[ER_DA_OOM](#) was added in 8.0.19.
- Error number: 3951; Symbol: [ER_DA_UDF_INVALID_ARGUMENT_TO_SET_CHARSET](#); SQLSTATE: HY000

Message: Character set can be set only for the UDF argument type STRING.

[ER_DA_UDF_INVALID_ARGUMENT_TO_SET_CHARSET](#) was added in 8.0.19.
- Error number: 3952; Symbol: [ER_DA_UDF_INVALID_RETURN_TYPE_TO_SET_CHARSET](#); SQLSTATE: HY000

Message: Character set can be set only for the UDF RETURN type STRING.

[ER_DA_UDF_INVALID_RETURN_TYPE_TO_SET_CHARSET](#) was added in 8.0.19.
- Error number: 3953; Symbol: [ER_MULTIPLE_INTO_CLAUSES](#); SQLSTATE: HY000

Message: Multiple INTO clauses in one query block.

[ER_MULTIPLE_INTO_CLAUSES](#) was added in 8.0.19.
- Error number: 3954; Symbol: [ER_MISPLACED_INTO](#); SQLSTATE: HY000

Message: Misplaced INTO clause, INTO is not allowed inside subqueries, and must be placed at end of UNION clauses.

[ER_MISPLACED_INTO](#) was added in 8.0.19.

- Error number: 3955; Symbol: `ER_USER_ACCESS_DENIED_FOR_USER_ACCOUNT_BLOCKED_BY_PASSWORD_LOCK`; SQLSTATE: HY000
Message: Access denied for user '%s'@'%s'. Account is blocked for %s day(s) (%s day(s) remaining) due to %u consecutive failed logins.
`ER_USER_ACCESS_DENIED_FOR_USER_ACCOUNT_BLOCKED_BY_PASSWORD_LOCK` was added in 8.0.19.
- Error number: 3956; Symbol: `ER_WARN_DEPRECATED_YEAR_UNSIGNED`; SQLSTATE: HY000
Message: UNSIGNED for the YEAR data type is deprecated and support for it will be removed in a future release.
`ER_WARN_DEPRECATED_YEAR_UNSIGNED` was added in 8.0.19.
- Error number: 3957; Symbol: `ER_CLONE_NETWORK_PACKET`; SQLSTATE: HY000
Message: Clone needs max_allowed_packet value to be %u or more. Current value is %u
`ER_CLONE_NETWORK_PACKET` was added in 8.0.19.
- Error number: 3958; Symbol: `ER_SDI_OPERATION_FAILED_MISSING_RECORD`; SQLSTATE: HY000
Message: Failed to %s sdi for %s.%s in %s due to missing record.
`ER_SDI_OPERATION_FAILED_MISSING_RECORD` was added in 8.0.19.
- Error number: 3959; Symbol: `ER_DEPENDENT_BY_CHECK_CONSTRAINT`; SQLSTATE: HY000
Message: Check constraint '%s' uses column '%s', hence column cannot be dropped or renamed.
`ER_DEPENDENT_BY_CHECK_CONSTRAINT` was added in 8.0.19.
- Error number: MY-010000; Symbol: `ER_PARSER_TRACE`; SQLSTATE: XX999
Message: Parser saw: %s
`ER_PARSER_TRACE` was added in 8.0.2.
- Error number: MY-010001; Symbol: `ER_BOOTSTRAP_CANT_THREAD`; SQLSTATE: HY000
Message: Can't create thread to handle bootstrap (errno: %d)
`ER_BOOTSTRAP_CANT_THREAD` was added in 8.0.2.
- Error number: MY-010002; Symbol: `ER_TRIGGER_INVALID_VALUE`; SQLSTATE: HY000
Message: Trigger for table '%s'. '%s': invalid %s value (%s).
`ER_TRIGGER_INVALID_VALUE` was added in 8.0.2.
- Error number: MY-010003; Symbol: `ER_OPT_WRONG_TREE`; SQLSTATE: HY000
Message: Wrong tree: %s
`ER_OPT_WRONG_TREE` was added in 8.0.2.
- Error number: MY-010004; Symbol: `ER_DD_FAILSAFE`; SQLSTATE: HY000

Message: Error: Invalid %s

[ER_DD_FAILSAFE](#) was added in 8.0.2.

- Error number: [MY-010005](#); Symbol: [ER_DD_NO_WRITES_NO_REPOPULATION](#); SQLSTATE: [HY000](#)

Message: Skip re-populating collations and character sets tables in %s%read-only mode.

[ER_DD_NO_WRITES_NO_REPOPULATION](#) was added in 8.0.2.

- Error number: [MY-010006](#); Symbol: [ER_DD_VERSION_FOUND](#); SQLSTATE: [HY000](#)

Message: Using data dictionary with version '%d'.

[ER_DD_VERSION_FOUND](#) was added in 8.0.2.

- Error number: [MY-010007](#); Symbol: [ER_DD_VERSION_INSTALLED](#); SQLSTATE: [HY000](#)

Message: Installed data dictionary with version %d

[ER_DD_VERSION_INSTALLED](#) was added in 8.0.2.

- Error number: [MY-010008](#); Symbol: [ER_DD_VERSION_UNSUPPORTED](#); SQLSTATE: [HY000](#)

Message: Data Dictionary version '%d' not supported.

[ER_DD_VERSION_UNSUPPORTED](#) was added in 8.0.2.

- Error number: [MY-010009](#); Symbol: [ER_LOG_SYSLOG_FACILITY_FAIL](#); SQLSTATE: [HY000](#)

Message: Failed to set syslog facility to "%s", setting to "%s" (%d) instead.

[ER_LOG_SYSLOG_FACILITY_FAIL](#) was added in 8.0.2, removed after 8.0.12.

- Error number: [MY-010010](#); Symbol: [ER_LOG_SYSLOG_CANNOT_OPEN](#); SQLSTATE: [HY000](#)

Message: Cannot open %s; check privileges, or remove syseventlog from --log-error-services!

[ER_LOG_SYSLOG_CANNOT_OPEN](#) was added in 8.0.2.

- Error number: [MY-010011](#); Symbol: [ER_LOG_SLOW_CANNOT_OPEN](#); SQLSTATE: [HY000](#)

Message: either restart the query logging by using "SET GLOBAL SLOW_QUERY_LOG=ON" or

[ER_LOG_SLOW_CANNOT_OPEN](#) was added in 8.0.2.

- Error number: [MY-010012](#); Symbol: [ER_LOG_GENERAL_CANNOT_OPEN](#); SQLSTATE: [HY000](#)

Message: either restart the query logging by using "SET GLOBAL GENERAL_LOG=ON" or

[ER_LOG_GENERAL_CANNOT_OPEN](#) was added in 8.0.2.

- Error number: [MY-010013](#); Symbol: [ER_LOG_CANNOT_WRITE](#); SQLSTATE: [HY000](#)

Message: Failed to write to %s: %s

[ER_LOG_CANNOT_WRITE](#) was added in 8.0.2.

- Error number: [MY-010014](#); Symbol: [ER_RPL_ZOMBIE_ENCOUNTERED](#); SQLSTATE: [HY000](#)

Message: While initializing dump thread for slave with %s <%s>, found a zombie dump thread with the same %s. Master is killing the zombie dump thread(%u).

[ER_RPL_ZOMBIE_ENCOUNTERED](#) was added in 8.0.2.

- Error number: [MY-010015](#); Symbol: [ER_RPL_GTID_TABLE_CANNOT_OPEN](#); SQLSTATE: [HY000](#)

Message: Gtid table is not ready to be used. Table '%s.%s' cannot be opened.

[ER_RPL_GTID_TABLE_CANNOT_OPEN](#) was added in 8.0.2.

- Error number: [MY-010016](#); Symbol: [ER_SYSTEM_SCHEMA_NOT_FOUND](#); SQLSTATE: [HY000](#)

Message: System schema directory does not exist.

[ER_SYSTEM_SCHEMA_NOT_FOUND](#) was added in 8.0.2.

- Error number: [MY-010017](#); Symbol: [ER_DD_INIT_UPGRADE_FAILED](#); SQLSTATE: [HY000](#)

Message: Error in initializing dictionary, upgrade will do a cleanup and exit

[ER_DD_INIT_UPGRADE_FAILED](#) was added in 8.0.2.

- Error number: [MY-010018](#); Symbol: [ER_VIEW_UNKNOWN_CHARSET_OR_COLLATION](#); SQLSTATE: [HY000](#)

Message: View '%s'. '%s': unknown charset name and/or collation name (client: '%s'; connection: '%s').

[ER_VIEW_UNKNOWN_CHARSET_OR_COLLATION](#) was added in 8.0.2.

- Error number: [MY-010019](#); Symbol: [ER_DD_VIEW_CANT_ALLOC_CHARSET](#); SQLSTATE: [HY000](#)

Message: Error in allocating memory for character set name for view %s.%s.

[ER_DD_VIEW_CANT_ALLOC_CHARSET](#) was added in 8.0.2.

- Error number: [MY-010020](#); Symbol: [ER_DD_INIT_FAILED](#); SQLSTATE: [HY000](#)

Message: Data Dictionary initialization failed.

[ER_DD_INIT_FAILED](#) was added in 8.0.2.

- Error number: [MY-010021](#); Symbol: [ER_DD_UPDATING_PLUGIN_MD_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to update plugin metadata in dictionary tables.

[ER_DD_UPDATING_PLUGIN_MD_FAILED](#) was added in 8.0.2.

- Error number: [MY-010022](#); Symbol: [ER_DD_POPULATING_TABLES_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to Populate DD tables.

[ER_DD_POPULATING_TABLES_FAILED](#) was added in 8.0.2.

- Error number: [MY-010023](#); Symbol: [ER_DD_VIEW_CANT_CREATE](#); SQLSTATE: [HY000](#)

Message: Error in Creating View %s.%s

[ER_DD_VIEW_CANT_CREATE](#) was added in 8.0.2.

- Error number: [MY-010024](#); Symbol: [ER_DD_METADATA_NOT_FOUND](#); SQLSTATE: [HY000](#)
Message: Unable to start server. Cannot find the meta data for data dictionary table '%s'.
[ER_DD_METADATA_NOT_FOUND](#) was added in 8.0.2.
- Error number: [MY-010025](#); Symbol: [ER_DD_CACHE_NOT_EMPTY_AT_SHUTDOWN](#); SQLSTATE: [HY000](#)
Message: Dictionary cache not empty at shutdown.
[ER_DD_CACHE_NOT_EMPTY_AT_SHUTDOWN](#) was added in 8.0.2.
- Error number: [MY-010026](#); Symbol: [ER_DD_OBJECT_REMAINS](#); SQLSTATE: [HY000](#)
Message: Dictionary objects used but not released.
[ER_DD_OBJECT_REMAINS](#) was added in 8.0.2.
- Error number: [MY-010027](#); Symbol: [ER_DD_OBJECT_REMAINS_IN_RELEASER](#); SQLSTATE: [HY000](#)
Message: Dictionary objects left in default releaser.
[ER_DD_OBJECT_REMAINS_IN_RELEASER](#) was added in 8.0.2.
- Error number: [MY-010028](#); Symbol: [ER_DD_OBJECT_RELEASER_REMAINS](#); SQLSTATE: [HY000](#)
Message: Dictionary object auto releaser not deleted
[ER_DD_OBJECT_RELEASER_REMAINS](#) was added in 8.0.2.
- Error number: [MY-010029](#); Symbol: [ER_DD_CANT_GET_OBJECT_KEY](#); SQLSTATE: [HY000](#)
Message: Error: Unable to create primary object key
[ER_DD_CANT_GET_OBJECT_KEY](#) was added in 8.0.2.
- Error number: [MY-010030](#); Symbol: [ER_DD_CANT_CREATE_OBJECT_KEY](#); SQLSTATE: [HY000](#)
Message: Error: Unable to create object key
[ER_DD_CANT_CREATE_OBJECT_KEY](#) was added in 8.0.2.
- Error number: [MY-010031](#); Symbol: [ER_CANT_CREATE_HANDLE_MGR_THREAD](#); SQLSTATE: [HY000](#)
Message: Can't create handle_manager thread (errno= %d)
[ER_CANT_CREATE_HANDLE_MGR_THREAD](#) was added in 8.0.2.
- Error number: [MY-010032](#); Symbol: [ER_RPL_REPO_HAS_GAPS](#); SQLSTATE: [HY000](#)
Message: It is not possible to change the type of the relay log's repository because there are workers' repositories with gaps. Please, fix the gaps first before doing such change.
[ER_RPL_REPO_HAS_GAPS](#) was added in 8.0.2.
- Error number: [MY-010033](#); Symbol: [ER_INVALID_VALUE_FOR_ENFORCE_GTID_CONSISTENCY](#); SQLSTATE: [HY000](#)
Message: option 'enforce-gtid-consistency': value '%s' was not recognized. Setting enforce-gtid-consistency to OFF.

[ER_INVALID_VALUE_FOR_ENFORCE_GTID_CONSISTENCY](#) was added in 8.0.2.

- Error number: [MY-010034](#); Symbol: [ER_CHANGED_ENFORCE_GTID_CONSISTENCY](#); SQLSTATE: [HY000](#)

Message: Changed ENFORCE_GTID_CONSISTENCY from %s to %s.

[ER_CHANGED_ENFORCE_GTID_CONSISTENCY](#) was added in 8.0.2.

- Error number: [MY-010035](#); Symbol: [ER_CHANGED_GTID_MODE](#); SQLSTATE: [HY000](#)

Message: Changed GTID_MODE from %s to %s.

[ER_CHANGED_GTID_MODE](#) was added in 8.0.2.

- Error number: [MY-010036](#); Symbol: [ER_DISABLED_STORAGE_ENGINE_AS_DEFAULT](#); SQLSTATE: [HY000](#)

Message: %s is set to a disabled storage engine %s.

[ER_DISABLED_STORAGE_ENGINE_AS_DEFAULT](#) was added in 8.0.2.

- Error number: [MY-010037](#); Symbol: [ER_DEBUG_SYNC_HIT](#); SQLSTATE: [HY000](#)

Message: Debug sync points hit: %s

[ER_DEBUG_SYNC_HIT](#) was added in 8.0.2.

- Error number: [MY-010038](#); Symbol: [ER_DEBUG_SYNC_EXECUTED](#); SQLSTATE: [HY000](#)

Message: Debug sync points executed: %s

[ER_DEBUG_SYNC_EXECUTED](#) was added in 8.0.2.

- Error number: [MY-010039](#); Symbol: [ER_DEBUG_SYNC_THREAD_MAX](#); SQLSTATE: [HY000](#)

Message: Debug sync points max active per thread: %s

[ER_DEBUG_SYNC_THREAD_MAX](#) was added in 8.0.2.

- Error number: [MY-010040](#); Symbol: [ER_DEBUG_SYNC_OOM](#); SQLSTATE: [HY000](#)

Message: Debug Sync Facility disabled due to lack of memory.

[ER_DEBUG_SYNC_OOM](#) was added in 8.0.2.

- Error number: [MY-010041](#); Symbol: [ER_CANT_INIT_TC_LOG](#); SQLSTATE: [HY000](#)

Message: Can't init tc log

[ER_CANT_INIT_TC_LOG](#) was added in 8.0.2.

- Error number: [MY-010042](#); Symbol: [ER_EVENT_CANT_INIT_QUEUE](#); SQLSTATE: [HY000](#)

Message: Event Scheduler: Can't initialize the execution queue

[ER_EVENT_CANT_INIT_QUEUE](#) was added in 8.0.2.

- Error number: [MY-010043](#); Symbol: [ER_EVENT_PURGING_QUEUE](#); SQLSTATE: [HY000](#)

Message: Event Scheduler: Purging the queue. %u events

[ER_EVENT_PURGING_QUEUE](#) was added in 8.0.2.

- Error number: [MY-010044](#); Symbol: [ER_EVENT_LAST_EXECUTION](#); SQLSTATE: [HY000](#)

Message: Event Scheduler: Last execution of %s.%s. %s

[ER_EVENT_LAST_EXECUTION](#) was added in 8.0.2.

- Error number: [MY-010045](#); Symbol: [ER_EVENT_MESSAGE_STACK](#); SQLSTATE: [HY000](#)

Message: %*s

[ER_EVENT_MESSAGE_STACK](#) was added in 8.0.2.

- Error number: [MY-010046](#); Symbol: [ER_EVENT_EXECUTION_FAILED](#); SQLSTATE: [HY000](#)

Message: Event Scheduler: [%s].[%s.%s] event execution failed.

[ER_EVENT_EXECUTION_FAILED](#) was added in 8.0.2.

- Error number: [MY-010047](#); Symbol: [ER_CANT_INIT_SCHEDULER_THREAD](#); SQLSTATE: [HY000](#)

Message: Event Scheduler: Cannot initialize the scheduler thread

[ER_CANT_INIT_SCHEDULER_THREAD](#) was added in 8.0.2.

- Error number: [MY-010048](#); Symbol: [ER_SCHEDULER_STOPPED](#); SQLSTATE: [HY000](#)

Message: Event Scheduler: Stopped

[ER_SCHEDULER_STOPPED](#) was added in 8.0.2.

- Error number: [MY-010049](#); Symbol: [ER_CANT_CREATE_SCHEDULER_THREAD](#); SQLSTATE: [HY000](#)

Message: Event scheduler: Failed to start scheduler, Can not create thread for event scheduler (errno=%d)

[ER_CANT_CREATE_SCHEDULER_THREAD](#) was added in 8.0.2.

- Error number: [MY-010050](#); Symbol: [ER_SCHEDULER_WAITING](#); SQLSTATE: [HY000](#)

Message: Event Scheduler: Waiting for the scheduler thread to reply

[ER_SCHEDULER_WAITING](#) was added in 8.0.2.

- Error number: [MY-010051](#); Symbol: [ER_SCHEDULER_STARTED](#); SQLSTATE: [HY000](#)

Message: Event Scheduler: scheduler thread started with id %u

[ER_SCHEDULER_STARTED](#) was added in 8.0.2.

- Error number: [MY-010052](#); Symbol: [ER_SCHEDULER_STOPPING_FAILED_TO_GET_EVENT](#); SQLSTATE: [HY000](#)

Message: Event Scheduler: Serious error during getting next event to execute. Stopping

[ER_SCHEDULER_STOPPING_FAILED_TO_GET_EVENT](#) was added in 8.0.2.

- Error number: [MY-010053](#); Symbol: [ER_SCHEDULER_STOPPING_FAILED_TO_CREATE_WORKER](#); SQLSTATE: [HY000](#)

Message: Event_scheduler::execute_top: Can not create event worker thread (errno=%d). Stopping event scheduler

[ER_SCHEDULER_STOPPING_FAILED_TO_CREATE_WORKER](#) was added in 8.0.2.

- Error number: [MY-010054](#); Symbol: [ER_SCHEDULER_KILLING](#); SQLSTATE: [HY000](#)

Message: Event Scheduler: Killing the scheduler thread, thread id %u

[ER_SCHEDULER_KILLING](#) was added in 8.0.2.

- Error number: [MY-010055](#); Symbol: [ER_UNABLE_TO_RESOLVE_IP](#); SQLSTATE: [HY000](#)

Message: IP address '%s' could not be resolved: %s

[ER_UNABLE_TO_RESOLVE_IP](#) was added in 8.0.2.

- Error number: [MY-010056](#); Symbol: [ER_UNABLE_TO_RESOLVE_HOSTNAME](#); SQLSTATE: [HY000](#)

Message: Host name '%s' could not be resolved: %s

[ER_UNABLE_TO_RESOLVE_HOSTNAME](#) was added in 8.0.2.

- Error number: [MY-010057](#); Symbol: [ER_HOSTNAME_RESEMBLES_IPV4](#); SQLSTATE: [HY000](#)

Message: IP address '%s' has been resolved to the host name '%s', which resembles IPv4-address itself.

[ER_HOSTNAME_RESEMBLES_IPV4](#) was added in 8.0.2.

- Error number: [MY-010058](#); Symbol: [ER_HOSTNAME_DOESNT_RESOLVE_TO](#); SQLSTATE: [HY000](#)

Message: Hostname '%s' does not resolve to '%s'.

[ER_HOSTNAME_DOESNT_RESOLVE_TO](#) was added in 8.0.2.

- Error number: [MY-010059](#); Symbol: [ER_ADDRESSES_FOR_HOSTNAME_HEADER](#); SQLSTATE: [HY000](#)

Message: Hostname '%s' has the following IP addresses:

[ER_ADDRESSES_FOR_HOSTNAME_HEADER](#) was added in 8.0.2.

- Error number: [MY-010060](#); Symbol: [ER_ADDRESSES_FOR_HOSTNAME_LIST_ITEM](#); SQLSTATE: [HY000](#)

Message: - %s

[ER_ADDRESSES_FOR_HOSTNAME_LIST_ITEM](#) was added in 8.0.2.

- Error number: [MY-010061](#); Symbol: [ER_TRG_WITHOUT_DEFINER](#); SQLSTATE: [HY000](#)

Message: Definer clause is missing in Trigger of Table %s. Rebuild Trigger to fix definer.

[ER_TRG_WITHOUT_DEFINER](#) was added in 8.0.2.

- Error number: [MY-010062](#); Symbol: [ER_TRG_NO_CLIENT_CHARSET](#); SQLSTATE: [HY000](#)

Message: Client character set is missing for trigger of table %s. Using default character set.

[ER_TRG_NO_CLIENT_CHARSET](#) was added in 8.0.2.

- Error number: [MY-010063](#); Symbol: [ER_PARSING_VIEW](#); SQLSTATE: [HY000](#)

Message: Error in parsing view %s.%s

[ER_PARSING_VIEW](#) was added in 8.0.2.

- Error number: [MY-010064](#); Symbol: [ER_COMPONENTS_INFRASTRUCTURE_BOOTSTRAP](#); SQLSTATE: [HY000](#)

Message: Failed to bootstrap components infrastructure.

[ER_COMPONENTS_INFRASTRUCTURE_BOOTSTRAP](#) was added in 8.0.2.

- Error number: [MY-010065](#); Symbol: [ER_COMPONENTS_INFRASTRUCTURE_SHUTDOWN](#); SQLSTATE: [HY000](#)

Message: Failed to shutdown components infrastructure.

[ER_COMPONENTS_INFRASTRUCTURE_SHUTDOWN](#) was added in 8.0.2.

- Error number: [MY-010066](#); Symbol: [ER_COMPONENTS_PERSIST_LOADER_BOOTSTRAP](#); SQLSTATE: [HY000](#)

Message: Failed to bootstrap persistent components loader.

[ER_COMPONENTS_PERSIST_LOADER_BOOTSTRAP](#) was added in 8.0.2.

- Error number: [MY-010067](#); Symbol: [ER_DEPART_WITH_GRACE](#); SQLSTATE: [HY000](#)

Message: Giving %d client threads a chance to die gracefully

[ER_DEPART_WITH_GRACE](#) was added in 8.0.2.

- Error number: [MY-010068](#); Symbol: [ER_CA_SELF_SIGNED](#); SQLSTATE: [HY000](#)

Message: CA certificate %s is self signed.

[ER_CA_SELF_SIGNED](#) was added in 8.0.2.

- Error number: [MY-010069](#); Symbol: [ER_SSL_LIBRARY_ERROR](#); SQLSTATE: [HY000](#)

Message: Failed to set up SSL because of the following SSL library error: %s

[ER_SSL_LIBRARY_ERROR](#) was added in 8.0.2.

- Error number: [MY-010070](#); Symbol: [ER_NO_THD_NO_UUID](#); SQLSTATE: [HY000](#)

Message: Failed to generate a server UUID because it is failed to allocate the THD.

[ER_NO_THD_NO_UUID](#) was added in 8.0.2.

- Error number: [MY-010071](#); Symbol: [ER_UUID_SALT](#); SQLSTATE: [HY000](#)

Message: Salting uuid generator variables, current_pid: %lu, server_start_time: %lu, bytes_sent: %llu,

[ER_UUID_SALT](#) was added in 8.0.2.

- Error number: [MY-010072](#); Symbol: [ER_UUID_IS](#); SQLSTATE: [HY000](#)

Message: Generated uuid: '%s', server_start_time: %lu, bytes_sent: %llu

[ER_UUID_IS](#) was added in 8.0.2.

- Error number: [MY-010073](#); Symbol: [ER_UUID_INVALID](#); SQLSTATE: [HY000](#)

Message: The server_uuid stored in auto.cnf file is not a valid UUID.

[ER_UUID_INVALID](#) was added in 8.0.2.

- Error number: [MY-010074](#); Symbol: [ER_UUID_SCRUB](#); SQLSTATE: [HY000](#)

Message: Garbage characters found at the end of the server_uuid value in auto.cnf file. It should be of length '%d' (UUID_LENGTH). Clear it and restart the server.

[ER_UUID_SCRUB](#) was added in 8.0.2.

- Error number: [MY-010075](#); Symbol: [ER_CREATING_NEW_UUID](#); SQLSTATE: [HY000](#)

Message: No existing UUID has been found, so we assume that this is the first time that this server has been started. Generating a new UUID: %s.

[ER_CREATING_NEW_UUID](#) was added in 8.0.2.

- Error number: [MY-010076](#); Symbol: [ER_CANT_CREATE_UUID](#); SQLSTATE: [HY000](#)

Message: Initialization of the server's UUID failed because it could not be read from the auto.cnf file. If this is a new server, the initialization failed because it was not possible to generate a new UUID.

[ER_CANT_CREATE_UUID](#) was added in 8.0.2.

- Error number: [MY-010077](#); Symbol: [ER_UNKNOWN_UNSUPPORTED_STORAGE_ENGINE](#); SQLSTATE: [HY000](#)

Message: Unknown/unsupported storage engine: %s

[ER_UNKNOWN_UNSUPPORTED_STORAGE_ENGINE](#) was added in 8.0.2.

- Error number: [MY-010078](#); Symbol: [ER_SECURE_AUTH_VALUE_UNSUPPORTED](#); SQLSTATE: [HY000](#)

Message: Unsupported value 0 for secure-auth

[ER_SECURE_AUTH_VALUE_UNSUPPORTED](#) was added in 8.0.2.

- Error number: [MY-010079](#); Symbol: [ER_INVALID_INSTRUMENT](#); SQLSTATE: [HY000](#)

Message: Invalid instrument name or value for performance_schema_instrument '%s'

[ER_INVALID_INSTRUMENT](#) was added in 8.0.2.

- Error number: [MY-010080](#); Symbol: [ER_INNODB_MANDATORY](#); SQLSTATE: [HY000](#)

Message: The use of InnoDB is mandatory since MySQL 5.7. The former options like '--innodb=0/1/OFF/ON' or '--skip-innodb' are ignored.

[ER_INNODB_MANDATORY](#) was added in 8.0.2.

- Error number: [MY-010082](#); Symbol: [ER_OLD_PASSWORDS_NO_MIDDLE_GROUND](#); SQLSTATE: [HY000](#)
Message: Invalid old_passwords mode: 1. Valid values are 2 and 0

[ER_OLD_PASSWORDS_NO_MIDDLE_GROUND](#) was added in 8.0.2, removed after 8.0.15.

- Error number: [MY-010083](#); Symbol: [ER_VERBOSE_REQUIRES_HELP](#); SQLSTATE: [HY000](#)
Message: --verbose is for use with --help; did you mean --log-error-verbosity?

[ER_VERBOSE_REQUIRES_HELP](#) was added in 8.0.2.

- Error number: [MY-010084](#); Symbol: [ER_POINTLESS_WITHOUT_SLOWLOG](#); SQLSTATE: [HY000](#)
Message: options --log-slow-admin-statements, --log-queries-not-using-indexes and --log-slow-slave-statements have no effect if --slow-query-log is not set

[ER_POINTLESS_WITHOUT_SLOWLOG](#) was added in 8.0.2.

- Error number: [MY-010085](#); Symbol: [ER_WASTEFUL_NET_BUFFER_SIZE](#); SQLSTATE: [HY000](#)
Message: net_buffer_length (%lu) is set to be larger than max_allowed_packet (%lu). Please rectify.

[ER_WASTEFUL_NET_BUFFER_SIZE](#) was added in 8.0.2.

- Error number: [MY-010086](#); Symbol: [ER_DEPRECATED_TIMESTAMP_IMPLICIT_DEFAULTS](#); SQLSTATE: [HY000](#)
Message: TIMESTAMP with implicit DEFAULT value is deprecated. Please use --explicit_defaults_for_timestamp server option (see documentation for more details).

[ER_DEPRECATED_TIMESTAMP_IMPLICIT_DEFAULTS](#) was added in 8.0.2.

- Error number: [MY-010087](#); Symbol: [ER_FT_BOOL_SYNTAX_INVALID](#); SQLSTATE: [HY000](#)
Message: Invalid ft-boolean-syntax string: %s

[ER_FT_BOOL_SYNTAX_INVALID](#) was added in 8.0.2.

- Error number: [MY-010088](#); Symbol: [ER_CREDENTIALLESS_AUTO_USER_BAD](#); SQLSTATE: [HY000](#)
Message: 'NO_AUTO_CREATE_USER' sql mode was not set.

[ER_CREDENTIALLESS_AUTO_USER_BAD](#) was added in 8.0.2.

- Error number: [MY-010089](#); Symbol: [ER_CONNECTION_HANDLING_OOM](#); SQLSTATE: [HY000](#)
Message: Could not allocate memory for connection handling

[ER_CONNECTION_HANDLING_OOM](#) was added in 8.0.2.

- Error number: [MY-010090](#); Symbol: [ER_THREAD_HANDLING_OOM](#); SQLSTATE: [HY000](#)
Message: Could not allocate memory for thread handling

[ER_THREAD_HANDLING_OOM](#) was added in 8.0.2.

- Error number: [MY-010091](#); Symbol: [ER_CANT_CREATE_TEST_FILE](#); SQLSTATE: [HY000](#)
Message: Can't create test file %s
[ER_CANT_CREATE_TEST_FILE](#) was added in 8.0.2.
- Error number: [MY-010092](#); Symbol: [ER_CANT_CREATE_PID_FILE](#); SQLSTATE: [HY000](#)
Message: Can't start server: can't create PID file: %s
[ER_CANT_CREATE_PID_FILE](#) was added in 8.0.2.
- Error number: [MY-010093](#); Symbol: [ER_CANT_REMOVE_PID_FILE](#); SQLSTATE: [HY000](#)
Message: Unable to delete pid file: %s
[ER_CANT_REMOVE_PID_FILE](#) was added in 8.0.2.
- Error number: [MY-010094](#); Symbol: [ER_CANT_CREATE_SHUTDOWN_THREAD](#); SQLSTATE: [HY000](#)
Message: Can't create thread to handle shutdown requests (errno= %d)
[ER_CANT_CREATE_SHUTDOWN_THREAD](#) was added in 8.0.2.
- Error number: [MY-010095](#); Symbol: [ER_SEC_FILE_PRIV_CANT_ACCESS_DIR](#); SQLSTATE: [HY000](#)
Message: Failed to access directory for --secure-file-priv. Please make sure that directory exists and is accessible by MySQL Server. Supplied value : %s
[ER_SEC_FILE_PRIV_CANT_ACCESS_DIR](#) was added in 8.0.2.
- Error number: [MY-010096](#); Symbol: [ER_SEC_FILE_PRIV_IGNORED](#); SQLSTATE: [HY000](#)
Message: Ignoring --secure-file-priv value as server is running with --initialize(-insecure).
[ER_SEC_FILE_PRIV_IGNORED](#) was added in 8.0.2.
- Error number: [MY-010097](#); Symbol: [ER_SEC_FILE_PRIV_EMPTY](#); SQLSTATE: [HY000](#)
Message: Insecure configuration for --secure-file-priv: Current value does not restrict location of generated files. Consider setting it to a valid, non-empty path.
[ER_SEC_FILE_PRIV_EMPTY](#) was added in 8.0.2.
- Error number: [MY-010098](#); Symbol: [ER_SEC_FILE_PRIV_NULL](#); SQLSTATE: [HY000](#)
Message: --secure-file-priv is set to NULL. Operations related to importing and exporting data are disabled
[ER_SEC_FILE_PRIV_NULL](#) was added in 8.0.2.
- Error number: [MY-010099](#); Symbol: [ER_SEC_FILE_PRIV_DIRECTORY_INSECURE](#); SQLSTATE: [HY000](#)
Message: Insecure configuration for --secure-file-priv: %s is accessible through --secure-file-priv. Consider choosing a different directory.
[ER_SEC_FILE_PRIV_DIRECTORY_INSECURE](#) was added in 8.0.2.
- Error number: [MY-010100](#); Symbol: [ER_SEC_FILE_PRIV_CANT_STAT](#); SQLSTATE: [HY000](#)

Message: Failed to get stat for directory pointed out by --secure-file-priv

`ER_SEC_FILE_PRIV_CANT_STAT` was added in 8.0.2.

- Error number: `MY-010101`; Symbol: `ER_SEC_FILE_PRIV_DIRECTORY_PERMISSIONS`; SQLSTATE: `HY000`

Message: Insecure configuration for --secure-file-priv: Location is accessible to all OS users. Consider choosing a different directory.

`ER_SEC_FILE_PRIV_DIRECTORY_PERMISSIONS` was added in 8.0.2.

- Error number: `MY-010102`; Symbol: `ER_SEC_FILE_PRIV_ARGUMENT_TOO_LONG`; SQLSTATE: `HY000`

Message: Value for --secure-file-priv is longer than maximum limit of %d

`ER_SEC_FILE_PRIV_ARGUMENT_TOO_LONG` was added in 8.0.2.

- Error number: `MY-010103`; Symbol: `ER_CANT_CREATE_NAMED_PIPES_THREAD`; SQLSTATE: `HY000`

Message: Can't create thread to handle named pipes (errno= %d)

`ER_CANT_CREATE_NAMED_PIPES_THREAD` was added in 8.0.2.

- Error number: `MY-010104`; Symbol: `ER_CANT_CREATE_TCPIP_THREAD`; SQLSTATE: `HY000`

Message: Can't create thread to handle TCP/IP (errno= %d)

`ER_CANT_CREATE_TCPIP_THREAD` was added in 8.0.2.

- Error number: `MY-010105`; Symbol: `ER_CANT_CREATE_SHM_THREAD`; SQLSTATE: `HY000`

Message: Can't create thread to handle shared memory (errno= %d)

`ER_CANT_CREATE_SHM_THREAD` was added in 8.0.2.

- Error number: `MY-010106`; Symbol: `ER_CANT_CREATE_INTERRUPT_THREAD`; SQLSTATE: `HY000`

Message: Can't create interrupt-thread (error %d, errno: %d)

`ER_CANT_CREATE_INTERRUPT_THREAD` was added in 8.0.2.

- Error number: `MY-010107`; Symbol: `ER_WRITABLE_CONFIG_REMOVED`; SQLSTATE: `HY000`

Message: World-writable config file '%s' has been removed.

`ER_WRITABLE_CONFIG_REMOVED` was added in 8.0.2.

- Error number: `MY-010108`; Symbol: `ER_CORE_VALUES`; SQLSTATE: `HY000`

Message: setrlimit could not change the size of core files to 'infinity'; We may not be able to generate a core file on signals

`ER_CORE_VALUES` was added in 8.0.2.

- Error number: `MY-010109`; Symbol: `ER_WRONG_DATETIME_SPEC`; SQLSTATE: `HY000`

Message: Wrong date/time format specifier: %s

[ER_WRONG_DATETIME_SPEC](#) was added in 8.0.2.

- Error number: [MY-010110](#); Symbol: [ER_RPL_BINLOG_FILTERS_OOM](#); SQLSTATE: [HY000](#)

Message: Could not allocate replication and binlog filters: %s

[ER_RPL_BINLOG_FILTERS_OOM](#) was added in 8.0.2.

- Error number: [MY-010111](#); Symbol: [ER_KEYCACHE_OOM](#); SQLSTATE: [HY000](#)

Message: Cannot allocate the keycache

[ER_KEYCACHE_OOM](#) was added in 8.0.2.

- Error number: [MY-010112](#); Symbol: [ER_CONFIRMING_THE_FUTURE](#); SQLSTATE: [HY000](#)

Message: Current time has got past year 2038. Validating current time with %d iterations before initiating the normal server shutdown process.

[ER_CONFIRMING_THE_FUTURE](#) was added in 8.0.2.

- Error number: [MY-010113](#); Symbol: [ER_BACK_IN_TIME](#); SQLSTATE: [HY000](#)

Message: Iteration %d: Obtained valid current time from system

[ER_BACK_IN_TIME](#) was added in 8.0.2.

- Error number: [MY-010114](#); Symbol: [ER_FUTURE_DATE](#); SQLSTATE: [HY000](#)

Message: Iteration %d: Current time obtained from system is greater than 2038

[ER_FUTURE_DATE](#) was added in 8.0.2.

- Error number: [MY-010115](#); Symbol: [ER_UNSUPPORTED_DATE](#); SQLSTATE: [HY000](#)

Message: This MySQL server doesn't support dates later then 2038

[ER_UNSUPPORTED_DATE](#) was added in 8.0.2.

- Error number: [MY-010116](#); Symbol: [ER_STARTING_AS](#); SQLSTATE: [HY000](#)

Message: %s (mysqld %s) starting as process %lu

[ER_STARTING_AS](#) was added in 8.0.2.

- Error number: [MY-010117](#); Symbol: [ER_SHUTTING_DOWN_SLAVE_THREADS](#); SQLSTATE: [HY000](#)

Message: Shutting down slave threads

[ER_SHUTTING_DOWN_SLAVE_THREADS](#) was added in 8.0.2.

- Error number: [MY-010118](#); Symbol: [ER_DISCONNECTING_REMAINING_CLIENTS](#); SQLSTATE: [HY000](#)

Message: Forcefully disconnecting %d remaining clients

[ER_DISCONNECTING_REMAINING_CLIENTS](#) was added in 8.0.2.

- Error number: [MY-010119](#); Symbol: [ER_ABORTING](#); SQLSTATE: [HY000](#)

Message: Aborting

[ER_ABORTING](#) was added in 8.0.2.

- Error number: [MY-010120](#); Symbol: [ER_BINLOG_END](#); SQLSTATE: [HY000](#)

Message: Binlog end

[ER_BINLOG_END](#) was added in 8.0.2.

- Error number: [MY-010121](#); Symbol: [ER_CALL_ME_LOCALHOST](#); SQLSTATE: [HY000](#)

Message: gethostname failed, using '%s' as hostname

[ER_CALL_ME_LOCALHOST](#) was added in 8.0.2.

- Error number: [MY-010122](#); Symbol: [ER_USER_REQUIRES_ROOT](#); SQLSTATE: [HY000](#)

Message: One can only use the --user switch if running as root

[ER_USER_REQUIRES_ROOT](#) was added in 8.0.2.

- Error number: [MY-010123](#); Symbol: [ER REALLY_RUN_AS_ROOT](#); SQLSTATE: [HY000](#)

Message: Fatal error: Please read "Security" section of the manual to find out how to run mysqld as root!

[ER REALLY_RUN_AS_ROOT](#) was added in 8.0.2.

- Error number: [MY-010124](#); Symbol: [ER_USER_WHAT_USER](#); SQLSTATE: [HY000](#)

Message: Fatal error: Can't change to run as user '%s' ; Please check that the user exists!

[ER_USER_WHAT_USER](#) was added in 8.0.2.

- Error number: [MY-010125](#); Symbol: [ER_TRANSPORTS_WHAT_TRANSPORTS](#); SQLSTATE: [HY000](#)

Message: Server is started with --require-secure-transport=ON but no secure transports (SSL or Shared Memory) are configured.

[ER_TRANSPORTS_WHAT_TRANSPORTS](#) was added in 8.0.2.

- Error number: [MY-010126](#); Symbol: [ER_FAIL_SETGID](#); SQLSTATE: [HY000](#)

Message: setgid: %s

[ER_FAIL_SETGID](#) was added in 8.0.2.

- Error number: [MY-010127](#); Symbol: [ER_FAIL_SETUID](#); SQLSTATE: [HY000](#)

Message: setuid: %s

[ER_FAIL_SETUID](#) was added in 8.0.2.

- Error number: [MY-010128](#); Symbol: [ER_FAIL_SETREGID](#); SQLSTATE: [HY000](#)

Message: setregid: %s

[ER_FAIL_SETREGID](#) was added in 8.0.2.

- Error number: [MY-010129](#); Symbol: [ER_FAIL_SETREUID](#); SQLSTATE: [HY000](#)
Message: setreuid: %s
[ER_FAIL_SETREUID](#) was added in 8.0.2.
- Error number: [MY-010130](#); Symbol: [ER_FAIL_CHROOT](#); SQLSTATE: [HY000](#)
Message: chroot: %s
[ER_FAIL_CHROOT](#) was added in 8.0.2.
- Error number: [MY-010131](#); Symbol: [ER_WIN_LISTEN_BUT_HOW](#); SQLSTATE: [HY000](#)
Message: TCP/IP, --shared-memory, or --named-pipe should be configured on NT OS
[ER_WIN_LISTEN_BUT_HOW](#) was added in 8.0.2.
- Error number: [MY-010132](#); Symbol: [ER_NOT_RIGHT_NOW](#); SQLSTATE: [HY000](#)
Message: CTRL-C ignored during startup
[ER_NOT_RIGHT_NOW](#) was added in 8.0.2.
- Error number: [MY-010133](#); Symbol: [ER_FIXING_CLIENT_CHARSET](#); SQLSTATE: [HY000](#)
Message: '%s' can not be used as client character set. '%s' will be used as default client character set.
[ER_FIXING_CLIENT_CHARSET](#) was added in 8.0.2.
- Error number: [MY-010134](#); Symbol: [ER_OOM](#); SQLSTATE: [HY000](#)
Message: Out of memory
[ER_OOM](#) was added in 8.0.2.
- Error number: [MY-010135](#); Symbol: [ER_FAILED_TO_LOCK_MEM](#); SQLSTATE: [HY000](#)
Message: Failed to lock memory. Errno: %d
[ER_FAILED_TO_LOCK_MEM](#) was added in 8.0.2.
- Error number: [MY-010136](#); Symbol: [ER_MYINIT_FAILED](#); SQLSTATE: [HY000](#)
Message: my_init() failed.
[ER_MYINIT_FAILED](#) was added in 8.0.2.
- Error number: [MY-010137](#); Symbol: [ER_BEG_INITFILE](#); SQLSTATE: [HY000](#)
Message: Execution of init_file '%s' started.
[ER_BEG_INITFILE](#) was added in 8.0.2.
- Error number: [MY-010138](#); Symbol: [ER_END_INITFILE](#); SQLSTATE: [HY000](#)
Message: Execution of init_file '%s' ended.
[ER_END_INITFILE](#) was added in 8.0.2.

- Error number: [MY-010139](#); Symbol: [ER_CHANGED_MAX_OPEN_FILES](#); SQLSTATE: [HY000](#)
Message: Changed limits: max_open_files: %lu (requested %lu)
[ER_CHANGED_MAX_OPEN_FILES](#) was added in 8.0.2.

Message: Could not increase number of max_open_files to more than %lu (request: %lu)
[ER_CANT_INCREASE_MAX_OPEN_FILES](#) was added in 8.0.2.
- Error number: [MY-010141](#); Symbol: [ER_CHANGED_MAX_CONNECTIONS](#); SQLSTATE: [HY000](#)
Message: Changed limits: max_connections: %lu (requested %lu)
[ER_CHANGED_MAX_CONNECTIONS](#) was added in 8.0.2.
- Error number: [MY-010142](#); Symbol: [ER_CHANGED_TABLE_OPEN_CACHE](#); SQLSTATE: [HY000](#)
Message: Changed limits: table_open_cache: %lu (requested %lu)
[ER_CHANGED_TABLE_OPEN_CACHE](#) was added in 8.0.2.
- Error number: [MY-010143](#); Symbol: [ER_THE_USER_ABIDES](#); SQLSTATE: [HY000](#)
Message: Ignoring user change to '%s' because the user was set to '%s' earlier on the command line
[ER_THE_USER_ABIDES](#) was added in 8.0.2.
- Error number: [MY-010144](#); Symbol: [ER_RPL_CANT_ADD_DO_TABLE](#); SQLSTATE: [HY000](#)
Message: Could not add do table rule '%s'!
[ER_RPL_CANT_ADD_DO_TABLE](#) was added in 8.0.2.
- Error number: [MY-010145](#); Symbol: [ER_RPL_CANT_ADD_IGNORE_TABLE](#); SQLSTATE: [HY000](#)
Message: Could not add ignore table rule '%s'!
[ER_RPL_CANT_ADD_IGNORE_TABLE](#) was added in 8.0.2.
- Error number: [MY-010146](#); Symbol: [ER_TRACK_VARIABLES_BOGUS](#); SQLSTATE: [HY000](#)
Message: The variable session_track_system_variables either has duplicate values or invalid values.
[ER_TRACK_VARIABLES_BOGUS](#) was added in 8.0.2.
- Error number: [MY-010147](#); Symbol: [ER_EXCESS_ARGUMENTS](#); SQLSTATE: [HY000](#)
Message: Too many arguments (first extra is '%s').
[ER_EXCESS_ARGUMENTS](#) was added in 8.0.2.
- Error number: [MY-010148](#); Symbol: [ER_VERBOSE_HINT](#); SQLSTATE: [HY000](#)
Message: Use --verbose --help to get a list of available options!
[ER_VERBOSE_HINT](#) was added in 8.0.2.

- Error number: [MY-010149](#); Symbol: [ER_CANT_READ_ERRMSG](#); SQLSTATE: [HY000](#)
Message: Unable to read errmsg.sys file
[ER_CANT_READ_ERRMSG](#) was added in 8.0.2.
- Error number: [MY-010150](#); Symbol: [ER_CANT_INIT_DBS](#); SQLSTATE: [HY000](#)
Message: Can't init databases
[ER_CANT_INIT_DBS](#) was added in 8.0.2.
- Error number: [MY-010151](#); Symbol: [ER_LOG_OUTPUT_CONTRADICTORY](#); SQLSTATE: [HY000](#)
Message: There were other values specified to log-output besides NONE. Disabling slow and general logs anyway.
[ER_LOG_OUTPUT_CONTRADICTORY](#) was added in 8.0.2.
- Error number: [MY-010152](#); Symbol: [ER_NO_CSV_NO_LOG_TABLES](#); SQLSTATE: [HY000](#)
Message: CSV engine is not present, falling back to the log files
[ER_NO_CSV_NO_LOG_TABLES](#) was added in 8.0.2.
- Error number: [MY-010153](#); Symbol: [ER_RPL_REWRITEDB_MISSING_ARROW](#); SQLSTATE: [HY000](#)
Message: Bad syntax in replicate-rewrite-db - missing '->'
[ER_RPL_REWRITEDB_MISSING_ARROW](#) was added in 8.0.2.
- Error number: [MY-010154](#); Symbol: [ER_RPL_REWRITEDB_EMPTY_FROM](#); SQLSTATE: [HY000](#)
Message: Bad syntax in replicate-rewrite-db - empty FROM db!
[ER_RPL_REWRITEDB_EMPTY_FROM](#) was added in 8.0.2.
- Error number: [MY-010155](#); Symbol: [ER_RPL_REWRITEDB_EMPTY_TO](#); SQLSTATE: [HY000](#)
Message: Bad syntax in replicate-rewrite-db - empty TO db!
[ER_RPL_REWRITEDB_EMPTY_TO](#) was added in 8.0.2.
- Error number: [MY-010156](#); Symbol: [ER_LOG_FILES_GIVEN_LOG_OUTPUT_IS_TABLE](#); SQLSTATE: [HY000](#)
Message: Although a path was specified for the %s, log tables are used. To enable logging to files use the --log-output=file option.
[ER_LOG_FILES_GIVEN_LOG_OUTPUT_IS_TABLE](#) was added in 8.0.2.
- Error number: [MY-010157](#); Symbol: [ER_LOG_FILE_INVALID](#); SQLSTATE: [HY000](#)
Message: Invalid value for %s: %s
[ER_LOG_FILE_INVALID](#) was added in 8.0.2.
- Error number: [MY-010158](#); Symbol: [ER_LOWER_CASE_TABLE_NAMES_CS_DD_ON_CI_FS_UNSUPPORTED](#); SQLSTATE: [HY000](#)

Message: The server option 'lower_case_table_names' is configured to use case sensitive table names but the data directory is on a case-insensitive file system which is an unsupported combination. Please consider either using a case sensitive file system for your data directory or switching to a case-insensitive table name mode.

[ER_LOWER_CASE_TABLE_NAMES_CS_DD_ON_CI_FS_UNSUPPORTED](#) was added in 8.0.2.

- Error number: [MY-010159](#); Symbol: [ER_LOWER_CASE_TABLE_NAMES_USING_2](#); SQLSTATE: [HY000](#)

Message: Setting lower_case_table_names=2 because file system for %s is case insensitive

[ER_LOWER_CASE_TABLE_NAMES_USING_2](#) was added in 8.0.2.

- Error number: [MY-010160](#); Symbol: [ER_LOWER_CASE_TABLE_NAMES_USING_0](#); SQLSTATE: [HY000](#)

Message: lower_case_table_names was set to 2, even though your the file system '%s' is case sensitive. Now setting lower_case_table_names to 0 to avoid future problems.

[ER_LOWER_CASE_TABLE_NAMES_USING_0](#) was added in 8.0.2.

- Error number: [MY-010161](#); Symbol: [ER_NEED_LOG_BIN](#); SQLSTATE: [HY000](#)

Message: You need to use --log-bin to make %s work.

[ER_NEED_LOG_BIN](#) was added in 8.0.2.

- Error number: [MY-010162](#); Symbol: [ER_NEED_FILE_INSTEAD_OF_DIR](#); SQLSTATE: [HY000](#)

Message: Path '%s' is a directory name, please specify a file name for %s option

[ER_NEED_FILE_INSTEAD_OF_DIR](#) was added in 8.0.2.

- Error number: [MY-010163](#); Symbol: [ER_LOG_BIN_BETTER_WITH_NAME](#); SQLSTATE: [HY000](#)

Message: No argument was provided to --log-bin, and --log-bin-index was not used; so replication may break when this MySQL server acts as a master and has his hostname changed!! Please use '--log-bin=%s' to avoid this problem.

[ER_LOG_BIN_BETTER_WITH_NAME](#) was added in 8.0.2.

- Error number: [MY-010164](#); Symbol: [ER_BINLOG_NEEDS_SERVERID](#); SQLSTATE: [HY000](#)

Message: You have enabled the binary log, but you haven't provided the mandatory server-id. Please refer to the proper server start-up parameters documentation

[ER_BINLOG_NEEDS_SERVERID](#) was added in 8.0.2.

- Error number: [MY-010165](#); Symbol: [ER_RPL_CANT_MAKE_PATHS](#); SQLSTATE: [HY000](#)

Message: Unable to create replication path names: out of memory or path names too long (path name exceeds %d or file name exceeds %d).

[ER_RPL_CANT_MAKE_PATHS](#) was added in 8.0.2.

- Error number: [MY-010166](#); Symbol: [ER_CANT_INITIALIZE_GTID](#); SQLSTATE: [HY000](#)
Message: Failed to initialize GTID structures.
[ER_CANT_INITIALIZE_GTID](#) was added in 8.0.2.
- Error number: [MY-010167](#); Symbol: [ER_CANT_INITIALIZE_EARLY_PLUGINS](#); SQLSTATE: [HY000](#)
Message: Failed to initialize early plugins.
[ER_CANT_INITIALIZE_EARLY_PLUGINS](#) was added in 8.0.2.
- Error number: [MY-010168](#); Symbol: [ER_CANT_INITIALIZE_BUILTIN_PLUGINS](#); SQLSTATE: [HY000](#)
Message: Failed to initialize builtin plugins.
[ER_CANT_INITIALIZE_BUILTIN_PLUGINS](#) was added in 8.0.2.
- Error number: [MY-010169](#); Symbol: [ER_CANT_INITIALIZE_DYNAMIC_PLUGINS](#); SQLSTATE: [HY000](#)
Message: Failed to initialize dynamic plugins.
[ER_CANT_INITIALIZE_DYNAMIC_PLUGINS](#) was added in 8.0.2.
- Error number: [MY-010170](#); Symbol: [ER_PERFSCHEMA_INIT_FAILED](#); SQLSTATE: [HY000](#)
Message: Performance schema disabled (reason: init failed).
[ER_PERFSCHEMA_INIT_FAILED](#) was added in 8.0.2.
- Error number: [MY-010171](#); Symbol: [ER_STACKSIZE_UNEXPECTED](#); SQLSTATE: [HY000](#)
Message: Asked for %lu thread stack, but got %ld
[ER_STACKSIZE_UNEXPECTED](#) was added in 8.0.2.
- Error number: [MY-010172](#); Symbol: [ER_CANT_SET_DATADIR](#); SQLSTATE: [HY000](#)
Message: failed to set datadir to %s
[ER_CANT_SET_DATADIR](#) was added in 8.0.2, removed after 8.0.13.
- Error number: [MY-010173](#); Symbol: [ER_CANT_STAT_DATADIR](#); SQLSTATE: [HY000](#)
Message: Can't read data directory's stats (%d): %s. Assuming that it's not owned by the same user/group
[ER_CANT_STAT_DATADIR](#) was added in 8.0.2.
- Error number: [MY-010174](#); Symbol: [ER_CANT_CHOWN_DATADIR](#); SQLSTATE: [HY000](#)
Message: Can't change data directory owner to %s
[ER_CANT_CHOWN_DATADIR](#) was added in 8.0.2.
- Error number: [MY-010175](#); Symbol: [ER_CANT_SET_UP_PERSISTED_VALUES](#); SQLSTATE: [HY000](#)
Message: Setting persistent options failed.

[ER_CANT_SET_UP_PERSISTED_VALUES](#) was added in 8.0.2.

- Error number: [MY-010176](#); Symbol: [ER_CANT_SAVE_GTIDS](#); SQLSTATE: [HY000](#)

Message: Failed to save the set of Global Transaction Identifiers of the last binary log into the mysql.gtid_executed table while the server was shutting down. The next server restart will make another attempt to save Global Transaction Identifiers into the table.

[ER_CANT_SAVE_GTIDS](#) was added in 8.0.2.

`ER_CONN_UNIX_PATH_TOO_LONG` was added in 8.0.2.

- Error number: `MY-010268`; Symbol: `ER_CONN_UNIX_LOCK_FILE_FAIL`; SQLSTATE: `HY000`

Message: Unable to setup unix socket lock file.

`ER_CONN_UNIX_LOCK_FILE_FAIL` was added in 8.0.2.

- Error number: `MY-010269`; Symbol: `ER_CONN_UNIX_NO_FD`; SQLSTATE: `HY000`

Message: Can't start server: UNIX Socket : %s

[ER_CONN_UNIX_NO_FD](#) was added in 8.0.2.

- Error number: [MY-010270](#); Symbol: [ER_CONN_UNIX_NO_BIND_NO_START](#); SQLSTATE: [HY000](#)
Message: Can't start server : Bind on unix socket: %s

[ER_CONN_UNIX_NO_BIND_NO_START](#) was added in 8.0.2.

- Error number: [MY-010271](#); Symbol: [ER_CONN_UNIX_LISTEN_FAILED](#); SQLSTATE: [HY000](#)
Message: listen() on Unix socket failed with error %d

[ER_CONN_UNIX_LISTEN_FAILED](#) was added in 8.0.2.

- Error number: [MY-010272](#); Symbol: [ER_CONN_UNIX_LOCK_FILE_GIVING_UP](#); SQLSTATE: [HY000](#)
Message: Unable to create unix socket lock file %s after retries.

[ER_CONN_UNIX_LOCK_FILE_GIVING_UP](#) was added in 8.0.2.

- Error number: [MY-010273](#); Symbol: [ER_CONN_UNIX_LOCK_FILE_CANT_CREATE](#); SQLSTATE: [HY000](#)
Message: Could not create unix socket lock file %s.

[ER_CONN_UNIX_LOCK_FILE_CANT_CREATE](#) was added in 8.0.2.

- Error number: [MY-010274](#); Symbol: [ER_CONN_UNIX_LOCK_FILE_CANT_OPEN](#); SQLSTATE: [HY000](#)
Message: Could not open unix socket lock file %s.

[ER_CONN_UNIX_LOCK_FILE_CANT_OPEN](#) was added in 8.0.2.

- Error number: [MY-010275](#); Symbol: [ER_CONN_UNIX_LOCK_FILE_CANT_READ](#); SQLSTATE: [HY000](#)
Message: Could not read unix socket lock file %s.

[ER_CONN_UNIX_LOCK_FILE_CANT_READ](#) was added in 8.0.2.

- Error number: [MY-010276](#); Symbol: [ER_CONN_UNIX_LOCK_FILE_EMPTY](#); SQLSTATE: [HY000](#)
Message: Unix socket lock file is empty %s.

[ER_CONN_UNIX_LOCK_FILE_EMPTY](#) was added in 8.0.2.

- Error number: [MY-010277](#); Symbol: [ER_CONN_UNIX_LOCK_FILE_PIDLESS](#); SQLSTATE: [HY000](#)
Message: Invalid pid in unix socket lock file %s.

[ER_CONN_UNIX_LOCK_FILE_PIDLESS](#) was added in 8.0.2.

- Error number: [MY-010278](#); Symbol: [ER_CONN_UNIX_LOCK_FILE_CANT_WRITE](#); SQLSTATE: [HY000](#)
Message: Could not write unix socket lock file %s errno %d.

[ER_CONN_UNIX_LOCK_FILE_CANT_WRITE](#) was added in 8.0.2.

- Error number: [MY-010279](#); Symbol: [ER_CONN_UNIX_LOCK_FILE_CANT_DELETE](#); SQLSTATE: [HY000](#)

Message: Could not remove unix socket lock file %s errno %d.

[ER_CONN_UNIX_LOCK_FILE_CANT_DELETE](#) was added in 8.0.2.

- Error number: [MY-010280](#); Symbol: [ER_CONN_UNIX_LOCK_FILE_CANT_SYNC](#); SQLSTATE: [HY000](#)

Message: Could not sync unix socket lock file %s errno %d.

[ER_CONN_UNIX_LOCK_FILE_CANT_SYNC](#) was added in 8.0.2.

- Error number: [MY-010281](#); Symbol: [ER_CONN_UNIX_LOCK_FILE_CANT_CLOSE](#); SQLSTATE: [HY000](#)

Message: Could not close unix socket lock file %s errno %d.

[ER_CONN_UNIX_LOCK_FILE_CANT_CLOSE](#) was added in 8.0.2.

- Error number: [MY-010282](#); Symbol: [ER_CONN_SOCKET_SELECT_FAILED](#); SQLSTATE: [HY000](#)

Message: mysqld: Got error %d from select

[ER_CONN_SOCKET_SELECT_FAILED](#) was added in 8.0.2.

- Error number: [MY-010283](#); Symbol: [ER_CONN_SOCKET_ACCEPT_FAILED](#); SQLSTATE: [HY000](#)

Message: Error in accept: %s

[ER_CONN_SOCKET_ACCEPT_FAILED](#) was added in 8.0.2.

- Error number: [MY-010284](#); Symbol: [ER_AUTH_RSA_CANT_FIND](#); SQLSTATE: [HY000](#)

Message: RSA %s key file not found: %s. Some authentication plugins will not work.

[ER_AUTH_RSA_CANT_FIND](#) was added in 8.0.2.

- Error number: [MY-010285](#); Symbol: [ER_AUTH_RSA_CANT_PARSE](#); SQLSTATE: [HY000](#)

Message: Failure to parse RSA %s key (file exists): %s: %s

[ER_AUTH_RSA_CANT_PARSE](#) was added in 8.0.2.

- Error number: [MY-010286](#); Symbol: [ER_AUTH_RSA_CANT_READ](#); SQLSTATE: [HY000](#)

Message: Failure to read key file: %s

[ER_AUTH_RSA_CANT_READ](#) was added in 8.0.2.

- Error number: [MY-010287](#); Symbol: [ER_AUTH_RSA_FILES_NOT_FOUND](#); SQLSTATE: [HY000](#)

Message: RSA key files not found. Some authentication plugins will not work.

[ER_AUTH_RSA_FILES_NOT_FOUND](#) was added in 8.0.2.

- Error number: [MY-010288](#); Symbol: [ER_CONN_ATTR_TRUNCATED](#); SQLSTATE: [HY000](#)

Message: Connection attributes of length %lu were truncated (%d bytes lost) for connection %llu, user %s@%s (as %s), auth: %s

[ER_CONN_ATTR_TRUNCATED](#) was added in 8.0.2.

- Error number: [MY-010289](#); Symbol: [ER_X509_CIPHERS_MISMATCH](#); SQLSTATE: [HY000](#)
Message: X.509 ciphers mismatch: should be '%s' but is '%s'
[ER_X509_CIPHERS_MISMATCH](#) was added in 8.0.2.
- Error number: [MY-010290](#); Symbol: [ER_X509_ISSUER_MISMATCH](#); SQLSTATE: [HY000](#)
Message: X.509 issuer mismatch: should be '%s' but is '%s'
[ER_X509_ISSUER_MISMATCH](#) was added in 8.0.2.
- Error number: [MY-010291](#); Symbol: [ER_X509_SUBJECT_MISMATCH](#); SQLSTATE: [HY000](#)
Message: X.509 subject mismatch: should be '%s' but is '%s'
[ER_X509_SUBJECT_MISMATCH](#) was added in 8.0.2.
- Error number: [MY-010292](#); Symbol: [ER_AUTH_CANT_ACTIVATE_ROLE](#); SQLSTATE: [HY000](#)
Message: Failed to activate default role %s for %s
[ER_AUTH_CANT_ACTIVATE_ROLE](#) was added in 8.0.2.
- Error number: [MY-010293](#); Symbol: [ER_X509_NEEDS_RSA_PRIVKEY](#); SQLSTATE: [HY000](#)
Message: Could not generate RSA private key required for X.509 certificate.
[ER_X509_NEEDS_RSA_PRIVKEY](#) was added in 8.0.2.
- Error number: [MY-010294](#); Symbol: [ER_X509_CANT_WRITE_KEY](#); SQLSTATE: [HY000](#)
Message: Could not write key file: %s
[ER_X509_CANT_WRITE_KEY](#) was added in 8.0.2.
- Error number: [MY-010295](#); Symbol: [ER_X509_CANT_CHMOD_KEY](#); SQLSTATE: [HY000](#)
Message: Could not set file permission for %s
[ER_X509_CANT_CHMOD_KEY](#) was added in 8.0.2.
- Error number: [MY-010296](#); Symbol: [ER_X509_CANT_READ_CA_KEY](#); SQLSTATE: [HY000](#)
Message: Could not read CA key file: %s
[ER_X509_CANT_READ_CA_KEY](#) was added in 8.0.2.
- Error number: [MY-010297](#); Symbol: [ER_X509_CANT_READ_CA_CERT](#); SQLSTATE: [HY000](#)
Message: Could not read CA certificate file: %s
[ER_X509_CANT_READ_CA_CERT](#) was added in 8.0.2.
- Error number: [MY-010298](#); Symbol: [ER_X509_CANT_CREATE_CERT](#); SQLSTATE: [HY000](#)
Message: Could not generate X.509 certificate.
[ER_X509_CANT_CREATE_CERT](#) was added in 8.0.2.

- Error number: [MY-010299](#); Symbol: [ER_X509_CANT_WRITE_CERT](#); SQLSTATE: [HY000](#)
Message: Could not write certificate file: %s
[ER_X509_CANT_WRITE_CERT](#) was added in 8.0.2.
- Error number: [MY-010300](#); Symbol: [ER_AUTH_CANT_CREATE_RSA_PAIR](#); SQLSTATE: [HY000](#)
Message: Could not generate RSA Private/Public key pair
[ER_AUTH_CANT_CREATE_RSA_PAIR](#) was added in 8.0.2.
- Error number: [MY-010301](#); Symbol: [ER_AUTH_CANT_WRITE_PRIVKEY](#); SQLSTATE: [HY000](#)
Message: Could not write private key file: %s
[ER_AUTH_CANT_WRITE_PRIVKEY](#) was added in 8.0.2.
- Error number: [MY-010302](#); Symbol: [ER_AUTH_CANT_WRITE_PUBKEY](#); SQLSTATE: [HY000](#)
Message: Could not write public key file: %s
[ER_AUTH_CANT_WRITE_PUBKEY](#) was added in 8.0.2.
- Error number: [MY-010303](#); Symbol: [ER_AUTH_SSL_CONF_PREVENTS_CERT_GENERATION](#); SQLSTATE: [HY000](#)
Message: Skipping generation of SSL certificates as options related to SSL are specified.
[ER_AUTH_SSL_CONF_PREVENTS_CERT_GENERATION](#) was added in 8.0.2.
- Error number: [MY-010304](#); Symbol: [ER_AUTH_USING_EXISTING_CERTS](#); SQLSTATE: [HY000](#)
Message: Skipping generation of SSL certificates as certificate files are present in data directory.
[ER_AUTH_USING_EXISTING_CERTS](#) was added in 8.0.2.
- Error number: [MY-010305](#); Symbol: [ER_AUTH_CERTS_SAVED_TO_DATADIR](#); SQLSTATE: [HY000](#)
Message: Auto generated SSL certificates are placed in data directory.
[ER_AUTH_CERTS_SAVED_TO_DATADIR](#) was added in 8.0.2.
- Error number: [MY-010306](#); Symbol: [ER_AUTH_CERT_GENERATION_DISABLED](#); SQLSTATE: [HY000](#)
Message: Skipping generation of SSL certificates as --auto_generate_certs is set to OFF.
[ER_AUTH_CERT_GENERATION_DISABLED](#) was added in 8.0.2.
- Error number: [MY-010307](#); Symbol: [ER_AUTH_RSA_CONF_PREVENTS_KEY_GENERATION](#); SQLSTATE: [HY000](#)
Message: Skipping generation of RSA key pair through %s as options related to RSA keys are specified.
[ER_AUTH_RSA_CONF_PREVENTS_KEY_GENERATION](#) was added in 8.0.2.
- Error number: [MY-010308](#); Symbol: [ER_AUTH_KEY_GENERATION_SKIPPED_PAIR_PRESENT](#); SQLSTATE: [HY000](#)
Message: Skipping generation of RSA key pair through %s as key files are present in data directory.

[ER_AUTH_KEY_GENERATION_SKIPPED_PAIR_PRESENT](#) was added in 8.0.2.

- Error number: [MY-010309](#); Symbol: [ER_AUTH_KEYS_SAVED_TO_DATADIR](#); SQLSTATE: [HY000](#)
Message: Auto generated RSA key files through %s are placed in data directory.

[ER_AUTH_KEYS_SAVED_TO_DATADIR](#) was added in 8.0.2.

- Error number: [MY-010310](#); Symbol: [ER_AUTH_KEY_GENERATION_DISABLED](#); SQLSTATE: [HY000](#)
Message: Skipping generation of RSA key pair as %s is set to OFF.

[ER_AUTH_KEY_GENERATION_DISABLED](#) was added in 8.0.2.

- Error number: [MY-010311](#); Symbol: [ER_AUTHCACHE_PROXIES_PRIV_SKIPPED_NEEDS_RESOLVE](#); SQLSTATE: [HY000](#)
Message: 'proxies_priv' entry '%s@%s %s@%s' ignored in --skip-name-resolve mode.

[ER_AUTHCACHE_PROXIES_PRIV_SKIPPED_NEEDS_RESOLVE](#) was added in 8.0.2.

- Error number: [MY-010312](#); Symbol: [ER_AUTHCACHE_PLUGIN_MISSING](#); SQLSTATE: [HY000](#)
Message: The plugin '%.*s' used to authenticate user '%s'@'%.*s' is not loaded. Nobody can currently login using this account.

[ER_AUTHCACHE_PLUGIN_MISSING](#) was added in 8.0.2.

- Error number: [MY-010313](#); Symbol: [ER_AUTHCACHE_PLUGIN_CONFIG](#); SQLSTATE: [HY000](#)
Message: The plugin '%s' is used to authenticate user '%s'@'%.*s', %s configured. Nobody can currently login using this account.

[ER_AUTHCACHE_PLUGIN_CONFIG](#) was added in 8.0.2.

- Error number: [MY-010314](#); Symbol: [ER_AUTHCACHE_ROLE_TABLES_DODGY](#); SQLSTATE: [HY000](#)
Message: Could not load mysql.role_edges and mysql.default_roles tables. ACL DDLs will not work unless mysql_upgrade is executed.

[ER_AUTHCACHE_ROLE_TABLES_DODGY](#) was added in 8.0.2, removed after 8.0.4.

- Error number: [MY-010315](#); Symbol: [ER_AUTHCACHE_USER_SKIPPED_NEEDS_RESOLVE](#); SQLSTATE: [HY000](#)
Message: 'user' entry '%s@%s' ignored in --skip-name-resolve mode.

[ER_AUTHCACHE_USER_SKIPPED_NEEDS_RESOLVE](#) was added in 8.0.2.

- Error number: [MY-010316](#); Symbol: [ER_AUTHCACHE_USER_TABLE_DODGY](#); SQLSTATE: [HY000](#)
Message: Fatal error: Could not read the column 'authentication_string' from table 'mysql.user'. Please perform the MySQL upgrade procedure.

[ER_AUTHCACHE_USER_TABLE_DODGY](#) was added in 8.0.2.

- Error number: [MY-010317](#); Symbol: [ER_AUTHCACHE_USER_IGNORED_DEPRECATED_PASSWORD](#); SQLSTATE: [HY000](#)

Message: User entry '%s'@'%s' has a deprecated pre-4.1 password. The user will be ignored and no one can login with this user anymore.

[ER_AUTHCACHE_USER_IGNORED_DEPRECATED_PASSWORD](#) was added in 8.0.2.

- Error number: [MY-010318](#); Symbol: [ER_AUTHCACHE_USER_IGNORED_NEEDS_PLUGIN](#); SQLSTATE: [HY000](#)

Message: User entry '%s'@'%s' has an empty plugin value. The user will be ignored and no one can login with this user anymore.

[ER_AUTHCACHE_USER_IGNORED_NEEDS_PLUGIN](#) was added in 8.0.2.

- Error number: [MY-010319](#); Symbol: [ER_AUTHCACHE_USER_IGNORED_INVALID_PASSWORD](#); SQLSTATE: [HY000](#)

Message: Found invalid password for user: '%s'@'%s'; Ignoring user

[ER_AUTHCACHE_USER_IGNORED_INVALID_PASSWORD](#) was added in 8.0.2.

- Error number: [MY-010320](#); Symbol: [ER_AUTHCACHE_EXPIRED_PASSWORD_UNSUPPORTED](#); SQLSTATE: [HY000](#)

Message: 'user' entry '%s'@'%s' has the password ignore flag raised, but its authentication plugin doesn't support password expiration. The user id will be ignored.

[ER_AUTHCACHE_EXPIRED_PASSWORD_UNSUPPORTED](#) was added in 8.0.2.

- Error number: [MY-010321](#); Symbol: [ER_NO_SUPER_WITHOUT_USER_PLUGIN](#); SQLSTATE: [HY000](#)

Message: Some of the user accounts with SUPER privileges were disabled because of empty mysql.user.plugin value. If you are upgrading from MySQL 5.6 to MySQL 5.7 it means that substitution for the empty plugin column was not possible. Probably because of pre 4.1 password hash. If your account is disabled you will need to perform the MySQL upgrade procedure. For complete instructions on how to upgrade MySQL to a new version please see the 'Upgrading MySQL' section from the MySQL manual.

[ER_NO_SUPER_WITHOUT_USER_PLUGIN](#) was added in 8.0.2.

- Error number: [MY-010322](#); Symbol: [ER_AUTHCACHE_DB_IGNORED_EMPTY_NAME](#); SQLSTATE: [HY000](#)

Message: Found an entry in the 'db' table with empty database name; Skipped

[ER_AUTHCACHE_DB_IGNORED_EMPTY_NAME](#) was added in 8.0.2.

- Error number: [MY-010323](#); Symbol: [ER_AUTHCACHE_DB_SKIPPED_NEEDS_RESOLVE](#); SQLSTATE: [HY000](#)

Message: 'db' entry '%s %s'@'%s' ignored in --skip-name-resolve mode.

[ER_AUTHCACHE_DB_SKIPPED_NEEDS_RESOLVE](#) was added in 8.0.2.

- Error number: [MY-010324](#); Symbol: [ER_AUTHCACHE_DB_ENTRY_LOWERCASED_REVOKE_WILL_FAIL](#); SQLSTATE: [HY000](#)

Message: 'db' entry '%s %s@%s' had database in mixed case that has been forced to lowercase because lower_case_table_names is set. It will not be possible to remove this privilege using REVOKE.

[ER_AUTHCACHE_DB_ENTRY_LOWERCASED_REVOKE_WILL_FAIL](#) was added in 8.0.2.
- Error number: [MY-010325](#); Symbol: [ER_AUTHCACHE_TABLE_PROXIES_PRIV_MISSING](#); SQLSTATE: [HY000](#)

Message: The system table mysql.proxies_priv is missing. Please perform the MySQL upgrade procedure.

[ER_AUTHCACHE_TABLE_PROXIES_PRIV_MISSING](#) was added in 8.0.2.
- Error number: [MY-010326](#); Symbol: [ER_AUTHCACHE_CANT_OPEN_AND_LOCK_PRIVILEGE_TABLES](#); SQLSTATE: [HY000](#)

Message: Fatal error: Can't open and lock privilege tables: %s

[ER_AUTHCACHE_CANT_OPEN_AND_LOCK_PRIVILEGE_TABLES](#) was added in 8.0.2.
- Error number: [MY-010327](#); Symbol: [ER_AUTHCACHE_CANT_INIT_GRANT_SUBSYSTEM](#); SQLSTATE: [HY000](#)

Message: Fatal: can't initialize grant subsystem - '%s'

[ER_AUTHCACHE_CANT_INIT_GRANT_SUBSYSTEM](#) was added in 8.0.2.
- Error number: [MY-010328](#); Symbol: [ER_AUTHCACHE_PROCS_PRIV_SKIPPED_NEEDS_RESOLVE](#); SQLSTATE: [HY000](#)

Message: 'procs_priv' entry '%s %s@%s' ignored in --skip-name-resolve mode.

[ER_AUTHCACHE_PROCS_PRIV_SKIPPED_NEEDS_RESOLVE](#) was added in 8.0.2.
- Error number: [MY-010329](#); Symbol: [ER_AUTHCACHE_PROCS_PRIV_ENTRY_IGNORED_BAD_ROUTINE_TYPE](#); SQLSTATE: [HY000](#)

Message: 'procs_priv' entry '%s' ignored, bad routine type

[ER_AUTHCACHE_PROCS_PRIV_ENTRY_IGNORED_BAD_ROUTINE_TYPE](#) was added in 8.0.2.
- Error number: [MY-010330](#); Symbol: [ER_AUTHCACHE_TABLES_PRIV_SKIPPED_NEEDS_RESOLVE](#); SQLSTATE: [HY000](#)

Message: 'tables_priv' entry '%s %s@%s' ignored in --skip-name-resolve mode.

[ER_AUTHCACHE_TABLES_PRIV_SKIPPED_NEEDS_RESOLVE](#) was added in 8.0.2.
- Error number: [MY-010331](#); Symbol: [ER_USER_NOT_IN_EXTRA_USERS_BINLOG_POSSIBLY_INCOMPLETE](#); SQLSTATE: [HY000](#)

Message: Failed to add %s in extra_users. Binary log entry may miss some of the users.

[ER_USER_NOT_IN_EXTRA_USERS_BINLOG_POSSIBLY_INCOMPLETE](#) was added in 8.0.2.
- Error number: [MY-010332](#); Symbol: [ER_DD_SCHEMA_NOT_FOUND](#); SQLSTATE: [HY000](#)

Message: Unable to start server. The data dictionary schema '%s' does not exist.

[ER_DD_SCHEMA_NOT_FOUND](#) was added in 8.0.2.

- Error number: [MY-010333](#); Symbol: [ER_DD_TABLE_NOT_FOUND](#); SQLSTATE: [HY000](#)

Message: Unable to start server. The data dictionary table '%s' does not exist.

[ER_DD_TABLE_NOT_FOUND](#) was added in 8.0.2.

- Error number: [MY-010334](#); Symbol: [ER_DD_SE_INIT_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to initialize DD Storage Engine

[ER_DD_SE_INIT_FAILED](#) was added in 8.0.2.

- Error number: [MY-010335](#); Symbol: [ER_DD_ABORTING_PARTIAL_UPGRADE](#); SQLSTATE: [HY000](#)

Message: Found partially upgraded DD. Aborting upgrade and deleting all DD tables. Start the upgrade process again.

[ER_DD_ABORTING_PARTIAL_UPGRADE](#) was added in 8.0.2.

- Error number: [MY-010336](#); Symbol: [ER_DD_FRM_EXISTS_FOR_TABLE](#); SQLSTATE: [HY000](#)

Message: Found .frm file with same name as one of the Dictionary Tables.

[ER_DD_FRM_EXISTS_FOR_TABLE](#) was added in 8.0.2.

- Error number: [MY-010337](#); Symbol: [ER_DD_CREATED_FOR_UPGRADE](#); SQLSTATE: [HY000](#)

Message: Created Data Dictionary for upgrade

[ER_DD_CREATED_FOR_UPGRADE](#) was added in 8.0.2.

- Error number: [MY-010338](#); Symbol: [ER_ERRMSG_CANT_FIND_FILE](#); SQLSTATE: [HY000](#)

Message: Can't find error-message file '%s'. Check error-message file location and 'lc-messages-dir' configuration directive.

[ER_ERRMSG_CANT_FIND_FILE](#) was added in 8.0.2.

- Error number: [MY-010339](#); Symbol: [ER_ERRMSG_LOADING_55_STYLE](#); SQLSTATE: [HY000](#)

Message: Using pre 5.5 semantics to load error messages from %s. If this is not intended, refer to the documentation for valid usage of --lc-messages-dir and --language parameters.

[ER_ERRMSG_LOADING_55_STYLE](#) was added in 8.0.2.

- Error number: [MY-010340](#); Symbol: [ER_ERRMSG_MISSING_IN_FILE](#); SQLSTATE: [HY000](#)

Message: Error message file '%s' had only %d error messages, but it should contain at least %d error messages. Check that the above file is the right version for this program!

[ER_ERRMSG_MISSING_IN_FILE](#) was added in 8.0.2.

- Error number: [MY-010341](#); Symbol: [ER_ERRMSG_OOM](#); SQLSTATE: [HY000](#)

Message: Not enough memory for messagefile '%s'

[ER_ERRMSG_OOM](#) was added in 8.0.2.

- Error number: [MY-010342](#); Symbol: [ER_ERRMSG_CANT_READ](#); SQLSTATE: [HY000](#)

Message: Can't read from messagefile '%s'

[ER_ERRMSG_CANT_READ](#) was added in 8.0.2.

- Error number: [MY-010343](#); Symbol: [ER_TABLE_INCOMPATIBLE_DECIMAL_FIELD](#); SQLSTATE: [HY000](#)

Message: Found incompatible DECIMAL field '%s' in %s; Please do "ALTER TABLE `%s` FORCE" to fix it!

[ER_TABLE_INCOMPATIBLE_DECIMAL_FIELD](#) was added in 8.0.2.

- Error number: [MY-010344](#); Symbol: [ER_TABLE_INCOMPATIBLE_YEAR_FIELD](#); SQLSTATE: [HY000](#)

Message: Found incompatible YEAR(x) field '%s' in %s; Please do "ALTER TABLE `%s` FORCE" to fix it!

[ER_TABLE_INCOMPATIBLE_YEAR_FIELD](#) was added in 8.0.2.

- Error number: [MY-010345](#); Symbol: [ER_INVALID_CHARSET_AND_DEFAULT_IS_MB](#); SQLSTATE: [HY000](#)

Message: '%s' had no or invalid character set, and default character set is multi-byte, so character column sizes may have changed

[ER_INVALID_CHARSET_AND_DEFAULT_IS_MB](#) was added in 8.0.2.

- Error number: [MY-010346](#); Symbol: [ER_TABLE_WRONG_KEY_DEFINITION](#); SQLSTATE: [HY000](#)

Message: Found wrong key definition in %s; Please do "ALTER TABLE `%s` FORCE " to fix it!

[ER_TABLE_WRONG_KEY_DEFINITION](#) was added in 8.0.2.

- Error number: [MY-010347](#); Symbol: [ER_CANT_OPEN_FRM_FILE](#); SQLSTATE: [HY000](#)

Message: Unable to open file %s

[ER_CANT_OPEN_FRM_FILE](#) was added in 8.0.2.

[ER_DB_OPT_NOT_FOUND_USING_DEFAULT_CHARSET](#) was added in 8.0.2.
- Error number: [MY-010773](#); Symbol: [ER_EVENT_CANT_GET_TIMEZONE_FROM_FIELD](#); SQLSTATE: [HY000](#)

Message: Event '%s'. '%s': invalid value in column mysql.event.time_zone.

This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the `mysql.event` system table and migrates its contents to the internal data dictionary.

`ER_EVENT_CANT_GET_TIMEZONE_FROM_FIELD` was added in 8.0.2.

- Error number: `MY-010774`; Symbol: `ER_EVENT_CANT_FIND_TIMEZONE`; SQLSTATE: `HY000`

Message: Event '%s'. '%s': has invalid time zone value

This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the `mysql.event` system table and migrates its contents to the internal data dictionary.

`ER_EVENT_CANT_FIND_TIMEZONE` was added in 8.0.2.

- Error number: `MY-010775`; Symbol: `ER_EVENT_CANT_GET_CHARSET`; SQLSTATE: `HY000`

Message: Event '%s'. '%s': invalid value in column mysql.event.character_set_client.

This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the `mysql.event` system table and migrates its contents to the internal data dictionary.

`ER_EVENT_CANT_GET_CHARSET` was added in 8.0.2.

- Error number: `MY-010776`; Symbol: `ER_EVENT_CANT_GET_COLLATION`; SQLSTATE: `HY000`

Message: Event '%s'. '%s': invalid value in column mysql.event.collation_connection.

This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the `mysql.event` system table and migrates its contents to the internal data dictionary.

`ER_EVENT_CANT_GET_COLLATION` was added in 8.0.2.

- Error number: `MY-010777`; Symbol: `ER_EVENT_CANT_OPEN_TABLE_MYSQL_EVENT`; SQLSTATE: `HY000`

Message: Failed to open mysql.event Table.

This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the `mysql.event` system table and migrates its contents to the internal data dictionary.

`ER_EVENT_CANT_OPEN_TABLE_MYSQL_EVENT` was added in 8.0.2.

- Error number: `MY-010778`; Symbol: `ER_CANT_PARSE_STORED_ROUTINE_BODY`; SQLSTATE: `HY000`

Message: Parsing '%s.%s' routine body failed.%s

`ER_CANT_PARSE_STORED_ROUTINE_BODY` was added in 8.0.2.

- Error number: `MY-010779`; Symbol: `ER_CANT_OPEN_TABLE_MYSQL_PROC`; SQLSTATE: `HY000`

Message: Failed to open mysql.proc Table.

This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the `mysql.proc` system table and migrates its contents to the internal data dictionary.

`ER_CANT_OPEN_TABLE_MYSQL_PROC` was added in 8.0.2.

- Error number: [MY-010780](#); Symbol: [ER_CANT_READ_TABLE_MYSQL_PROC](#); SQLSTATE: [HY000](#)

Message: Failed to read mysql.proc table.

This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the `mysql.proc` system table and migrates its contents to the internal data dictionary.

[ER_CANT_READ_TABLE_MYSQL_PROC](#) was added in 8.0.2.

- Error number: [MY-010781](#); Symbol: [ER_FILE_EXISTS_DURING_UPGRADE](#); SQLSTATE: [HY000](#)

Message: Found %s file in mysql schema. DD will create .ibd file with same name. Please rename table and start upgrade process again.

[ER_FILE_EXISTS_DURING_UPGRADE](#) was added in 8.0.2.

Message: Resource group post initialization failed.
[ER_RESOURCE_GROUP_POST_INIT_FAILED](#) was added in 8.0.4.
- Error number: [MY-010945](#); Symbol: [ER_RESOURCE_GROUP_SUBSYSTEM_INIT_FAILED](#); SQLSTATE: [HY000](#)

Message: Resource Group subsystem initialization failed.

[ER_RESOURCE_GROUP_SUBSYSTEM_INIT_FAILED](#) was added in 8.0.4.

- Error number: [MY-010946](#); Symbol: [ER_FAILED_START_MYSQLD_DAEMON](#); SQLSTATE: [HY000](#)

Message: Failed to start mysqld daemon. Check mysqld error log.

[ER_FAILED_START_MYSQLD_DAEMON](#) was added in 8.0.4.

- Error number: [MY-010947](#); Symbol: [ER_CANNOT_CHANGE_TO_ROOT_DIR](#); SQLSTATE: [HY000](#)

Message: Cannot change to root directory: %s.

[ER_CANNOT_CHANGE_TO_ROOT_DIR](#) was added in 8.0.4.

- Error number: [MY-010948](#); Symbol: [ER_PERSISTENT_PRIVILEGES_BOOTSTRAP](#); SQLSTATE: [HY000](#)

Message: Failed to bootstrap persistent privileges.

[ER_PERSISTENT_PRIVILEGES_BOOTSTRAP](#) was added in 8.0.4.

- Error number: [MY-010949](#); Symbol: [ER_BASEDIR_SET_TO](#); SQLSTATE: [HY000](#)

Message: Basedir set to %s.

[ER_BASEDIR_SET_TO](#) was added in 8.0.4.

- Error number: [MY-010950](#); Symbol: [ER_RPL_FILTER_ADD_WILD_DO_TABLE_FAILED](#); SQLSTATE: [HY000](#)

Message: Could not add wild do table rule '%s'!

[ER_RPL_FILTER_ADD_WILD_DO_TABLE_FAILED](#) was added in 8.0.4.

- Error number: [MY-010951](#); Symbol: [ER_RPL_FILTER_ADD_WILD_IGNORE_TABLE_FAILED](#); SQLSTATE: [HY000](#)

Message: Could not add wild ignore table rule '%s'!

[ER_RPL_FILTER_ADD_WILD_IGNORE_TABLE_FAILED](#) was added in 8.0.4.

- Error number: [MY-010952](#); Symbol: [ER_PRIVILEGE_SYSTEM_INIT_FAILED](#); SQLSTATE: [HY000](#)

Message: The privilege system failed to initialize correctly. For complete instructions on how to upgrade MySQL to a new version please see the 'Upgrading MySQL' section from the MySQL manual.

[ER_PRIVILEGE_SYSTEM_INIT_FAILED](#) was added in 8.0.4.

- Error number: [MY-010953](#); Symbol: [ER_CANNOT_SET_LOG_ERROR_SERVICES](#); SQLSTATE: [HY000](#)

Message: Cannot set services "%s" requested in --log-error-services, using defaults.

[ER_CANNOT_SET_LOG_ERROR_SERVICES](#) was added in 8.0.4.

- Error number: [MY-010954](#); Symbol: [ER_PERFSCHEMA_TABLES_INIT_FAILED](#); SQLSTATE: [HY000](#)

Message: Performance schema tables initialization failed.

[ER_PERFSCHEMA_TABLES_INIT_FAILED](#) was added in 8.0.4.

- Error number: [MY-010955](#); Symbol: [ER_TX_EXTRACTION_ALGORITHM_FOR_BINLOG_TX_DEPEDENCY_TRACKING](#); SQLSTATE: [HY000](#)

Message: The transaction_write_set_extraction must be set to %s when binlog_transaction_dependency_tracking is %s.

[ER_TX_EXTRACTION_ALGORITHM_FOR_BINLOG_TX_DEPEDENCY_TRACKING](#) was added in 8.0.4.

- Error number: [MY-010956](#); Symbol: [ER_INVALID_REPLICATION_TIMESTAMPS](#); SQLSTATE: [HY000](#)

Message: Invalid replication timestamps: original commit timestamp is more recent than the immediate commit timestamp. This may be an issue if delayed replication is active. Make sure that servers have their clocks set to the correct time. No further message will be emitted until after timestamps become valid again.

[ER_INVALID_REPLICATION_TIMESTAMPS](#) was added in 8.0.4.

- Error number: [MY-010957](#); Symbol: [ER_RPL_TIMESTAMPS_RETURNED_TO_NORMAL](#); SQLSTATE: [HY000](#)

Message: The replication timestamps have returned to normal values.

[ER_RPL_TIMESTAMPS_RETURNED_TO_NORMAL](#) was added in 8.0.4.

- Error number: [MY-010958](#); Symbol: [ER_BINLOG_FILE_OPEN_FAILED](#); SQLSTATE: [HY000](#)

Message: %s.

[ER_BINLOG_FILE_OPEN_FAILED](#) was added in 8.0.4.

- Error number: [MY-010959](#); Symbol: [ER_BINLOG_EVENT_WRITE_TO_STMT_CACHE_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to write an incident event into stmt_cache.

[ER_BINLOG_EVENT_WRITE_TO_STMT_CACHE_FAILED](#) was added in 8.0.4.

- Error number: [MY-010960](#); Symbol: [ER_SLAVE_RELAY_LOG_TRUNCATE_INFO](#); SQLSTATE: [HY000](#)

Message: Relaylog file %s size was %llu, but was truncated at %llu.

[ER_SLAVE_RELAY_LOG_TRUNCATE_INFO](#) was added in 8.0.4.

- Error number: [MY-010961](#); Symbol: [ER_SLAVE_RELAY_LOG_PURGE_FAILED](#); SQLSTATE: [HY000](#)

Message: Unable to purge relay log files. %s:%s.

[ER_SLAVE_RELAY_LOG_PURGE_FAILED](#) was added in 8.0.4.

- Error number: [MY-010962](#); Symbol: [ER_RPL_SLAVE_FILTER_CREATE_FAILED](#); SQLSTATE: [HY000](#)

Message: Slave: failed in creating filter for channel '%s'.

[ER_RPL_SLAVE_FILTER_CREATE_FAILED](#) was added in 8.0.4.

- Error number: `MY-010963`; Symbol: `ER_RPL_SLAVE_GLOBAL_FILTERS_COPY_FAILED`; SQLSTATE: `HY000`

Message: Slave: failed in copying the global filters to its own per-channel filters on configuration for channel '%s'.

`ER_RPL_SLAVE_GLOBAL_FILTERS_COPY_FAILED` was added in 8.0.4.
- Error number: `MY-010964`; Symbol: `ER_RPL_SLAVE_RESET_FILTER_OPTIONS`; SQLSTATE: `HY000`

Message: There are per-channel replication filter(s) configured for channel '%s' which does not exist. The filter(s) have been discarded.

`ER_RPL_SLAVE_RESET_FILTER_OPTIONS` was added in 8.0.4.
- Error number: `MY-010965`; Symbol: `ER_MISSING_GRANT_SYSTEM_TABLE`; SQLSTATE: `HY000`

Message: The system table `mysql.global_grants` is missing. Please perform the MySQL upgrade procedure.

`ER_MISSING_GRANT_SYSTEM_TABLE` was added in 8.0.4.
- Error number: `MY-010966`; Symbol: `ER_MISSING_ACL_SYSTEM_TABLE`; SQLSTATE: `HY000`

Message: ACL table `mysql.%.s` missing. Some operations may fail.

`ER_MISSING_ACL_SYSTEM_TABLE` was added in 8.0.4.
- Error number: `MY-010967`; Symbol: `ER_ANONYMOUS_AUTH_ID_NOT_ALLOWED_IN_MANDATORY_ROLES`; SQLSTATE: `HY000`

Message: Can't set mandatory_role %s@%s: Anonymous authorization IDs are not allowed as roles.

`ER_ANONYMOUS_AUTH_ID_NOT_ALLOWED_IN_MANDATORY_ROLES` was added in 8.0.4.
- Error number: `MY-010968`; Symbol: `ER_UNKNOWN_AUTH_ID_IN_MANDATORY_ROLE`; SQLSTATE: `HY000`

Message: Can't set mandatory_role: There's no such authorization ID %s@%s.

`ER_UNKNOWN_AUTH_ID_IN_MANDATORY_ROLE` was added in 8.0.4.
- Error number: `MY-010969`; Symbol: `ER_WRITE_ROW_TO_PARTITION_FAILED`; SQLSTATE: `HY000`

Message: Table '%s' failed to move/insert a row from part %d into part %d: %s.

`ER_WRITE_ROW_TO_PARTITION_FAILED` was added in 8.0.4.
- Error number: `MY-010970`; Symbol: `ER_RESOURCE_GROUP_METADATA_UPDATE_SKIPPED`; SQLSTATE: `HY000`

Message: Skipped updating resource group metadata in InnoDB read only mode.

`ER_RESOURCE_GROUP_METADATA_UPDATE_SKIPPED` was added in 8.0.4.
- Error number: `MY-010971`; Symbol: `ER_FAILED_TO_PERSIST_RESOURCE_GROUP_METADATA`; SQLSTATE: `HY000`

Message: Failed to persist resource group %s to Data Dictionary.

[ER_FAILED_TO_PERSIST_RESOURCE_GROUP_METADATA](#) was added in 8.0.4.

- Error number: [MY-010972](#); Symbol: [ER_FAILED_TO_DESERIALIZE_RESOURCE_GROUP](#); SQLSTATE: [HY000](#)

Message: Failed to deserialize resource group %s.

[ER_FAILED_TO_DESERIALIZE_RESOURCE_GROUP](#) was added in 8.0.4.

- Error number: [MY-010973](#); Symbol: [ER_FAILED_TO_UPDATE_RESOURCE_GROUP](#); SQLSTATE: [HY000](#)

Message: Update of resource group %s failed.

[ER_FAILED_TO_UPDATE_RESOURCE_GROUP](#) was added in 8.0.4.

- Error number: [MY-010974](#); Symbol: [ER_RESOURCE_GROUP_VALIDATION_FAILED](#); SQLSTATE: [HY000](#)

Message: Validation of resource group %s failed. Resource group is disabled.

[ER_RESOURCE_GROUP_VALIDATION_FAILED](#) was added in 8.0.4.

- Error number: [MY-010975](#); Symbol: [ER_FAILED_TO_ALLOCATE_MEMORY_FOR_RESOURCE_GROUP](#); SQLSTATE: [HY000](#)

Message: Unable to allocate memory for Resource Group %s.

[ER_FAILED_TO_ALLOCATE_MEMORY_FOR_RESOURCE_GROUP](#) was added in 8.0.4.

- Error number: [MY-010976](#); Symbol: [ER_FAILED_TO_ALLOCATE_MEMORY_FOR_RESOURCE_GROUP_HASH](#); SQLSTATE: [HY000](#)

Message: Failed to allocate memory for resource group hash.

[ER_FAILED_TO_ALLOCATE_MEMORY_FOR_RESOURCE_GROUP_HASH](#) was added in 8.0.4.

- Error number: [MY-010977](#); Symbol: [ER_FAILED_TO_ADD_RESOURCE_GROUP_TO_MAP](#); SQLSTATE: [HY000](#)

Message: Failed to add resource group %s to resource group map.

[ER_FAILED_TO_ADD_RESOURCE_GROUP_TO_MAP](#) was added in 8.0.4.

- Error number: [MY-010978](#); Symbol: [ER_RESOURCE_GROUP_IS_DISABLED](#); SQLSTATE: [HY000](#)

Message: Resource group feature is disabled. (Server is compiled with DISABLE_PSI_THREAD).

[ER_RESOURCE_GROUP_IS_DISABLED](#) was added in 8.0.4.

- Error number: [MY-010979](#); Symbol: [ER_FAILED_TO_APPLY_RESOURCE_GROUP_CONTROLLER](#); SQLSTATE: [HY000](#)

Message: Unable to apply resource group controller %s.

[ER_FAILED_TO_APPLY_RESOURCE_GROUP_CONTROLLER](#) was added in 8.0.4.

- Error number: [MY-010980](#); Symbol: [ER_FAILED_TO_ACQUIRE_LOCK_ON_RESOURCE_GROUP](#); SQLSTATE: [HY000](#)

Message: Unable to acquire lock on the resource group %s. Hint to switch resource group shall be ignored.

[ER_FAILED_TO_ACQUIRE_LOCK_ON_RESOURCE_GROUP](#) was added in 8.0.4.
- Error number: [MY-010981](#); Symbol: [ER_PFS_NOTIFICATION_FUNCTION_REGISTER_FAILED](#); SQLSTATE: [HY000](#)

Message: PFS %s notification function registration failed.

[ER_PFS_NOTIFICATION_FUNCTION_REGISTER_FAILED](#) was added in 8.0.4.
- Error number: [MY-010982](#); Symbol: [ER_RES_GRP_SET_THR_AFFINITY_FAILED](#); SQLSTATE: [HY000](#)

Message: Unable to bind thread id %llu to cpu id %u (error code %d - %s).

[ER_RES_GRP_SET_THR_AFFINITY_FAILED](#) was added in 8.0.4.
- Error number: [MY-010983](#); Symbol: [ER_RES_GRP_SET_THR_AFFINITY_TO_CPUS_FAILED](#); SQLSTATE: [HY000](#)

Message: Unable to bind thread id %llu to cpu ids (error code %d - %s).

[ER_RES_GRP_SET_THR_AFFINITY_TO_CPUS_FAILED](#) was added in 8.0.4.
- Error number: [MY-010984](#); Symbol: [ER_RES_GRP_THD_UNBIND_FROM_CPU_FAILED](#); SQLSTATE: [HY000](#)

Message: Unbind thread id %llu failed. (error code %d - %s).

[ER_RES_GRP_THD_UNBIND_FROM_CPU_FAILED](#) was added in 8.0.4.
- Error number: [MY-010985](#); Symbol: [ER_RES_GRP_SET_THREAD_PRIORITY_FAILED](#); SQLSTATE: [HY000](#)

Message: Setting thread priority %d to thread id %llu failed. (error code %d - %s).

[ER_RES_GRP_SET_THREAD_PRIORITY_FAILED](#) was added in 8.0.4.
- Error number: [MY-010986](#); Symbol: [ER_RES_GRP_FAILED_TO_DETERMINE_NICE_CAPABILITY](#); SQLSTATE: [HY000](#)

Message: Unable to determine CAP_SYS_NICE capability.

[ER_RES_GRP_FAILED_TO_DETERMINE_NICE_CAPABILITY](#) was added in 8.0.4.
- Error number: [MY-010987](#); Symbol: [ER_RES_GRP_FAILED_TO_GET_THREAD_HANDLE](#); SQLSTATE: [HY000](#)

Message: %s failed: Failed to get handle for thread %llu.

[ER_RES_GRP_FAILED_TO_GET_THREAD_HANDLE](#) was added in 8.0.4.
- Error number: [MY-010988](#); Symbol: [ER_RES_GRP_GET_THREAD_PRIO_NOT_SUPPORTED](#); SQLSTATE: [HY000](#)

Message: Retrieval of thread priority unsupported on %s.

[ER_RES_GRP_GET_THREAD_PRIO_NOT_SUPPORTED](#) was added in 8.0.4.

- Error number: [MY-010989](#); Symbol: [ER_RES_GRP_FAILED_DETERMINE_CPU_COUNT](#); SQLSTATE: [HY000](#)

Message: Unable to determine the number of CPUs.

[ER_RES_GRP_FAILED_DETERMINE_CPU_COUNT](#) was added in 8.0.4.

- Error number: [MY-010990](#); Symbol: [ER_RES_GRP_FEATURE_NOT_AVAILABLE](#); SQLSTATE: [HY000](#)

Message: Resource group feature shall not be available. Incompatible thread handling option.

[ER_RES_GRP_FEATURE_NOT_AVAILABLE](#) was added in 8.0.4.

- Error number: [MY-010991](#); Symbol: [ER_RES_GRP_INVALID_THREAD_PRIORITY](#); SQLSTATE: [HY000](#)

Message: Invalid thread priority %d for a %s resource group. Allowed range is [%d, %d].

[ER_RES_GRP_INVALID_THREAD_PRIORITY](#) was added in 8.0.4.

- Error number: [MY-010992](#); Symbol: [ER_RES_GRP_SOLARIS_PROCESSOR_BIND_TO_CPUID_FAILED](#); SQLSTATE: [HY000](#)

Message: bind_to_cpu failed: processor_bind for cpuid %u failed (error code %d - %s).

[ER_RES_GRP_SOLARIS_PROCESSOR_BIND_TO_CPUID_FAILED](#) was added in 8.0.4.

[ER_DD_UPGRADE_FAILED_TO_ACQUIRE_TABLESPACE](#) was added in 8.0.4.
- Error number: [MY-010999](#); Symbol: [ER_DD_UPGRADE_FAILED_TO_RESOLVE_TABLESPACE_ENGINE](#); SQLSTATE: [HY000](#)
Message: Error in resolving Engine name for tablespace %s with engine %s.
[ER_DD_UPGRADE_FAILED_TO_RESOLVE_TABLESPACE_ENGINE](#) was added in 8.0.4.
- Error number: [MY-011000](#); Symbol: [ER_FAILED_TO_CREATE_SDI_FOR_TABLESPACE](#); SQLSTATE: [HY000](#)
Message: Error in creating SDI for %s tablespace.
[ER_FAILED_TO_CREATE_SDI_FOR_TABLESPACE](#) was added in 8.0.4.
- Error number: [MY-011001](#); Symbol: [ER_FAILED_TO_STORE_SDI_FOR_TABLESPACE](#); SQLSTATE: [HY000](#)
Message: Error in storing SDI for %s tablespace.
[ER_FAILED_TO_STORE_SDI_FOR_TABLESPACE](#) was added in 8.0.4.
- Error number: [MY-011002](#); Symbol: [ER_DD_UPGRADE_FAILED_TO_FETCH_TABLES](#); SQLSTATE: [HY000](#)
Message: Error in fetching list of tables.
[ER_DD_UPGRADE_FAILED_TO_FETCH_TABLES](#) was added in 8.0.4.
- Error number: [MY-011003](#); Symbol: [ER_DD_UPGRADE_DD_POPULATED](#); SQLSTATE: [HY000](#)
Message: Finished populating Data Dictionary tables with data.
[ER_DD_UPGRADE_DD_POPULATED](#) was added in 8.0.4.
- Error number: [MY-011004](#); Symbol: [ER_DD_UPGRADE_INFO_FILE_OPEN_FAILED](#); SQLSTATE: [HY000](#)
Message: Could not open the upgrade info file '%s' in the MySQL servers datadir, errno: %d.
[ER_DD_UPGRADE_INFO_FILE_OPEN_FAILED](#) was added in 8.0.4.
- Error number: [MY-011005](#); Symbol: [ER_DD_UPGRADE_INFO_FILE_CLOSE_FAILED](#); SQLSTATE: [HY000](#)
Message: Could not close the upgrade info file '%s' in the MySQL servers datadir, errno: %d.

[ER_DD_UPGRADE_INFO_FILE_CLOSE_FAILED](#) was added in 8.0.4.

- Error number: [MY-011006](#); Symbol: [ER_DD_UPGRADE_TABLESPACE_MIGRATION_FAILED](#); SQLSTATE: [HY000](#)

Message: Got error %d from SE while migrating tablespaces.

[ER_DD_UPGRADE_TABLESPACE_MIGRATION_FAILED](#) was added in 8.0.4.

- Error number: [MY-011007](#); Symbol: [ER_DD_UPGRADE_FAILED_TO_CREATE_TABLE_STATS](#); SQLSTATE: [HY000](#)

Message: Error in creating TABLE statistics entry. Fix statistics data by using ANALYZE command.

[ER_DD_UPGRADE_FAILED_TO_CREATE_TABLE_STATS](#) was added in 8.0.4.

- Error number: [MY-011008](#); Symbol: [ER_DD_UPGRADE_TABLE_STATS_MIGRATE_COMPLETED](#); SQLSTATE: [HY000](#)

Message: Finished migrating TABLE statistics data.

[ER_DD_UPGRADE_TABLE_STATS_MIGRATE_COMPLETED](#) was added in 8.0.4.

- Error number: [MY-011009](#); Symbol: [ER_DD_UPGRADE_FAILED_TO_CREATE_INDEX_STATS](#); SQLSTATE: [HY000](#)

Message: Error in creating Index statistics entry. Fix statistics data by using ANALYZE command.

[ER_DD_UPGRADE_FAILED_TO_CREATE_INDEX_STATS](#) was added in 8.0.4.

- Error number: [MY-011010](#); Symbol: [ER_DD_UPGRADE_INDEX_STATS_MIGRATE_COMPLETED](#); SQLSTATE: [HY000](#)

Message: Finished migrating INDEX statistics data.

[ER_DD_UPGRADE_INDEX_STATS_MIGRATE_COMPLETED](#) was added in 8.0.4.

- Error number: [MY-011011](#); Symbol: [ER_DD_UPGRADE_FAILED_FIND_VALID_DATA_DIR](#); SQLSTATE: [HY000](#)

Message: Failed to find valid data directory.

[ER_DD_UPGRADE_FAILED_FIND_VALID_DATA_DIR](#) was added in 8.0.4.

- Error number: [MY-011012](#); Symbol: [ER_DD_UPGRADE_START](#); SQLSTATE: [HY000](#)

Message: Starting upgrade of data directory.

[ER_DD_UPGRADE_START](#) was added in 8.0.4.

- Error number: [MY-011013](#); Symbol: [ER_DD_UPGRADE_FAILED_INIT_DD_SE](#); SQLSTATE: [HY000](#)

Message: Failed to initialize DD Storage Engine.

[ER_DD_UPGRADE_FAILED_INIT_DD_SE](#) was added in 8.0.4.

- Error number: [MY-011014](#); Symbol: [ER_DD_UPGRADE_FOUND_PARTIALLY_UPGRADED_DD_ABORT](#); SQLSTATE: [HY000](#)

Message: Found partially upgraded DD. Aborting upgrade and deleting all DD tables. Start the upgrade process again.

[ER_DD_UPGRADE_FOUND_PARTIALLY_UPGRADED_DD_ABORT](#) was added in 8.0.4.

- Error number: [MY-011015](#); Symbol:

[ER_DD_UPGRADE_FOUND_PARTIALLY_UPGRADED_DD_CONTINUE](#); SQLSTATE: [HY000](#)

Message: Found partially upgraded DD. Upgrade will continue and start the server.

[ER_DD_UPGRADE_FOUND_PARTIALLY_UPGRADED_DD_CONTINUE](#) was added in 8.0.4.

- Error number: [MY-011016](#); Symbol: [ER_DD_UPGRADE_SE_LOGS_FAILED](#); SQLSTATE: [HY000](#)

Message: Error in upgrading engine logs.

[ER_DD_UPGRADE_SE_LOGS_FAILED](#) was added in 8.0.4.

- Error number: [MY-011017](#); Symbol: [ER_DD_UPGRADE_SDI_INFO_UPDATE_FAILED](#); SQLSTATE: [HY000](#)

Message: Error in updating SDI information.

[ER_DD_UPGRADE_SDI_INFO_UPDATE_FAILED](#) was added in 8.0.4.

- Error number: [MY-011018](#); Symbol: [ER_SKIP_UPDATING_METADATA_IN_SE_RO_MODE](#); SQLSTATE: [HY000](#)

Message: Skip updating %s metadata in InnoDB read-only mode.

[ER_SKIP_UPDATING_METADATA_IN_SE_RO_MODE](#) was added in 8.0.4.

- Error number: [MY-011019](#); Symbol: [ER_CREATED_SYSTEM_WITH_VERSION](#); SQLSTATE: [HY000](#)

Message: Created system views with I_S version %d.

[ER_CREATED_SYSTEM_WITH_VERSION](#) was added in 8.0.4.

- Error number: [MY-011020](#); Symbol: [ER_UNKNOWN_ERROR_DETECTED_IN_SE](#); SQLSTATE: [HY000](#)

Message: Unknown error detected %d in handler.

[ER_UNKNOWN_ERROR_DETECTED_IN_SE](#) was added in 8.0.4.

- Error number: [MY-011021](#); Symbol: [ER_READ_LOG_EVENT_FAILED](#); SQLSTATE: [HY000](#)

Message: Error in Log_event::read_log_event(): '%s', data_len: %lu, event_type: %d.

[ER_READ_LOG_EVENT_FAILED](#) was added in 8.0.4.

- Error number: [MY-011022](#); Symbol: [ER_ROW_DATA_TOO_BIG_TO_WRITE_IN_BINLOG](#); SQLSTATE: [HY000](#)

Message: The row data is greater than 4GB, which is too big to write to the binary log.

[ER_ROW_DATA_TOO_BIG_TO_WRITE_IN_BINLOG](#) was added in 8.0.4.

- Error number: [MY-011023](#); Symbol: [ER_FAILED_TO_CONSTRUCT_DROP_EVENT_QUERY](#); SQLSTATE: [HY000](#)

Message: Unable to construct DROP EVENT SQL query string.

[ER_FAILED_TO_CONSTRUCT_DROP_EVENT_QUERY](#) was added in 8.0.4.

- Error number: [MY-011024](#); Symbol: [ER_FAILED_TO_BINLOG_DROP_EVENT](#); SQLSTATE: [HY000](#)

Message: Unable to binlog drop event %s.%s.

[ER_FAILED_TO_BINLOG_DROP_EVENT](#) was added in 8.0.4.

- Error number: [MY-011025](#); Symbol: [ER_FAILED_TO_START_SLAVE_THREAD](#); SQLSTATE: [HY000](#)

Message: Failed to start slave threads for channel '%s'.

[ER_FAILED_TO_START_SLAVE_THREAD](#) was added in 8.0.4.

- Error number: [MY-011026](#); Symbol: [ER_RPL_IO_THREAD_KILLED](#); SQLSTATE: [HY000](#)

Message: %s%s.

[ER_RPL_IO_THREAD_KILLED](#) was added in 8.0.4.

- Error number: [MY-011027](#); Symbol: [ER_SLAVE_RECONNECT_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed registering on master, reconnecting to try again, log '%s' at position %s. %s.

[ER_SLAVE_RECONNECT_FAILED](#) was added in 8.0.4.

- Error number: [MY-011028](#); Symbol: [ER_SLAVE_KILLED_AFTER_RECONNECT](#); SQLSTATE: [HY000](#)

Message: Slave I/O thread killed during or after reconnect.

[ER_SLAVE_KILLED_AFTER_RECONNECT](#) was added in 8.0.4.

- Error number: [MY-011029](#); Symbol: [ER_SLAVE_NOT_STARTED_ON_SOME_CHANNELS](#); SQLSTATE: [HY000](#)

Message: Some of the channels are not created/initialized properly. Check for additional messages above. You will not be able to start replication on those channels until the issue is resolved and the server restarted.

[ER_SLAVE_NOT_STARTED_ON_SOME_CHANNELS](#) was added in 8.0.4.

- Error number: [MY-011030](#); Symbol: [ER_FAILED_TO_ADD_RPL_FILTER](#); SQLSTATE: [HY000](#)

Message: Failed to add a replication filter into filter map for channel '%s'.

[ER_FAILED_TO_ADD_RPL_FILTER](#) was added in 8.0.4.

- Error number: [MY-011031](#); Symbol: [ER_PER_CHANNEL_RPL_FILTER_CONF_FOR_GRP_RPL](#); SQLSTATE: [HY000](#)

Message: There are per-channel replication filter(s) configured for group replication channel '%s' which is disallowed. The filter(s) have been discarded.

[ER_PER_CHANNEL_RPL_FILTER_CONF_FOR_GRP_RPL](#) was added in 8.0.4.

- Error number: [MY-011032](#); Symbol: [ER_RPL_FILTERS_NOT_ATTACHED_TO_CHANNEL](#); SQLSTATE: [HY000](#)

Message: There are per-channel replication filter(s) configured for channel '%s' which does not exist. The filter(s) have been discarded.

`ER_RPL_FILTERS_NOT_ATTACHED_TO_CHANNEL` was added in 8.0.4.

- Error number: `MY-011033`; Symbol: `ER_FAILED_TO_BUILD_DO_AND_IGNORE_TABLE_HASHES`; SQLSTATE: `HY000`

Message: An error occurred while building do_table and ignore_table rules to hashes for per-channel filter.

`ER_FAILED_TO_BUILD_DO_AND_IGNORE_TABLE_HASHES` was added in 8.0.4.

- Error number: `MY-011034`; Symbol: `ER_CLONE_PLUGIN_NOT_LOADED`; SQLSTATE: `HY000`

Message: Clone plugin not loaded.

`ER_CLONE_PLUGIN_NOT_LOADED` was added in 8.0.4, removed after 8.0.16.

- Error number: `MY-011034`; Symbol: `ER_CLONE_PLUGIN_NOT_LOADED_TRACE`; SQLSTATE: `HY000`

Message: Clone plugin cannot be loaded.

`ER_CLONE_PLUGIN_NOT_LOADED_TRACE` was added in 8.0.17.

- Error number: `MY-011035`; Symbol: `ER_CLONE_HANDLER_EXISTS`; SQLSTATE: `HY000`

Message: Clone Handler exists.

`ER_CLONE_HANDLER_EXISTS` was added in 8.0.4, removed after 8.0.16.

- Error number: `MY-011035`; Symbol: `ER_CLONE_HANDLER_EXIST_TRACE`; SQLSTATE: `HY000`

Message: Clone Handler exists.

`ER_CLONE_HANDLER_EXIST_TRACE` was added in 8.0.17.

- Error number: `MY-011036`; Symbol: `ER_FAILED_TO_CREATE_CLONE_HANDLER`; SQLSTATE: `HY000`

Message: Could not create Clone Handler.

`ER_FAILED_TO_CREATE_CLONE_HANDLER` was added in 8.0.4, removed after 8.0.16.

- Error number: `MY-011036`; Symbol: `ER_CLONE_CREATE_HANDLER_FAIL_TRACE`; SQLSTATE: `HY000`

Message: Could not create Clone Handler.

`ER_CLONE_CREATE_HANDLER_FAIL_TRACE` was added in 8.0.17.

- Error number: `MY-011037`; Symbol: `ER_CYCLE_TIMER_IS_NOT_AVAILABLE`; SQLSTATE: `HY000`

Message: The CYCLE timer is not available. WAIT events in the performance_schema will not be timed.

`ER_CYCLE_TIMER_IS_NOT_AVAILABLE` was added in 8.0.4.

- Error number: `MY-011038`; Symbol: `ER_NANOSECOND_TIMER_IS_NOT_AVAILABLE`; SQLSTATE: `HY000`

Message: The NANOSECOND timer is not available. IDLE/STAGE/STATEMENT/TRANSACTION events in the performance_schema will not be timed.

[ER_NANOSECOND_TIMER_IS_NOT_AVAILABLE](#) was added in 8.0.4.

- Error number: [MY-011039](#); Symbol: [ER_MICROSECOND_TIMER_IS_NOT_AVAILABLE](#); SQLSTATE: [HY000](#)

Message: The MICROSECOND timer is not available. IDLE/STAGE/STATEMENT/TRANSACTION events in the performance_schema will not be timed.

[ER_MICROSECOND_TIMER_IS_NOT_AVAILABLE](#) was added in 8.0.4.

- Error number: [MY-011040](#); Symbol: [ER_PFS_MALLOC_ARRAY_OVERFLOW](#); SQLSTATE: [HY000](#)

Message: Failed to allocate memory for %zu chunks each of size %zu for buffer '%s' due to overflow.

[ER_PFS_MALLOC_ARRAY_OVERFLOW](#) was added in 8.0.4.

- Error number: [MY-011041](#); Symbol: [ER_PFS_MALLOC_ARRAY_OOM](#); SQLSTATE: [HY000](#)

Message: Failed to allocate %zu bytes for buffer '%s' due to out-of-memory.

[ER_PFS_MALLOC_ARRAY_OOM](#) was added in 8.0.4.

- Error number: [MY-011042](#); Symbol: [ER_INNODB_FAILED_TO_FIND_IDX_WITH_KEY_NO](#); SQLSTATE: [HY000](#)

Message: InnoDB could not find index %s key no %u for table %s through its index translation table.

[ER_INNODB_FAILED_TO_FIND_IDX_WITH_KEY_NO](#) was added in 8.0.4.

- Error number: [MY-011043](#); Symbol: [ER_INNODB_FAILED_TO_FIND_IDX](#); SQLSTATE: [HY000](#)

Message: Cannot find index %s in InnoDB index translation table.

[ER_INNODB_FAILED_TO_FIND_IDX](#) was added in 8.0.4.

- Error number: [MY-011044](#); Symbol: [ER_INNODB_FAILED_TO_FIND_IDX_FROM_DICT_CACHE](#); SQLSTATE: [HY000](#)

Message: InnoDB could not find key no %u with name %s from dict cache for table %s.

[ER_INNODB_FAILED_TO_FIND_IDX_FROM_DICT_CACHE](#) was added in 8.0.4.

- Error number: [MY-011045](#); Symbol: [ER_INNODB_ACTIVE_INDEX_CHANGE_FAILED](#); SQLSTATE: [HY000](#)

Message: InnoDB: change_active_index(%u) failed.

[ER_INNODB_ACTIVE_INDEX_CHANGE_FAILED](#) was added in 8.0.4.

- Error number: [MY-011046](#); Symbol: [ER_INNODB_DIFF_IN_REF_LEN](#); SQLSTATE: [HY000](#)

Message: Stored ref len is %lu, but table ref len is %lu.

[ER_INNODB_DIFF_IN_REF_LEN](#) was added in 8.0.4.

- Error number: [MY-011047](#); Symbol: [ER_WRONG_TYPE_FOR_COLUMN_PREFIX_IDX_FLD](#); SQLSTATE: [HY000](#)

Message: MySQL is trying to create a column prefix index field, on an inappropriate data type. Table name %s, column name %s.

[ER_WRONG_TYPE_FOR_COLUMN_PREFIX_IDX_FLD](#) was added in 8.0.4.
- Error number: [MY-011048](#); Symbol: [ER_INNODB_CANNOT_CREATE_TABLE](#); SQLSTATE: [HY000](#)

Message: Cannot create table %s.

[ER_INNODB_CANNOT_CREATE_TABLE](#) was added in 8.0.4.
- Error number: [MY-011049](#); Symbol: [ER_INNODB_INTERNAL_INDEX](#); SQLSTATE: [HY000](#)

Message: Found index %s in InnoDB index list but not its MySQL index number. It could be an InnoDB internal index.

[ER_INNODB_INTERNAL_INDEX](#) was added in 8.0.4.
- Error number: [MY-011050](#); Symbol: [ER_INNODB_IDX_CNT_MORE_THAN_DEFINED_IN_MYSQL](#); SQLSTATE: [HY000](#)

Message: InnoDB: Table %s contains %lu indexes inside InnoDB, which is different from the number of indexes %u defined in MySQL.

[ER_INNODB_IDX_CNT_MORE_THAN_DEFINED_IN_MYSQL](#) was added in 8.0.4.
- Error number: [MY-011051](#); Symbol: [ER_INNODB_IDX_CNT_FEWER_THAN_DEFINED_IN_MYSQL](#); SQLSTATE: [HY000](#)

Message: Table %s contains fewer indexes inside InnoDB than are defined in the MySQL. Have you mixed up with data dictionary from different installation?

[ER_INNODB_IDX_CNT_FEWER_THAN_DEFINED_IN_MYSQL](#) was added in 8.0.4.
- Error number: [MY-011052](#); Symbol: [ER_INNODB_IDX_COLUMN_CNT_DIFF](#); SQLSTATE: [HY000](#)

Message: Index %s of %s has %lu columns unique inside InnoDB, but MySQL is asking statistics for %lu columns. Have you mixed data dictionary from different installation?

[ER_INNODB_IDX_COLUMN_CNT_DIFF](#) was added in 8.0.4.
- Error number: [MY-011053](#); Symbol: [ER_INNODB_USE_MONITOR_GROUP_NAME](#); SQLSTATE: [HY000](#)

Message: Monitor counter '%s' cannot be turned on/off individually. Please use its module name to turn on/off the counters in the module as a group.

[ER_INNODB_USE_MONITOR_GROUP_NAME](#) was added in 8.0.4.
- Error number: [MY-011054](#); Symbol: [ER_INNODB_MONITOR_DEFAULT_VALUE_NOT_DEFINED](#); SQLSTATE: [HY000](#)

Message: Default value is not defined for this set option. Please specify correct counter or module name.

[ER_INNODB_MONITOR_DEFAULT_VALUE_NOT_DEFINED](#) was added in 8.0.4.
- Error number: [MY-011055](#); Symbol: [ER_INNODB_MONITOR_IS_ENABLED](#); SQLSTATE: [HY000](#)

Message: InnoDB: Monitor %s is already enabled.

[ER_INNODB_MONITOR_IS_ENABLED](#) was added in 8.0.4.

- Error number: [MY-011056](#); Symbol: [ER_INNODB_INVALID_MONITOR_COUNTER_NAME](#); SQLSTATE: [HY000](#)

Message: Invalid monitor counter : %s.

[ER_INNODB_INVALID_MONITOR_COUNTER_NAME](#) was added in 8.0.4.

- Error number: [MY-011057](#); Symbol: [ER_WIN_LOAD_LIBRARY_FAILED](#); SQLSTATE: [HY000](#)

Message: LoadLibrary("%s") failed: GetLastError returns %lu.

[ER_WIN_LOAD_LIBRARY_FAILED](#) was added in 8.0.4.

- Error number: [MY-011058](#); Symbol: [ER_PARTITION_HANDLER_ADMIN_MSG](#); SQLSTATE: [HY000](#)

Message: %s.

[ER_PARTITION_HANDLER_ADMIN_MSG](#) was added in 8.0.4.

Message: The option expire_logs_days cannot be used together with option binlog_expire_logs_seconds. Therefore, value of expire_logs_days is ignored.

[ER_EXPIRE_LOGS_DAYS_IGNORED](#) was added in 8.0.4.

- Error number: [MY-011080](#); Symbol: [ER_BINLOG_MALFORMED_OR_OLD_RELAY_LOG](#); SQLSTATE: [HY000](#)

Message: malformed or very old relay log which does not have FormatDescriptor.

[ER_BINLOG_MALFORMED_OR_OLD_RELAY_LOG](#) was added in 8.0.4.

- Error number: [MY-011081](#); Symbol: [ER_DD_UPGRADE_VIEW_COLUMN_NAME_TOO_LONG](#); SQLSTATE: [HY000](#)

Message: Upgrade of view '%s.%s' failed. Re-create the view with the explicit column name lesser than 64 characters.

[ER_DD_UPGRADE_VIEW_COLUMN_NAME_TOO_LONG](#) was added in 8.0.4.
- Error number: [MY-011082](#); Symbol: [ER_TABLE_NEEDS_DUMP_UPGRADE](#); SQLSTATE: [HY000](#)

Message: Table upgrade required for '%s'. Please dump/reload table to fix it!

[ER_TABLE_NEEDS_DUMP_UPGRADE](#) was added in 8.0.4.
- Error number: [MY-011083](#); Symbol: [ER_DD_UPGRADE_FAILED_TO_UPDATE_VER_NO_IN_TABLESPACE](#); SQLSTATE: [HY000](#)

Message: Error in updating version number in %s tablespace.

[ER_DD_UPGRADE_FAILED_TO_UPDATE_VER_NO_IN_TABLESPACE](#) was added in 8.0.4.
- Error number: [MY-011084](#); Symbol: [ER_KEYRING_MIGRATION_FAILED](#); SQLSTATE: [HY000](#)

Message: Keyring migration failed.

[ER_KEYRING_MIGRATION_FAILED](#) was added in 8.0.4.
- Error number: [MY-011085](#); Symbol: [ER_KEYRING_MIGRATION_SUCCESSFUL](#); SQLSTATE: [HY000](#)

Message: Keyring migration successful.

[ER_KEYRING_MIGRATION_SUCCESSFUL](#) was added in 8.0.4.
- Error number: [MY-011086](#); Symbol: [ER_RESTART_RECEIVED_INFO](#); SQLSTATE: [HY000](#)

Message: Received RESTART from user %s. Restarting mysqld (Version: %s).

[ER_RESTART_RECEIVED_INFO](#) was added in 8.0.4.
- Error number: [MY-011087](#); Symbol: [ER_LCTN_CHANGED](#); SQLSTATE: [HY000](#)

Message: Different lower_case_table_names settings for server ('%u') and data dictionary ('%u').

[ER_LCTN_CHANGED](#) was added in 8.0.4.
- Error number: [MY-011088](#); Symbol: [ER_DD_INITIALIZE](#); SQLSTATE: [HY000](#)

Message: Data dictionary initializing version '%u'.

[ER_DD_INITIALIZE](#) was added in 8.0.4.
- Error number: [MY-011089](#); Symbol: [ER_DD_RESTART](#); SQLSTATE: [HY000](#)

Message: Data dictionary restarting version '%u'.

[ER_DD_RESTART](#) was added in 8.0.4.
- Error number: [MY-011090](#); Symbol: [ER_DD_UPGRADE](#); SQLSTATE: [HY000](#)

Message: Data dictionary upgrading from version '%u' to '%u'.

[ER_DD_UPGRADE](#) was added in 8.0.4.

- Error number: [MY-011091](#); Symbol: [ER_DD_UPGRADE_OFF](#); SQLSTATE: [HY000](#)

Message: Data dictionary upgrade prohibited by the command line option '--no_dd_upgrade'.

[ER_DD_UPGRADE_OFF](#) was added in 8.0.4.

- Error number: [MY-011092](#); Symbol: [ER_DD_UPGRADE_VERSION_NOT_SUPPORTED](#); SQLSTATE: [HY000](#)

Message: Upgrading the data dictionary from dictionary version '%u' is not supported.

[ER_DD_UPGRADE_VERSION_NOT_SUPPORTED](#) was added in 8.0.4.

- Error number: [MY-011093](#); Symbol: [ER_DD_UPGRADE_SCHEMA_UNAVAILABLE](#); SQLSTATE: [HY000](#)

Message: Upgrading the data dictionary failed, temporary schema name '%s' not available.

[ER_DD_UPGRADE_SCHEMA_UNAVAILABLE](#) was added in 8.0.4.

- Error number: [MY-011094](#); Symbol: [ER_DD_MINOR_DOWNGRADE](#); SQLSTATE: [HY000](#)

Message: Data dictionary minor downgrade from version '%u' to '%u'.

[ER_DD_MINOR_DOWNGRADE](#) was added in 8.0.4.

- Error number: [MY-011095](#); Symbol: [ER_DD_MINOR_DOWNGRADE_VERSION_NOT_SUPPORTED](#); SQLSTATE: [HY000](#)

Message: Minor downgrade of the Data dictionary from dictionary version '%u' is not supported.

[ER_DD_MINOR_DOWNGRADE_VERSION_NOT_SUPPORTED](#) was added in 8.0.4.

- Error number: [MY-011096](#); Symbol: [ER_DD_NO_VERSION_FOUND](#); SQLSTATE: [HY000](#)

Message: No data dictionary version number found.

[ER_DD_NO_VERSION_FOUND](#) was added in 8.0.4.

- Error number: [MY-011097](#); Symbol: [ER_THREAD_POOL_NOT_SUPPORTED_ON_PLATFORM](#); SQLSTATE: [HY000](#)

Message: Thread pool not supported, requires a minimum of %s.

[ER_THREAD_POOL_NOT_SUPPORTED_ON_PLATFORM](#) was added in 8.0.4.

- Error number: [MY-011098](#); Symbol: [ER_THREAD_POOL_SIZE_TOO_LOW](#); SQLSTATE: [HY000](#)

Message: thread_pool_size=0 means thread pool disabled, Allowed range of thread_pool_size is %d-%d.

[ER_THREAD_POOL_SIZE_TOO_LOW](#) was added in 8.0.4.

- Error number: [MY-011099](#); Symbol: [ER_THREAD_POOL_SIZE_TOO_HIGH](#); SQLSTATE: [HY000](#)

Message: thread_pool_size=%lu is too high, %d is maximum, thread pool is disabled. Allowed range of thread_pool_size is %d-%d.

[ER_THREAD_POOL_SIZE_TOO_HIGH](#) was added in 8.0.4.

- Error number: [MY-011100](#); Symbol: [ER_THREAD_POOL_ALGORITHM_INVALID](#); SQLSTATE: [HY000](#)

Message: thread_pool_algorithm can be set to 0 and 1, 0 indicates the default low concurrency algorithm, 1 means a high concurrency algorithm.

[ER_THREAD_POOL_ALGORITHM_INVALID](#) was added in 8.0.4.

- Error number: [MY-011101](#); Symbol: [ER_THREAD_POOL_INVALID_STALL_LIMIT](#); SQLSTATE: [HY000](#)

Message: thread_pool_stall_limit can be %d at minimum and %d at maximum, smaller values would render the thread pool fairly useless and higher values could make it possible to have undetected deadlock issues in the MySQL Server.

[ER_THREAD_POOL_INVALID_STALL_LIMIT](#) was added in 8.0.4.

- Error number: [MY-011102](#); Symbol: [ER_THREAD_POOL_INVALID_PRIO_KICKUP_TIMER](#); SQLSTATE: [HY000](#)

Message: Invalid value of thread_pool_prio_kickup_timer specified. Value of thread_pool_prio_kickup_timer should be in range 0-4294967294.

[ER_THREAD_POOL_INVALID_PRIO_KICKUP_TIMER](#) was added in 8.0.4.

- Error number: [MY-011103](#); Symbol: [ER_THREAD_POOL_MAX_UNUSED_THREADS_INVALID](#); SQLSTATE: [HY000](#)

Message: thread_pool_max_unused_threads cannot be set higher than %d.

[ER_THREAD_POOL_MAX_UNUSED_THREADS_INVALID](#) was added in 8.0.4.

- Error number: [MY-011104](#); Symbol: [ER_THREAD_POOL_CON_HANDLER_INIT_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to instantiate the connection handler object.

[ER_THREAD_POOL_CON_HANDLER_INIT_FAILED](#) was added in 8.0.4.

- Error number: [MY-011105](#); Symbol: [ER_THREAD_POOL_INIT_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to initialize thread pool plugin.

[ER_THREAD_POOL_INIT_FAILED](#) was added in 8.0.4.

- Error number: [MY-011106](#); Symbol: [ER_THREAD_POOL_PLUGIN_STARTED](#); SQLSTATE: [HY000](#)

Message: Thread pool plugin started successfully with parameters: thread_pool_size = %lu, thread_pool_algorithm = %s, thread_pool_stall_limit = %u, thread_pool_prio_kickup_timer = %u, thread_pool_max_unused_threads = %u, thread_pool_high_priority_connection = %d.

[ER_THREAD_POOL_PLUGIN_STARTED](#) was added in 8.0.4.

- Error number: [MY-011107](#); Symbol: [ER_THREAD_POOL_CANNOT_SET_THREAD_SPECIFIC_DATA](#); SQLSTATE: [HY000](#)

Message: Can't setup connection teardown thread-specific data.

`ER_THREAD_POOL_CANNOT_SET_THREAD_SPECIFIC_DATA` was added in 8.0.4.

- Error number: `MY-011108`; Symbol: `ER_THREAD_POOL_FAILED_TO_CREATE_CONNECT_HANDLER_THD`; SQLSTATE: `HY000`

Message: Creation of connect handler thread failed.

`ER_THREAD_POOL_FAILED_TO_CREATE_CONNECT_HANDLER_THD` was added in 8.0.4.

- Error number: `MY-011109`; Symbol: `ER_THREAD_POOL_FAILED_TO_CREATE_THD_AND_AUTH_CONN`; SQLSTATE: `HY000`

Message: Failed to create thd and authenticate connection.

`ER_THREAD_POOL_FAILED_TO_CREATE_THD_AND_AUTH_CONN` was added in 8.0.4.

- Error number: `MY-011110`; Symbol: `ER_THREAD_POOL_FAILED_PROCESS_CONNECT_EVENT`; SQLSTATE: `HY000`

Message: Failed to process connection event.

`ER_THREAD_POOL_FAILED_PROCESS_CONNECT_EVENT` was added in 8.0.4.

- Error number: `MY-011111`; Symbol: `ER_THREAD_POOL_FAILED_TO_CREATE_POOL`; SQLSTATE: `HY000`

Message: Can't create pool thread (error %d, errno: %d).

`ER_THREAD_POOL_FAILED_TO_CREATE_POOL` was added in 8.0.4.

- Error number: `MY-011112`; Symbol: `ER_THREAD_POOL_RATE_LIMITED_ERROR_MSGS`; SQLSTATE: `HY000`

Message: %.*s.

`ER_THREAD_POOL_RATE_LIMITED_ERROR_MSGS` was added in 8.0.4.

- Error number: `MY-011113`; Symbol: `ER_THREAD_POOL_LOW_LEVEL_INIT_FAILED`; SQLSTATE: `HY000`

Message: `tp_group_low_level_init()` failed.

`ER_THREAD_POOL_LOW_LEVEL_INIT_FAILED` was added in 8.0.4.

- Error number: `MY-011114`; Symbol: `ER_THREAD_POOL_LOW_LEVEL_REARM_FAILED`; SQLSTATE: `HY000`

Message: Rearm failed even after 30 seconds, can't continue without notify socket.

`ER_THREAD_POOL_LOW_LEVEL_REARM_FAILED` was added in 8.0.4.

- Error number: `MY-011115`; Symbol: `ER_THREAD_POOL_BUFFER_TOO_SMALL`; SQLSTATE: `HY000`

Message: %s: %s buffer is too small

`ER_THREAD_POOL_BUFFER_TOO_SMALL` was added in 8.0.4.

- Error number: `MY-011116`; Symbol: `ER_MECAB_NOT_SUPPORTED`; SQLSTATE: `HY000`

Message: Mecab v%s is not supported, the lowest version supported is v%s.

[ER_MECAB_NOT_SUPPORTED](#) was added in 8.0.4.

- Error number: [MY-011117](#); Symbol: [ER_MECAB_NOT_VERIFIED](#); SQLSTATE: [HY000](#)

Message: Mecab v%s is not verified, the highest version supported is v%s.

[ER_MECAB_NOT_VERIFIED](#) was added in 8.0.4.

- Error number: [MY-011118](#); Symbol: [ER_MECAB_CREATING_MODEL](#); SQLSTATE: [HY000](#)

Message: Mecab: Trying createModel(%s).

[ER_MECAB_CREATING_MODEL](#) was added in 8.0.4.

- Error number: [MY-011119](#); Symbol: [ER_MECAB_FAILED_TO_CREATE_MODEL](#); SQLSTATE: [HY000](#)

Message: Mecab: createModel() failed: %s.

[ER_MECAB_FAILED_TO_CREATE_MODEL](#) was added in 8.0.4.

- Error number: [MY-011120](#); Symbol: [ER_MECAB_FAILED_TO_CREATE_TRIGGER](#); SQLSTATE: [HY000](#)

Message: Mecab: createTagger() failed: %s.

[ER_MECAB_FAILED_TO_CREATE_TRIGGER](#) was added in 8.0.4.

- Error number: [MY-011121](#); Symbol: [ER_MECAB_UNSUPPORTED_CHARSET](#); SQLSTATE: [HY000](#)

Message: Mecab: Unsupported dictionary charset %s.

[ER_MECAB_UNSUPPORTED_CHARSET](#) was added in 8.0.4.

- Error number: [MY-011122](#); Symbol: [ER_MECAB_CHARSET_LOADED](#); SQLSTATE: [HY000](#)

Message: Mecab: Loaded dictionary charset is %s.

[ER_MECAB_CHARSET_LOADED](#) was added in 8.0.4.

- Error number: [MY-011123](#); Symbol: [ER_MECAB_PARSE_FAILED](#); SQLSTATE: [HY000](#)

Message: Mecab: parse() failed: %s.

[ER_MECAB_PARSE_FAILED](#) was added in 8.0.4.

- Error number: [MY-011124](#); Symbol: [ER_MECAB_OOM_WHILE_PARSING_TEXT](#); SQLSTATE: [HY000](#)

Message: Mecab: parse() failed: out of memory.

[ER_MECAB_OOM_WHILE_PARSING_TEXT](#) was added in 8.0.4.

- Error number: [MY-011125](#); Symbol: [ER_MECAB_CREATE_LATTICE_FAILED](#); SQLSTATE: [HY000](#)

Message: Mecab: createLattice() failed: %s.

[ER_MECAB_CREATE_LATTICE_FAILED](#) was added in 8.0.4.

- Error number: [MY-011126](#); Symbol: [ER_SEMISYNC_TRACE_ENTER_FUNC](#); SQLSTATE: [HY000](#)

Message: FIREWALL RESET for '%s'
[ER_FIREWALL_RESET_FOR_USER](#) was added in 8.0.4.
- Error number: [MY-011196](#); Symbol: [ER_FIREWALL_STATUS_FLUSHED](#); SQLSTATE: [HY000](#)

Message: Counters are reset to zero

`ER_FIREWALL_STATUS_FLUSHED` was added in 8.0.4.

- Error number: `MY-011197`; Symbol: `ER_KEYRING_LOGGER_ERROR_MSG`; SQLSTATE: `HY000`

Message: %s

`ER_KEYRING_LOGGER_ERROR_MSG` was added in 8.0.4.

- Error number: `MY-011198`; Symbol: `ER_AUDIT_LOG_FILTER_IS_NOT_INSTALLED`; SQLSTATE: `HY000`

Message: Audit Log plugin supports a filtering, which has not been installed yet. Audit Log plugin will run in the legacy mode, which will be disabled in the next release.

`ER_AUDIT_LOG_FILTER_IS_NOT_INSTALLED` was added in 8.0.4.

- Error number: `MY-011199`; Symbol: `ER_AUDIT_LOG_SWITCHING_TO_INCLUDE_LIST`; SQLSTATE: `HY000`

Message: Previously exclude list is used, now we start using include list, exclude list is set to NULL.

`ER_AUDIT_LOG_SWITCHING_TO_INCLUDE_LIST` was added in 8.0.4.

- Error number: `MY-011200`; Symbol: `ER_AUDIT_LOG_CANNOT_SET_LOG_POLICY_WITH_OTHER_POLICIES`; SQLSTATE: `HY000`

Message: Cannot set audit_log_policy simultaneously with either audit_log_connection_policy or audit_log_statement_policy, setting audit_log_connection_policy and audit_log_statement_policy based on audit_log_policy.

`ER_AUDIT_LOG_CANNOT_SET_LOG_POLICY_WITH_OTHER_POLICIES` was added in 8.0.4.

- Error number: `MY-011201`; Symbol: `ER_AUDIT_LOG_ONLY_INCLUDE_LIST_USED`; SQLSTATE: `HY000`

Message: Both include and exclude lists provided, include list is preferred, exclude list is set to NULL.

`ER_AUDIT_LOG_ONLY_INCLUDE_LIST_USED` was added in 8.0.4.

- Error number: `MY-011202`; Symbol: `ER_AUDIT_LOG_INDEX_MAP_CANNOT_ACCESS_DIR`; SQLSTATE: `HY000`

Message: Could not access '%s' directory.

`ER_AUDIT_LOG_INDEX_MAP_CANNOT_ACCESS_DIR` was added in 8.0.4.

- Error number: `MY-011203`; Symbol: `ER_AUDIT_LOG_WRITER_RENAME_FILE_FAILED`; SQLSTATE: `HY000`

Message: Could not rename file from '%s' to '%s'.

`ER_AUDIT_LOG_WRITER_RENAME_FILE_FAILED` was added in 8.0.4.

- Error number: `MY-011204`; Symbol: `ER_AUDIT_LOG_WRITER_DEST_FILE_ALREADY_EXISTS`; SQLSTATE: `HY000`

Message: File '%s' should not exist. It may be incomplete. The server crashed.

[ER_AUDIT_LOG_WRITER_DEST_FILE_ALREADY_EXISTS](#) was added in 8.0.4.

- Error number: [MY-011205](#); Symbol: [ER_AUDIT_LOG_WRITER_RENAME_FILE_FAILED_REMOVE_FILE_MANUALLY](#); SQLSTATE: [HY000](#)

Message: Could not rename file from '%s' to '%s'. Remove the file manually.

[ER_AUDIT_LOG_WRITER_RENAME_FILE_FAILED_REMOVE_FILE_MANUALLY](#) was added in 8.0.4.

- Error number: [MY-011206](#); Symbol: [ER_AUDIT_LOG_WRITER_INCOMPLETE_FILE_RENAMED](#); SQLSTATE: [HY000](#)

Message: Incomplete file renamed from '%s' to '%s'.

[ER_AUDIT_LOG_WRITER_INCOMPLETE_FILE_RENAMED](#) was added in 8.0.4.

- Error number: [MY-011207](#); Symbol: [ER_AUDIT_LOG_WRITER_FAILED_TO_WRITE_TO_FILE](#); SQLSTATE: [HY000](#)

Message: Error writing file '%s' (errno: %d - %s).

[ER_AUDIT_LOG_WRITER_FAILED_TO_WRITE_TO_FILE](#) was added in 8.0.4.

- Error number: [MY-011208](#); Symbol: [ER_AUDIT_LOG_EC_WRITER_FAILED_TO_INIT_ENCRYPTION](#); SQLSTATE: [HY000](#)

Message: Could not initialize audit log file encryption.

[ER_AUDIT_LOG_EC_WRITER_FAILED_TO_INIT_ENCRYPTION](#) was added in 8.0.4.

- Error number: [MY-011209](#); Symbol: [ER_AUDIT_LOG_EC_WRITER_FAILED_TO_INIT_COMPRESSION](#); SQLSTATE: [HY000](#)

Message: Could not initialize audit log file compression.

[ER_AUDIT_LOG_EC_WRITER_FAILED_TO_INIT_COMPRESSION](#) was added in 8.0.4.

- Error number: [MY-011210](#); Symbol: [ER_AUDIT_LOG_EC_WRITER_FAILED_TO_CREATE_FILE](#); SQLSTATE: [HY000](#)

Message: Could not create '%s' file for audit logging.

[ER_AUDIT_LOG_EC_WRITER_FAILED_TO_CREATE_FILE](#) was added in 8.0.4.

- Error number: [MY-011211](#); Symbol: [ER_AUDIT_LOG_RENAME_LOG_FILE_BEFORE_FLUSH](#); SQLSTATE: [HY000](#)

Message: Audit log file (%s) must be manually renamed before audit_log_flush is set to true.

[ER_AUDIT_LOG_RENAME_LOG_FILE_BEFORE_FLUSH](#) was added in 8.0.4.

- Error number: [MY-011212](#); Symbol: [ER_AUDIT_LOG_FILTER_RESULT_MSG](#); SQLSTATE: [HY000](#)

Message: %s

[ER_AUDIT_LOG_FILTER_RESULT_MSG](#) was added in 8.0.4.

- Error number: [MY-011213](#); Symbol: [ER_AUDIT_LOG_JSON_READER_FAILED_TO_PARSE](#); SQLSTATE: [HY000](#)

Message: Error parsing JSON event. Event not accessible.

[ER_AUDIT_LOG_JSON_READER_FAILED_TO_PARSE](#) was added in 8.0.4.
- Error number: [MY-011214](#); Symbol: [ER_AUDIT_LOG_JSON_READER_BUF_TOO_SMALL](#); SQLSTATE: [HY000](#)

Message: Buffer is too small to hold JSON event. Number of events skipped: %zu.

[ER_AUDIT_LOG_JSON_READER_BUF_TOO_SMALL](#) was added in 8.0.4.
- Error number: [MY-011215](#); Symbol: [ER_AUDIT_LOG_JSON_READER_FAILED_TO_OPEN_FILE](#); SQLSTATE: [HY000](#)

Message: Could not open JSON file for reading. Reading next file if exists.

[ER_AUDIT_LOG_JSON_READER_FAILED_TO_OPEN_FILE](#) was added in 8.0.4.
- Error number: [MY-011216](#); Symbol: [ER_AUDIT_LOG_JSON_READER_FILE_PARSING_ERROR](#); SQLSTATE: [HY000](#)

Message: JSON file parsing error. Reading next file if exists

[ER_AUDIT_LOG_JSON_READER_FILE_PARSING_ERROR](#) was added in 8.0.4.
- Error number: [MY-011217](#); Symbol: [ER_AUDIT_LOG_FILTER_INVALID_COLUMN_COUNT](#); SQLSTATE: [HY000](#)

Message: Invalid column count in the '%s.%s' table.

[ER_AUDIT_LOG_FILTER_INVALID_COLUMN_COUNT](#) was added in 8.0.4.
- Error number: [MY-011218](#); Symbol: [ER_AUDIT_LOG_FILTER_INVALID_COLUMN_DEFINITION](#); SQLSTATE: [HY000](#)

Message: Invalid column definition of the '%s.%s' table.

[ER_AUDIT_LOG_FILTER_INVALID_COLUMN_DEFINITION](#) was added in 8.0.4.
- Error number: [MY-011219](#); Symbol: [ER_AUDIT_LOG_FILTER_FAILED_TO_STORE_TABLE_FLDS](#); SQLSTATE: [HY000](#)

Message: Could not store field of the %s table.

[ER_AUDIT_LOG_FILTER_FAILED_TO_STORE_TABLE_FLDS](#) was added in 8.0.4.
- Error number: [MY-011220](#); Symbol: [ER_AUDIT_LOG_FILTER_FAILED_TO_UPDATE_TABLE](#); SQLSTATE: [HY000](#)

Message: Could not update %s table.

[ER_AUDIT_LOG_FILTER_FAILED_TO_UPDATE_TABLE](#) was added in 8.0.4.
- Error number: [MY-011221](#); Symbol: [ER_AUDIT_LOG_FILTER_FAILED_TO_INSERT_INTO_TABLE](#); SQLSTATE: [HY000](#)

Message: Could not insert into %s table.

[ER_AUDIT_LOG_FILTER_FAILED_TO_INSERT_INTO_TABLE](#) was added in 8.0.4.

- Error number: [MY-011222](#); Symbol: [ER_AUDIT_LOG_FILTER_FAILED_TO_DELETE_FROM_TABLE](#); SQLSTATE: [HY000](#)

Message: Could not delete from %s table.

[ER_AUDIT_LOG_FILTER_FAILED_TO_DELETE_FROM_TABLE](#) was added in 8.0.4.

- Error number: [MY-011223](#); Symbol: [ER_AUDIT_LOG_FILTER_FAILED_TO_INIT_TABLE_FOR_READ](#); SQLSTATE: [HY000](#)

Message: Could not initialize %s table for reading.

[ER_AUDIT_LOG_FILTER_FAILED_TO_INIT_TABLE_FOR_READ](#) was added in 8.0.4.

- Error number: [MY-011224](#); Symbol: [ER_AUDIT_LOG_FILTER_FAILED_TO_READ_TABLE](#); SQLSTATE: [HY000](#)

Message: Could not read %s table.

[ER_AUDIT_LOG_FILTER_FAILED_TO_READ_TABLE](#) was added in 8.0.4.

- Error number: [MY-011225](#); Symbol: [ER_AUDIT_LOG_FILTER_FAILED_TO_CLOSE_TABLE_AFTER_READING](#); SQLSTATE: [HY000](#)

Message: Could not close %s table reading.

[ER_AUDIT_LOG_FILTER_FAILED_TO_CLOSE_TABLE_AFTER_READING](#) was added in 8.0.4.

- Error number: [MY-011226](#); Symbol: [ER_AUDIT_LOG_FILTER_USER_AND_HOST_CANNOT_BE_EMPTY](#); SQLSTATE: [HY000](#)

Message: Both user and host columns of %s table cannot be empty.

[ER_AUDIT_LOG_FILTER_USER_AND_HOST_CANNOT_BE_EMPTY](#) was added in 8.0.4.

- Error number: [MY-011227](#); Symbol: [ER_AUDIT_LOG_FILTER_FLD_FILTERNAME_CANNOT_BE_EMPTY](#); SQLSTATE: [HY000](#)

Message: Filtername column of %s table cannot be empty.

[ER_AUDIT_LOG_FILTER_FLD_FILTERNAME_CANNOT_BE_EMPTY](#) was added in 8.0.4.

- Error number: [MY-011228](#); Symbol: [ER_VALIDATE_PWD_DICT_FILE_NOT_SPECIFIED](#); SQLSTATE: [HY000](#)

Message: Dictionary file not specified

[ER_VALIDATE_PWD_DICT_FILE_NOT_SPECIFIED](#) was added in 8.0.4.

- Error number: [MY-011229](#); Symbol: [ER_VALIDATE_PWD_DICT_FILE_NOT_LOADED](#); SQLSTATE: [HY000](#)

Message: Dictionary file not loaded

[ER_VALIDATE_PWD_DICT_FILE_NOT_LOADED](#) was added in 8.0.4.
- Error number: [MY-011230](#); Symbol: [ER_VALIDATE_PWD_DICT_FILE_TOO_BIG](#); SQLSTATE: [HY000](#)

Message: Dictionary file size exceeded MAX_DICTIONARY_FILE_LENGTH, not loaded

[ER_VALIDATE_PWD_DICT_FILE_TOO_BIG](#) was added in 8.0.4.
- Error number: [MY-011231](#); Symbol: [ER_VALIDATE_PWD_FAILED_TO_READ_DICT_FILE](#); SQLSTATE: [HY000](#)

Message: Exception while reading the dictionary file

[ER_VALIDATE_PWD_FAILED_TO_READ_DICT_FILE](#) was added in 8.0.4.
- Error number: [MY-011232](#); Symbol: [ER_VALIDATE_PWD_FAILED_TO_GET_FLD_FROM_SECURITY_CTX](#); SQLSTATE: [HY000](#)

Message: Can't retrieve the %s from the security context

[ER_VALIDATE_PWD_FAILED_TO_GET_FLD_FROM_SECURITY_CTX](#) was added in 8.0.4.
- Error number: [MY-011233](#); Symbol: [ER_VALIDATE_PWD_FAILED_TO_GET_SECURITY_CTX](#); SQLSTATE: [HY000](#)

Message: Can't retrieve the security context

[ER_VALIDATE_PWD_FAILED_TO_GET_SECURITY_CTX](#) was added in 8.0.4.
- Error number: [MY-011234](#); Symbol: [ER_VALIDATE_PWD_LENGTH_CHANGED](#); SQLSTATE: [HY000](#)

Message: Effective value of validate_password_length is changed. New value is %d

[ER_VALIDATE_PWD_LENGTH_CHANGED](#) was added in 8.0.4.
- Error number: [MY-011235](#); Symbol: [ER_REWRITER_QUERY_ERROR_MSG](#); SQLSTATE: [HY000](#)

Message: %s

[ER_REWRITER_QUERY_ERROR_MSG](#) was added in 8.0.4.
- Error number: [MY-011236](#); Symbol: [ER_REWRITER_QUERY_FAILED](#); SQLSTATE: [HY000](#)

Message: Rewritten query failed to parse:%s

[ER_REWRITER_QUERY_FAILED](#) was added in 8.0.4.
- Error number: [MY-011237](#); Symbol: [ER_XPLUGIN_STARTUP_FAILED](#); SQLSTATE: [HY000](#)

Message: Startup failed with error "%s"

[ER_XPLUGIN_STARTUP_FAILED](#) was added in 8.0.4.
- Error number: [MY-011238](#); Symbol: [ER_XPLUGIN_SERVER_EXITING](#); SQLSTATE: [HY000](#)

Message: Exiting

[ER_XPLUGIN_SERVER_EXITING](#) was added in 8.0.4, removed after 8.0.12.

- Error number: [MY-011239](#); Symbol: [ER_XPLUGIN_SERVER_EXITED](#); SQLSTATE: [HY000](#)

Message: Exit done

[ER_XPLUGIN_SERVER_EXITED](#) was added in 8.0.4, removed after 8.0.12.

Message: The log-filter component "%s" got confused at "%s" (state: %s) ...

[ER_COMPONENT_FILTER_CONFUSED](#) was added in 8.0.4.

- Error number: [MY-011262](#); Symbol: [ER_STOP_SLAVE_IO_THREAD_DISK_SPACE](#); SQLSTATE: [HY000](#)

Message: Waiting until I/O thread for channel '%s' finish writing to disk before stopping. Free some disk space or use 'KILL' to abort I/O thread operation. Notice that aborting the I/O thread while rotating the relay log might corrupt the relay logs, requiring a server restart to fix it.

[ER_STOP_SLAVE_IO_THREAD_DISK_SPACE](#) was added in 8.0.2.

- Error number: [MY-011263](#); Symbol: [ER_LOG_FILE_CANNOT_OPEN](#); SQLSTATE: [HY000](#)

Message: Could not use %s for logging (error %d - %s). Turning logging off for the server process. To turn it on again: fix the cause, then %s restart the MySQL server.

[ER_LOG_FILE_CANNOT_OPEN](#) was added in 8.0.2.

- Error number: [MY-011268](#); Symbol: [ER_PERSIST_OPTION_STATUS](#); SQLSTATE: [HY000](#)

Message: Configuring persisted options failed: "%s".

[ER_PERSIST_OPTION_STATUS](#) was added in 8.0.11.

- Error number: [MY-011269](#); Symbol: [ER_NOT_IMPLEMENTED_GET_TABLESPACE_STATISTICS](#); SQLSTATE: [HY000](#)

Message: The storage engine '%s' does not provide dynamic table statistics

[ER_NOT_IMPLEMENTED_GET_TABLESPACE_STATISTICS](#) was added in 8.0.11.

- Error number: [MY-011272](#); Symbol: [ER_SSL_FIPS_MODE_ERROR](#); SQLSTATE: [HY000](#)

Message: SSL fips mode error: %s

[ER_SSL_FIPS_MODE_ERROR](#) was added in 8.0.11.

- Error number: [MY-011273](#); Symbol: [ER_CONN_INIT_CONNECT_IGNORED](#); SQLSTATE: [HY000](#)

Message: init_connect variable is ignored for user: %s host: %s due to expired password.

[ER_CONN_INIT_CONNECT_IGNORED](#) was added in 8.0.11.

- Error number: [MY-011275](#); Symbol: [ER_REWRITER_OOM](#); SQLSTATE: [HY000](#)

Message: Out of memory.

[ER_REWRITER_OOM](#) was added in 8.0.11.

- Error number: [MY-011276](#); Symbol: [ER_REWRITER_TABLE_MALFORMED_ERROR](#); SQLSTATE: [HY000](#)

Message: Wrong column count or names when loading rules.

[ER_REWRITER_TABLE_MALFORMED_ERROR](#) was added in 8.0.11.

- Error number: [MY-011277](#); Symbol: [ER_REWRITER_LOAD_FAILED](#); SQLSTATE: [HY000](#)

Message: Some rules failed to load.

[ER_REWRITER_LOAD_FAILED](#) was added in 8.0.11.

- Error number: [MY-011278](#); Symbol: [ER_REWRITER_READ_FAILED](#); SQLSTATE: [HY000](#)

Message: Got error from storage engine while refreshing rewrite rules.

[ER_REWRITER_READ_FAILED](#) was added in 8.0.11.

- Error number: [MY-011279](#); Symbol: [ER_CONN_CONTROL_EVENT_COORDINATOR_INIT_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to initialize Connection_event_coordinator

[ER_CONN_CONTROL_EVENT_COORDINATOR_INIT_FAILED](#) was added in 8.0.11.

- Error number: [MY-011280](#); Symbol: [ER_CONN_CONTROL_STAT_CONN_DELAY_TRIGGERED_UPDATE_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to update connection delay triggered stats

[ER_CONN_CONTROL_STAT_CONN_DELAY_TRIGGERED_UPDATE_FAILED](#) was added in 8.0.11.

- Error number: [MY-011281](#); Symbol: [ER_CONN_CONTROL_STAT_CONN_DELAY_TRIGGERED_RESET_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to reset connection delay triggered stats

[ER_CONN_CONTROL_STAT_CONN_DELAY_TRIGGERED_RESET_FAILED](#) was added in 8.0.11.

- Error number: [MY-011282](#); Symbol: [ER_CONN_CONTROL_INVALID_CONN_DELAY_TYPE](#); SQLSTATE: [HY000](#)

Message: Unexpected option type for connection delay.

[ER_CONN_CONTROL_INVALID_CONN_DELAY_TYPE](#) was added in 8.0.11.

- Error number: [MY-011283](#); Symbol: [ER_CONN_CONTROL_DELAY_ACTION_INIT_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to initialize Connection_delay_action

[ER_CONN_CONTROL_DELAY_ACTION_INIT_FAILED](#) was added in 8.0.11.

- Error number: [MY-011284](#); Symbol: [ER_CONN_CONTROL_FAILED_TO_SET_CONN_DELAY](#); SQLSTATE: [HY000](#)

Message: Could not set %s delay for connection delay.

[ER_CONN_CONTROL_FAILED_TO_SET_CONN_DELAY](#) was added in 8.0.11.

- Error number: [MY-011285](#); Symbol: [ER_CONN_CONTROL_FAILED_TO_UPDATE_CONN_DELAY_HASH](#); SQLSTATE: [HY000](#)

Message: Failed to update connection delay hash for account : %s

[ER_CONN_CONTROL_FAILED_TO_UPDATE_CONN_DELAY_HASH](#) was added in 8.0.11.

- Error number: [MY-011286](#); Symbol: [ER_XPLUGIN_FORCE_STOP_CLIENT](#); SQLSTATE: [HY000](#)

Message: %s: Force stopping client because exception occurred: %s

[ER_XPLUGIN_FORCE_STOP_CLIENT](#) was added in 8.0.11.

- Error number: [MY-011287](#); Symbol: [ER_XPLUGIN_MAX_AUTH_ATTEMPTS_REACHED](#); SQLSTATE: [HY000](#)

Message: %s.%u: Maximum number of authentication attempts reached, login failed.

[ER_XPLUGIN_MAX_AUTH_ATTEMPTS_REACHED](#) was added in 8.0.11.

- Error number: [MY-011288](#); Symbol: [ER_XPLUGIN_BUFFER_PAGE_ALLOC_FAILED](#); SQLSTATE: [HY000](#)

Message: Error allocating Buffer_page: %s

[ER_XPLUGIN_BUFFER_PAGE_ALLOC_FAILED](#) was added in 8.0.11.

- Error number: [MY-011289](#); Symbol: [ER_XPLUGIN_DETECTED_HANGING_CLIENTS](#); SQLSTATE: [HY000](#)

Message: Detected %u hanging client(s)

[ER_XPLUGIN_DETECTED_HANGING_CLIENTS](#) was added in 8.0.11.
- Error number: [MY-011290](#); Symbol: [ER_XPLUGIN_FAILED_TO_ACCEPT_CLIENT](#); SQLSTATE: [HY000](#)

Message: Error accepting client

[ER_XPLUGIN_FAILED_TO_ACCEPT_CLIENT](#) was added in 8.0.11.
- Error number: [MY-011291](#); Symbol: [ER_XPLUGIN_FAILED_TO_SCHEDULE_CLIENT](#); SQLSTATE: [HY000](#)

Message: Internal error scheduling client for execution

[ER_XPLUGIN_FAILED_TO_SCHEDULE_CLIENT](#) was added in 8.0.11.
- Error number: [MY-011292](#); Symbol: [ER_XPLUGIN_FAILED_TO_PREPARE_IO_INTERFACES](#); SQLSTATE: [HY000](#)

Message: Preparation of I/O interfaces failed, X Protocol won't be accessible

[ER_XPLUGIN_FAILED_TO_PREPARE_IO_INTERFACES](#) was added in 8.0.11.
- Error number: [MY-011293](#); Symbol: [ER_XPLUGIN_SRV_SESSION_INIT_THREAD_FAILED](#); SQLSTATE: [HY000](#)

Message: srv_session_init_thread returned error

[ER_XPLUGIN_SRV_SESSION_INIT_THREAD_FAILED](#) was added in 8.0.11.
- Error number: [MY-011294](#); Symbol: [ER_XPLUGIN_UNABLE_TO_USE_USER_SESSION_ACCOUNT](#); SQLSTATE: [HY000](#)

Message: Unable to use user mysql.session account when connecting the server for internal plugin requests.

[ER_XPLUGIN_UNABLE_TO_USE_USER_SESSION_ACCOUNT](#) was added in 8.0.11.
- Error number: [MY-011295](#); Symbol: [ER_XPLUGIN_REFERENCE_TO_USER_ACCOUNT_DOC_SECTION](#); SQLSTATE: [HY000](#)

Message: For more information, please see the X Plugin User Account section in the MySQL documentation

[ER_XPLUGIN_REFERENCE_TO_USER_ACCOUNT_DOC_SECTION](#) was added in 8.0.11.
- Error number: [MY-011296](#); Symbol: [ER_XPLUGIN_UNEXPECTED_EXCEPTION_DISPATCHING_CMD](#); SQLSTATE: [HY000](#)

Message: %s: Unexpected exception dispatching command: %s

[ER_XPLUGIN_UNEXPECTED_EXCEPTION_DISPATCHING_CMD](#) was added in 8.0.11.

- Error number: [MY-011297](#); Symbol: [ER_XPLUGIN_EXCEPTION_IN_TASK_SCHEDULER](#); SQLSTATE: [HY000](#)

Message: Exception in post: %s

[ER_XPLUGIN_EXCEPTION_IN_TASK_SCHEDULER](#) was added in 8.0.11.
- Error number: [MY-011298](#); Symbol: [ER_XPLUGIN_TASK_SCHEDULING_FAILED](#); SQLSTATE: [HY000](#)

Message: Internal error scheduling task

[ER_XPLUGIN_TASK_SCHEDULING_FAILED](#) was added in 8.0.11.
- Error number: [MY-011299](#); Symbol: [ER_XPLUGIN_EXCEPTION_IN_EVENT_LOOP](#); SQLSTATE: [HY000](#)

Message: Exception in event loop: "%s": %s

[ER_XPLUGIN_EXCEPTION_IN_EVENT_LOOP](#) was added in 8.0.11.
- Error number: [MY-011300](#); Symbol: [ER_XPLUGIN_LISTENER_SETUP_FAILED](#); SQLSTATE: [HY000](#)

Message: Setup of %s failed, %s

[ER_XPLUGIN_LISTENER_SETUP_FAILED](#) was added in 8.0.11.
- Error number: [MY-011301](#); Symbol: [ER_XPLUING_NET_STARTUP_FAILED](#); SQLSTATE: [HY000](#)

Message: %s

[ER_XPLUING_NET_STARTUP_FAILED](#) was added in 8.0.11.
- Error number: [MY-011302](#); Symbol: [ER_XPLUGIN_FAILED_AT_SSL_CONF](#); SQLSTATE: [HY000](#)

Message: Failed at SSL configuration: "%s"

[ER_XPLUGIN_FAILED_AT_SSL_CONF](#) was added in 8.0.11.
- Error number: [MY-011303](#); Symbol: [ER_XPLUGIN_CLIENT_SSL_HANDSHAKE_FAILED](#); SQLSTATE: [HY000](#)

Message: Error during SSL handshake for client connection (%i)

[ER_XPLUGIN_CLIENT_SSL_HANDSHAKE_FAILED](#) was added in 8.0.11, removed after 8.0.12.
- Error number: [MY-011304](#); Symbol: [ER_XPLUGIN_SSL_HANDSHAKE_WITH_SERVER_FAILED](#); SQLSTATE: [HY000](#)

Message: %s: Error during SSL handshake

[ER_XPLUGIN_SSL_HANDSHAKE_WITH_SERVER_FAILED](#) was added in 8.0.11, removed after 8.0.12.
- Error number: [MY-011305](#); Symbol: [ER_XPLUGIN_FAILED_TO_CREATE_SESSION_FOR_CONN](#); SQLSTATE: [HY000](#)

Message: %s: Error creating session for connection from %s

- Error number: [MY-011306](#); Symbol: [ER_XPLUGIN_FAILED_TO_INITIALIZE_SESSION](#); SQLSTATE: [HY000](#)

Message: %s: Error initializing session for connection: %s

[ER_XPLUGIN_FAILED_TO_INITIALIZE_SESSION](#) was added in 8.0.11.
- Error number: [MY-011307](#); Symbol: [ER_XPLUGIN_MESSAGE_TOO_LONG](#); SQLSTATE: [HY000](#)

Message: %s: Message of size %u received, exceeding the limit of %i

[ER_XPLUGIN_MESSAGE_TOO_LONG](#) was added in 8.0.11.
- Error number: [MY-011308](#); Symbol: [ER_XPLUGIN_UNINITIALIZED_MESSAGE](#); SQLSTATE: [HY000](#)

Message: Message is not properly initialized: %s

[ER_XPLUGIN_UNINITIALIZED_MESSAGE](#) was added in 8.0.11.
- Error number: [MY-011309](#); Symbol: [ER_XPLUGIN_FAILED_TO_SET_MIN_NUMBER_OF_WORKERS](#); SQLSTATE: [HY000](#)

Message: Unable to set minimal number of workers to %u; actual value is %i

[ER_XPLUGIN_FAILED_TO_SET_MIN_NUMBER_OF_WORKERS](#) was added in 8.0.11.
- Error number: [MY-011310](#); Symbol: [ER_XPLUGIN_UNABLE_TO_ACCEPT_CONNECTION](#); SQLSTATE: [HY000](#)

Message: Unable to accept connection, disconnecting client

[ER_XPLUGIN_UNABLE_TO_ACCEPT_CONNECTION](#) was added in 8.0.11.
- Error number: [MY-011311](#); Symbol: [ER_XPLUGIN_ALL_IO_INTERFACES_DISABLED](#); SQLSTATE: [HY000](#)

Message: All I/O interfaces are disabled, X Protocol won't be accessible

[ER_XPLUGIN_ALL_IO_INTERFACES_DISABLED](#) was added in 8.0.11.
- Error number: [MY-011312](#); Symbol: [ER_XPLUGIN_INVALID_MSG_DURING_CLIENT_INIT](#); SQLSTATE: [HY000](#)

Message: %s: Invalid message %i received during client initialization

[ER_XPLUGIN_INVALID_MSG_DURING_CLIENT_INIT](#) was added in 8.0.11, removed after 8.0.12.
- Error number: [MY-011313](#); Symbol: [ER_XPLUGIN_CLOSING_CLIENTS_ON_SHUTDOWN](#); SQLSTATE: [HY000](#)

Message: %s: closing client because of shutdown (state: %i)

[ER_XPLUGIN_CLOSING_CLIENTS_ON_SHUTDOWN](#) was added in 8.0.11, removed after 8.0.12.
- Error number: [MY-011314](#); Symbol: [ER_XPLUGIN_ERROR_READING_SOCKET](#); SQLSTATE: [HY000](#)

Message: %s: Error reading from socket %s (%i)

[ER_XPLUGIN_ERROR_READING_SOCKET](#) was added in 8.0.11.

- Error number: [MY-011315](#); Symbol: [ER_XPLUGIN_PEER_DISCONNECTED_WHILE_READING_MSG_BODY](#); SQLSTATE: [HY000](#)
Message: %s: peer disconnected while reading message body
[ER_XPLUGIN_PEER_DISCONNECTED_WHILE_READING_MSG_BODY](#) was added in 8.0.11.
- Error number: [MY-011316](#); Symbol: [ER_XPLUGIN_READ_FAILED_CLOSING_CONNECTION](#); SQLSTATE: [HY000](#)
Message: client_id:%s - %s while reading from socket, closing connection
[ER_XPLUGIN_READ_FAILED_CLOSING_CONNECTION](#) was added in 8.0.11.
- Error number: [MY-011317](#); Symbol: [ER_XPLUGIN_INVALID_AUTH_METHOD](#); SQLSTATE: [HY000](#)
Message: %s.%u: Invalid authentication method %s
[ER_XPLUGIN_INVALID_AUTH_METHOD](#) was added in 8.0.11, removed after 8.0.12.
- Error number: [MY-011318](#); Symbol: [ER_XPLUGIN_UNEXPECTED_MSG_DURING_AUTHENTICATION](#); SQLSTATE: [HY000](#)
Message: %s: Unexpected message of type %i received during authentication
[ER_XPLUGIN_UNEXPECTED_MSG_DURING_AUTHENTICATION](#) was added in 8.0.11, removed after 8.0.12.
- Error number: [MY-011319](#); Symbol: [ER_XPLUGIN_ERROR_WRITING_TO_CLIENT](#); SQLSTATE: [HY000](#)
Message: Error writing to client: %s (%i)
[ER_XPLUGIN_ERROR_WRITING_TO_CLIENT](#) was added in 8.0.11, removed after 8.0.12.
- Error number: [MY-011320](#); Symbol: [ER_XPLUGIN_SCHEDULER_STARTED](#); SQLSTATE: [HY000](#)
Message: Scheduler "%s" started.
[ER_XPLUGIN_SCHEDULER_STARTED](#) was added in 8.0.11, removed after 8.0.12.
- Error number: [MY-011321](#); Symbol: [ER_XPLUGIN_SCHEDULER_STOPPED](#); SQLSTATE: [HY000](#)
Message: Scheduler "%s" stopped.
[ER_XPLUGIN_SCHEDULER_STOPPED](#) was added in 8.0.11, removed after 8.0.12.
- Error number: [MY-011322](#); Symbol: [ER_XPLUGIN_LISTENER_SYS_VARIABLE_ERROR](#); SQLSTATE: [HY000](#)
Message: Please see the MySQL documentation for '%s' system variables to fix the error
[ER_XPLUGIN_LISTENER_SYS_VARIABLE_ERROR](#) was added in 8.0.11.
- Error number: [MY-011323](#); Symbol: [ER_XPLUGIN_LISTENER_STATUS_MSG](#); SQLSTATE: [HY000](#)
Message: X Plugin ready for connections. %s
[ER_XPLUGIN_LISTENER_STATUS_MSG](#) was added in 8.0.11.

- Error number: [MY-011324](#); Symbol: [ER_XPLUGIN_RETRYING_BIND_ON_PORT](#); SQLSTATE: [HY000](#)
Message: Retrying `bind()` on TCP/IP port %i
[ER_XPLUGIN_RETRYING_BIND_ON_PORT](#) was added in 8.0.11.
- Error number: [MY-011325](#); Symbol: [ER_XPLUGIN_SHUTDOWN_TRIGGERED](#); SQLSTATE: [HY000](#)
Message: Shutdown triggered by mysqld abort flag
[ER_XPLUGIN_SHUTDOWN_TRIGGERED](#) was added in 8.0.11, removed after 8.0.12.
- Error number: [MY-011326](#); Symbol: [ER_XPLUGIN_USER_ACCOUNT_WITH_ALL_PERMISSIONS](#); SQLSTATE: [HY000](#)
Message: Using %s account for authentication which has all required permissions
[ER_XPLUGIN_USER_ACCOUNT_WITH_ALL_PERMISSIONS](#) was added in 8.0.11, removed after 8.0.12.
- Error number: [MY-011327](#); Symbol: [ER_XPLUGIN_EXISTING_USER_ACCOUNT_WITH_INCOMPLETE_GRANTS](#); SQLSTATE: [HY000](#)
Message: Using existing %s account for authentication. Incomplete grants will be fixed
[ER_XPLUGIN_EXISTING_USER_ACCOUNT_WITH_INCOMPLETE_GRANTS](#) was added in 8.0.11.
- Error number: [MY-011328](#); Symbol: [ER_XPLUGIN_SERVER_STARTS_HANDLING_CONNECTIONS](#); SQLSTATE: [HY000](#)
Message: Server starts handling incoming connections
[ER_XPLUGIN_SERVER_STARTS_HANDLING_CONNECTIONS](#) was added in 8.0.11, removed after 8.0.12.
- Error number: [MY-011329](#); Symbol: [ER_XPLUGIN_SERVER_STOPPED_HANDLING_CONNECTIONS](#); SQLSTATE: [HY000](#)
Message: Stopped handling incoming connections
[ER_XPLUGIN_SERVER_STOPPED_HANDLING_CONNECTIONS](#) was added in 8.0.11, removed after 8.0.12.
- Error number: [MY-011330](#); Symbol: [ER_XPLUGIN_FAILED_TO_INTERRUPT_SESSION](#); SQLSTATE: [HY000](#)
Message: %s: Could not interrupt client session
[ER_XPLUGIN_FAILED_TO_INTERRUPT_SESSION](#) was added in 8.0.11, removed after 8.0.12.
- Error number: [MY-011331](#); Symbol: [ER_XPLUGIN_CLIENT_RELEASE_TRIGGERED](#); SQLSTATE: [HY000](#)
Message: %s: release triggered by timeout in state:%i
[ER_XPLUGIN_CLIENT_RELEASE_TRIGGERED](#) was added in 8.0.11, removed after 8.0.12.

- Error number: [MY-011332](#); Symbol: [ER_XPLUGIN_IPv6_AVAILABLE](#); SQLSTATE: [HY000](#)
Message: IPv6 is available
[ER_XPLUGIN_IPv6_AVAILABLE](#) was added in 8.0.11.
- Error number: [MY-011333](#); Symbol: [ER_XPLUGIN_UNIX_SOCKET_NOT_CONFIGURED](#); SQLSTATE: [HY000](#)
Message: UNIX socket not configured
[ER_XPLUGIN_UNIX_SOCKET_NOT_CONFIGURED](#) was added in 8.0.11, removed after 8.0.12.
- Error number: [MY-011334](#); Symbol: [ER_XPLUGIN_CLIENT_KILL_MSG](#); SQLSTATE: [HY000](#)
Message: Kill client: %i %s
[ER_XPLUGIN_CLIENT_KILL_MSG](#) was added in 8.0.11.
- Error number: [MY-011335](#); Symbol: [ER_XPLUGIN_FAILED_TO_GET_SECURITY_CTX](#); SQLSTATE: [HY000](#)
Message: Could not get security context for session
[ER_XPLUGIN_FAILED_TO_GET_SECURITY_CTX](#) was added in 8.0.11.
- Error number: [MY-011336](#); Symbol: [ER_XPLUGIN_FAILED_TO_SWITCH_SECURITY_CTX_TO_ROOT](#); SQLSTATE: [HY000](#)
Message: Unable to switch security context to root
[ER_XPLUGIN_FAILED_TO_SWITCH_SECURITY_CTX_TO_ROOT](#) was added in 8.0.11, removed after 8.0.12.
- Error number: [MY-011337](#); Symbol: [ER_XPLUGIN_FAILED_TO_CLOSE_SQL_SESSION](#); SQLSTATE: [HY000](#)
Message: Error closing SQL session
[ER_XPLUGIN_FAILED_TO_CLOSE_SQL_SESSION](#) was added in 8.0.11.
- Error number: [MY-011338](#); Symbol: [ER_XPLUGIN_FAILED_TO_EXECUTE_ADMIN_CMD](#); SQLSTATE: [HY000](#)
Message: Error executing admin command %s: %s
[ER_XPLUGIN_FAILED_TO_EXECUTE_ADMIN_CMD](#) was added in 8.0.11.
- Error number: [MY-011339](#); Symbol: [ER_XPLUGIN_EMPTY_ADMIN_CMD](#); SQLSTATE: [HY000](#)
Message: Error executing empty admin command
[ER_XPLUGIN_EMPTY_ADMIN_CMD](#) was added in 8.0.11.
- Error number: [MY-011340](#); Symbol: [ER_XPLUGIN_FAILED_TO_GET_SYS_VAR](#); SQLSTATE: [HY000](#)
Message: Unable to retrieve system variable '%s'
[ER_XPLUGIN_FAILED_TO_GET_SYS_VAR](#) was added in 8.0.11.

- Error number: [MY-011341](#); Symbol: [ER_XPLUGIN_FAILED_TO_GET_CREATION_STMT](#); SQLSTATE: [HY000](#)

Message: Unable to get creation stmt for collection '%s\'; query result size: %lu

[ER_XPLUGIN_FAILED_TO_GET_CREATION_STMT](#) was added in 8.0.11.
- Error number: [MY-011342](#); Symbol: [ER_XPLUGIN_FAILED_TO_GET_ENGINE_INFO](#); SQLSTATE: [HY000](#)

Message: Unable to get engine info for collection '%s\'; creation stmt: %s

[ER_XPLUGIN_FAILED_TO_GET_ENGINE_INFO](#) was added in 8.0.11.
- Error number: [MY-011343](#); Symbol: [ER_XPLUGIN_FAIL_TO_GET_RESULT_DATA](#); SQLSTATE: [HY000](#)

Message: Error getting result data: %s

[ER_XPLUGIN_FAIL_TO_GET_RESULT_DATA](#) was added in 8.0.11, removed after 8.0.12.
- Error number: [MY-011344](#); Symbol: [ER_XPLUGIN_CAPABILITY_EXPIRED_PASSWORD](#); SQLSTATE: [HY000](#)

Message: Capability expired password failed with error: %s

[ER_XPLUGIN_CAPABILITY_EXPIRED_PASSWORD](#) was added in 8.0.11, removed after 8.0.12.
- Error number: [MY-011345](#); Symbol: [ER_XPLUGIN_FAILED_TO_SET_SO_REUSEADDR_FLAG](#); SQLSTATE: [HY000](#)

Message: Failed to set SO_REUSEADDR flag (error: %d).

[ER_XPLUGIN_FAILED_TO_SET_SO_REUSEADDR_FLAG](#) was added in 8.0.11.
- Error number: [MY-011346](#); Symbol: [ER_XPLUGIN_FAILED_TO_OPEN_INTERNAL_SESSION](#); SQLSTATE: [HY000](#)

Message: Could not open internal MySQL session

[ER_XPLUGIN_FAILED_TO_OPEN_INTERNAL_SESSION](#) was added in 8.0.11.
- Error number: [MY-011347](#); Symbol: [ER_XPLUGIN_FAILED_TO_SWITCH_CONTEXT](#); SQLSTATE: [HY000](#)

Message: Unable to switch context to user %s

[ER_XPLUGIN_FAILED_TO_SWITCH_CONTEXT](#) was added in 8.0.11.
- Error number: [MY-011348](#); Symbol: [ER_XPLUGIN_FAILED_TO_UNREGISTER_UDF](#); SQLSTATE: [HY000](#)

Message: Can't unregister '%s\'; user defined function

[ER_XPLUGIN_FAILED_TO_UNREGISTER_UDF](#) was added in 8.0.11.
- Error number: [MY-011349](#); Symbol: [ER_XPLUGIN_GET_PEER_ADDRESS_FAILED](#); SQLSTATE: [HY000](#)

Message: %s: get peer address failed, can't resolve IP to hostname

[ER_XPLUGIN_GET_PEER_ADDRESS_FAILED](#) was added in 8.0.11, removed after 8.0.12.

- Error number: [MY-011350](#); Symbol: [ER_XPLUGIN_CAPABILITY_CLIENT_INTERACTIVE_FAILED](#); SQLSTATE: [HY000](#)

Message: Capability client interactive failed with error: %s

[ER_XPLUGIN_CAPABILITY_CLIENT_INTERACTIVE_FAILED](#) was added in 8.0.11, removed after 8.0.12.

- Error number: [MY-011351](#); Symbol: [ER_XPLUGIN_FAILED_TO_RESET_IPV6_V6ONLY_FLAG](#); SQLSTATE: [HY000](#)

Message: Failed to reset IPV6_V6ONLY flag (error: %d). The server will listen to IPv6 addresses only.

[ER_XPLUGIN_FAILED_TO_RESET_IPV6_V6ONLY_FLAG](#) was added in 8.0.11.

- Error number: [MY-011352](#); Symbol: [ER_KEYRING_INVALID_KEY_TYPE](#); SQLSTATE: [HY000](#)

Message: Invalid key type

[ER_KEYRING_INVALID_KEY_TYPE](#) was added in 8.0.11.

- Error number: [MY-011353](#); Symbol: [ER_KEYRING_INVALID_KEY_LENGTH](#); SQLSTATE: [HY000](#)

Message: Invalid key length for given block cipher

[ER_KEYRING_INVALID_KEY_LENGTH](#) was added in 8.0.11.

- Error number: [MY-011354](#); Symbol: [ER_KEYRING_FAILED_TO_CREATE_KEYRING_DIR](#); SQLSTATE: [HY000](#)

Message: Could not create keyring directory. The keyring_file will stay unusable until correct path to the keyring directory gets provided

[ER_KEYRING_FAILED_TO_CREATE_KEYRING_DIR](#) was added in 8.0.11.

- Error number: [MY-011355](#); Symbol: [ER_KEYRING_FILE_INIT_FAILED](#); SQLSTATE: [HY000](#)

Message: keyring_file initialization failure. Please check if the keyring_file_data points to readable keyring file or keyring file can be created in the specified location. The keyring_file will stay unusable until correct path to the keyring file gets provided

[ER_KEYRING_FILE_INIT_FAILED](#) was added in 8.0.11.

- Error number: [MY-011356](#); Symbol: [ER_KEYRING_INTERNAL_EXCEPTION_FAILED_FILE_INIT](#); SQLSTATE: [HY000](#)

Message: keyring_file initialization failure due to internal exception inside the plugin.

[ER_KEYRING_INTERNAL_EXCEPTION_FAILED_FILE_INIT](#) was added in 8.0.11.

- Error number: [MY-011357](#); Symbol: [ER_KEYRING_FAILED_TO_GENERATE_KEY](#); SQLSTATE: [HY000](#)
Message: Failed to generate a key due to internal exception inside keyring_file plugin
[ER_KEYRING_FAILED_TO_GENERATE_KEY](#) was added in 8.0.11.
- Error number: [MY-011358](#); Symbol: [ER_KEYRING_CHECK_KEY_FAILED_DUE_TO_INVALID_KEY](#); SQLSTATE: [HY000](#)
Message: Error while %s key: invalid key_type
[ER_KEYRING_CHECK_KEY_FAILED_DUE_TO_INVALID_KEY](#) was added in 8.0.11.
- Error number: [MY-011359](#); Symbol: [ER_KEYRING_CHECK_KEY_FAILED_DUE_TO_EMPTY_KEY_ID](#); SQLSTATE: [HY000](#)
Message: Error while %s key: key_id cannot be empty
[ER_KEYRING_CHECK_KEY_FAILED_DUE_TO_EMPTY_KEY_ID](#) was added in 8.0.11.

Message: Failed to %s due to internal exception inside %s plugin
[ER_KEYRING_OPERATION_FAILED_DUE_TO_INTERNAL_ERROR](#) was added in 8.0.11.
- Error number: [MY-011361](#); Symbol: [ER_KEYRING_INCORRECT_FILE](#); SQLSTATE: [HY000](#)
Message: Incorrect Keyring file
[ER_KEYRING_INCORRECT_FILE](#) was added in 8.0.11.
- Error number: [MY-011362](#); Symbol: [ER_KEYRING_FOUND_MALFORMED_BACKUP_FILE](#); SQLSTATE: [HY000](#)
Message: Found malformed keyring backup file - removing it
[ER_KEYRING_FOUND_MALFORMED_BACKUP_FILE](#) was added in 8.0.11.
- Error number: [MY-011363](#); Symbol: [ER_KEYRING_FAILED_TO_RESTORE_FROM_BACKUP_FILE](#); SQLSTATE: [HY000](#)
Message: Error while restoring keyring from backup file cannot overwrite keyring with backup
[ER_KEYRING_FAILED_TO_RESTORE_FROM_BACKUP_FILE](#) was added in 8.0.11.
- Error number: [MY-011364](#); Symbol: [ER_KEYRING_FAILED_TO_FLUSH_KEYRING_TO_FILE](#); SQLSTATE: [HY000](#)
Message: Error while flushing in-memory keyring into keyring file
[ER_KEYRING_FAILED_TO_FLUSH_KEYRING_TO_FILE](#) was added in 8.0.11.
- Error number: [MY-011365](#); Symbol: [ER_KEYRING_FAILED_TO_GET_FILE_STAT](#); SQLSTATE: [HY000](#)
Message: Error while reading stat for %s. Please check if file %s was not removed. OS returned this error: %s

[ER_KEYRING_FAILED_TO_GET_FILE_STAT](#) was added in 8.0.11.

- Error number: [MY-011366](#); Symbol: [ER_KEYRING_FAILED_TO_REMOVE_FILE](#); SQLSTATE: [HY000](#)

Message: Could not remove file %s OS returned this error: %s

[ER_KEYRING_FAILED_TO_REMOVE_FILE](#) was added in 8.0.11.

- Error number: [MY-011367](#); Symbol: [ER_KEYRING_FAILED_TO_TRUNCATE_FILE](#); SQLSTATE: [HY000](#)

Message: Could not truncate file %s. OS returned this error: %s

[ER_KEYRING_FAILED_TO_TRUNCATE_FILE](#) was added in 8.0.11.

- Error number: [MY-011368](#); Symbol: [ER_KEYRING_UNKNOWN_ERROR](#); SQLSTATE: [HY000](#)

Message: Unknown error %d

[ER_KEYRING_UNKNOWN_ERROR](#) was added in 8.0.11.

- Error number: [MY-011369](#); Symbol: [ER_KEYRING_FAILED_TO_SET_KEYRING_FILE_DATA](#); SQLSTATE: [HY000](#)

Message: keyring_file_data cannot be set to new value as the keyring file cannot be created/accessed in the provided path

[ER_KEYRING_FAILED_TO_SET_KEYRING_FILE_DATA](#) was added in 8.0.11.

- Error number: [MY-011370](#); Symbol: [ER_KEYRING_FILE_IO_ERROR](#); SQLSTATE: [HY000](#)

Message: %s

[ER_KEYRING_FILE_IO_ERROR](#) was added in 8.0.11.

- Error number: [MY-011371](#); Symbol: [ER_KEYRING_FAILED_TO_LOAD_KEYRING_CONTENT](#); SQLSTATE: [HY000](#)

Message: Error while loading keyring content. The keyring might be malformed

[ER_KEYRING_FAILED_TO_LOAD_KEYRING_CONTENT](#) was added in 8.0.11.

- Error number: [MY-011372](#); Symbol: [ER_KEYRING_FAILED_TO_FLUSH_KEYS_TO_KEYRING](#); SQLSTATE: [HY000](#)

Message: Could not flush keys to keyring

[ER_KEYRING_FAILED_TO_FLUSH_KEYS_TO_KEYRING](#) was added in 8.0.11.

- Error number: [MY-011373](#); Symbol: [ER_KEYRING_FAILED_TO_FLUSH_KEYS_TO_KEYRING_BACKUP](#); SQLSTATE: [HY000](#)

Message: Could not flush keys to keyring's backup

[ER_KEYRING_FAILED_TO_FLUSH_KEYS_TO_KEYRING_BACKUP](#) was added in 8.0.11.

- Error number: [MY-011374](#); Symbol: [ER_KEYRING_KEY_FETCH_FAILED_DUE_TO_EMPTY_KEY_ID](#); SQLSTATE: [HY000](#)

Message: Error while fetching key: key_id cannot be empty

[ER_KEYRING_KEY_FETCH_FAILED_DUE_TO_EMPTY_KEY_ID](#) was added in 8.0.11.

- Error number: [MY-011375](#); Symbol: [ER_KEYRING_FAILED_TO_REMOVE_KEY_DUE_TO_EMPTY_ID](#); SQLSTATE: [HY000](#)

Message: Error while removing key: key_id cannot be empty

[ER_KEYRING_FAILED_TO_REMOVE_KEY_DUE_TO_EMPTY_ID](#) was added in 8.0.11.

- Error number: [MY-011376](#); Symbol: [ER_KEYRING_OKV_INCORRECT_KEY_VAULT_CONFIGURED](#); SQLSTATE: [HY000](#)

Message: For keyring_okv to be initialized, please point keyring_okv_conf_dir variable to a directory with Oracle Key Vault configuration file and ssl materials

[ER_KEYRING_OKV_INCORRECT_KEY_VAULT_CONFIGURED](#) was added in 8.0.11.

- Error number: [MY-011377](#); Symbol: [ER_KEYRING_OKV_INIT_FAILED_DUE_TO_INCORRECT_CONF](#); SQLSTATE: [HY000](#)

Message: keyring_okv initialization failure. Please check that the keyring_okv_conf_dir points to a readable directory and that the directory contains Oracle Key Vault configuration file and ssl materials. Please also check that Oracle Key Vault is up and running.

[ER_KEYRING_OKV_INIT_FAILED_DUE_TO_INCORRECT_CONF](#) was added in 8.0.11.

- Error number: [MY-011378](#); Symbol: [ER_KEYRING_OKV_INIT_FAILED_DUE_TO_INTERNAL_ERROR](#); SQLSTATE: [HY000](#)

Message: keyring_okv initialization failure due to internal exception inside the plugin

[ER_KEYRING_OKV_INIT_FAILED_DUE_TO_INTERNAL_ERROR](#) was added in 8.0.11.

- Error number: [MY-011379](#); Symbol: [ER_KEYRING_OKV_INVALID_KEY_TYPE](#); SQLSTATE: [HY000](#)

Message: Invalid key type

[ER_KEYRING_OKV_INVALID_KEY_TYPE](#) was added in 8.0.11.

- Error number: [MY-011380](#); Symbol: [ER_KEYRING_OKV_INVALID_KEY_LENGTH_FOR_CIPHER](#); SQLSTATE: [HY000](#)

Message: Invalid key length for given block cipher

[ER_KEYRING_OKV_INVALID_KEY_LENGTH_FOR_CIPHER](#) was added in 8.0.11.

- Error number: [MY-011381](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_GENERATE_KEY_DUE_TO_INTERNAL_ERROR](#); SQLSTATE: [HY000](#)

Message: Failed to generate a key due to internal exception inside keyring_okv plugin

[ER_KEYRING_OKV_FAILED_TO_GENERATE_KEY_DUE_TO_INTERNAL_ERROR](#) was added in 8.0.11.

- Error number: [MY-011382](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_FIND_SERVER_ENTRY](#); SQLSTATE: [HY000](#)

Message: Could not find entry for server in configuration file %s

[ER_KEYRING_OKV_FAILED_TO_FIND_SERVER_ENTRY](#) was added in 8.0.11.

- Error number: [MY-011383](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_FIND_STANDBY_SERVER_ENTRY](#); SQLSTATE: [HY000](#)

Message: Could not find entry for standby server in configuration file %s

[ER_KEYRING_OKV_FAILED_TO_FIND_STANDBY_SERVER_ENTRY](#) was added in 8.0.11.

- Error number: [MY-011384](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_PARSE_CONF_FILE](#); SQLSTATE: [HY000](#)

Message: Could not parse the %s file provided

[ER_KEYRING_OKV_FAILED_TO_PARSE_CONF_FILE](#) was added in 8.0.11.

- Error number: [MY-011385](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_LOAD_KEY_UID](#); SQLSTATE: [HY000](#)

Message: Could not load keys' uids from the OKV server

[ER_KEYRING_OKV_FAILED_TO_LOAD_KEY_UID](#) was added in 8.0.11.

- Error number: [MY-011386](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_INIT_SSL_LAYER](#); SQLSTATE: [HY000](#)

Message: Could not initialize ssl layer

[ER_KEYRING_OKV_FAILED_TO_INIT_SSL_LAYER](#) was added in 8.0.11.

- Error number: [MY-011387](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_INIT_CLIENT](#); SQLSTATE: [HY000](#)

Message: Could not initialize OKV client

[ER_KEYRING_OKV_FAILED_TO_INIT_CLIENT](#) was added in 8.0.11.

- Error number: [MY-011388](#); Symbol: [ER_KEYRING_OKV_CONNECTION_TO_SERVER_FAILED](#); SQLSTATE: [HY000](#)

Message: Could not connect to the OKV server

[ER_KEYRING_OKV_CONNECTION_TO_SERVER_FAILED](#) was added in 8.0.11.

- Error number: [MY-011389](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_REMOVE_KEY](#); SQLSTATE: [HY000](#)

Message: Could not remove the key

[ER_KEYRING_OKV_FAILED_TO_REMOVE_KEY](#) was added in 8.0.11.

- Error number: [MY-011390](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_ADD_ATTRIBUTE](#); SQLSTATE: [HY000](#)

Message: Could not add attribute, attribute_name=%s attribute value=%s

[ER_KEYRING_OKV_FAILED_TO_ADD_ATTRIBUTE](#) was added in 8.0.11.
- Error number: [MY-011391](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_GENERATE_KEY](#); SQLSTATE: [HY000](#)

Message: Could not generate the key.

[ER_KEYRING_OKV_FAILED_TO_GENERATE_KEY](#) was added in 8.0.11.
- Error number: [MY-011392](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_STORE_KEY](#); SQLSTATE: [HY000](#)

Message: Could not store the key.

[ER_KEYRING_OKV_FAILED_TO_STORE_KEY](#) was added in 8.0.11.
- Error number: [MY-011393](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_ACTIVATE_KEYS](#); SQLSTATE: [HY000](#)

Message: Could not activate the key.

[ER_KEYRING_OKV_FAILED_TO_ACTIVATE_KEYS](#) was added in 8.0.11.
- Error number: [MY-011394](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_FETCH_KEY](#); SQLSTATE: [HY000](#)

Message: Could not fetch generated key

[ER_KEYRING_OKV_FAILED_TO_FETCH_KEY](#) was added in 8.0.11.
- Error number: [MY-011395](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_STORE_OR_GENERATE_KEY](#); SQLSTATE: [HY000](#)

Message: Could not store/generate the key - failed to set key attribute x-key-ready

[ER_KEYRING_OKV_FAILED_TO_STORE_OR_GENERATE_KEY](#) was added in 8.0.11.
- Error number: [MY-011396](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_RETRIEVE_KEY_SIGNATURE](#); SQLSTATE: [HY000](#)

Message: Could not retrieve key signature from custom attributes

[ER_KEYRING_OKV_FAILED_TO_RETRIEVE_KEY_SIGNATURE](#) was added in 8.0.11.
- Error number: [MY-011397](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_RETRIEVE_KEY](#); SQLSTATE: [HY000](#)

Message: Could not retrieve key from OKV

[ER_KEYRING_OKV_FAILED_TO_RETRIEVE_KEY](#) was added in 8.0.11.
- Error number: [MY-011398](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_LOAD_SSL_TRUST_STORE](#); SQLSTATE: [HY000](#)

Message: Error loading trust store

[ER_KEYRING_OKV_FAILED_TO_LOAD_SSL_TRUST_STORE](#) was added in 8.0.11.

- Error number: [MY-011399](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_SET_CERTIFICATE_FILE](#); SQLSTATE: [HY000](#)

Message: Error setting the certificate file.

[ER_KEYRING_OKV_FAILED_TO_SET_CERTIFICATE_FILE](#) was added in 8.0.11.

- Error number: [MY-011400](#); Symbol: [ER_KEYRING_OKV_FAILED_TO_SET_KEY_FILE](#); SQLSTATE: [HY000](#)

Message: Error setting the key file.

[ER_KEYRING_OKV_FAILED_TO_SET_KEY_FILE](#) was added in 8.0.11.

- Error number: [MY-011401](#); Symbol: [ER_KEYRING_OKV_KEY_MISMATCH](#); SQLSTATE: [HY000](#)

Message: Private key does not match the certificate public key

[ER_KEYRING_OKV_KEY_MISMATCH](#) was added in 8.0.11.

- Error number: [MY-011402](#); Symbol: [ER_KEYRING_ENCRYPTED_FILE_INCORRECT_KEYRING_FILE](#); SQLSTATE: [HY000](#)

Message: Incorrect Keyring file

[ER_KEYRING_ENCRYPTED_FILE_INCORRECT_KEYRING_FILE](#) was added in 8.0.11.

- Error number: [MY-011403](#); Symbol: [ER_KEYRING_ENCRYPTED_FILE_DECRYPTION_FAILED](#); SQLSTATE: [HY000](#)

Message: Keyring_encrypted_file decryption failed. Please verify --keyring-encrypted-file-password option value.

[ER_KEYRING_ENCRYPTED_FILE_DECRYPTION_FAILED](#) was added in 8.0.11.

- Error number: [MY-011404](#); Symbol: [ER_KEYRING_ENCRYPTED_FILE_FOUND_MALFORMED_BACKUP_FILE](#); SQLSTATE: [HY000](#)

Message: Found malformed keyring backup file - removing it

[ER_KEYRING_ENCRYPTED_FILE_FOUND_MALFORMED_BACKUP_FILE](#) was added in 8.0.11.

- Error number: [MY-011405](#); Symbol: [ER_KEYRING_ENCRYPTED_FILE_FAILED_TO_RESTORE_KEYRING](#); SQLSTATE: [HY000](#)

Message: Error while restoring keyring from backup file cannot overwrite keyring with backup

[ER_KEYRING_ENCRYPTED_FILE_FAILED_TO_RESTORE_KEYRING](#) was added in 8.0.11.

- Error number: [MY-011406](#); Symbol: [ER_KEYRING_ENCRYPTED_FILE_FAILED_TO_FLUSH_KEYRING](#); SQLSTATE: [HY000](#)

Message: Error while flushing in-memory keyring into keyring file

[ER_KEYRING_ENCRYPTED_FILE_FAILED_TO_FLUSH_KEYRING](#) was added in 8.0.11.
- Error number: [MY-011407](#); Symbol: [ER_KEYRING_ENCRYPTED_FILE_ENCRYPTION_FAILED](#); SQLSTATE: [HY000](#)

Message: Keyring_encrypted_file encryption failed. Please verify --keyring-encrypted-file-password option value.

[ER_KEYRING_ENCRYPTED_FILE_ENCRYPTION_FAILED](#) was added in 8.0.11.
- Error number: [MY-011408](#); Symbol: [ER_KEYRING_ENCRYPTED_FILE_INVALID_KEYRING_DIR](#); SQLSTATE: [HY000](#)

Message: keyring_encrypted_file_data cannot be set to new value as the keyring file cannot be created/ accessed in the provided path

[ER_KEYRING_ENCRYPTED_FILE_INVALID_KEYRING_DIR](#) was added in 8.0.11.
- Error number: [MY-011409](#); Symbol: [ER_KEYRING_ENCRYPTED_FILE_FAILED_TO_CREATE_KEYRING_DIR](#); SQLSTATE: [HY000](#)

Message: Could not create keyring directory The keyring_encrypted_file will stay unusable until correct path to the keyring directory gets provided

[ER_KEYRING_ENCRYPTED_FILE_FAILED_TO_CREATE_KEYRING_DIR](#) was added in 8.0.11.
- Error number: [MY-011410](#); Symbol: [ER_KEYRING_ENCRYPTED_FILE_PASSWORD_IS_INVALID](#); SQLSTATE: [HY000](#)

Message: The keyring_encrypted_file_password must be set to a valid value.

[ER_KEYRING_ENCRYPTED_FILE_PASSWORD_IS_INVALID](#) was added in 8.0.11.
- Error number: [MY-011411](#); Symbol: [ER_KEYRING_ENCRYPTED_FILE_PASSWORD_IS_TOO_LONG](#); SQLSTATE: [HY000](#)

Message: Too long keyring_encrypted_file_password value.

[ER_KEYRING_ENCRYPTED_FILE_PASSWORD_IS_TOO_LONG](#) was added in 8.0.11.
- Error number: [MY-011412](#); Symbol: [ER_KEYRING_ENCRYPTED_FILE_INIT_FAILURE](#); SQLSTATE: [HY000](#)

Message: keyring_encrypted_file initialization failure. Please check if the keyring_encrypted_file_data points to readable keyring file or keyring file can be created in the specified location or password to decrypt keyring file is correct.

[ER_KEYRING_ENCRYPTED_FILE_INIT_FAILURE](#) was added in 8.0.11.
- Error number: [MY-011413](#); Symbol: [ER_KEYRING_ENCRYPTED_FILE_INIT_FAILED_DUE_TO_INTERNAL_ERROR](#); SQLSTATE: [HY000](#)

Message: keyring_encrypted_file initialization failure due to internal exception inside the plugin

`ER_KEYRING_ENCRYPTED_FILE_INIT_FAILED_DUE_TO_INTERNAL_ERROR` was added in 8.0.11.

- Error number: `MY-011414`; Symbol: `ER_KEYRING_ENCRYPTED_FILE_GEN_KEY_FAILED_DUE_TO_INTERNAL_ERROR`; SQLSTATE: `HY000`

Message: Failed to generate a key due to internal exception inside `keyring_encrypted_file` plugin

`ER_KEYRING_ENCRYPTED_FILE_GEN_KEY_FAILED_DUE_TO_INTERNAL_ERROR` was added in 8.0.11.

- Error number: `MY-011415`; Symbol: `ER_KEYRING_AWS_FAILED_TO_SET_CMK_ID`; SQLSTATE: `HY000`

Message: `keyring_aws_cmk_id` cannot be set to the new value as AWS KMS seems to not understand the id provided. Please check that CMK id provided is correct.

`ER_KEYRING_AWS_FAILED_TO_SET_CMK_ID` was added in 8.0.11.

- Error number: `MY-011416`; Symbol: `ER_KEYRING_AWS_FAILED_TO_SET_REGION`; SQLSTATE: `HY000`

Message: `keyring_aws_region` cannot be set to the new value as AWS KMS seems to not understand the region provided. Please check that region provided is correct.

`ER_KEYRING_AWS_FAILED_TO_SET_REGION` was added in 8.0.11.

- Error number: `MY-011417`; Symbol: `ER_KEYRING_AWS_FAILED_TO_OPEN_CONF_FILE`; SQLSTATE: `HY000`

Message: Could not open `keyring_aws` configuration file: %s. OS returned this error: %s

`ER_KEYRING_AWS_FAILED_TO_OPEN_CONF_FILE` was added in 8.0.11.

- Error number: `MY-011418`; Symbol: `ER_KEYRING_AWS_FAILED_TO_ACCESS_KEY_ID_FROM_CONF_FILE`; SQLSTATE: `HY000`

Message: Could not read AWS access key id from `keyring_aws` configuration file: %s. OS returned this error: %s

`ER_KEYRING_AWS_FAILED_TO_ACCESS_KEY_ID_FROM_CONF_FILE` was added in 8.0.11.

- Error number: `MY-011419`; Symbol: `ER_KEYRING_AWS_FAILED_TO_ACCESS_KEY_FROM_CONF_FILE`; SQLSTATE: `HY000`

Message: Could not read AWS access key from `keyring_aws` configuration file: %s. OS returned this error: %s

`ER_KEYRING_AWS_FAILED_TO_ACCESS_KEY_FROM_CONF_FILE` was added in 8.0.11.

- Error number: `MY-011420`; Symbol: `ER_KEYRING_AWS_INVALID_CONF_FILE_PATH`; SQLSTATE: `HY000`

Message: Path to `keyring_aws` configuration file cannot be empty

`ER_KEYRING_AWS_INVALID_CONF_FILE_PATH` was added in 8.0.11.

- Error number: [MY-011421](#); Symbol: [ER_KEYRING_AWS_INVALID_DATA_FILE_PATH](#); SQLSTATE: [HY000](#)

Message: Path to keyring_aws storage file cannot be empty.

[ER_KEYRING_AWS_INVALID_DATA_FILE_PATH](#) was added in 8.0.11.

- Error number: [MY-011422](#); Symbol: [ER_KEYRING_AWS_FAILED_TO_ACCESS_OR_CREATE_KEYRING_DIR](#); SQLSTATE: [HY000](#)

Message: Unable to create/access keyring directory.

[ER_KEYRING_AWS_FAILED_TO_ACCESS_OR_CREATE_KEYRING_DIR](#) was added in 8.0.11.

- Error number: [MY-011423](#); Symbol: [ER_KEYRING_AWS_FAILED_TO_ACCESS_OR_CREATE_KEYRING_DATA_FILE](#); SQLSTATE: [HY000](#)

Message: Unable to create/access keyring_aws storage file. Please check if keyring_aws_data_file points to location where keyring file can be created/accessed. Please also make sure that MySQL server's user has high enough privileges to access this location.

[ER_KEYRING_AWS_FAILED_TO_ACCESS_OR_CREATE_KEYRING_DATA_FILE](#) was added in 8.0.11.

- Error number: [MY-011424](#); Symbol: [ER_KEYRING_AWS_FAILED_TO_INIT_DUE_TO_INTERNAL_ERROR](#); SQLSTATE: [HY000](#)

Message: keyring_aws initialization failed due to internal error when initializing synchronization primitive - %s. OS returned this error: %s:

[ER_KEYRING_AWS_FAILED_TO_INIT_DUE_TO_INTERNAL_ERROR](#) was added in 8.0.11.

- Error number: [MY-011425](#); Symbol: [ER_KEYRING_AWS_FAILED_TO_ACCESS_DATA_FILE](#); SQLSTATE: [HY000](#)

Message: Could not access keyring_aws storage file in the path provided. Please check if the keyring_aws directory can be accessed by MySQL Server

[ER_KEYRING_AWS_FAILED_TO_ACCESS_DATA_FILE](#) was added in 8.0.11.

- Error number: [MY-011426](#); Symbol: [ER_KEYRING_AWS_CMK_ID_NOT_SET](#); SQLSTATE: [HY000](#)

Message: keyring_aws_cmek_id has to be set

[ER_KEYRING_AWS_CMK_ID_NOT_SET](#) was added in 8.0.11.

- Error number: [MY-011427](#); Symbol: [ER_KEYRING_AWS_FAILED_TO_GET_KMS_CREDENTIAL_FROM_CONF_FILE](#); SQLSTATE: [HY000](#)

Message: Could not get AWS KMS credentials from the configuration file

[ER_KEYRING_AWS_FAILED_TO_GET_KMS_CREDENTIAL_FROM_CONF_FILE](#) was added in 8.0.11.

- Error number: [MY-011428](#); Symbol: [ER_KEYRING_AWS_INIT_FAILURE](#); SQLSTATE: [HY000](#)

Message: keyring_aws initialization failure.

[ER_KEYRING_AWS_INIT_FAILURE](#) was added in 8.0.11.

- Error number: [MY-011429](#); Symbol: [ER_KEYRING_AWS_FAILED_TO_INIT_DUE_TO_PLUGIN_INTERNAL_ERROR](#); SQLSTATE: [HY000](#)
Message: keyring_aws initialization failure due to internal exception inside the plugin
[ER_KEYRING_AWS_FAILED_TO_INIT_DUE_TO_PLUGIN_INTERNAL_ERROR](#) was added in 8.0.11.
- Error number: [MY-011430](#); Symbol: [ER_KEYRING_AWS_INVALID_KEY_LENGTH_FOR_CIPHER](#); SQLSTATE: [HY000](#)
Message: Invalid key length for given block cipher
[ER_KEYRING_AWS_INVALID_KEY_LENGTH_FOR_CIPHER](#) was added in 8.0.11.

[ER_KEYRING_AWS_FAILED_TO_GENERATE_NEW_KEY](#) was added in 8.0.11.

- Error number: [MY-011439](#); Symbol: [ER_KEYRING_AWS_FAILED_TO_ENCRYPT_KEY](#); SQLSTATE: [HY000](#)

Message: Could not encrypt key. AWS KMS returned this error: %s

[ER_KEYRING_AWS_FAILED_TO_ENCRYPT_KEY](#) was added in 8.0.11.

- Error number: [MY-011440](#); Symbol: [ER_KEYRING_AWS_FAILED_TO_RE_ENCRYPT_KEY](#); SQLSTATE: [HY000](#)

Message: Could not re-encrypt key. AWS KMS returned this error: %s

[ER_KEYRING_AWS_FAILED_TO_RE_ENCRYPT_KEY](#) was added in 8.0.11.

- Error number: [MY-011441](#); Symbol: [ER_KEYRING_AWS_FAILED_TO_DECRYPT_KEY](#); SQLSTATE: [HY000](#)

Message: Could not decrypt key. AWS KMS returned this error: %s

[ER_KEYRING_AWS_FAILED_TO_DECRYPT_KEY](#) was added in 8.0.11.

- Error number: [MY-011442](#); Symbol: [ER_KEYRING_AWS_FAILED_TO_ROTATE_CMK](#); SQLSTATE: [HY000](#)

Message: Could not rotate the CMK. AWS KMS returned this error: %s

[ER_KEYRING_AWS_FAILED_TO_ROTATE_CMK](#) was added in 8.0.11.

- Error number: [MY-011443](#); Symbol: [ER_GRP_RPL_GTID_ALREADY_USED](#); SQLSTATE: [HY000](#)

Message: The requested GTID '%s:%lld' was already used, the transaction will rollback.

[ER_GRP_RPL_GTID_ALREADY_USED](#) was added in 8.0.11.

- Error number: [MY-011444](#); Symbol: [ER_GRP_RPL_APPLIER_THD_KILLED](#); SQLSTATE: [HY000](#)

Message: The group replication applier thread was killed.

[ER_GRP_RPL_APPLIER_THD_KILLED](#) was added in 8.0.11.

- Error number: [MY-011445](#); Symbol: [ER_GRP_RPL_EVENT_HANDLING_ERROR](#); SQLSTATE: [HY000](#)

Message: Error at event handling! Got error: %d.

[ER_GRP_RPL_EVENT_HANDLING_ERROR](#) was added in 8.0.11.

- Error number: [MY-011446](#); Symbol: [ER_GRP_RPL_ERROR_GTID_EXECUTION_INFO](#); SQLSTATE: [HY000](#)

Message: Error when extracting group GTID execution information, some recovery operations may face future issues.

[ER_GRP_RPL_ERROR_GTID_EXECUTION_INFO](#) was added in 8.0.11.
- Error number: [MY-011447](#); Symbol: [ER_GRP_RPL_CERTIFICATE_SIZE_ERROR](#); SQLSTATE: [HY000](#)

Message: An error occurred when trying to reduce the Certification information size for transmission.

[ER_GRP_RPL_CERTIFICATE_SIZE_ERROR](#) was added in 8.0.11.
- Error number: [MY-011448](#); Symbol: [ER_GRP_RPL_CREATE_APPLIER_CACHE_ERROR](#); SQLSTATE: [HY000](#)

Message: Failed to create group replication pipeline applier cache!

[ER_GRP_RPL_CREATE_APPLIER_CACHE_ERROR](#) was added in 8.0.11.
- Error number: [MY-011449](#); Symbol: [ER_GRP_RPL_UNBLOCK_WAITING_THD](#); SQLSTATE: [HY000](#)

Message: Unblocking the group replication thread waiting for applier to start, as the start group replication was killed.

[ER_GRP_RPL_UNBLOCK_WAITING_THD](#) was added in 8.0.11.
- Error number: [MY-011450](#); Symbol: [ER_GRP_RPL_APPLIER_PIPELINE_NOT_DISPOSED](#); SQLSTATE: [HY000](#)

Message: The group replication applier pipeline was not properly disposed. Check the error log for further info.

[ER_GRP_RPL_APPLIER_PIPELINE_NOT_DISPOSED](#) was added in 8.0.11.
- Error number: [MY-011451](#); Symbol: [ER_GRP_RPL_APPLIER_THD_EXECUTION_ABORTED](#); SQLSTATE: [HY000](#)

Message: The applier thread execution was aborted. Unable to process more transactions, this member will now leave the group.

[ER_GRP_RPL_APPLIER_THD_EXECUTION_ABORTED](#) was added in 8.0.11.
- Error number: [MY-011452](#); Symbol: [ER_GRP_RPL_APPLIER_EXECUTION_FATAL_ERROR](#); SQLSTATE: [HY000](#)

Message: Fatal error during execution on the Applier process of Group Replication. The server will now leave the group.

[ER_GRP_RPL_APPLIER_EXECUTION_FATAL_ERROR](#) was added in 8.0.11.
- Error number: [MY-011453](#); Symbol: [ER_GRP_RPL_ERROR_STOPPING_CHANNELS](#); SQLSTATE: [HY000](#)

Message: Error stopping all replication channels while server was leaving the group. %s

[ER_GRP_RPL_ERROR_STOPPING_CHANNELS](#) was added in 8.0.11.

- Error number: [MY-011454](#); Symbol: [ER_GRP_RPL_ERROR_SENDING_SINGLE_PRIMARY_MSSG](#); SQLSTATE: [HY000](#)

Message: Error sending single primary message informing that primary did apply relay logs.

[ER_GRP_RPL_ERROR_SENDING_SINGLE_PRIMARY_MSSG](#) was added in 8.0.11.
- Error number: [MY-011455](#); Symbol: [ER_GRP_RPL_UPDATE_TRANS_SNAPSHOT_VER_ERROR](#); SQLSTATE: [HY000](#)

Message: Error updating transaction snapshot version after transaction being positively certified.

[ER_GRP_RPL_UPDATE_TRANS_SNAPSHOT_VER_ERROR](#) was added in 8.0.11.
- Error number: [MY-011456](#); Symbol: [ER_GRP_RPL_SIDNO_FETCH_ERROR](#); SQLSTATE: [HY000](#)

Message: Error fetching transaction sidno after transaction being positively certified.

[ER_GRP_RPL_SIDNO_FETCH_ERROR](#) was added in 8.0.11.
- Error number: [MY-011457](#); Symbol: [ER_GRP_RPL_BROADCAST_COMMIT_TRANS_MSSG_FAILED](#); SQLSTATE: [HY000](#)

Message: Broadcast of committed transactions message failed.

[ER_GRP_RPL_BROADCAST_COMMIT_TRANS_MSSG_FAILED](#) was added in 8.0.11.
- Error number: [MY-011458](#); Symbol: [ER_GRP_RPL_GROUP_NAME_PARSE_ERROR](#); SQLSTATE: [HY000](#)

Message: Unable to parse the group name during the Certification module initialization.

[ER_GRP_RPL_GROUP_NAME_PARSE_ERROR](#) was added in 8.0.11.
- Error number: [MY-011459](#); Symbol: [ER_GRP_RPL_ADD_GRP_SID_TO_GRP_GTID_SID_MAP_ERROR](#); SQLSTATE: [HY000](#)

Message: Unable to add the group_sid in the group_gtid_sid_map during the Certification module initialization.

[ER_GRP_RPL_ADD_GRP_SID_TO_GRP_GTID_SID_MAP_ERROR](#) was added in 8.0.11.
- Error number: [MY-011460](#); Symbol: [ER_GRP_RPL_UPDATE_GRP_GTID_EXECUTED_ERROR](#); SQLSTATE: [HY000](#)

Message: Error updating group_gtid_executed GTID set during the Certification module initialization.

[ER_GRP_RPL_UPDATE_GRP_GTID_EXECUTED_ERROR](#) was added in 8.0.11.
- Error number: [MY-011461](#); Symbol: [ER_GRP_RPL_DONOR_TRANS_INFO_ERROR](#); SQLSTATE: [HY000](#)

Message: Unable to handle the donor's transaction information when initializing the conflict detection component. Possible out of memory error.

[ER_GRP_RPL_DONOR_TRANS_INFO_ERROR](#) was added in 8.0.11.

- Error number: [MY-011462](#); Symbol: [ER_GRP_RPL_SERVER_CONN_ERROR](#); SQLSTATE: [HY000](#)
Message: Error when establishing a server connection during the Certification module initialization.
[ER_GRP_RPL_SERVER_CONN_ERROR](#) was added in 8.0.11.
- Error number: [MY-011463](#); Symbol: [ER_GRP_RPL_ERROR_FETCHING_GTID_EXECUTED_SET](#); SQLSTATE: [HY000](#)
Message: Error when extracting this member GTID executed set. Certification module can't be properly initialized.
[ER_GRP_RPL_ERROR_FETCHING_GTID_EXECUTED_SET](#) was added in 8.0.11.
- Error number: [MY-011464](#); Symbol: [ER_GRP_RPL_ADD_GTID_TO_GRPGTID_EXECUTED_ERROR](#); SQLSTATE: [HY000](#)
Message: Error while adding the server GTID EXECUTED set to the group_gtid_execute during the Certification module initialization.
[ER_GRP_RPL_ADD_GTID_TO_GRPGTID_EXECUTED_ERROR](#) was added in 8.0.11.
- Error number: [MY-011465](#); Symbol: [ER_GRP_RPL_ERROR_FETCHING_GTID_SET](#); SQLSTATE: [HY000](#)
Message: Error when extracting this member retrieved set for its applier. Certification module can't be properly initialized.
[ER_GRP_RPL_ERROR_FETCHING_GTID_SET](#) was added in 8.0.11.
- Error number: [MY-011466](#); Symbol: [ER_GRP_RPL_ADD_RETRIEVED_SET_TO_GRP_GTID_EXECUTED_ERROR](#); SQLSTATE: [HY000](#)
Message: Error while adding the member retrieved set to the group_gtid_executed during the Certification module initialization.
[ER_GRP_RPL_ADD_RETRIEVED_SET_TO_GRP_GTID_EXECUTED_ERROR](#) was added in 8.0.11.
- Error number: [MY-011467](#); Symbol: [ER_GRP_RPL_CERTIFICATION_INITIALIZATION_FAILURE](#); SQLSTATE: [HY000](#)
Message: Error during Certification module initialization.
[ER_GRP_RPL_CERTIFICATION_INITIALIZATION_FAILURE](#) was added in 8.0.11.
- Error number: [MY-011468](#); Symbol: [ER_GRP_RPL_UPDATE_LAST_CONFLICT_FREE_TRANS_ERROR](#); SQLSTATE: [HY000](#)
Message: Unable to update last conflict free transaction, this transaction will not be tracked on performance_schema.replication_group_member_stats.last_conflict_free_transaction.
[ER_GRP_RPL_UPDATE_LAST_CONFLICT_FREE_TRANS_ERROR](#) was added in 8.0.11.
- Error number: [MY-011469](#); Symbol: [ER_GRP_RPL_UPDATE_TRANS_SNAPSHOT_REF_VER_ERROR](#); SQLSTATE: [HY000](#)
Message: Error updating transaction snapshot version reference for internal storage.
[ER_GRP_RPL_UPDATE_TRANS_SNAPSHOT_REF_VER_ERROR](#) was added in 8.0.11.

- Error number: [MY-011470](#); Symbol: [ER_GRP_RPL_FETCH_TRANS_SIDNO_ERROR](#); SQLSTATE: [HY000](#)

Message: Error fetching transaction sidno while adding to the group_gtid_executed set.

[ER_GRP_RPL_FETCH_TRANS_SIDNO_ERROR](#) was added in 8.0.11.
- Error number: [MY-011471](#); Symbol: [ER_GRP_RPL_ERROR_VERIFYING_SIDNO](#); SQLSTATE: [HY000](#)

Message: Error while ensuring the sidno be present in the group_gtid_executed.

[ER_GRP_RPL_ERROR_VERIFYING_SIDNO](#) was added in 8.0.11.
- Error number: [MY-011472](#); Symbol: [ER_GRP_RPL_CANT_GENERATE_GTID](#); SQLSTATE: [HY000](#)

Message: Impossible to generate Global Transaction Identifier: the integer component reached the maximal value. Restart the group with a new group_replication_group_name.

[ER_GRP_RPL_CANT_GENERATE_GTID](#) was added in 8.0.11.
- Error number: [MY-011473](#); Symbol: [ER_GRP_RPL_INVALID_GTID_SET](#); SQLSTATE: [HY000](#)

Message: Invalid stable transactions set.

[ER_GRP_RPL_INVALID_GTID_SET](#) was added in 8.0.11.
- Error number: [MY-011474](#); Symbol: [ER_GRP_RPL_UPDATE_GTID_SET_ERROR](#); SQLSTATE: [HY000](#)

Message: Error updating stable transactions set.

[ER_GRP_RPL_UPDATE_GTID_SET_ERROR](#) was added in 8.0.11.
- Error number: [MY-011475](#); Symbol: [ER_GRP_RPL_RECEIVED_SET_MISSING_GTIDS](#); SQLSTATE: [HY000](#)

Message: There was an error when filling the missing GTIDs on the applier channel received set. Despite not critical, on the long run this may cause performance issues.

[ER_GRP_RPL_RECEIVED_SET_MISSING_GTIDS](#) was added in 8.0.11.
- Error number: [MY-011476](#); Symbol: [ER_GRP_RPL_SKIP_COMPUTATION_TRANS_COMMITTED](#); SQLSTATE: [HY000](#)

Message: Skipping the computation of the Transactions_committed_all_members field as an older instance of this computation is still ongoing.

[ER_GRP_RPL_SKIP_COMPUTATION_TRANS_COMMITTED](#) was added in 8.0.11.
- Error number: [MY-011477](#); Symbol: [ER_GRP_RPL_NULL_PACKET](#); SQLSTATE: [HY000](#)

Message: Null packet on certifier's queue.

[ER_GRP_RPL_NULL_PACKET](#) was added in 8.0.11.
- Error number: [MY-011478](#); Symbol: [ER_GRP_RPL_CANT_READ_GTID](#); SQLSTATE: [HY000](#)

Message: Error reading GTIDs from the message.

[ER_GRP_RPL_CANT_READ_GTID](#) was added in 8.0.11.

- Error number: [MY-011479](#); Symbol: [ER_GRP_RPL_PROCESS_GTID_SET_ERROR](#); SQLSTATE: [HY000](#)
Message: Error processing stable transactions set.
[ER_GRP_RPL_PROCESS_GTID_SET_ERROR](#) was added in 8.0.11.
- Error number: [MY-011480](#); Symbol: [ER_GRP_RPL_PROCESS_INTERSECTION_GTID_SET_ERROR](#); SQLSTATE: [HY000](#)
Message: Error processing intersection of stable transactions set.
[ER_GRP_RPL_PROCESS_INTERSECTION_GTID_SET_ERROR](#) was added in 8.0.11.
- Error number: [MY-011481](#); Symbol: [ER_GRP_RPL_SET_STABLE_TRANS_ERROR](#); SQLSTATE: [HY000](#)
Message: Error setting stable transactions set.
[ER_GRP_RPL_SET_STABLE_TRANS_ERROR](#) was added in 8.0.11.
- Error number: [MY-011482](#); Symbol: [ER_GRP_RPL_CANT_READ_GRP_GTID_EXTRACTED](#); SQLSTATE: [HY000](#)
Message: Error reading group_gtid_extracted from the View_change_log_event.
[ER_GRP_RPL_CANT_READ_GRP_GTID_EXTRACTED](#) was added in 8.0.11.
- Error number: [MY-011483](#); Symbol: [ER_GRP_RPL_CANT_READ_WRITE_SET_ITEM](#); SQLSTATE: [HY000](#)
Message: Error reading the write set item '%s' from the View_change_log_event.
[ER_GRP_RPL_CANT_READ_WRITE_SET_ITEM](#) was added in 8.0.11.
- Error number: [MY-011484](#); Symbol: [ER_GRP_RPL_INIT_CERTIFICATION_INFO_FAILURE](#); SQLSTATE: [HY000](#)
Message: Error during certification_info initialization.
[ER_GRP_RPL_INIT_CERTIFICATION_INFO_FAILURE](#) was added in 8.0.11.
- Error number: [MY-011485](#); Symbol: [ER_GRP_RPL_CONFLICT_DETECTION_DISABLED](#); SQLSTATE: [HY000](#)
Message: Primary had applied all relay logs, disabled conflict detection.
[ER_GRP_RPL_CONFLICT_DETECTION_DISABLED](#) was added in 8.0.11.
- Error number: [MY-011486](#); Symbol: [ER_GRP_RPL_MSG_DISCARDED](#); SQLSTATE: [HY000](#)
Message: Message received while the plugin is not ready, message discarded.
[ER_GRP_RPL_MSG_DISCARDED](#) was added in 8.0.11.
- Error number: [MY-011487](#); Symbol: [ER_GRP_RPL_MISSING_GRP_RPL_APPLIER](#); SQLSTATE: [HY000](#)
Message: Message received without a proper group replication applier.
[ER_GRP_RPL_MISSING_GRP_RPL_APPLIER](#) was added in 8.0.11.

- Error number: [MY-011488](#); Symbol: [ER_GRP_RPL_CERTIFIER_MSSG_PROCESS_ERROR](#); SQLSTATE: [HY000](#)

Message: Error processing message in Certifier.

[ER_GRP_RPL_CERTIFIER_MSSG_PROCESS_ERROR](#) was added in 8.0.11.
- Error number: [MY-011489](#); Symbol: [ER_GRP_RPL_SRV_NOT_ONLINE](#); SQLSTATE: [HY000](#)

Message: This server was not declared online since it is on status %s.

[ER_GRP_RPL_SRV_NOT_ONLINE](#) was added in 8.0.11.
- Error number: [MY-011490](#); Symbol: [ER_GRP_RPL_SRV_ONLINE](#); SQLSTATE: [HY000](#)

Message: This server was declared online within the replication group.

[ER_GRP_RPL_SRV_ONLINE](#) was added in 8.0.11.
- Error number: [MY-011491](#); Symbol: [ER_GRP_RPL_DISABLE_SRV_READ_MODE_RESTRICTED](#); SQLSTATE: [HY000](#)

Message: When declaring the plugin online it was not possible to disable the server read mode settings. Try to disable it manually.

[ER_GRP_RPL_DISABLE_SRV_READ_MODE_RESTRICTED](#) was added in 8.0.11.
- Error number: [MY-011492](#); Symbol: [ER_GRP_RPL_MEM_ONLINE](#); SQLSTATE: [HY000](#)

Message: The member with address %s:%u was declared online within the replication group.

[ER_GRP_RPL_MEM_ONLINE](#) was added in 8.0.11.
- Error number: [MY-011493](#); Symbol: [ER_GRP_RPL_MEM_UNREACHABLE](#); SQLSTATE: [HY000](#)

Message: Member with address %s:%u has become unreachable.

[ER_GRP_RPL_MEM_UNREACHABLE](#) was added in 8.0.11.
- Error number: [MY-011494](#); Symbol: [ER_GRP_RPL_MEM_REACHABLE](#); SQLSTATE: [HY000](#)

Message: Member with address %s:%u is reachable again.

[ER_GRP_RPL_MEM_REACHABLE](#) was added in 8.0.11.
- Error number: [MY-011495](#); Symbol: [ER_GRP_RPL_SRV_BLOCKED](#); SQLSTATE: [HY000](#)

Message: This server is not able to reach a majority of members in the group. This server will now block all updates. The server will remain blocked until contact with the majority is restored. It is possible to use `group_replication_force_members` to force a new group membership.

[ER_GRP_RPL_SRV_BLOCKED](#) was added in 8.0.11.
- Error number: [MY-011496](#); Symbol: [ER_GRP_RPL_SRV_BLOCKED_FOR_SECS](#); SQLSTATE: [HY000](#)

Message: This server is not able to reach a majority of members in the group. This server will now block all updates. The server will remain blocked for the next %lu seconds. Unless contact with the majority is restored, after this time the member will error out and leave the group. It is possible to use `group_replication_force_members` to force a new group membership.

[ER_GRP_RPL_SRV_BLOCKED_FOR_SECS](#) was added in 8.0.11.

- Error number: [MY-011497](#); Symbol: [ER_GRP_RPL_CHANGE_GRP_MEM_NOT_PROCESSED](#); SQLSTATE: [HY000](#)

Message: A group membership change was received but the plugin is already leaving due to the configured timeout on group_replication_unreachable_majority_timeout option.

[ER_GRP_RPL_CHANGE_GRP_MEM_NOT_PROCESSED](#) was added in 8.0.11.

- Error number: [MY-011498](#); Symbol: [ER_GRP_RPL_MEMBER_CONTACT_RESTORED](#); SQLSTATE: [HY000](#)

Message: The member has resumed contact with a majority of the members in the group. Regular operation is restored and transactions are unblocked.

[ER_GRP_RPL_MEMBER_CONTACT_RESTORED](#) was added in 8.0.11.

- Error number: [MY-011499](#); Symbol: [ER_GRP_RPL_MEMBER_REMOVED](#); SQLSTATE: [HY000](#)

Message: Members removed from the group: %s

[ER_GRP_RPL_MEMBER_REMOVED](#) was added in 8.0.11.

- Error number: [MY-011500](#); Symbol: [ER_GRP_RPL_PRIMARY_MEMBER_LEFT_GRP](#); SQLSTATE: [HY000](#)

Message: Primary server with address %s left the group. Electing new Primary.

[ER_GRP_RPL_PRIMARY_MEMBER_LEFT_GRP](#) was added in 8.0.11.

- Error number: [MY-011501](#); Symbol: [ER_GRP_RPL_MEMBER_ADDED](#); SQLSTATE: [HY000](#)

Message: Members joined the group: %s

[ER_GRP_RPL_MEMBER_ADDED](#) was added in 8.0.11.

- Error number: [MY-011502](#); Symbol: [ER_GRP_RPL_MEMBER_EXIT_PLUGIN_ERROR](#); SQLSTATE: [HY000](#)

Message: There was a previous plugin error while the member joined the group. The member will now exit the group.

[ER_GRP_RPL_MEMBER_EXIT_PLUGIN_ERROR](#) was added in 8.0.11.

- Error number: [MY-011503](#); Symbol: [ER_GRP_RPL_MEMBER_CHANGE](#); SQLSTATE: [HY000](#)

Message: Group membership changed to %s on view %s.

[ER_GRP_RPL_MEMBER_CHANGE](#) was added in 8.0.11.

- Error number: [MY-011504](#); Symbol: [ER_GRP_RPL_MEMBER_LEFT_GRP](#); SQLSTATE: [HY000](#)

Message: Group membership changed: This member has left the group.

[ER_GRP_RPL_MEMBER_LEFT_GRP](#) was added in 8.0.11.

- Error number: [MY-011505](#); Symbol: [ER_GRP_RPL_MEMBER_EXPELLED](#); SQLSTATE: [HY000](#)

Message: Member was expelled from the group due to network failures, changing member status to ERROR.

[ER_GRP_RPL_MEMBER_EXPELLED](#) was added in 8.0.11.

- Error number: [MY-011506](#); Symbol: [ER_GRP_RPL_SESSION_OPEN_FAILED](#); SQLSTATE: [HY000](#)

Message: Unable to open session to (re)set read only mode. Skipping.

[ER_GRP_RPL_SESSION_OPEN_FAILED](#) was added in 8.0.11.

- Error number: [MY-011507](#); Symbol: [ER_GRP_RPL_NEW_PRIMARY_ELECTED](#); SQLSTATE: [HY000](#)

Message: A new primary with address %s:%u was elected. %s

[ER_GRP_RPL_NEW_PRIMARY_ELECTED](#) was added in 8.0.11.

- Error number: [MY-011508](#); Symbol: [ER_GRP_RPL_DISABLE_READ_ONLY_FAILED](#); SQLSTATE: [HY000](#)

Message: Unable to disable super read only flag. Try to disable it manually

[ER_GRP_RPL_DISABLE_READ_ONLY_FAILED](#) was added in 8.0.11.

- Error number: [MY-011509](#); Symbol: [ER_GRP_RPL_ENABLE_READ_ONLY_FAILED](#); SQLSTATE: [HY000](#)

Message: Unable to set super read only flag. Try to set it manually.

[ER_GRP_RPL_ENABLE_READ_ONLY_FAILED](#) was added in 8.0.11.

- Error number: [MY-011510](#); Symbol: [ER_GRP_RPL_SRV_PRIMARY_MEM](#); SQLSTATE: [HY000](#)

Message: This server is working as primary member.

[ER_GRP_RPL_SRV_PRIMARY_MEM](#) was added in 8.0.11.

- Error number: [MY-011511](#); Symbol: [ER_GRP_RPL_SRV_SECONDARY_MEM](#); SQLSTATE: [HY000](#)

Message: This server is working as secondary member with primary member address %s:%u.

[ER_GRP_RPL_SRV_SECONDARY_MEM](#) was added in 8.0.11.

- Error number: [MY-011512](#); Symbol: [ER_GRP_RPL_NO_SUITABLE_PRIMARY_MEM](#); SQLSTATE: [HY000](#)

Message: Unable to set any member as primary. No suitable candidate.

[ER_GRP_RPL_NO_SUITABLE_PRIMARY_MEM](#) was added in 8.0.11.

- Error number: [MY-011513](#); Symbol: [ER_GRP_RPL_SUPER_READ_ONLY_ACTIVATE_ERROR](#); SQLSTATE: [HY000](#)

Message: Error when activating super_read_only mode on start. The member will now exit the group.

[ER_GRP_RPL_SUPER_READ_ONLY_ACTIVATE_ERROR](#) was added in 8.0.11.

- Error number: [MY-011514](#); Symbol: [ER_GRP_RPL_EXCEEDS_AUTO_INC_VALUE](#); SQLSTATE: [HY000](#)

Message: Group contains %lu members which is greater than auto_increment_increment value of %lu. This can lead to a higher transactional abort rate.

[ER_GRP_RPL_EXCEEDS_AUTO_INC_VALUE](#) was added in 8.0.11.

- Error number: [MY-011515](#); Symbol: [ER_GRP_RPL_DATA_NOT_PROVIDED_BY_MEM](#); SQLSTATE: [HY000](#)

Message: Member with address '%s:%u' didn't provide any data during the last group change. Group information can be outdated and lead to errors on recovery.

[ER_GRP_RPL_DATA_NOT_PROVIDED_BY_MEM](#) was added in 8.0.11.

- Error number: [MY-011516](#); Symbol: [ER_GRP_RPL_MEMBER_ALREADY_EXISTS](#); SQLSTATE: [HY000](#)

Message: There is already a member with server_uuid %s. The member will now exit the group.

[ER_GRP_RPL_MEMBER_ALREADY_EXISTS](#) was added in 8.0.11.

- Error number: [MY-011517](#); Symbol: [ER_GRP_RPL_GRP_CHANGE_INFO_EXTRACT_ERROR](#); SQLSTATE: [HY000](#)

Message: Error when extracting information for group change. Operations and checks made to group joiners may be incomplete.

[ER_GRP_RPL_GRP_CHANGE_INFO_EXTRACT_ERROR](#) was added in 8.0.11.

- Error number: [MY-011518](#); Symbol: [ER_GRP_RPL_GTID_EXECUTED_EXTRACT_ERROR](#); SQLSTATE: [HY000](#)

Message: Error when extracting this member GTID executed set. Operations and checks made to group joiners may be incomplete.

[ER_GRP_RPL_GTID_EXECUTED_EXTRACT_ERROR](#) was added in 8.0.11.

- Error number: [MY-011519](#); Symbol: [ER_GRP_RPL_GTID_SET_EXTRACT_ERROR](#); SQLSTATE: [HY000](#)

Message: Error when extracting this member retrieved set for its applier. Operations and checks made to group joiners may be incomplete.

[ER_GRP_RPL_GTID_SET_EXTRACT_ERROR](#) was added in 8.0.11.

- Error number: [MY-011520](#); Symbol: [ER_GRP_RPL_START_FAILED](#); SQLSTATE: [HY000](#)

Message: The START GROUP_REPLICATION command failed since the group already has 9 members.

[ER_GRP_RPL_START_FAILED](#) was added in 8.0.11.

- Error number: [MY-011521](#); Symbol: [ER_GRP_RPL_MEMBER_VER_INCOMPATIBLE](#); SQLSTATE: [HY000](#)

Message: Member version is incompatible with the group.

[ER_GRP_RPL_MEMBER_VER_INCOMPATIBLE](#) was added in 8.0.11.

- Error number: [MY-011522](#); Symbol: [ER_GRP_RPL_TRANS_NOT_PRESENT_IN_GRP](#); SQLSTATE: [HY000](#)

Message: The member contains transactions not present in the group. The member will now exit the group.

[ER_GRP_RPL_TRANS_NOT_PRESENT_IN_GRP](#) was added in 8.0.11.

- Error number: [MY-011523](#); Symbol: [ER_GRP_RPL_TRANS_GREATER_THAN_GRP](#); SQLSTATE: [HY000](#)

Message: It was not possible to assess if the member has more transactions than the group. The member will now exit the group.

[ER_GRP_RPL_TRANS_GREATER_THAN_GRP](#) was added in 8.0.11.

- Error number: [MY-011524](#); Symbol: [ER_GRP_RPL_MEMBER_VERSION_LOWER_THAN_GRP](#); SQLSTATE: [HY000](#)

Message: Member version is lower than some group member, but since option 'group_replication_allow_local_lower_version_join' is enabled, member will be allowed to join.

[ER_GRP_RPL_MEMBER_VERSION_LOWER_THAN_GRP](#) was added in 8.0.11.

- Error number: [MY-011525](#); Symbol: [ER_GRP_RPL_LOCAL_GTID_SETS_PROCESS_ERROR](#); SQLSTATE: [HY000](#)

Message: Error processing local GTID sets when comparing this member transactions against the group.

[ER_GRP_RPL_LOCAL_GTID_SETS_PROCESS_ERROR](#) was added in 8.0.11.

- Error number: [MY-011526](#); Symbol: [ER_GRP_RPL_MEMBER_TRANS_GREATER_THAN_GRP](#); SQLSTATE: [HY000](#)

Message: This member has more executed transactions than those present in the group. Local transactions: %s > Group transactions: %s

[ER_GRP_RPL_MEMBER_TRANS_GREATER_THAN_GRP](#) was added in 8.0.11.

- Error number: [MY-011527](#); Symbol: [ER_GRP_RPL_BLOCK_SIZE_DIFF_FROM_GRP](#); SQLSTATE: [HY000](#)

Message: The member is configured with a group_replication_gtid_assignment_block_size option value '%llu' different from the group '%llu'. The member will now exit the group.

[ER_GRP_RPL_BLOCK_SIZE_DIFF_FROM_GRP](#) was added in 8.0.11.

- Error number: [MY-011528](#); Symbol: [ER_GRP_RPL_TRANS_WRITE_SET_EXTRACT_DIFF_FROM_GRP](#); SQLSTATE: [HY000](#)

Message: The member is configured with a transaction-write-set-extraction option value '%s' different from the group '%s'. The member will now exit the group.

[ER_GRP_RPL_TRANS_WRITE_SET_EXTRACT_DIFF_FROM_GRP](#) was added in 8.0.11.

- Error number: [MY-011529](#); Symbol: [ER_GRP_RPL_MEMBER_CFG_INCOMPATIBLE_WITH_GRP_CFG](#); SQLSTATE: [HY000](#)

Message: The member configuration is not compatible with the group configuration. Variables such as `single_primary_mode` or `enforce_update_everywhere_checks` must have the same value on every server in the group. (member configuration option: [%s], group configuration option: [%s]).

[ER_GRP_RPL_MEMBER_CFG_INCOMPATIBLE_WITH_GRP_CFG](#) was added in 8.0.11.

- Error number: [MY-011530](#); Symbol: [ER_GRP_RPL_MEMBER_STOP_RPL_CHANNELS_ERROR](#); SQLSTATE: [HY000](#)

Message: Error stopping all replication channels while server was leaving the group. %s

[ER_GRP_RPL_MEMBER_STOP_RPL_CHANNELS_ERROR](#) was added in 8.0.11.

- Error number: [MY-011531](#); Symbol: [ER_GRP_RPL_PURGE_APPLIER_LOGS](#); SQLSTATE: [HY000](#)

Message: Detected previous RESET MASTER invocation or an issue exists in the group replication applier relay log. Purging existing applier logs.

[ER_GRP_RPL_PURGE_APPLIER_LOGS](#) was added in 8.0.11.

- Error number: [MY-011532](#); Symbol: [ER_GRP_RPL_RESET_APPLIER_MODULE_LOGS_ERROR](#); SQLSTATE: [HY000](#)

Message: Unknown error occurred while resetting applier's module logs.

[ER_GRP_RPL_RESET_APPLIER_MODULE_LOGS_ERROR](#) was added in 8.0.11.

- Error number: [MY-011533](#); Symbol: [ER_GRP_RPL_APPLIER_THD_SETUP_ERROR](#); SQLSTATE: [HY000](#)

Message: Failed to setup the group replication applier thread.

[ER_GRP_RPL_APPLIER_THD_SETUP_ERROR](#) was added in 8.0.11.

- Error number: [MY-011534](#); Symbol: [ER_GRP_RPL_APPLIER_THD_START_ERROR](#); SQLSTATE: [HY000](#)

Message: Error while starting the group replication applier thread

[ER_GRP_RPL_APPLIER_THD_START_ERROR](#) was added in 8.0.11.

- Error number: [MY-011535](#); Symbol: [ER_GRP_RPL_APPLIER_THD_STOP_ERROR](#); SQLSTATE: [HY000](#)

Message: Failed to stop the group replication applier thread.

[ER_GRP_RPL_APPLIER_THD_STOP_ERROR](#) was added in 8.0.11.

- Error number: [MY-011536](#); Symbol: [ER_GRP_RPL_FETCH_TRANS_DATA_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to fetch transaction data containing required transaction info for applier

[ER_GRP_RPL_FETCH_TRANS_DATA_FAILED](#) was added in 8.0.11.

- Error number: [MY-011537](#); Symbol: [ER_GRP_RPL_SLAVE_IO_THD_PRIMARY_UNKNOWN](#); SQLSTATE: [HY000](#)

Message: Can't start slave IO THREAD of channel '%s' when group replication is running with single-primary mode and the primary member is not known.

[ER_GRP_RPL_SLAVE_IO_THD_PRIMARY_UNKNOWN](#) was added in 8.0.11.

- Error number: [MY-011538](#); Symbol: [ER_GRP_RPL_SLAVE_IO_THD_ON_SECONDARY_MEMBER](#); SQLSTATE: [HY000](#)

Message: Can't start slave IO THREAD of channel '%s' when group replication is running with single-primary mode on a secondary member.

[ER_GRP_RPL_SLAVE_IO_THD_ON_SECONDARY_MEMBER](#) was added in 8.0.11.

- Error number: [MY-011539](#); Symbol: [ER_GRP_RPL_SLAVE_SQL_THD_PRIMARY_UNKNOWN](#); SQLSTATE: [HY000](#)

Message: Can't start slave SQL THREAD of channel '%s' when group replication is running with single-primary mode and the primary member is not known.

[ER_GRP_RPL_SLAVE_SQL_THD_PRIMARY_UNKNOWN](#) was added in 8.0.11.

- Error number: [MY-011540](#); Symbol: [ER_GRP_RPL_SLAVE_SQL_THD_ON_SECONDARY_MEMBER](#); SQLSTATE: [HY000](#)

Message: Can't start slave SQL THREAD of channel '%s' when group replication is running with single-primary mode on a secondary member.

[ER_GRP_RPL_SLAVE_SQL_THD_ON_SECONDARY_MEMBER](#) was added in 8.0.11.

- Error number: [MY-011541](#); Symbol: [ER_GRP_RPL_NEEDS_INNODB_TABLE](#); SQLSTATE: [HY000](#)

Message: Table %s does not use the InnoDB storage engine. This is not compatible with Group Replication.

[ER_GRP_RPL_NEEDS_INNODB_TABLE](#) was added in 8.0.11.

- Error number: [MY-011542](#); Symbol: [ER_GRP_RPL_PRIMARY_KEY_NOT_DEFINED](#); SQLSTATE: [HY000](#)

Message: Table %s does not have any PRIMARY KEY. This is not compatible with Group Replication.

[ER_GRP_RPL_PRIMARY_KEY_NOT_DEFINED](#) was added in 8.0.11.

- Error number: [MY-011543](#); Symbol: [ER_GRP_RPL_FK_WITH_CASCADE_UNSUPPORTED](#); SQLSTATE: [HY000](#)

Message: Table %s has a foreign key with 'CASCADE', 'SET NULL' or 'SET DEFAULT' clause. This is not compatible with Group Replication.

[ER_GRP_RPL_FK_WITH_CASCADE_UNSUPPORTED](#) was added in 8.0.11.

- Error number: [MY-011544](#); Symbol: [ER_GRP_RPL_AUTO_INC_RESET](#); SQLSTATE: [HY000](#)

Message: auto_increment_increment is reset to %lu

[ER_GRP_RPL_AUTO_INC_RESET](#) was added in 8.0.11.

- Error number: [MY-011545](#); Symbol: [ER_GRP_RPL_AUTO_INC_OFFSET_RESET](#); SQLSTATE: [HY000](#)

Message: auto_increment_offset is reset to %lu

[ER_GRP_RPL_AUTO_INC_OFFSET_RESET](#) was added in 8.0.11.

- Error number: [MY-011546](#); Symbol: [ER_GRP_RPL_AUTO_INC_SET](#); SQLSTATE: [HY000](#)

Message: auto_increment_increment is set to %lu

[ER_GRP_RPL_AUTO_INC_SET](#) was added in 8.0.11.

- Error number: [MY-011547](#); Symbol: [ER_GRP_RPL_AUTO_INC_OFFSET_SET](#); SQLSTATE: [HY000](#)

Message: auto_increment_offset is set to %lu

[ER_GRP_RPL_AUTO_INC_OFFSET_SET](#) was added in 8.0.11.

- Error number: [MY-011548](#); Symbol: [ER_GRP_RPL_FETCH_TRANS_CONTEXT_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to fetch transaction context containing required transaction info for certification

[ER_GRP_RPL_FETCH_TRANS_CONTEXT_FAILED](#) was added in 8.0.11.

- Error number: [MY-011549](#); Symbol: [ER_GRP_RPL_FETCH_FORMAT_DESC_LOG_EVENT_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to fetch Format_description_log_event containing required server info for applier

[ER_GRP_RPL_FETCH_FORMAT_DESC_LOG_EVENT_FAILED](#) was added in 8.0.11.

- Error number: [MY-011550](#); Symbol: [ER_GRP_RPL_FETCH_TRANS_CONTEXT_LOG_EVENT_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to fetch Transaction_context_log_event containing required transaction info for certification

[ER_GRP_RPL_FETCH_TRANS_CONTEXT_LOG_EVENT_FAILED](#) was added in 8.0.11.

- Error number: [MY-011551](#); Symbol: [ER_GRP_RPL_FETCH_SNAPSHOT_VERSION_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to read snapshot version from transaction context event required for certification

[ER_GRP_RPL_FETCH_SNAPSHOT_VERSION_FAILED](#) was added in 8.0.11.

- Error number: [MY-011552](#); Symbol: [ER_GRP_RPL_FETCH_GTID_LOG_EVENT_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to fetch Gtid_log_event containing required transaction info for certification

[ER_GRP_RPL_FETCH_GTID_LOG_EVENT_FAILED](#) was added in 8.0.11.

- Error number: [MY-011553](#); Symbol: [ER_GRP_RPL_UPDATE_SERV_CERTIFICATE_FAILED](#); SQLSTATE: [HY000](#)

Message: Unable to update certification result on server side, thread_id: %lu

[ER_GRP_RPL_UPDATE_SERV_CERTIFICATE_FAILED](#) was added in 8.0.11.

- Error number: [MY-011554](#); Symbol: [ER_GRP_RPL_ADD_GTID_INFO_WITH_LOCAL_GTID_FAILED](#); SQLSTATE: [HY000](#)

Message: Unable to add gtid information to the group_gtid_executed set when gtid was provided for local transactions

[ER_GRP_RPL_ADD_GTID_INFO_WITH_LOCAL_GTID_FAILED](#) was added in 8.0.11.

- Error number: [MY-011555](#); Symbol: [ER_GRP_RPL_ADD_GTID_INFO_WITHOUT_LOCAL_GTID_FAILED](#); SQLSTATE: [HY000](#)

Message: Unable to add gtid information to the group_gtid_executed set when no gtid was provided for local transactions

[ER_GRP_RPL_ADD_GTID_INFO_WITHOUT_LOCAL_GTID_FAILED](#) was added in 8.0.11.

- Error number: [MY-011556](#); Symbol: [ER_GRP_RPL_NOTIFY_CERTIFICATION_OUTCOME_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to notify certification outcome

[ER_GRP_RPL_NOTIFY_CERTIFICATION_OUTCOME_FAILED](#) was added in 8.0.11.

- Error number: [MY-011557](#); Symbol: [ER_GRP_RPL_ADD_GTID_INFO_WITH_REMOTE_GTID_FAILED](#); SQLSTATE: [HY000](#)

Message: Unable to add gtid information to the group_gtid_executed set when gtid was provided for remote transactions

[ER_GRP_RPL_ADD_GTID_INFO_WITH_REMOTE_GTID_FAILED](#) was added in 8.0.11.

- Error number: [MY-011558](#); Symbol: [ER_GRP_RPL_ADD_GTID_INFO_WITHOUT_REMOTE_GTID_FAILED](#); SQLSTATE: [HY000](#)

Message: Unable to add gtid information to the group_gtid_executed set when gtid was not provided for remote transactions

[ER_GRP_RPL_ADD_GTID_INFO_WITHOUT_REMOTE_GTID_FAILED](#) was added in 8.0.11.

- Error number: [MY-011559](#); Symbol: [ER_GRP_RPL_FETCH_VIEW_CHANGE_LOG_EVENT_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to fetch View_change_log_event containing required info for certification

[ER_GRP_RPL_FETCH_VIEW_CHANGE_LOG_EVENT_FAILED](#) was added in 8.0.11.

- Error number: [MY-011560](#); Symbol: [ER_GRP_RPL_CONTACT_WITH_SRV_FAILED](#); SQLSTATE: [HY000](#)

Message: Error when contacting the server to ensure the proper logging of a group change in the binlog

[ER_GRP_RPL_CONTACT_WITH_SRV_FAILED](#) was added in 8.0.11.

- Error number: [MY-011561](#); Symbol: [ER_GRP_RPL_SRV_WAIT_TIME_OUT](#); SQLSTATE: [HY000](#)

Message: Timeout when waiting for the server to execute local transactions in order assure the group change proper logging

[ER_GRP_RPL_SRV_WAIT_TIME_OUT](#) was added in 8.0.11.

- Error number: [MY-011562](#); Symbol: [ER_GRP_RPL_FETCH_LOG_EVENT_FAILED](#); SQLSTATE: [HY000](#)
Message: Failed to fetch Log_event containing required server info for applier
[ER_GRP_RPL_FETCH_LOG_EVENT_FAILED](#) was added in 8.0.11.
- Error number: [MY-011563](#); Symbol: [ER_GRP_RPL_START_GRP_RPL_FAILED](#); SQLSTATE: [HY000](#)
Message: Unable to start Group Replication. Replication applier infrastructure is not initialized since the server was started with --initialize, --initialize-insecure or --upgrade=MINIMAL on a server upgrade.
[ER_GRP_RPL_START_GRP_RPL_FAILED](#) was added in 8.0.11.
- Error number: [MY-011564](#); Symbol: [ER_GRP_RPL_CONN_INTERNAL_PLUGIN_FAIL](#); SQLSTATE: [HY000](#)
Message: Failed to establish an internal server connection to execute plugin operations
[ER_GRP_RPL_CONN_INTERNAL_PLUGIN_FAIL](#) was added in 8.0.11.
- Error number: [MY-011565](#); Symbol: [ER_GRP_RPL_SUPER_READ_ON](#); SQLSTATE: [HY000](#)
Message: Setting super_read_only=ON.
[ER_GRP_RPL_SUPER_READ_ON](#) was added in 8.0.11.
- Error number: [MY-011566](#); Symbol: [ER_GRP_RPL_SUPER_READ_OFF](#); SQLSTATE: [HY000](#)
Message: Setting super_read_only=OFF.
[ER_GRP_RPL_SUPER_READ_OFF](#) was added in 8.0.11.
- Error number: [MY-011567](#); Symbol: [ER_GRP_RPL_KILLED_SESSION_ID](#); SQLSTATE: [HY000](#)
Message: killed session id: %d status: %d
[ER_GRP_RPL_KILLED_SESSION_ID](#) was added in 8.0.11.
- Error number: [MY-011568](#); Symbol: [ER_GRP_RPL_KILLED_FAILED_ID](#); SQLSTATE: [HY000](#)
Message: killed failed id: %d failed: %d
[ER_GRP_RPL_KILLED_FAILED_ID](#) was added in 8.0.11.
- Error number: [MY-011569](#); Symbol: [ER_GRP_RPL_INTERNAL_QUERY](#); SQLSTATE: [HY000](#)
Message: Internal query: %s result in error. Error number: %ld
[ER_GRP_RPL_INTERNAL_QUERY](#) was added in 8.0.11.
- Error number: [MY-011570](#); Symbol: [ER_GRP_RPL_COPY_FROM_EMPTY_STRING](#); SQLSTATE: [HY000](#)
Message: Error copying from empty string
[ER_GRP_RPL_COPY_FROM_EMPTY_STRING](#) was added in 8.0.11.
- Error number: [MY-011571](#); Symbol: [ER_GRP_RPL_QUERY_FAIL](#); SQLSTATE: [HY000](#)
Message: Query execution resulted in failure. errno: %d

[ER_GRP_RPL_QUERY_FAIL](#) was added in 8.0.11.

- Error number: [MY-011572](#); Symbol: [ER_GRP_RPL_CREATE_SESSION_UNABLE](#); SQLSTATE: [HY000](#)
Message: Unable to create a session for executing the queries on the server

[ER_GRP_RPL_CREATE_SESSION_UNABLE](#) was added in 8.0.11.

- Error number: [MY-011573](#); Symbol: [ER_GRP_RPL_MEMBER_NOT_FOUND](#); SQLSTATE: [HY000](#)
Message: The member with address %s:%u has unexpectedly disappeared, killing the current group replication recovery connection

[ER_GRP_RPL_MEMBER_NOT_FOUND](#) was added in 8.0.11.

- Error number: [MY-011574](#); Symbol: [ER_GRP_RPL_MAXIMUM_CONNECTION_RETRIES_REACHED](#); SQLSTATE: [HY000](#)
Message: Maximum number of retries when trying to connect to a donor reached. Aborting group replication incremental recovery.

[ER_GRP_RPL_MAXIMUM_CONNECTION_RETRIES_REACHED](#) was added in 8.0.11.

- Error number: [MY-011575](#); Symbol: [ER_GRP_RPL_ALL_DONORS_LEFT_ABORT_RECOVERY](#); SQLSTATE: [HY000](#)
Message: All donors left. Aborting group replication incremental recovery.

[ER_GRP_RPL_ALL_DONORS_LEFT_ABORT_RECOVERY](#) was added in 8.0.11.

- Error number: [MY-011576](#); Symbol: [ER_GRP_RPL_ESTABLISH_RECOVERY_WITH_DONOR](#); SQLSTATE: [HY000](#)
Message: Establishing group recovery connection with a possible donor. Attempt %d/%d

[ER_GRP_RPL_ESTABLISH_RECOVERY_WITH_DONOR](#) was added in 8.0.11.

- Error number: [MY-011577](#); Symbol: [ER_GRP_RPL_ESTABLISH_RECOVERY_WITH_ANOTHER_DONOR](#); SQLSTATE: [HY000](#)
Message: Retrying group recovery connection with another donor. Attempt %d/%d

[ER_GRP_RPL_ESTABLISH_RECOVERY_WITH_ANOTHER_DONOR](#) was added in 8.0.11.

- Error number: [MY-011578](#); Symbol: [ER_GRP_RPL_NO_VALID_DONOR](#); SQLSTATE: [HY000](#)
Message: No valid donors exist in the group, retrying

[ER_GRP_RPL_NO_VALID_DONOR](#) was added in 8.0.11.

- Error number: [MY-011579](#); Symbol: [ER_GRP_RPL_CONFIG_RECOVERY](#); SQLSTATE: [HY000](#)
Message: Error when configuring the asynchronous recovery channel connection to the donor.

[ER_GRP_RPL_CONFIG_RECOVERY](#) was added in 8.0.11.

- Error number: [MY-011580](#); Symbol: [ER_GRP_RPL_ESTABLISHING_CONN_GRP_REC_DONOR](#); SQLSTATE: [HY000](#)

Message: Establishing connection to a group replication recovery donor %s at %s port: %d.

[ER_GRP_RPL_ESTABLISHING_CONN_GRP_REC_DONOR](#) was added in 8.0.11.

- Error number: [MY-011581](#); Symbol: [ER_GRP_RPL_CREATE_GRP_RPL_REC_CHANNEL](#); SQLSTATE: [HY000](#)

Message: Error while creating the group replication recovery channel with donor %s at %s port: %d.

[ER_GRP_RPL_CREATE_GRP_RPL_REC_CHANNEL](#) was added in 8.0.11.

- Error number: [MY-011582](#); Symbol: [ER_GRP_RPL_DONOR_SERVER_CONN](#); SQLSTATE: [HY000](#)

Message: There was an error when connecting to the donor server. Please check that group_replication_recovery channel credentials and all MEMBER_HOST column values of performance_schema.replication_group_members table are correct and DNS resolvable.

[ER_GRP_RPL_DONOR_SERVER_CONN](#) was added in 8.0.11.

- Error number: [MY-011583](#); Symbol: [ER_GRP_RPL_CHECK_STATUS_TABLE](#); SQLSTATE: [HY000](#)

Message: For details please check performance_schema.replication_connection_status table and error log messages of Slave I/O for channel group_replication_recovery.

[ER_GRP_RPL_CHECK_STATUS_TABLE](#) was added in 8.0.11.

- Error number: [MY-011584](#); Symbol: [ER_GRP_RPL_STARTING_GRP_REC](#); SQLSTATE: [HY000](#)

Message: Error while starting the group replication incremental recovery receiver/applier threads

[ER_GRP_RPL_STARTING_GRP_REC](#) was added in 8.0.11.

- Error number: [MY-011585](#); Symbol: [ER_GRP_RPL_DONOR_CONN_TERMINATION](#); SQLSTATE: [HY000](#)

Message: Terminating existing group replication donor connection and purging the corresponding logs.

[ER_GRP_RPL_DONOR_CONN_TERMINATION](#) was added in 8.0.11.

- Error number: [MY-011586](#); Symbol: [ER_GRP_RPL_STOPPING_GRP_REC](#); SQLSTATE: [HY000](#)

Message: Error when stopping the group replication incremental recovery's donor connection

[ER_GRP_RPL_STOPPING_GRP_REC](#) was added in 8.0.11.

- Error number: [MY-011587](#); Symbol: [ER_GRP_RPL_PURGE_REC](#); SQLSTATE: [HY000](#)

Message: Error when purging the group replication recovery's relay logs

[ER_GRP_RPL_PURGE_REC](#) was added in 8.0.11.

- Error number: [MY-011588](#); Symbol: [ER_GRP_RPL_UNABLE_TO_KILL_CONN_REC_DONOR_APPLIER](#); SQLSTATE: [HY000](#)

Message: Unable to kill the current group replication recovery donor connection after an applier error. Incremental recovery will shutdown.

[ER_GRP_RPL_UNABLE_TO_KILL_CONN_REC_DONOR_APPLIER](#) was added in 8.0.11.

- Error number: [MY-011589](#); Symbol: [ER_GRP_RPL_UNABLE_TO_KILL_CONN_REC_DONOR_FAILOVER](#); SQLSTATE: [HY000](#)

Message: Unable to kill the current group replication recovery donor connection during failover. Incremental recovery will shutdown.

[ER_GRP_RPL_UNABLE_TO_KILL_CONN_REC_DONOR_FAILOVER](#) was added in 8.0.11.
- Error number: [MY-011590](#); Symbol: [ER_GRP_RPL_FAILED_TO_NOTIFY_GRP_MEMBERSHIP_EVENT](#); SQLSTATE: [HY000](#)

Message: Unexpected error when notifying an internal component named %s regarding a group membership event.

[ER_GRP_RPL_FAILED_TO_NOTIFY_GRP_MEMBERSHIP_EVENT](#) was added in 8.0.11.
- Error number: [MY-011591](#); Symbol: [ER_GRP_RPL_FAILED_TO_BROADCAST_GRP_MEMBERSHIP_NOTIFICATION](#); SQLSTATE: [HY000](#)

Message: An undefined error was found while broadcasting an internal group membership notification! This is likely to happen if your components or plugins are not properly loaded or are malfunctioning!

[ER_GRP_RPL_FAILED_TO_BROADCAST_GRP_MEMBERSHIP_NOTIFICATION](#) was added in 8.0.11.
- Error number: [MY-011592](#); Symbol: [ER_GRP_RPL_FAILED_TO_BROADCAST_MEMBER_STATUS_NOTIFICATION](#); SQLSTATE: [HY000](#)

Message: An undefined error was found while broadcasting an internal group member status notification! This is likely to happen if your components or plugins are not properly loaded or are malfunctioning!

[ER_GRP_RPL_FAILED_TO_BROADCAST_MEMBER_STATUS_NOTIFICATION](#) was added in 8.0.11.
- Error number: [MY-011593](#); Symbol: [ER_GRP_RPL_OOM_FAILED_TO_GENERATE_IDENTIFICATION_HASH](#); SQLSTATE: [HY000](#)

Message: No memory to generate write identification hash

[ER_GRP_RPL_OOM_FAILED_TO_GENERATE_IDENTIFICATION_HASH](#) was added in 8.0.11.
- Error number: [MY-011594](#); Symbol: [ER_GRP_RPL_WRITE_IDENT_HASH_BASE64_ENCODING_FAILED](#); SQLSTATE: [HY000](#)

Message: Base 64 encoding of the write identification hash failed

[ER_GRP_RPL_WRITE_IDENT_HASH_BASE64_ENCODING_FAILED](#) was added in 8.0.11.
- Error number: [MY-011595](#); Symbol: [ER_GRP_RPL_INVALID_BINLOG_FORMAT](#); SQLSTATE: [HY000](#)

Message: Binlog format should be ROW for Group Replication

[ER_GRP_RPL_INVALID_BINLOG_FORMAT](#) was added in 8.0.11.
- Error number: [MY-011596](#); Symbol: [ER_GRP_RPL_BINLOG_CHECKSUM_SET](#); SQLSTATE: [HY000](#)

Message: binlog_checksum should be NONE for Group Replication

[ER_GRP_RPL_BINLOG_CHECKSUM_SET](#) was added in 8.0.11.

- Error number: [MY-011597](#); Symbol: [ER_GRP_RPL_TRANS_WRITE_SET_EXTRACTION_NOT_SET](#); SQLSTATE: [HY000](#)

Message: A transaction_write_set_extraction algorithm should be selected when running Group Replication

[ER_GRP_RPL_TRANS_WRITE_SET_EXTRACTION_NOT_SET](#) was added in 8.0.11.
- Error number: [MY-011598](#); Symbol: [ER_GRP_RPL_UNSUPPORTED_TRANS_ISOLATION](#); SQLSTATE: [HY000](#)

Message: Transaction isolation level (tx_isolation) is set to SERIALIZABLE, which is not compatible with Group Replication

[ER_GRP_RPL_UNSUPPORTED_TRANS_ISOLATION](#) was added in 8.0.11.
- Error number: [MY-011599](#); Symbol: [ER_GRP_RPL_CANNOT_EXECUTE_TRANS_WHILE_STOPPING](#); SQLSTATE: [HY000](#)

Message: Transaction cannot be executed while Group Replication is stopping.

[ER_GRP_RPL_CANNOT_EXECUTE_TRANS_WHILE_STOPPING](#) was added in 8.0.11.
- Error number: [MY-011600](#); Symbol: [ER_GRP_RPL_CANNOT_EXECUTE_TRANS_WHILE_RECOVERING](#); SQLSTATE: [HY000](#)

Message: Transaction cannot be executed while Group Replication is recovering. Try again when the server is ONLINE.

[ER_GRP_RPL_CANNOT_EXECUTE_TRANS_WHILE_RECOVERING](#) was added in 8.0.11.
- Error number: [MY-011601](#); Symbol: [ER_GRP_RPL_CANNOT_EXECUTE_TRANS_IN_ERROR_STATE](#); SQLSTATE: [HY000](#)

Message: Transaction cannot be executed while Group Replication is on ERROR state. Check for errors and restart the plugin

[ER_GRP_RPL_CANNOT_EXECUTE_TRANS_IN_ERROR_STATE](#) was added in 8.0.11.
- Error number: [MY-011602](#); Symbol: [ER_GRP_RPL_CANNOT_EXECUTE_TRANS_IN_OFFLINE_MODE](#); SQLSTATE: [HY000](#)

Message: Transaction cannot be executed while Group Replication is OFFLINE. Check for errors and restart the plugin

[ER_GRP_RPL_CANNOT_EXECUTE_TRANS_IN_OFFLINE_MODE](#) was added in 8.0.11.
- Error number: [MY-011603](#); Symbol: [ER_GRP_RPL_MULTIPLE_CACHE_TYPE_NOT_SUPPORTED_FOR_SESSION](#); SQLSTATE: [HY000](#)

Message: We can only use one cache type at a time on session %u

[ER_GRP_RPL_MULTIPLE_CACHE_TYPE_NOT_SUPPORTED_FOR_SESSION](#) was added in 8.0.11.
- Error number: [MY-011604](#); Symbol: [ER_GRP_RPL_FAILED_TO_REINIT_BINLOG_CACHE_FOR_READ](#); SQLSTATE: [HY000](#)

Message: Failed to reinit binlog cache log for read on session %u

[ER_GRP_RPL_FAILED_TO_REINIT_BINLOG_CACHE_FOR_READ](#) was added in 8.0.11.

- Error number: [MY-011605](#); Symbol: [ER_GRP_RPL_FAILED_TO_CREATE_TRANS_CONTEXT](#); SQLSTATE: [HY000](#)

Message: Failed to create the context of the current transaction on session %u

[ER_GRP_RPL_FAILED_TO_CREATE_TRANS_CONTEXT](#) was added in 8.0.11.

- Error number: [MY-011606](#); Symbol: [ER_GRP_RPL_FAILED_TO_EXTRACT_TRANS_WRITE_SET](#); SQLSTATE: [HY000](#)

Message: Failed to extract the set of items written during the execution of the current transaction on session %u

[ER_GRP_RPL_FAILED_TO_EXTRACT_TRANS_WRITE_SET](#) was added in 8.0.11.

- Error number: [MY-011607](#); Symbol: [ER_GRP_RPL_FAILED_TO_GATHER_TRANS_WRITE_SET](#); SQLSTATE: [HY000](#)

Message: Failed to gather the set of items written during the execution of the current transaction on session %u

[ER_GRP_RPL_FAILED_TO_GATHER_TRANS_WRITE_SET](#) was added in 8.0.11.

- Error number: [MY-011608](#); Symbol: [ER_GRP_RPL_TRANS_SIZE_EXCEEDS_LIMIT](#); SQLSTATE: [HY000](#)

Message: Error on session %u. Transaction of size %llu exceeds specified limit %lu. To increase the limit please adjust `group_replication_transaction_size_limit` option.

[ER_GRP_RPL_TRANS_SIZE_EXCEEDS_LIMIT](#) was added in 8.0.11.

- Error number: [MY-011609](#); Symbol: [ER_GRP_RPL_REINIT_OF_INTERNAL_CACHE_FOR_READ_FAILED](#); SQLSTATE: [HY000](#)

Message: Error while re-initializing an internal cache, for read operations, on session %u

[ER_GRP_RPL_REINIT_OF_INTERNAL_CACHE_FOR_READ_FAILED](#) was added in 8.0.11, removed after 8.0.12.

- Error number: [MY-011610](#); Symbol: [ER_GRP_RPL_APPENDING_DATA_TO_INTERNAL_CACHE_FAILED](#); SQLSTATE: [HY000](#)

Message: Error while appending data to an internal cache on session %u

[ER_GRP_RPL_APPENDING_DATA_TO_INTERNAL_CACHE_FAILED](#) was added in 8.0.11, removed after 8.0.12.

- Error number: [MY-011611](#); Symbol: [ER_GRP_RPL_WRITE_TO_BINLOG_CACHE_FAILED](#); SQLSTATE: [HY000](#)

Message: Error while writing binary log cache on session %u

[ER_GRP_RPL_WRITE_TO_BINLOG_CACHE_FAILED](#) was added in 8.0.11, removed after 8.0.12.

- Error number: [MY-011611](#); Symbol: [ER_GRP_RPL_WRITE_TO_TRANSACTION_MESSAGE_FAILED](#); SQLSTATE: [HY000](#)

Message: Error while writing to transaction message on session %u

`ER_GRP_RPL_WRITE_TO_TRANSACTION_MESSAGE_FAILED` was added in 8.0.13.

- Error number: `MY-011612`; Symbol: `ER_GRP_RPL_FAILED_TO_REGISTER_TRANS_OUTCOME_NOTIFICATION`; SQLSTATE: `HY000`

Message: Unable to register for getting notifications regarding the outcome of the transaction on session %u

`ER_GRP_RPL_FAILED_TO_REGISTER_TRANS_OUTCOME_NOTIFICATION` was added in 8.0.11.

- Error number: `MY-011613`; Symbol: `ER_GRP_RPL_MSG_TOO_LONG_BROADCASTING_TRANS_FAILED`; SQLSTATE: `HY000`

Message: Error broadcasting transaction to the group on session %u. Message is too big.

`ER_GRP_RPL_MSG_TOO_LONG_BROADCASTING_TRANS_FAILED` was added in 8.0.11.

- Error number: `MY-011614`; Symbol: `ER_GRP_RPL_BROADCASTING_TRANS_TO_GRP_FAILED`; SQLSTATE: `HY000`

Message: Error while broadcasting the transaction to the group on session %u

`ER_GRP_RPL_BROADCASTING_TRANS_TO_GRP_FAILED` was added in 8.0.11.

- Error number: `MY-011615`; Symbol: `ER_GRP_RPL_ERROR_WHILE_WAITING_FOR_CONFLICT_DETECTION`; SQLSTATE: `HY000`

Message: Error while waiting for conflict detection procedure to finish on session %u

`ER_GRP_RPL_ERROR_WHILE_WAITING_FOR_CONFLICT_DETECTION` was added in 8.0.11.

- Error number: `MY-011616`; Symbol: `ER_GRP_RPL_REINIT_OF_INTERNAL_CACHE_FOR_WRITE_FAILED`; SQLSTATE: `HY000`

Message: Error while re-initializing an internal cache, for write operations, on session %u

`ER_GRP_RPL_REINIT_OF_INTERNAL_CACHE_FOR_WRITE_FAILED` was added in 8.0.11, removed after 8.0.12.

- Error number: `MY-011617`; Symbol: `ER_GRP_RPL_FAILED_TO_CREATE_COMMIT_CACHE`; SQLSTATE: `HY000`

Message: Failed to create group replication commit cache on session %u

`ER_GRP_RPL_FAILED_TO_CREATE_COMMIT_CACHE` was added in 8.0.11, removed after 8.0.12.

- Error number: `MY-011618`; Symbol: `ER_GRP_RPL_REINIT_OF_COMMIT_CACHE_FOR_WRITE_FAILED`; SQLSTATE: `HY000`

Message: Failed to reinit group replication commit cache for write on session %u

`ER_GRP_RPL_REINIT_OF_COMMIT_CACHE_FOR_WRITE_FAILED` was added in 8.0.11, removed after 8.0.12.

- Error number: `MY-011619`; Symbol: `ER_GRP_RPL_PREV_REC_SESSION_RUNNING`; SQLSTATE: `HY000`

Message: A previous recovery session is still running. Please stop the group replication plugin and wait for it to stop

[ER_GRP_RPL_PREV_REC_SESSION_RUNNING](#) was added in 8.0.11.

- Error number: [MY-011620](#); Symbol: [ER_GRP_RPL_FATAL_REC_PROCESS](#); SQLSTATE: [HY000](#)

Message: Fatal error during the incremental recovery process of Group Replication. The server will leave the group.

[ER_GRP_RPL_FATAL_REC_PROCESS](#) was added in 8.0.11.

- Error number: [MY-011621](#); Symbol: [ER_GRP_RPL_WHILE_STOPPING_REP_CHANNEL](#); SQLSTATE: [HY000](#)

Message: Error stopping all replication channels while server was leaving the group. %s

[ER_GRP_RPL_WHILE_STOPPING_REP_CHANNEL](#) was added in 8.0.11, removed after 8.0.17.

- Error number: [MY-011622](#); Symbol: [ER_GRP_RPL_UNABLE_TO_EVALUATE_APPLIER_STATUS](#); SQLSTATE: [HY000](#)

Message: Unable to evaluate the group replication applier execution status. Group replication recovery will shutdown to avoid data corruption.

[ER_GRP_RPL_UNABLE_TO_EVALUATE_APPLIER_STATUS](#) was added in 8.0.11.

- Error number: [MY-011623](#); Symbol: [ER_GRP_RPL_ONLY_ONE_SERVER_ALIVE](#); SQLSTATE: [HY000](#)

Message: Only one server alive. Declaring this server as online within the replication group

[ER_GRP_RPL_ONLY_ONE_SERVER_ALIVE](#) was added in 8.0.11.

- Error number: [MY-011624](#); Symbol: [ER_GRP_RPL_CERTIFICATION_REC_PROCESS](#); SQLSTATE: [HY000](#)

Message: Error when processing certification information in the incremental recovery process

[ER_GRP_RPL_CERTIFICATION_REC_PROCESS](#) was added in 8.0.11.

- Error number: [MY-011625](#); Symbol: [ER_GRP_RPL_UNABLE_TO_ENSURE_EXECUTION_REC](#); SQLSTATE: [HY000](#)

Message: Unable to ensure the execution of group transactions received during recovery.

[ER_GRP_RPL_UNABLE_TO_ENSURE_EXECUTION_REC](#) was added in 8.0.11.

- Error number: [MY-011626](#); Symbol: [ER_GRP_RPL_WHILE_SENDING_MSG_REC](#); SQLSTATE: [HY000](#)

Message: Error while sending message in the group replication incremental recovery process.

[ER_GRP_RPL_WHILE_SENDING_MSG_REC](#) was added in 8.0.11.

- Error number: [MY-011627](#); Symbol: [ER_GRP_RPL_READ_UNABLE_FOR_SUPER_READ_ONLY](#); SQLSTATE: [HY000](#)

Message: Unable to read the server value for the super_read_only variable.

[ER_GRP_RPL_READ_UNABLE_FOR_SUPER_READ_ONLY](#) was added in 8.0.11.

- Error number: [MY-011628](#); Symbol: [ER_GRP_RPL_READ_UNABLE_FOR_READ_ONLY_SUPER_READ_ONLY](#); SQLSTATE: [HY000](#)

Message: Unable to read the server values for the read_only and super_read_only variables.

[ER_GRP_RPL_READ_UNABLE_FOR_READ_ONLY_SUPER_READ_ONLY](#) was added in 8.0.11.

- Error number: [MY-011629](#); Symbol: [ER_GRP_RPL_UNABLE_TO_RESET_SERVER_READ_MODE](#); SQLSTATE: [HY000](#)

Message: Unable to reset the server read mode settings. Try to reset them manually.

[ER_GRP_RPL_UNABLE_TO_RESET_SERVER_READ_MODE](#) was added in 8.0.11.

- Error number: [MY-011630](#); Symbol: [ER_GRP_RPL_UNABLE_TO_CERTIFY_PLUGIN_TRANS](#); SQLSTATE: [HY000](#)

Message: Due to a plugin error, some transactions were unable to be certified and will now rollback.

[ER_GRP_RPL_UNABLE_TO_CERTIFY_PLUGIN_TRANS](#) was added in 8.0.11.

- Error number: [MY-011631](#); Symbol: [ER_GRP_RPL_UNBLOCK_CERTIFIED_TRANS](#); SQLSTATE: [HY000](#)

Message: Error when trying to unblock non certified or consistent transactions. Check for consistency errors when restarting the service

[ER_GRP_RPL_UNBLOCK_CERTIFIED_TRANS](#) was added in 8.0.11.

- Error number: [MY-011632](#); Symbol: [ER_GRP_RPL_SERVER_WORKING_AS_SECONDARY](#); SQLSTATE: [HY000](#)

Message: This server is working as secondary member with primary member address %s:%u.

[ER_GRP_RPL_SERVER_WORKING_AS_SECONDARY](#) was added in 8.0.11.

- Error number: [MY-011633](#); Symbol: [ER_GRP_RPL_FAILED_TO_START_WITH_INVALID_SERVER_ID](#); SQLSTATE: [HY000](#)

Message: Unable to start Group Replication. Replication applier infrastructure is not initialized since the server was started with server_id=0. Please, restart the server with server_id larger than 0.

[ER_GRP_RPL_FAILED_TO_START_WITH_INVALID_SERVER_ID](#) was added in 8.0.11.

- Error number: [MY-011634](#); Symbol: [ER_GRP_RPL_FORCE_MEMBERS_MUST_BE_EMPTY](#); SQLSTATE: [HY000](#)

Message: group_replication_force_members must be empty on group start. Current value: '%s'

[ER_GRP_RPL_FORCE_MEMBERS_MUST_BE_EMPTY](#) was added in 8.0.11.

- Error number: [MY-011635](#); Symbol: [ER_GRP_RPL_PLUGIN_STRUCT_INIT_NOT_POSSIBLE_ON_SERVER_START](#); SQLSTATE: [HY000](#)
Message: It was not possible to guarantee the initialization of plugin structures on server start
[ER_GRP_RPL_PLUGIN_STRUCT_INIT_NOT_POSSIBLE_ON_SERVER_START](#) was added in 8.0.11.
- Error number: [MY-011636](#); Symbol: [ER_GRP_RPL_FAILED_TO_ENABLE_SUPER_READ_ONLY_MODE](#); SQLSTATE: [HY000](#)
Message: Could not enable the server read only mode and guarantee a safe recovery execution
[ER_GRP_RPL_FAILED_TO_ENABLE_SUPER_READ_ONLY_MODE](#) was added in 8.0.11.
- Error number: [MY-011637](#); Symbol: [ER_GRP_RPL_FAILED_TO_INIT_COMMUNICATION_ENGINE](#); SQLSTATE: [HY000](#)
Message: Error on group communication engine initialization
[ER_GRP_RPL_FAILED_TO_INIT_COMMUNICATION_ENGINE](#) was added in 8.0.11.
- Error number: [MY-011638](#); Symbol: [ER_GRP_RPL_FAILED_TO_START_ON_SECONDARY_WITH_ASYNC_CHANNELS](#); SQLSTATE: [HY000](#)
Message: Can't start group replication on secondary member with single-primary mode while asynchronous replication channels are running.
[ER_GRP_RPL_FAILED_TO_START_ON_SECONDARY_WITH_ASYNC_CHANNELS](#) was added in 8.0.11.
- Error number: [MY-011639](#); Symbol: [ER_GRP_RPL_FAILED_TO_START_COMMUNICATION_ENGINE](#); SQLSTATE: [HY000](#)
Message: Error on group communication engine start
[ER_GRP_RPL_FAILED_TO_START_COMMUNICATION_ENGINE](#) was added in 8.0.11.
- Error number: [MY-011640](#); Symbol: [ER_GRP_RPL_TIMEOUT_ON_VIEW_AFTER_JOINING_GRP](#); SQLSTATE: [HY000](#)
Message: Timeout on wait for view after joining group
[ER_GRP_RPL_TIMEOUT_ON_VIEW_AFTER_JOINING_GRP](#) was added in 8.0.11.
- Error number: [MY-011641](#); Symbol: [ER_GRP_RPL_FAILED_TO_CALL_GRP_COMMUNICATION_INTERFACE](#); SQLSTATE: [HY000](#)
Message: Error calling group communication interfaces
[ER_GRP_RPL_FAILED_TO_CALL_GRP_COMMUNICATION_INTERFACE](#) was added in 8.0.11.
- Error number: [MY-011642](#); Symbol: [ER_GRP_RPL_MEMBER_SERVER_UUID_IS_INCOMPATIBLE_WITH_GRP](#); SQLSTATE: [HY000](#)
Message: Member server_uuid is incompatible with the group. Server_uuid %s matches group_name %s.
[ER_GRP_RPL_MEMBER_SERVER_UUID_IS_INCOMPATIBLE_WITH_GRP](#) was added in 8.0.11.
- Error number: [MY-011643](#); Symbol: [ER_GRP_RPL_MEMBER_CONF_INFO](#); SQLSTATE: [HY000](#)

Message: Member configuration: member_id: %lu; member_uuid: "%s"; single-primary mode: "%s"; group_replication_auto_increment_increment: %lu;

[ER_GRP_RPL_MEMBER_CONF_INFO](#) was added in 8.0.11.

- Error number: [MY-011644](#); Symbol: [ER_GRP_RPL_FAILED_TO_CONFIRM_IF_SERVER_LEFT_GRP](#); SQLSTATE: [HY000](#)

Message: Unable to confirm whether the server has left the group or not. Check performance_schema.replication_group_members to check group membership information.

[ER_GRP_RPL_FAILED_TO_CONFIRM_IF_SERVER_LEFT_GRP](#) was added in 8.0.11.

- Error number: [MY-011645](#); Symbol: [ER_GRP_RPL_SERVER_IS_ALREADY_LEAVING](#); SQLSTATE: [HY000](#)

Message: Skipping leave operation: concurrent attempt to leave the group is on-going.

[ER_GRP_RPL_SERVER_IS_ALREADY_LEAVING](#) was added in 8.0.11.

- Error number: [MY-011646](#); Symbol: [ER_GRP_RPL_SERVER_ALREADY_LEFT](#); SQLSTATE: [HY000](#)

Message: Skipping leave operation: member already left the group.

[ER_GRP_RPL_SERVER_ALREADY_LEFT](#) was added in 8.0.11.

- Error number: [MY-011647](#); Symbol: [ER_GRP_RPL_WAITING_FOR_VIEW_UPDATE](#); SQLSTATE: [HY000](#)

Message: Going to wait for view modification

[ER_GRP_RPL_WAITING_FOR_VIEW_UPDATE](#) was added in 8.0.11.

- Error number: [MY-011648](#); Symbol: [ER_GRP_RPL_TIMEOUT_RECEIVING_VIEW_CHANGE_ON_SHUTDOWN](#); SQLSTATE: [HY000](#)

Message: While leaving the group due to a stop, shutdown or failure there was a timeout receiving a view change. This can lead to a possible inconsistent state. Check the log for more details

[ER_GRP_RPL_TIMEOUT_RECEIVING_VIEW_CHANGE_ON_SHUTDOWN](#) was added in 8.0.11.

- Error number: [MY-011649](#); Symbol: [ER_GRP_RPL_REQUESTING_NON_MEMBER_SERVER_TO_LEAVE](#); SQLSTATE: [HY000](#)

Message: Requesting to leave the group despite of not being a member

[ER_GRP_RPL_REQUESTING_NON_MEMBER_SERVER_TO_LEAVE](#) was added in 8.0.11.

- Error number: [MY-011650](#); Symbol: [ER_GRP_RPL_IS_STOPPING](#); SQLSTATE: [HY000](#)

Message: Plugin 'group_replication' is stopping.

[ER_GRP_RPL_IS_STOPPING](#) was added in 8.0.11.

- Error number: [MY-011651](#); Symbol: [ER_GRP_RPL_IS_STOPPED](#); SQLSTATE: [HY000](#)
Message: Plugin 'group_replication' has been stopped.
[ER_GRP_RPL_IS_STOPPED](#) was added in 8.0.11.
- Error number: [MY-011652](#); Symbol: [ER_GRP_RPL_FAILED_TO_ENABLE_READ_ONLY_MODE_ON_SHUTDOWN](#); SQLSTATE: [HY000](#)
Message: On plugin shutdown it was not possible to enable the server read only mode. Local transactions will be accepted and committed.
[ER_GRP_RPL_FAILED_TO_ENABLE_READ_ONLY_MODE_ON_SHUTDOWN](#) was added in 8.0.11.
- Error number: [MY-011653](#); Symbol: [ER_GRP_RPL_RECOVERY_MODULE_TERMINATION_TIMED_OUT_ON_SHUTDOWN](#); SQLSTATE: [HY000](#)
Message: On shutdown there was a timeout on the Group Replication recovery module termination. Check the log for more details
[ER_GRP_RPL_RECOVERY_MODULE_TERMINATION_TIMED_OUT_ON_SHUTDOWN](#) was added in 8.0.11.
- Error number: [MY-011654](#); Symbol: [ER_GRP_RPL_APPLIER_TERMINATION_TIMED_OUT_ON_SHUTDOWN](#); SQLSTATE: [HY000](#)
Message: On shutdown there was a timeout on the Group Replication applier termination.
[ER_GRP_RPL_APPLIER_TERMINATION_TIMED_OUT_ON_SHUTDOWN](#) was added in 8.0.11.
- Error number: [MY-011655](#); Symbol: [ER_GRP_RPL_FAILED_TO_SHUTDOWN_REGISTRY_MODULE](#); SQLSTATE: [HY000](#)
Message: Unexpected failure while shutting down registry module!
[ER_GRP_RPL_FAILED_TO_SHUTDOWN_REGISTRY_MODULE](#) was added in 8.0.11.
- Error number: [MY-011656](#); Symbol: [ER_GRP_RPL_FAILED_TO_INIT_HANDLER](#); SQLSTATE: [HY000](#)
Message: Failure during Group Replication handler initialization
[ER_GRP_RPL_FAILED_TO_INIT_HANDLER](#) was added in 8.0.11.
- Error number: [MY-011657](#); Symbol: [ER_GRP_RPL_FAILED_TO_REGISTER_SERVER_STATE_OBSERVER](#); SQLSTATE: [HY000](#)
Message: Failure when registering the server state observers
[ER_GRP_RPL_FAILED_TO_REGISTER_SERVER_STATE_OBSERVER](#) was added in 8.0.11.
- Error number: [MY-011658](#); Symbol: [ER_GRP_RPL_FAILED_TO_REGISTER_TRANS_STATE_OBSERVER](#); SQLSTATE: [HY000](#)
Message: Failure when registering the transactions state observers
[ER_GRP_RPL_FAILED_TO_REGISTER_TRANS_STATE_OBSERVER](#) was added in 8.0.11.
- Error number: [MY-011659](#); Symbol: [ER_GRP_RPL_FAILED_TO_REGISTER_BINLOG_STATE_OBSERVER](#); SQLSTATE: [HY000](#)

Message: Failure when registering the binlog state observers

[ER_GRP_RPL_FAILED_TO_REGISTER_BINLOG_STATE_OBSERVER](#) was added in 8.0.11.

- Error number: [MY-011660](#); Symbol: [ER_GRP_RPL_FAILED_TO_START_ON_BOOT](#); SQLSTATE: [HY000](#)

Message: Unable to start Group Replication on boot

[ER_GRP_RPL_FAILED_TO_START_ON_BOOT](#) was added in 8.0.11.

- Error number: [MY-011661](#); Symbol: [ER_GRP_RPL_FAILED_TO_STOP_ON_PLUGIN_UNINSTALL](#); SQLSTATE: [HY000](#)

Message: Failure when stopping Group Replication on plugin uninstall

[ER_GRP_RPL_FAILED_TO_STOP_ON_PLUGIN_UNINSTALL](#) was added in 8.0.11.

- Error number: [MY-011662](#); Symbol: [ER_GRP_RPL_FAILED_TO_UNREGISTER_SERVER_STATE_OBSERVER](#); SQLSTATE: [HY000](#)

Message: Failure when unregistering the server state observers

[ER_GRP_RPL_FAILED_TO_UNREGISTER_SERVER_STATE_OBSERVER](#) was added in 8.0.11.

- Error number: [MY-011663](#); Symbol: [ER_GRP_RPL_FAILED_TO_UNREGISTER_TRANS_STATE_OBSERVER](#); SQLSTATE: [HY000](#)

Message: Failure when unregistering the transactions state observers

[ER_GRP_RPL_FAILED_TO_UNREGISTER_TRANS_STATE_OBSERVER](#) was added in 8.0.11.

- Error number: [MY-011664](#); Symbol: [ER_GRP_RPL_FAILED_TO_UNREGISTER_BINLOG_STATE_OBSERVER](#); SQLSTATE: [HY000](#)

Message: Failure when unregistering the binlog state observers

[ER_GRP_RPL_FAILED_TO_UNREGISTER_BINLOG_STATE_OBSERVER](#) was added in 8.0.11.

- Error number: [MY-011665](#); Symbol: [ER_GRP_RPL_ALL_OBSERVERS_UNREGISTERED](#); SQLSTATE: [HY000](#)

Message: All Group Replication server observers have been successfully unregistered

[ER_GRP_RPL_ALL_OBSERVERS_UNREGISTERED](#) was added in 8.0.11.

- Error number: [MY-011666](#); Symbol: [ER_GRP_RPL_FAILED_TO_PARSE_THE_GRP_NAME](#); SQLSTATE: [HY000](#)

Message: Unable to parse the group name.

[ER_GRP_RPL_FAILED_TO_PARSE_THE_GRP_NAME](#) was added in 8.0.11.

- Error number: [MY-011667](#); Symbol: [ER_GRP_RPL_FAILED_TO_GENERATE_SIDNO_FOR_GRP](#); SQLSTATE: [HY000](#)

Message: Unable to parse the group name.

[ER_GRP_RPL_FAILED_TO_GENERATE_SIDNO_FOR_GRP](#) was added in 8.0.11.
- Error number: [MY-011668](#); Symbol: [ER_GRP_RPL_APPLIER_NOT_STARTED_DUE_TO_RUNNING_PREV_SHUTDOWN](#); SQLSTATE: [HY000](#)

Message: Cannot start the Group Replication applier as a previous shutdown is still running: The thread will stop once its task is complete.

[ER_GRP_RPL_APPLIER_NOT_STARTED_DUE_TO_RUNNING_PREV_SHUTDOWN](#) was added in 8.0.11.
- Error number: [MY-011669](#); Symbol: [ER_GRP_RPL_FAILED_TO_INIT_APPLIER_MODULE](#); SQLSTATE: [HY000](#)

Message: Unable to initialize the Group Replication applier module.

[ER_GRP_RPL_FAILED_TO_INIT_APPLIER_MODULE](#) was added in 8.0.11.
- Error number: [MY-011670](#); Symbol: [ER_GRP_RPL_APPLIER_INITIALIZED](#); SQLSTATE: [HY000](#)

Message: Group Replication applier module successfully initialized!

[ER_GRP_RPL_APPLIER_INITIALIZED](#) was added in 8.0.11.

Message: LOG_SLAVE_UPDATES should be ON for Group Replication

[ER_GRP_RPL_LOG_SLAVE_UPDATES_NOT_SET](#) was added in 8.0.11.

- Error number: [MY-011678](#); Symbol: [ER_GRP_RPL_INVALID_TRANS_WRITE_SET_EXTRACTION_VALUE](#); SQLSTATE: [HY000](#)

Message: Extraction of transaction write sets requires an hash algorithm configuration. Please, double check that the parameter transaction-write-set-extraction is set to a valid algorithm.

[ER_GRP_RPL_INVALID_TRANS_WRITE_SET_EXTRACTION_VALUE](#) was added in 8.0.11.

- Error number: [MY-011679](#); Symbol: [ER_GRP_RPL_RELAY_LOG_INFO_REPO_MUST_BE_TABLE](#); SQLSTATE: [HY000](#)

Message: Relay log info repository must be set to TABLE

[ER_GRP_RPL_RELAY_LOG_INFO_REPO_MUST_BE_TABLE](#) was added in 8.0.11.

- Error number: [MY-011680](#); Symbol: [ER_GRP_RPL_MASTER_INFO_REPO_MUST_BE_TABLE](#); SQLSTATE: [HY000](#)

Message: Master info repository must be set to TABLE.

[ER_GRP_RPL_MASTER_INFO_REPO_MUST_BE_TABLE](#) was added in 8.0.11.

- Error number: [MY-011681](#); Symbol: [ER_GRP_RPL_INCORRECT_TYPE_SET_FOR_PARALLEL_APPLIER](#); SQLSTATE: [HY000](#)

Message: In order to use parallel applier on Group Replication, parameter slave-parallel-type must be set to 'LOGICAL_CLOCK'.

[ER_GRP_RPL_INCORRECT_TYPE_SET_FOR_PARALLEL_APPLIER](#) was added in 8.0.11.

- Error number: [MY-011682](#); Symbol: [ER_GRP_RPL_SLAVE_PRESERVE_COMMIT_ORDER_NOT_SET](#); SQLSTATE: [HY000](#)

Message: Group Replication requires slave-preserve-commit-order to be set to ON when using more than 1 applier threads.

[ER_GRP_RPL_SLAVE_PRESERVE_COMMIT_ORDER_NOT_SET](#) was added in 8.0.11.

- Error number: [MY-011683](#); Symbol: [ER_GRP_RPL_SINGLE_PRIM_MODE_NOT_ALLOWED_WITH_UPDATE_EVERYWHERE](#); SQLSTATE: [HY000](#)

Message: It is not allowed to run single primary mode with 'enforce_update_everywhere_checks' enabled.

[ER_GRP_RPL_SINGLE_PRIM_MODE_NOT_ALLOWED_WITH_UPDATE_EVERYWHERE](#) was added in 8.0.11.

- Error number: [MY-011684](#); Symbol: [ER_GRP_RPL_MODULE_TERMINATE_ERROR](#); SQLSTATE: [HY000](#)

Message: error_message: %s

[ER_GRP_RPL_MODULE_TERMINATE_ERROR](#) was added in 8.0.11.

- Error number: [MY-011685](#); Symbol: [ER_GRP_RPL_GRP_NAME_OPTION_MANDATORY](#); SQLSTATE: [HY000](#)

Message: The group name option is mandatory

[ER_GRP_RPL_GRP_NAME_OPTION_MANDATORY](#) was added in 8.0.11.

- Error number: [MY-011686](#); Symbol: [ER_GRP_RPL_GRP_NAME_IS_TOO_LONG](#); SQLSTATE: [HY000](#)

Message: The group name '%s' is not a valid UUID, its length is too big

[ER_GRP_RPL_GRP_NAME_IS_TOO_LONG](#) was added in 8.0.11.

- Error number: [MY-011687](#); Symbol: [ER_GRP_RPL_GRP_NAME_IS_NOT_VALID_UUID](#); SQLSTATE: [HY000](#)

Message: The group name '%s' is not a valid UUID

[ER_GRP_RPL_GRP_NAME_IS_NOT_VALID_UUID](#) was added in 8.0.11.

- Error number: [MY-011688](#); Symbol: [ER_GRP_RPL_FLOW_CTRL_MIN_QUOTA_GREATER_THAN_MAX_QUOTA](#); SQLSTATE: [HY000](#)

Message: group_replication_flow_control_min_quota cannot be larger than group_replication_flow_control_max_quota

[ER_GRP_RPL_FLOW_CTRL_MIN_QUOTA_GREATER_THAN_MAX_QUOTA](#) was added in 8.0.11.

- Error number: [MY-011689](#); Symbol: [ER_GRP_RPL_FLOW_CTRL_MIN_RECOVERY_QUOTA_GREATER_THAN_MAX_QUOTA](#); SQLSTATE: [HY000](#)

Message: group_replication_flow_control_min_recovery_quota cannot be larger than group_replication_flow_control_max_quota

[ER_GRP_RPL_FLOW_CTRL_MIN_RECOVERY_QUOTA_GREATER_THAN_MAX_QUOTA](#) was added in 8.0.11.

- Error number: [MY-011690](#); Symbol: [ER_GRP_RPL_FLOW_CTRL_MAX_QUOTA_SMALLER_THAN_MIN_QUOTAS](#); SQLSTATE: [HY000](#)

Message: group_replication_flow_control_max_quota cannot be smaller than group_replication_flow_control_min_quota or group_replication_flow_control_min_recovery_quota

[ER_GRP_RPL_FLOW_CTRL_MAX_QUOTA_SMALLER_THAN_MIN_QUOTAS](#) was added in 8.0.11.

- Error number: [MY-011691](#); Symbol: [ER_GRP_RPL_INVALID_SSL_RECOVERY_STRING](#); SQLSTATE: [HY000](#)

Message: The given value for recovery ssl option '%s' is invalid as its length is beyond the limit

[ER_GRP_RPL_INVALID_SSL_RECOVERY_STRING](#) was added in 8.0.11.

- Error number: [MY-011692](#); Symbol: [ER_GRP_RPL_SUPPORTS_ONLY_ONE_FORCE_MEMBERS_SET](#); SQLSTATE: [HY000](#)

Message: There is one group_replication_force_members operation already ongoing

[ER_GRP_RPL_SUPPORTS_ONLY_ONE_FORCE_MEMBERS_SET](#) was added in 8.0.11.

- Error number: [MY-011693](#); Symbol: [ER_GRP_RPL_FORCE_MEMBERS_SET_UPDATE_NOT_ALLOWED](#); SQLSTATE: [HY000](#)

Message: group_replication_force_members can only be updated when Group Replication is running and a majority of the members are unreachable

[ER_GRP_RPL_FORCE_MEMBERS_SET_UPDATE_NOT_ALLOWED](#) was added in 8.0.11.

- Error number: [MY-011694](#); Symbol: [ER_GRP_RPL_GRP_COMMUNICATION_INIT_WITH_CONF](#); SQLSTATE: [HY000](#)

Message: Initialized group communication with configuration: group_replication_group_name: '%s'; group_replication_local_address: '%s'; group_replication_group_seeds: '%s'; group_replication_bootstrap_group: '%s'; group_replication_poll_spin_loops: %lu; group_replication_compression_threshold: %lu; group_replication_ip_whitelist: '%s'; group_replication_communication_debug_options: '%s'; group_replication_member_expel_timeout: '%lu'; group_replication_communication_max_message_size: %lu; group_replication_message_cache_size: '%luu'

[ER_GRP_RPL_GRP_COMMUNICATION_INIT_WITH_CONF](#) was added in 8.0.11.

- Error number: [MY-011695](#); Symbol: [ER_GRP_RPL_UNKNOWN_GRP_RPL_APPLIER_PIPELINE_REQUESTED](#); SQLSTATE: [HY000](#)

Message: Unknown group replication applier pipeline requested

[ER_GRP_RPL_UNKNOWN_GRP_RPL_APPLIER_PIPELINE_REQUESTED](#) was added in 8.0.11.

- Error number: [MY-011696](#); Symbol: [ER_GRP_RPL_FAILED_TO_BOOTSTRAP_EVENT_HANDLING_INFRASTRUCTURE](#); SQLSTATE: [HY000](#)

Message: Unable to bootstrap group replication event handling infrastructure. Unknown handler type: %d

[ER_GRP_RPL_FAILED_TO_BOOTSTRAP_EVENT_HANDLING_INFRASTRUCTURE](#) was added in 8.0.11.

- Error number: [MY-011697](#); Symbol: [ER_GRP_RPL_APPLIER_HANDLER_NOT_INITIALIZED](#); SQLSTATE: [HY000](#)

Message: One of the group replication applier handlers is null due to an initialization error

[ER_GRP_RPL_APPLIER_HANDLER_NOT_INITIALIZED](#) was added in 8.0.11.

- Error number: [MY-011698](#); Symbol: [ER_GRP_RPL_APPLIER_HANDLER_IS_IN_USE](#); SQLSTATE: [HY000](#)

Message: A group replication applier handler, marked as unique, is already in use.

[ER_GRP_RPL_APPLIER_HANDLER_IS_IN_USE](#) was added in 8.0.11.

- Error number: [MY-011699](#); Symbol: [ER_GRP_RPL_APPLIER_HANDLER_ROLE_IS_IN_USE](#); SQLSTATE: [HY000](#)

Message: A group replication applier handler role, that was marked as unique, is already in use.

[ER_GRP_RPL_APPLIER_HANDLER_ROLE_IS_IN_USE](#) was added in 8.0.11.

- Error number: [MY-011700](#); Symbol: [ER_GRP_RPL_FAILED_TO_INIT_APPLIER_HANDLER](#); SQLSTATE: [HY000](#)

Message: Error on group replication applier handler initialization

[ER_GRP_RPL_FAILED_TO_INIT_APPLIER_HANDLER](#) was added in 8.0.11.

- Error number: [MY-011701](#); Symbol: [ER_GRP_RPL_SQL_SERVICE_FAILED_TO_INIT_SESSION_THREAD](#); SQLSTATE: [HY000](#)

Message: Error when initializing a session thread for internal server connection.

[ER_GRP_RPL_SQL_SERVICE_FAILED_TO_INIT_SESSION_THREAD](#) was added in 8.0.11.

- Error number: [MY-011702](#); Symbol: [ER_GRP_RPL_SQL_SERVICE_COMM_SESSION_NOT_INITIALIZED](#); SQLSTATE: [HY000](#)

Message: Error running internal SQL query: %s. The internal server communication session is not initialized

[ER_GRP_RPL_SQL_SERVICE_COMM_SESSION_NOT_INITIALIZED](#) was added in 8.0.11.

- Error number: [MY-011703](#); Symbol: [ER_GRP_RPL_SQL_SERVICE_SERVER_SESSION_KILLED](#); SQLSTATE: [HY000](#)

Message: Error running internal SQL query: %s. The internal server session was killed or server is shutting down.

[ER_GRP_RPL_SQL_SERVICE_SERVER_SESSION_KILLED](#) was added in 8.0.11.

- Error number: [MY-011704](#); Symbol: [ER_GRP_RPL_SQL_SERVICE_FAILED_TO_RUN_SQL_QUERY](#); SQLSTATE: [HY000](#)

Message: Error running internal SQL query: %s. Got internal SQL error: %s(%d)

[ER_GRP_RPL_SQL_SERVICE_FAILED_TO_RUN_SQL_QUERY](#) was added in 8.0.11.

- Error number: [MY-011705](#); Symbol: [ER_GRP_RPL_SQL_SERVICE_SERVER_INTERNAL_FAILURE](#); SQLSTATE: [HY000](#)

Message: Error running internal SQL query: %s. Internal failure.

[ER_GRP_RPL_SQL_SERVICE_SERVER_INTERNAL_FAILURE](#) was added in 8.0.11.

- Error number: [MY-011706](#); Symbol:
[ER_GRP_RPL_SQL_SERVICE_RETRIES_EXCEEDED_ON_SESSION_STATE](#); SQLSTATE: [HY000](#)

Message: Error, maximum number of retries exceeded when waiting for the internal server session state to be operating

[ER_GRP_RPL_SQL_SERVICE_RETRIES_EXCEEDED_ON_SESSION_STATE](#) was added in 8.0.11.
- Error number: [MY-011707](#); Symbol:
[ER_GRP_RPL_SQL_SERVICE_FAILED_TO_FETCH_SECURITY_CTX](#); SQLSTATE: [HY000](#)

Message: Error when trying to fetch security context when contacting the server for internal plugin requests.

[ER_GRP_RPL_SQL_SERVICE_FAILED_TO_FETCH_SECURITY_CTX](#) was added in 8.0.11.
- Error number: [MY-011708](#); Symbol:
[ER_GRP_RPL_SQL_SERVICE_SERVER_ACCESS_DENIED_FOR_USER](#); SQLSTATE: [HY000](#)

Message: There was an error when trying to access the server with user: %s. Make sure the user is present in the server and that the MySQL upgrade procedure was run correctly.

[ER_GRP_RPL_SQL_SERVICE_SERVER_ACCESS_DENIED_FOR_USER](#) was added in 8.0.11.
- Error number: [MY-011709](#); Symbol:
[ER_GRP_RPL_SQL_SERVICE_MAX_CONN_ERROR_FROM_SERVER](#); SQLSTATE: [HY000](#)

Message: Failed to establish an internal server connection to execute plugin operations since the server does not have available connections, please increase @@GLOBAL.MAX_CONNECTIONS. Server error: %i.

[ER_GRP_RPL_SQL_SERVICE_MAX_CONN_ERROR_FROM_SERVER](#) was added in 8.0.11.
- Error number: [MY-011710](#); Symbol: [ER_GRP_RPL_SQL_SERVICE_SERVER_ERROR_ON_CONN](#); SQLSTATE: [HY000](#)

Message: Failed to establish an internal server connection to execute plugin operations. Server error: %i. Server error message: %s

[ER_GRP_RPL_SQL_SERVICE_SERVER_ERROR_ON_CONN](#) was added in 8.0.11.
- Error number: [MY-011711](#); Symbol:
[ER_GRP_RPL_UNREACHABLE_MAJORITY_TIMEOUT_FOR_MEMBER](#); SQLSTATE: [HY000](#)

Message: This member could not reach a majority of the members for more than %ld seconds. The member will now leave the group as instructed by the group_replication_unreachable_majority_timeout option.

[ER_GRP_RPL_UNREACHABLE_MAJORITY_TIMEOUT_FOR_MEMBER](#) was added in 8.0.11.
- Error number: [MY-011712](#); Symbol: [ER_GRP_RPL_SERVER_SET_TO_READ_ONLY_DUE_TO_ERRORS](#); SQLSTATE: [HY000](#)

Message: The server was automatically set into read only mode after an error was detected.

[ER_GRP_RPL_SERVER_SET_TO_READ_ONLY_DUE_TO_ERRORS](#) was added in 8.0.11.

- Error number: [MY-011713](#); Symbol: [ER_GRP_RPL_GMS_LISTENER_FAILED_TO_LOG_NOTIFICATION](#); SQLSTATE: [HY000](#)
Message: Unable to log notification to table (errno: %lu) (res: %d)! Message: %s
[ER_GRP_RPL_GMS_LISTENER_FAILED_TO_LOG_NOTIFICATION](#) was added in 8.0.11.
- Error number: [MY-011714](#); Symbol: [ER_GRP_RPL_GRP_COMMUNICATION_ENG_INIT_FAILED](#); SQLSTATE: [HY000](#)
Message: Failure in group communication engine '%s' initialization
[ER_GRP_RPL_GRP_COMMUNICATION_ENG_INIT_FAILED](#) was added in 8.0.11.
- Error number: [MY-011715](#); Symbol: [ER_GRP_RPL_SET_GRP_COMMUNICATION_ENG_LOGGER_FAILED](#); SQLSTATE: [HY000](#)
Message: Unable to set the group communication engine logger
[ER_GRP_RPL_SET_GRP_COMMUNICATION_ENG_LOGGER_FAILED](#) was added in 8.0.11.
- Error number: [MY-011716](#); Symbol: [ER_GRP_RPL_DEBUG_OPTIONS](#); SQLSTATE: [HY000](#)
Message: Current debug options are: '%s'.
[ER_GRP_RPL_DEBUG_OPTIONS](#) was added in 8.0.11.
- Error number: [MY-011717](#); Symbol: [ER_GRP_RPL_INVALID_DEBUG_OPTIONS](#); SQLSTATE: [HY000](#)
Message: Some debug options in '%s' are not valid.
[ER_GRP_RPL_INVALID_DEBUG_OPTIONS](#) was added in 8.0.11.
- Error number: [MY-011718](#); Symbol: [ER_GRP_RPL_EXIT_GRP_GCS_ERROR](#); SQLSTATE: [HY000](#)
Message: Error calling group communication interfaces while trying to leave the group
[ER_GRP_RPL_EXIT_GRP_GCS_ERROR](#) was added in 8.0.11.
- Error number: [MY-011719](#); Symbol: [ER_GRP_RPL_GRP_MEMBER_OFFLINE](#); SQLSTATE: [HY000](#)
Message: Member is not ONLINE, it is not possible to force a new group membership
[ER_GRP_RPL_GRP_MEMBER_OFFLINE](#) was added in 8.0.11.
- Error number: [MY-011720](#); Symbol: [ER_GRP_RPL_GCS_INTERFACE_ERROR](#); SQLSTATE: [HY000](#)
Message: Error calling group communication interfaces
[ER_GRP_RPL_GCS_INTERFACE_ERROR](#) was added in 8.0.11.
- Error number: [MY-011721](#); Symbol: [ER_GRP_RPL_FORCE_MEMBER_VALUE_SET_ERROR](#); SQLSTATE: [HY000](#)
Message: Error setting group_replication_force_members value '%s' on group communication interfaces
[ER_GRP_RPL_FORCE_MEMBER_VALUE_SET_ERROR](#) was added in 8.0.11.
- Error number: [MY-011722](#); Symbol: [ER_GRP_RPL_FORCE_MEMBER_VALUE_SET](#); SQLSTATE: [HY000](#)

Message: The group_replication_force_members value '%s' was set in the group communication interfaces

[ER_GRP_RPL_FORCE_MEMBER_VALUE_SET](#) was added in 8.0.11.

- Error number: [MY-011723](#); Symbol: [ER_GRP_RPL_FORCE_MEMBER_VALUE_TIME_OUT](#); SQLSTATE: [HY000](#)

Message: Timeout on wait for view after setting group_replication_force_members value '%s' into group communication interfaces

[ER_GRP_RPL_FORCE_MEMBER_VALUE_TIME_OUT](#) was added in 8.0.11.

- Error number: [MY-011724](#); Symbol: [ER_GRP_RPL_BROADCAST_COMMIT_MSSG_TOO_BIG](#); SQLSTATE: [HY000](#)

Message: Broadcast of committed transactions message failed. Message is too big.

[ER_GRP_RPL_BROADCAST_COMMIT_MSSG_TOO_BIG](#) was added in 8.0.11.

- Error number: [MY-011725](#); Symbol: [ER_GRP_RPL_SEND_STATS_ERROR](#); SQLSTATE: [HY000](#)

Message: Error while sending stats message

[ER_GRP_RPL_SEND_STATS_ERROR](#) was added in 8.0.11.

- Error number: [MY-011726](#); Symbol: [ER_GRP_RPL_MEMBER_STATS_INFO](#); SQLSTATE: [HY000](#)

Message: Flow control - update member stats: %s stats certifier_queue %d, applier_queue %d certified %ld (%ld), applied %ld (%ld), local %ld (%ld), quota %ld (%ld) mode=%d

[ER_GRP_RPL_MEMBER_STATS_INFO](#) was added in 8.0.11.

- Error number: [MY-011727](#); Symbol: [ER_GRP_RPL_FLOW_CONTROL_STATS](#); SQLSTATE: [HY000](#)

Message: Flow control: throttling to %ld commits per %ld sec, with %d writing and %d non-recovering members, min capacity %lld, lim throttle %lld

[ER_GRP_RPL_FLOW_CONTROL_STATS](#) was added in 8.0.11.

- Error number: [MY-011728](#); Symbol: [ER_GRP_RPL_UNABLE_TO_CONVERT_PACKET_TO_EVENT](#); SQLSTATE: [HY000](#)

Message: Unable to convert a packet into an event on the applier. Error: %s

[ER_GRP_RPL_UNABLE_TO_CONVERT_PACKET_TO_EVENT](#) was added in 8.0.11.

- Error number: [MY-011729](#); Symbol: [ER_GRP_RPL_PIPELINE_CREATE_FAILED](#); SQLSTATE: [HY000](#)

Message: Failed to create group replication pipeline cache.

[ER_GRP_RPL_PIPELINE_CREATE_FAILED](#) was added in 8.0.11.

- Error number: [MY-011730](#); Symbol: [ER_GRP_RPL_PIPELINE_REINIT_FAILED_WRITE](#); SQLSTATE: [HY000](#)

Message: Failed to reinit group replication pipeline cache for write.

[ER_GRP_RPL_PIPELINE_REINIT_FAILED_WRITE](#) was added in 8.0.11.
- Error number: [MY-011731](#); Symbol: [ER_GRP_RPL_UNABLE_TO_CONVERT_EVENT_TO_PACKET](#); SQLSTATE: [HY000](#)

Message: Unable to convert the event into a packet on the applier. Error: %s

[ER_GRP_RPL_UNABLE_TO_CONVERT_EVENT_TO_PACKET](#) was added in 8.0.11.
- Error number: [MY-011732](#); Symbol: [ER_GRP_RPL_PIPELINE_FLUSH_FAIL](#); SQLSTATE: [HY000](#)

Message: Failed to flush group replication pipeline cache.

[ER_GRP_RPL_PIPELINE_FLUSH_FAIL](#) was added in 8.0.11.
- Error number: [MY-011733](#); Symbol: [ER_GRP_RPL_PIPELINE_REINIT_FAILED_READ](#); SQLSTATE: [HY000](#)

Message: Failed to reinit group replication pipeline cache for read.

[ER_GRP_RPL_PIPELINE_REINIT_FAILED_READ](#) was added in 8.0.11.
- Error number: [MY-011734](#); Symbol: [ER_GRP_RPL_STOP_REP_CHANNEL](#); SQLSTATE: [HY000](#)

Message: Error stopping all replication channels while server was leaving the group. Got error: %d. Please check the error log for more details.

[ER_GRP_RPL_STOP_REP_CHANNEL](#) was added in 8.0.11, removed after 8.0.17.
- Error number: [MY-011735](#); Symbol: [ER_GRP_RPL_GCS_GR_ERROR_MSG](#); SQLSTATE: [HY000](#)

Message: %s

[ER_GRP_RPL_GCS_GR_ERROR_MSG](#) was added in 8.0.11.
- Error number: [MY-011736](#); Symbol: [ER_GRP_RPL_SLAVE_IO_THREAD_UNBLOCKED](#); SQLSTATE: [HY000](#)

Message: The slave IO thread of channel '%s' is unblocked as the member is declared ONLINE now.

[ER_GRP_RPL_SLAVE_IO_THREAD_UNBLOCKED](#) was added in 8.0.11.
- Error number: [MY-011737](#); Symbol: [ER_GRP_RPL_SLAVE_IO_THREAD_ERROR_OUT](#); SQLSTATE: [HY000](#)

Message: The slave IO thread of channel '%s' will error out as the member failed to come ONLINE.

[ER_GRP_RPL_SLAVE_IO_THREAD_ERROR_OUT](#) was added in 8.0.11.
- Error number: [MY-011738](#); Symbol: [ER_GRP_RPL_SLAVE_APPLIER_THREAD_UNBLOCKED](#); SQLSTATE: [HY000](#)

Message: The slave applier thread of channel '%s' is unblocked as the member is declared ONLINE now.

[ER_GRP_RPL_SLAVE_APPLIER_THREAD_UNBLOCKED](#) was added in 8.0.11.

- Error number: [MY-011739](#); Symbol: [ER_GRP_RPL_SLAVE_APPLIER_THREAD_ERROR_OUT](#); SQLSTATE: [HY000](#)

Message: The slave applier thread of channel '%s' will error out as the member failed to come ONLINE.

[ER_GRP_RPL_SLAVE_APPLIER_THREAD_ERROR_OUT](#) was added in 8.0.11.

- Error number: [MY-011740](#); Symbol: [ER_LDAP_AUTH_FAILED_TO_CREATE_OR_GET_CONNECTION](#); SQLSTATE: [HY000](#)

Message: LDAP authentication initialize: failed to create/ get connection from the pool.

[ER_LDAP_AUTH_FAILED_TO_CREATE_OR_GET_CONNECTION](#) was added in 8.0.11.

- Error number: [MY-011741](#); Symbol: [ER_LDAP_AUTH_DEINIT_FAILED](#); SQLSTATE: [HY000](#)

Message: LDAP authentication de_initialize Failed

[ER_LDAP_AUTH_DEINIT_FAILED](#) was added in 8.0.11.

- Error number: [MY-011742](#); Symbol: [ER_LDAP_AUTH_SKIPPING_USER_GROUP_SEARCH](#); SQLSTATE: [HY000](#)

Message: Skipping group search, No group attribute mentioned

[ER_LDAP_AUTH_SKIPPING_USER_GROUP_SEARCH](#) was added in 8.0.11.

- Error number: [MY-011743](#); Symbol: [ER_LDAP_AUTH_POOL_DISABLE_MAX_SIZE_ZERO](#); SQLSTATE: [HY000](#)

Message: Pool max size is 0, connection pool is disabled

[ER_LDAP_AUTH_POOL_DISABLE_MAX_SIZE_ZERO](#) was added in 8.0.11.

- Error number: [MY-011744](#); Symbol: [ER_LDAP_AUTH_FAILED_TO_CREATE_LDAP_OBJECT_CREATOR](#); SQLSTATE: [HY000](#)

Message: Connection pool initialization, failed to create LDAP object creator

[ER_LDAP_AUTH_FAILED_TO_CREATE_LDAP_OBJECT_CREATOR](#) was added in 8.0.11.

- Error number: [MY-011745](#); Symbol: [ER_LDAP_AUTH_FAILED_TO_CREATE_LDAP_OBJECT](#); SQLSTATE: [HY000](#)

Message: Connection pool initialization, failed to create LDAP object

[ER_LDAP_AUTH_FAILED_TO_CREATE_LDAP_OBJECT](#) was added in 8.0.11.

- Error number: [MY-011746](#); Symbol: [ER_LDAP_AUTH_TLS_CONF](#); SQLSTATE: [HY000](#)

Message: LDAP TLS configuration

[ER_LDAP_AUTH_TLS_CONF](#) was added in 8.0.11.

- Error number: [MY-011747](#); Symbol: [ER_LDAP_AUTH_TLS_CONNECTION](#); SQLSTATE: [HY000](#)

Message: LDAP TLS connection

[ER_LDAP_AUTH_TLS_CONNECTION](#) was added in 8.0.11.

- Error number: [MY-011748](#); Symbol: [ER_LDAP_AUTH_CONN_POOL_NOT_CREATED](#); SQLSTATE: [HY000](#)

Message: LDAP pool is not created.

[ER_LDAP_AUTH_CONN_POOL_NOT_CREATED](#) was added in 8.0.11.

- Error number: [MY-011749](#); Symbol: [ER_LDAP_AUTH_CONN_POOL_INITIALIZING](#); SQLSTATE: [HY000](#)

Message: LDAP pool is initializing

[ER_LDAP_AUTH_CONN_POOL_INITIALIZING](#) was added in 8.0.11.

- Error number: [MY-011750](#); Symbol: [ER_LDAP_AUTH_CONN_POOL_DEINITIALIZING](#); SQLSTATE: [HY000](#)

Message: LDAP pool is de-initializing

[ER_LDAP_AUTH_CONN_POOL_DEINITIALIZING](#) was added in 8.0.11.

- Error number: [MY-011751](#); Symbol: [ER_LDAP_AUTH_ZERO_MAX_POOL_SIZE_UNCHANGED](#); SQLSTATE: [HY000](#)

Message: Pool max size old and new values are 0

[ER_LDAP_AUTH_ZERO_MAX_POOL_SIZE_UNCHANGED](#) was added in 8.0.11.

- Error number: [MY-011752](#); Symbol: [ER_LDAP_AUTH_POOL_REINITIALIZING](#); SQLSTATE: [HY000](#)

Message: LDAP pool is re-initializing

[ER_LDAP_AUTH_POOL_REINITIALIZING](#) was added in 8.0.11.

- Error number: [MY-011753](#); Symbol: [ER_LDAP_AUTH_FAILED_TO_WRITE_PACKET](#); SQLSTATE: [HY000](#)

Message: Plug-in has failed to write the packet.

[ER_LDAP_AUTH_FAILED_TO_WRITE_PACKET](#) was added in 8.0.11.

- Error number: [MY-011754](#); Symbol: [ER_LDAP_AUTH_SETTING_USERNAME](#); SQLSTATE: [HY000](#)

Message: Setting LDAP user name as : %s

[ER_LDAP_AUTH_SETTING_USERNAME](#) was added in 8.0.11.

- Error number: [MY-011755](#); Symbol: [ER_LDAP_AUTH_USER_AUTH_DATA](#); SQLSTATE: [HY000](#)

Message: User authentication data: %s size: %lu

[ER_LDAP_AUTH_USER_AUTH_DATA](#) was added in 8.0.11.

[ER_IB_MSG_1132](#) was added in 8.0.11.

- Error number: [MY-012958](#); Symbol: [ER_IB_MSG_1133](#); SQLSTATE: [HY000](#)

Message: Small buffer pool size (%lluM), the flst_validate() debug function can cause a deadlock if the buffer pool fills up.

[ER_IB_MSG_1133](#) was added in 8.0.11.

- Error number: [MY-012959](#); Symbol: [ER_IB_MSG_1134](#); SQLSTATE: [HY000](#)

Message: Could not open or create the system tablespace. If you tried to add new data files to the system tablespace, and it failed here, you should now edit innodb_data_file_path in my.cnf back to what it was, and remove the new ibdata files InnoDB created in this failed attempt. InnoDB only wrote those files full of zeros, but did not yet use them in any way. But be careful: do not remove old data files which contain your precious data!

[ER_IB_MSG_1134](#) was added in 8.0.11.

- Error number: [MY-012960](#); Symbol: [ER_IB_MSG_1135](#); SQLSTATE: [HY000](#)

Message: Cannot create log files because data files are corrupt or the database was not shut down cleanly after creating the data files.

[ER_IB_MSG_1135](#) was added in 8.0.11.

- Error number: [MY-012961](#); Symbol: [ER_IB_MSG_1136](#); SQLSTATE: [HY000](#)

Message: Only one log file found

[ER_IB_MSG_1136](#) was added in 8.0.11.

- Error number: [MY-012962](#); Symbol: [ER_IB_MSG_1137](#); SQLSTATE: [HY000](#)

Message: Log file %s size %llu is not a multiple of innodb_page_size

[ER_IB_MSG_1137](#) was added in 8.0.11.

- Error number: [MY-012963](#); Symbol: [ER_IB_MSG_1138](#); SQLSTATE: [HY000](#)

Message: Log file %s is of different size %llu bytes than other log files %llu bytes!

[ER_IB_MSG_1138](#) was added in 8.0.11.

- Error number: [MY-012964](#); Symbol: [ER_IB_MSG_1139](#); SQLSTATE: [HY000](#)

Message: Use --innodb-directories to find the tablespace files. If that fails then use --innodb-force-recovery=1 to ignore this and to permanently lose all changes to the missing tablespace(s)

[ER_IB_MSG_1139](#) was added in 8.0.11.

- Error number: [MY-012965](#); Symbol: [ER_IB_MSG_1140](#); SQLSTATE: [HY000](#)

Message: The log file may have been corrupt and it is possible that the log scan or parsing did not proceed far enough in recovery. Please run CHECK TABLE on your InnoDB tables to check that they are ok! It may be safest to recover your InnoDB database from a backup!

[ER_IB_MSG_1140](#) was added in 8.0.11.

- Error number: [MY-012966](#); Symbol: [ER_IB_MSG_1141](#); SQLSTATE: [HY000](#)

Message: Cannot resize log files in read-only mode.

[ER_IB_MSG_1141](#) was added in 8.0.11.

- Error number: [MY-012967](#); Symbol: [ER_IB_MSG_1142](#); SQLSTATE: [HY000](#)

Message: Cannot open DD tablespace.

[ER_IB_MSG_1142](#) was added in 8.0.11.

- Error number: [MY-012968](#); Symbol: [ER_IB_MSG_1143](#); SQLSTATE: [HY000](#)

- Error number: [MY-013151](#); Symbol: [ER_SERVER_TEST_MESSAGE](#); SQLSTATE: [HY000](#)
Message: Simulated error

`ER_SERVER_TEST_MESSAGE` was added in 8.0.11.

- Error number: `MY-013152`; Symbol: `ER_AUDIT_LOG_JSON_FILTER_PARSING_ERROR`; SQLSTATE: `HY000`

Message: %s

`ER_AUDIT_LOG_JSON_FILTER_PARSING_ERROR` was added in 8.0.11.

- Error number: `MY-013153`; Symbol: `ER_AUDIT_LOG_JSON_FILTERING_NOT_ENABLED`; SQLSTATE: `HY000`

Message: Audit Log filtering has not been installed.

`ER_AUDIT_LOG_JSON_FILTERING_NOT_ENABLED` was added in 8.0.11.

- Error number: `MY-013154`; Symbol: `ER_PLUGIN_FAILED_TO_OPEN_TABLES`; SQLSTATE: `HY000`

Message: Failed to open the %s filter tables.

`ER_PLUGIN_FAILED_TO_OPEN_TABLES` was added in 8.0.11.

- Error number: `MY-013155`; Symbol: `ER_PLUGIN_FAILED_TO_OPEN_TABLE`; SQLSTATE: `HY000`

Message: Failed to open '%s.%s' %s table.

`ER_PLUGIN_FAILED_TO_OPEN_TABLE` was added in 8.0.11.

- Error number: `MY-013156`; Symbol: `ER_AUDIT_LOG_JSON_FILTER_NAME_CANNOT_BE_EMPTY`; SQLSTATE: `HY000`

Message: Filter name cannot be empty.

`ER_AUDIT_LOG_JSON_FILTER_NAME_CANNOT_BE_EMPTY` was added in 8.0.11.

- Error number: `MY-013157`; Symbol: `ER_AUDIT_LOG_USER_NAME_INVALID_CHARACTER`; SQLSTATE: `HY000`

Message: Invalid character in the user name.

`ER_AUDIT_LOG_USER_NAME_INVALID_CHARACTER` was added in 8.0.11.

- Error number: `MY-013158`; Symbol: `ER_AUDIT_LOG_UDF_INSUFFICIENT_PRIVILEGE`; SQLSTATE: `HY000`

Message: Request ignored for '%s'@'%s'. SUPER or AUDIT_ADMIN needed to perform operation

`ER_AUDIT_LOG_UDF_INSUFFICIENT_PRIVILEGE` was added in 8.0.11.

- Error number: `MY-013159`; Symbol: `ER_AUDIT_LOG_NO_KEYRING_PLUGIN_INSTALLED`; SQLSTATE: `HY000`

Message: No keyring plugin installed.

`ER_AUDIT_LOG_NO_KEYRING_PLUGIN_INSTALLED` was added in 8.0.11.

- Error number: `MY-013160`; Symbol: `ER_AUDIT_LOG_HOST_NAME_INVALID_CHARACTER`; SQLSTATE: `HY000`

Message: Invalid character in the host name.

`ER_AUDIT_LOG_HOST_NAME_INVALID_CHARACTER` was added in 8.0.11.

- Error number: `MY-013161`; Symbol:

`ER_AUDIT_LOG_ENCRYPTION_PASSWORD_HAS_NOT_BEEN_SET`; SQLSTATE: `HY000`

Message: Audit log encryption password has not been set; it will be generated automatically. Use `audit_log_encryption_password_get` to obtain the password or `audit_log_encryption_password_set` to set a new one.

`ER_AUDIT_LOG_ENCRYPTION_PASSWORD_HAS_NOT_BEEN_SET` was added in 8.0.11.

- Error number: `MY-013162`; Symbol: `ER_AUDIT_LOG_COULD_NOT_CREATE_AES_KEY`; SQLSTATE: `HY000`

Message: Could not create AES key. OpenSSL's `EVP_BytesToKey` function failed.

`ER_AUDIT_LOG_COULD_NOT_CREATE_AES_KEY` was added in 8.0.11.

- Error number: `MY-013163`; Symbol:

`ER_AUDIT_LOG_ENCRYPTION_PASSWORD_CANNOT_BE_FETCHED`; SQLSTATE: `HY000`

Message: Audit log encryption password cannot be fetched from the keyring. Password used so far is used for encryption.

`ER_AUDIT_LOG_ENCRYPTION_PASSWORD_CANNOT_BE_FETCHED` was added in 8.0.11.

- Error number: `MY-013164`; Symbol: `ER_COULD_NOT_REINITIALIZE_AUDIT_LOG_FILTERS`; SQLSTATE: `HY000`

Message: Could not reinitialize audit log filters.

`ER_COULD_NOT_REINITIALIZE_AUDIT_LOG_FILTERS` was added in 8.0.11.

- Error number: `MY-013165`; Symbol: `ER_AUDIT_LOG_JSON_USER_NAME_CANNOT_BE_EMPTY`; SQLSTATE: `HY000`

Message: User cannot be empty.

`ER_AUDIT_LOG_JSON_USER_NAME_CANNOT_BE_EMPTY` was added in 8.0.11.

- Error number: `MY-013166`; Symbol:

`ER_AUDIT_LOG_USER_FIRST_CHARACTER_MUST_BE_ALPHANUMERIC`; SQLSTATE: `HY000`

Message: First character of the user name must be alphanumeric.

`ER_AUDIT_LOG_USER_FIRST_CHARACTER_MUST_BE_ALPHANUMERIC` was added in 8.0.11.

- Error number: `MY-013167`; Symbol: `ER_AUDIT_LOG_JSON_FILTER_DOES_NOT_EXIST`; SQLSTATE: `HY000`

Message: Specified filter has not been found.

`ER_AUDIT_LOG_JSON_FILTER_DOES_NOT_EXIST` was added in 8.0.11.

- Error number: `MY-013168`; Symbol: `ER_IB_MSG_1271`; SQLSTATE: `HY000`

Message: Cannot upgrade server earlier than 5.7 to 8.0

[ER_IB_MSG_1271](#) was added in 8.0.11.

- Error number: [MY-013169](#); Symbol: [ER_STARTING_INIT](#); SQLSTATE: [HY000](#)

Message: %s (mysqld %s) initializing of server in progress as process %lu

[ER_STARTING_INIT](#) was added in 8.0.11.

- Error number: [MY-013170](#); Symbol: [ER_ENDING_INIT](#); SQLSTATE: [HY000](#)

Message: %s (mysqld %s) initializing of server has completed

[ER_ENDING_INIT](#) was added in 8.0.11.

- Error number: [MY-013171](#); Symbol: [ER_IB_MSG_1272](#); SQLSTATE: [HY000](#)

Message: Cannot boot server version %lu on data directory built by version %llu. Downgrade is not supported

[ER_IB_MSG_1272](#) was added in 8.0.11.

- Error number: [MY-013172](#); Symbol: [ER_SERVER_SHUTDOWN_INFO](#); SQLSTATE: [HY000](#)

Message: Received SHUTDOWN from user %s. Shutting down mysqld (Version: %s).

[ER_SERVER_SHUTDOWN_INFO](#) was added in 8.0.12.

- Error number: [MY-013173](#); Symbol: [ER_GRP_RPL_PLUGIN_ABORT](#); SQLSTATE: [HY000](#)

Message: The plugin encountered a critical error and will abort: %s

[ER_GRP_RPL_PLUGIN_ABORT](#) was added in 8.0.12.

- Error number: [MY-013177](#); Symbol: [ER_AUDIT_LOG_TABLE_DEFINITION_NOT_UPDATED](#); SQLSTATE: [HY000](#)

Message: '%s.%s' table definition has not been upgraded; Please perform the MySQL upgrade procedure.

[ER_AUDIT_LOG_TABLE_DEFINITION_NOT_UPDATED](#) was added in 8.0.12.

- Error number: [MY-013178](#); Symbol: [ER_DD_INITIALIZE_SQL_ERROR](#); SQLSTATE: [HY000](#)

Message: Execution of server-side SQL statement '%s' failed with error code = %d, error message = '%s'.

[ER_DD_INITIALIZE_SQL_ERROR](#) was added in 8.0.12.

- Error number: [MY-013179](#); Symbol: [ER_NO_PATH_FOR_SHARED_LIBRARY](#); SQLSTATE: [HY000](#)

Message: No paths allowed for shared library.

[ER_NO_PATH_FOR_SHARED_LIBRARY](#) was added in 8.0.13.

- Error number: [MY-013180](#); Symbol: [ER_UDF_ALREADY_EXISTS](#); SQLSTATE: [HY000](#)

Message: Function '%s' already exists.

[ER_UDF_ALREADY_EXISTS](#) was added in 8.0.13.

- Error number: [MY-013181](#); Symbol: [ER_SET_EVENT_FAILED](#); SQLSTATE: [HY000](#)

Message: Got Error: %ld from SetEvent.

[ER_SET_EVENT_FAILED](#) was added in 8.0.13.

- Error number: [MY-013182](#); Symbol: [ER_FAILED_TO_ALLOCATE_SSL_BIO](#); SQLSTATE: [HY000](#)

Message: Error allocating SSL BIO.

[ER_FAILED_TO_ALLOCATE_SSL_BIO](#) was added in 8.0.13.

- Error number: [MY-013183](#); Symbol: [ER_IB_MSG_1273](#); SQLSTATE: [HY000](#)

Message: %s

[ER_IB_MSG_1273](#) was added in 8.0.13.

- Error number: [MY-013184](#); Symbol: [ER_PID_FILEPATH_LOCATIONS_INACCESSIBLE](#); SQLSTATE: [HY000](#)

Message: One or several locations were inaccessible while checking PID filepath.

[ER_PID_FILEPATH_LOCATIONS_INACCESSIBLE](#) was added in 8.0.13.

- Error number: [MY-013185](#); Symbol: [ER_UNKNOWN_VARIABLE_IN_PERSISTED_CONFIG_FILE](#); SQLSTATE: [HY000](#)

Message: Currently unknown variable '%s' was read from the persisted config file.

[ER_UNKNOWN_VARIABLE_IN_PERSISTED_CONFIG_FILE](#) was added in 8.0.13.

- Error number: [MY-013186](#); Symbol: [ER_FAILED_TO_HANDLE_DEFAULTS_FILE](#); SQLSTATE: [HY000](#)

Message: Fatal error in defaults handling. Program aborted!

[ER_FAILED_TO_HANDLE_DEFAULTS_FILE](#) was added in 8.0.13.

- Error number: [MY-013187](#); Symbol: [ER_DUPLICATE_SYS_VAR](#); SQLSTATE: [HY000](#)

Message: Duplicate variable name '%s'.

[ER_DUPLICATE_SYS_VAR](#) was added in 8.0.13.

- Error number: [MY-013188](#); Symbol: [ER_FAILED_TO_INIT_SYS_VAR](#); SQLSTATE: [HY000](#)

Message: Failed to initialize system variables.

[ER_FAILED_TO_INIT_SYS_VAR](#) was added in 8.0.13.

- Error number: [MY-013189](#); Symbol: [ER_SYS_VAR_NOT_FOUND](#); SQLSTATE: [HY000](#)

Message: Variable name '%s' not found.

[ER_SYS_VAR_NOT_FOUND](#) was added in 8.0.13.

Message: Error when waiting for the server to execute local transactions in order assure the group change proper logging

[ER_GRP_RPL_SRV_GTID_WAIT_ERROR](#) was added in 8.0.16.

- Error number: [MY-013402](#); Symbol: [ER_GRP_DELAYED_VCLE_LOGGING](#); SQLSTATE: [HY000](#)

Message: Unable to log the group change View log event in its exaction position in the log. This will not however affect the group replication recovery process or the overall plugin process.

[ER_GRP_DELAYED_VCLE_LOGGING](#) was added in 8.0.16.

- Error number: [MY-013404](#); Symbol: [ER_BINLOG_UNABLE_TO_ROTATE_GTID_TABLE_READONLY](#); SQLSTATE: [HY000](#)

Message: Unable to create a new binlog file: Table `mysql.gtid_executed` couldn't be opened. %s

[ER_BINLOG_UNABLE_TO_ROTATE_GTID_TABLE_READONLY](#) was added in 8.0.16.

- Error number: [MY-013405](#); Symbol: [ER_NETWORK_NAMESPACES_NOT_SUPPORTED](#); SQLSTATE: [HY000](#)

Message: Network Namespaces is not supported on this platform

[ER_NETWORK_NAMESPACES_NOT_SUPPORTED](#) was added in 8.0.16.

- Error number: [MY-013406](#); Symbol: [ER_UNKNOWN_NETWORK_NAMESPACE](#); SQLSTATE: [HY000](#)

Message: Unknown network namespace '%s'

[ER_UNKNOWN_NETWORK_NAMESPACE](#) was added in 8.0.16.

- Error number: [MY-013407](#); Symbol: [ER_NETWORK_NAMESPACE_NOT_ALLOWED_FOR_WILDCARD_ADDRESS](#); SQLSTATE: [HY000](#)

Message: Network namespace not allowed for wildcard interface address

[ER_NETWORK_NAMESPACE_NOT_ALLOWED_FOR_WILDCARD_ADDRESS](#) was added in 8.0.16.

- Error number: [MY-013408](#); Symbol: [ER_SETNS_FAILED](#); SQLSTATE: [HY000](#)

Message: setns() failed with error '%s'

[ER_SETNS_FAILED](#) was added in 8.0.16.

- Error number: [MY-013409](#); Symbol: [ER_WILDCARD_NOT_ALLOWED_FOR_MULTIADDRESS_BIND](#); SQLSTATE: [HY000](#)

Message: Wildcard address value not allowed for multivalued bind address

[ER_WILDCARD_NOT_ALLOWED_FOR_MULTIADDRESS_BIND](#) was added in 8.0.16.

- Error number: [MY-013410](#); Symbol: [ER_NETWORK_NAMESPACE_FILE_PATH_TOO_LONG](#); SQLSTATE: [HY000](#)

Message: The path to a special network namespace file is too long. (got %u > max %u)

[ER_NETWORK_NAMESPACE_FILE_PATH_TOO_LONG](#) was added in 8.0.16.

- Error number: [MY-013411](#); Symbol: [ER_IB_MSG_TOO_LONG_PATH](#); SQLSTATE: [HY000](#)

Message: Cannot create tablespace '%s'. The filepath is too long for this OS.

[ER_IB_MSG_TOO_LONG_PATH](#) was added in 8.0.16.

- Error number: [MY-013412](#); Symbol: [ER_IB_RECV_FIRST_REC_GROUP_INVALID](#); SQLSTATE: [HY000](#)

Message: The last block of redo had corrupted first_rec_group and became fixed (%u -> %u).

[ER_IB_RECV_FIRST_REC_GROUP_INVALID](#) was added in 8.0.16.

- Error number: [MY-013413](#); Symbol: [ER_DD_UPGRADE_COMPLETED](#); SQLSTATE: [HY000](#)

Message: Data dictionary upgrade from version '%u' to '%u' completed.

[ER_DD_UPGRADE_COMPLETED](#) was added in 8.0.16.

- Error number: [MY-013414](#); Symbol: [ER_SSL_SERVER_CERT_VERIFY_FAILED](#); SQLSTATE: [HY000](#)
Message: Server SSL certificate doesn't verify: %s

[ER_SSL_SERVER_CERT_VERIFY_FAILED](#) was added in 8.0.16.

- Error number: [MY-013415](#); Symbol: [ER_PERSIST_OPTION_USER_TRUNCATED](#); SQLSTATE: [HY000](#)
Message: Truncated a user name for %s that was too long while reading the persisted variables file

[ER_PERSIST_OPTION_USER_TRUNCATED](#) was added in 8.0.16.

- Error number: [MY-013416](#); Symbol: [ER_PERSIST_OPTION_HOST_TRUNCATED](#); SQLSTATE: [HY000](#)
Message: Truncated a host name for %s that was too long while reading the persisted variables file

[ER_PERSIST_OPTION_HOST_TRUNCATED](#) was added in 8.0.16.

- Error number: [MY-013417](#); Symbol: [ER_NET_WAIT_ERROR](#); SQLSTATE: [HY000](#)
Message: The wait_timeout period was exceeded, the idle time since last command was too long.

[ER_NET_WAIT_ERROR](#) was added in 8.0.16.

- Error number: [MY-013418](#); Symbol: [ER_IB_MSG_1285](#); SQLSTATE: [HY000](#)
Message: '%s' found not encrypted while '%s' is ON. Trying to encrypt it now.

[ER_IB_MSG_1285](#) was added in 8.0.16.

- Error number: [MY-013419](#); Symbol: [ER_IB_MSG_CLOCK_MONOTONIC_UNSUPPORTED](#); SQLSTATE: [HY000](#)
Message: CLOCK_MONOTONIC is unsupported, so do not change the system time when MySQL is running !

[ER_IB_MSG_CLOCK_MONOTONIC_UNSUPPORTED](#) was added in 8.0.16.

- Error number: [MY-013420](#); Symbol: [ER_IB_MSG_CLOCK_GETTIME_FAILED](#); SQLSTATE: [HY000](#)
Message: clock_gettime() failed: %s

[ER_IB_MSG_CLOCK_GETTIME_FAILED](#) was added in 8.0.16.

- Error number: [MY-013421](#); Symbol: [ER_PLUGIN_NOT_EARLY_DUP](#); SQLSTATE: [HY000](#)
Message: Plugin '%s' is not to be used as an "early" plugin. Don't add it to --early-plugin-load, keyring migration etc.

[ER_PLUGIN_NOT_EARLY_DUP](#) was added in 8.0.16.

- Error number: [MY-013422](#); Symbol: [ER_PLUGIN_NO_INSTALL_DUP](#); SQLSTATE: [HY000](#)
Message: Plugin '%s' is marked as not dynamically installable. You have to stop the server to install it.

[ER_PLUGIN_NO_INSTALL_DUP](#) was added in 8.0.16.

- Error number: [MY-013423](#); Symbol: [ER_WARN_DEPRECATED_SQL_CALC_FOUND_ROWS](#); SQLSTATE: [HY000](#)

Message: SQL_CALC_FOUND_ROWS is deprecated and will be removed in a future release. Consider using two separate queries instead.

[ER_WARN_DEPRECATED_SQL_CALC_FOUND_ROWS](#) was added in 8.0.16.
- Error number: [MY-013424](#); Symbol: [ER_WARN_DEPRECATED_FOUND_ROWS](#); SQLSTATE: [HY000](#)

Message: FOUND_ROWS() is deprecated and will be removed in a future release. Consider using COUNT(*) instead.

[ER_WARN_DEPRECATED_FOUND_ROWS](#) was added in 8.0.16.
- Error number: [MY-013425](#); Symbol: [ER_BINLOG_UNSAFE_DEFAULT_EXPRESSION_IN_SUBSTATEMENT](#); SQLSTATE: [HY000](#)

Message: The statement is unsafe because it invokes a trigger or a stored function that modifies a table that has a column with a DEFAULT expression that may return a different value on the slave.

[ER_BINLOG_UNSAFE_DEFAULT_EXPRESSION_IN_SUBSTATEMENT](#) was added in 8.0.16.
- Error number: [MY-013426](#); Symbol: [ER_GRP_RPL_MEMBER_VER_READ_COMPATIBLE](#); SQLSTATE: [HY000](#)

Message: Member version is read compatible with the group.

[ER_GRP_RPL_MEMBER_VER_READ_COMPATIBLE](#) was added in 8.0.16.
- Error number: [MY-013427](#); Symbol: [ER_LOCK_ORDER_INIT_FAILED](#); SQLSTATE: [HY000](#)

Message: Lock order disabled (reason: init failed).

[ER_LOCK_ORDER_INIT_FAILED](#) was added in 8.0.16.
- Error number: [MY-013428](#); Symbol: [ER_AUDIT_LOG_KEYRING_ID_TIMESTAMP_VALUE_IS_INVALID](#); SQLSTATE: [HY000](#)

Message: Keyring ID timestamp value is invalid: '%s'

[ER_AUDIT_LOG_KEYRING_ID_TIMESTAMP_VALUE_IS_INVALID](#) was added in 8.0.16.
- Error number: [MY-013429](#); Symbol: [ER_AUDIT_LOG_FILE_NAME_TIMESTAMP_VALUE_IS_MISSING_OR_INVALID](#); SQLSTATE: [HY000](#)

Message: Cannot process audit log file. File name timestamp value is missing or invalid: '%s'

[ER_AUDIT_LOG_FILE_NAME_TIMESTAMP_VALUE_IS_MISSING_OR_INVALID](#) was added in 8.0.16.
- Error number: [MY-013430](#); Symbol: [ER_AUDIT_LOG_FILE_NAME_DOES_NOT_HAVE_REQUIRED_FORMAT](#); SQLSTATE: [HY000](#)

Message: Cannot process audit log file. File name does not have required format: '%s'

[ER_AUDIT_LOG_FILE_NAME_DOES_NOT_HAVE_REQUIRED_FORMAT](#) was added in 8.0.16.
- Error number: [MY-013431](#); Symbol: [ER_AUDIT_LOG_FILE_NAME_KEYRING_ID_VALUE_IS_MISSING](#); SQLSTATE: [HY000](#)

Message: Cannot process audit log file. File name keyring ID value is missing: '%s'

[ER_AUDIT_LOG_FILE_NAME_KEYRING_ID_VALUE_IS_MISSING](#) was added in 8.0.16.

- Error number: [MY-013432](#); Symbol: [ER_AUDIT_LOG_FILE_HAS_BEEN_SUCCESSFULLY_PROCESSED](#); SQLSTATE: [HY000](#)

Message: Audit log file has been successfully processed: '%s'

[ER_AUDIT_LOG_FILE_HAS_BEEN_SUCCESSFULLY_PROCESSED](#) was added in 8.0.16.

- Error number: [MY-013433](#); Symbol: [ER_AUDIT_LOG_COULD_NOT_OPEN_FILE_FOR_READING](#); SQLSTATE: [HY000](#)

Message: Could not open audit log file for reading: '%s'

[ER_AUDIT_LOG_COULD_NOT_OPEN_FILE_FOR_READING](#) was added in 8.0.16.

- Error number: [MY-013434](#); Symbol: [ER_AUDIT_LOG_INVALID_FILE_CONTENT](#); SQLSTATE: [HY000](#)

Message: Invalid audit log file content: '%s'

[ER_AUDIT_LOG_INVALID_FILE_CONTENT](#) was added in 8.0.16.

- Error number: [MY-013435](#); Symbol: [ER_AUDIT_LOG_CANNOT_READ_PASSWORD](#); SQLSTATE: [HY000](#)

Message: Cannot read password: '%s'

[ER_AUDIT_LOG_CANNOT_READ_PASSWORD](#) was added in 8.0.16.

- Error number: [MY-013436](#); Symbol: [ER_AUDIT_LOG_CANNOT_STORE_PASSWORD](#); SQLSTATE: [HY000](#)

Message: Cannot store password: '%s'

[ER_AUDIT_LOG_CANNOT_STORE_PASSWORD](#) was added in 8.0.16.

- Error number: [MY-013437](#); Symbol: [ER_AUDIT_LOG_CANNOT_REMOVE_PASSWORD](#); SQLSTATE: [HY000](#)

Message: Cannot remove password: '%s'

[ER_AUDIT_LOG_CANNOT_REMOVE_PASSWORD](#) was added in 8.0.16.

- Error number: [MY-013438](#); Symbol: [ER_AUDIT_LOG_PASSWORD_HAS_BEEN_COPIED](#); SQLSTATE: [HY000](#)

Message: 'audit_log' password has been copied into '%s' and will be removed with first purged password.

[ER_AUDIT_LOG_PASSWORD_HAS_BEEN_COPIED](#) was added in 8.0.16.

- Error number: [MY-013447](#); Symbol: [ER_LDAP_EMPTY_USERDN_PASSWORD](#); SQLSTATE: [HY000](#)

Message: Empty user dn or password is not allowed, not attempting LDAP bind.

[ER_LDAP_EMPTY_USERDN_PASSWORD](#) was added in 8.0.16.

- Error number: [MY-013449](#); Symbol: [ER_ACL_WRONG_OR_MISSING_ACL_TABLES_LOG](#); SQLSTATE: [HY000](#)

Message: The current layout of the ACL tables does not conform to the server's expected layout. They're either altered, missing or not upgraded from a previous version. However a best effort attempt to read data from these tables will still be made.

[ER_ACL_WRONG_OR_MISSING_ACL_TABLES_LOG](#) was added in 8.0.17.

- Error number: [MY-013450](#); Symbol: [ER_LOCK_ORDER_FAILED_WRITE_FILE](#); SQLSTATE: [HY000](#)

Message: LOCK_ORDER: Failed to write to file <%s>.

[ER_LOCK_ORDER_FAILED_WRITE_FILE](#) was added in 8.0.17.

- Error number: [MY-013451](#); Symbol: [ER_LOCK_ORDER_FAILED_READ_FILE](#); SQLSTATE: [HY000](#)

Message: LOCK_ORDER: Failed to read from file <%s>.

[ER_LOCK_ORDER_FAILED_READ_FILE](#) was added in 8.0.17.

- Error number: [MY-013452](#); Symbol: [ER_LOCK_ORDER_MESSAGE](#); SQLSTATE: [HY000](#)

Message: LOCK_ORDER message: %s

[ER_LOCK_ORDER_MESSAGE](#) was added in 8.0.17.

- Error number: [MY-013453](#); Symbol: [ER_LOCK_ORDER_DEPENDENCIES_SYNTAX](#); SQLSTATE: [HY000](#)

Message: Lock order dependencies file <%s> (%d:%d) - (%d:%d) : %s

[ER_LOCK_ORDER_DEPENDENCIES_SYNTAX](#) was added in 8.0.17.

- Error number: [MY-013454](#); Symbol: [ER_LOCK_ORDER_SCANNER_SYNTAX](#); SQLSTATE: [HY000](#)

Message: Lock order scanner: (%d:%d) - (%d:%d) : %s

[ER_LOCK_ORDER_SCANNER_SYNTAX](#) was added in 8.0.17.

- Error number: [MY-013455](#); Symbol: [ER_DATA_DIRECTORY_UNUSABLE_DELETABLE](#); SQLSTATE: [HY000](#)

Message: The newly created data directory %s by --initialize is unusable. You can remove it.

[ER_DATA_DIRECTORY_UNUSABLE_DELETABLE](#) was added in 8.0.17.

- Error number: [MY-013456](#); Symbol: [ER_IB_MSG_BTREE_LEVEL_LIMIT_EXCEEDED](#); SQLSTATE: [HY000](#)

Message: No. of B-tree level created for index %s has crossed the permissible limit. If debug option innodb_limit_optimistic_insert_debug is being used try tweaking it to include more records in a page.

[ER_IB_MSG_BTREE_LEVEL_LIMIT_EXCEEDED](#) was added in 8.0.17.

- Error number: [MY-013457](#); Symbol: [ER_IB_CLONE_START_STOP](#); SQLSTATE: [HY000](#)

Message: %s

[ER_IB_CLONE_START_STOP](#) was added in 8.0.17.

- Error number: [MY-013458](#); Symbol: [ER_IB_CLONE_OPERATION](#); SQLSTATE: [HY000](#)
Message: %s
[ER_IB_CLONE_OPERATION](#) was added in 8.0.17.
- Error number: [MY-013459](#); Symbol: [ER_IB_CLONE_RESTART](#); SQLSTATE: [HY000](#)
Message: %s
[ER_IB_CLONE_RESTART](#) was added in 8.0.17.
- Error number: [MY-013460](#); Symbol: [ER_IB_CLONE_USER_DATA](#); SQLSTATE: [HY000](#)
Message: Clone removing all user data for provisioning: %s
[ER_IB_CLONE_USER_DATA](#) was added in 8.0.17.
- Error number: [MY-013461](#); Symbol: [ER_IB_CLONE_NON_INNODB_TABLE](#); SQLSTATE: [HY000](#)
Message: Non innodb table: %s.%s is not cloned and is empty.
[ER_IB_CLONE_NON_INNODB_TABLE](#) was added in 8.0.17.
- Error number: [MY-013462](#); Symbol: [ER_CLONE_SHUTDOWN_TRACE](#); SQLSTATE: [HY000](#)
Message: Clone shutting down server as RESTART failed. Please start server to complete clone operation.
[ER_CLONE_SHUTDOWN_TRACE](#) was added in 8.0.17.
- Error number: [MY-013463](#); Symbol: [ER_GRP_RPL_GTID_PURGED_EXTRACT_ERROR](#); SQLSTATE: [HY000](#)
Message: Error when extracting this member GTID purged set. Operations and checks made to group joiners may be incomplete.
[ER_GRP_RPL_GTID_PURGED_EXTRACT_ERROR](#) was added in 8.0.17.
- Error number: [MY-013464](#); Symbol: [ER_GRP_RPL_CLONE_PROCESS_PREPARE_ERROR](#); SQLSTATE: [HY000](#)
Message: There was an issue when configuring the remote cloning process: %s
[ER_GRP_RPL_CLONE_PROCESS_PREPARE_ERROR](#) was added in 8.0.17.
- Error number: [MY-013465](#); Symbol: [ER_GRP_RPL_CLONE_PROCESS_EXEC_ERROR](#); SQLSTATE: [HY000](#)
Message: There was an issue when cloning from another server: %s
[ER_GRP_RPL_CLONE_PROCESS_EXEC_ERROR](#) was added in 8.0.17.
- Error number: [MY-013466](#); Symbol: [ER_GRP_RPL_RECOVERY_EVAL_ERROR](#); SQLSTATE: [HY000](#)
Message: There was an issue when trying to evaluate the best distributed recovery strategy while joining.%s
[ER_GRP_RPL_RECOVERY_EVAL_ERROR](#) was added in 8.0.17.

- Error number: [MY-013467](#); Symbol: [ER_GRP_RPL_NO_POSSIBLE_RECOVERY](#); SQLSTATE: [HY000](#)

Message: No valid or ONLINE members exist to get the missing data from the group. For cloning check if donors of the same version and with clone plugin installed exist. For incremental recovery check if you have donors where the required data was not purged from the binary logs.

[ER_GRP_RPL_NO_POSSIBLE_RECOVERY](#) was added in 8.0.17.

- Error number: [MY-013468](#); Symbol: [ER_GRP_RPL_CANT_KILL_THREAD](#); SQLSTATE: [HY000](#)

Message: The group replication plugin could not kill the plugin routine for %s. %s

[ER_GRP_RPL_CANT_KILL_THREAD](#) was added in 8.0.17.

- Error number: [MY-013469](#); Symbol: [ER_GRP_RPL_RECOVERY_STRAT_CLONE_THRESHOLD](#); SQLSTATE: [HY000](#)

Message: Due to the number of missing transactions being higher than the configured threshold of %llu, this member will start distributed recovery using clone.

[ER_GRP_RPL_RECOVERY_STRAT_CLONE_THRESHOLD](#) was added in 8.0.17.

- Error number: [MY-013470](#); Symbol: [ER_GRP_RPL_RECOVERY_STRAT_CLONE_PURGED](#); SQLSTATE: [HY000](#)

Message: As no ONLINE member has the missing data for recovering in its binary logs, this member will start distributed recovery using clone.

[ER_GRP_RPL_RECOVERY_STRAT_CLONE_PURGED](#) was added in 8.0.17.

- Error number: [MY-013471](#); Symbol: [ER_GRP_RPL_RECOVERY_STRAT_CHOICE](#); SQLSTATE: [HY000](#)

Message: Distributed recovery will transfer data using: %s

[ER_GRP_RPL_RECOVERY_STRAT_CHOICE](#) was added in 8.0.17.

- Error number: [MY-013472](#); Symbol: [ER_GRP_RPL_RECOVERY_STRAT_FALLBACK](#); SQLSTATE: [HY000](#)

Message: Due to some issue on the previous step distributed recovery is now executing: %s

[ER_GRP_RPL_RECOVERY_STRAT_FALLBACK](#) was added in 8.0.17.

- Error number: [MY-013473](#); Symbol: [ER_GRP_RPL_RECOVERY_STRAT_NO_FALLBACK](#); SQLSTATE: [HY000](#)

Message: Due to a critical cloning error or lack of donors, distributed recovery cannot be executed. The member will now leave the group.

[ER_GRP_RPL_RECOVERY_STRAT_NO_FALLBACK](#) was added in 8.0.17.

- Error number: [MY-013474](#); Symbol: [ER_GRP_RPL_SLAVE_THREAD_ERROR_ON_CLONE](#); SQLSTATE: [HY000](#)

Message: The '%s' thread of channel '%s' will error out as the server will attempt to clone another server

[ER_GRP_RPL_SLAVE_THREAD_ERROR_ON_CLONE](#) was added in 8.0.17.

- Error number: [MY-013475](#); Symbol: [ER_UNKNOWN_TABLE_IN_UPGRADE](#); SQLSTATE: [HY000](#)

Message: Unknown table '%s'

[ER_UNKNOWN_TABLE_IN_UPGRADE](#) was added in 8.0.17.

- Error number: [MY-013476](#); Symbol: [ER_IDENT_CAUSES_TOO_LONG_PATH_IN_UPGRADE](#); SQLSTATE: [HY000](#)

Message: Long database name and identifier for object resulted in path length exceeding %d characters. Path: '%s'.

[ER_IDENT_CAUSES_TOO_LONG_PATH_IN_UPGRADE](#) was added in 8.0.17.

- Error number: [MY-013477](#); Symbol: [ER_XA_CANT_CREATE_MDL_BACKUP](#); SQLSTATE: [HY000](#)

Message: XA: Failed to take MDL Lock backup of PREPARED XA transaction during client disconnect.

[ER_XA_CANT_CREATE_MDL_BACKUP](#) was added in 8.0.13.

- Error number: [MY-013478](#); Symbol: [ER_AUDIT_LOG_SUPER_PRIVILEGE_REQUIRED](#); SQLSTATE: [HY000](#)

Message: SUPER privilege or AUDIT_ADMIN role required for '%s'@'%s' user.

[ER_AUDIT_LOG_SUPER_PRIVILEGE_REQUIRED](#) was added in 8.0.11.

- Error number: [MY-013479](#); Symbol: [ER_AUDIT_LOG_UDF_INVALID_ARGUMENT_TYPE](#); SQLSTATE: [HY000](#)

Message: Invalid argument type

[ER_AUDIT_LOG_UDF_INVALID_ARGUMENT_TYPE](#) was added in 8.0.11.

- Error number: [MY-013480](#); Symbol: [ER_AUDIT_LOG_UDF_INVALID_ARGUMENT_COUNT](#); SQLSTATE: [HY000](#)

Message: Invalid argument count

[ER_AUDIT_LOG_UDF_INVALID_ARGUMENT_COUNT](#) was added in 8.0.11.

- Error number: [MY-013481](#); Symbol: [ER_AUDIT_LOG_HAS_NOT_BEEN_INSTALLED](#); SQLSTATE: [HY000](#)

Message: audit_log plugin has not been installed using INSTALL PLUGIN syntax.

[ER_AUDIT_LOG_HAS_NOT_BEEN_INSTALLED](#) was added in 8.0.11.

- Error number: [MY-013482](#); Symbol: [ER_AUDIT_LOG_UDF_READ_INVALID_MAX_ARRAY_LENGTH_ARG_TYPE](#); SQLSTATE: [HY000](#)

Message: Invalid "max_array_length" argument type.

[ER_AUDIT_LOG_UDF_READ_INVALID_MAX_ARRAY_LENGTH_ARG_TYPE](#) was added in 8.0.11.

- Error number: [MY-013483](#); Symbol: [ER_LOG_CANNOT_WRITE_EXTENDED](#); SQLSTATE: [HY000](#)

Message: Failed to write to %s: %s (%s)

[ER_LOG_CANNOT_WRITE_EXTENDED](#) was added in 8.0.17.

- Error number: [MY-013484](#); Symbol: [ER_UPGRADE_WITH_PARTITIONED_TABLES_REJECTED](#); SQLSTATE: [HY000](#)

Message: Upgrading from server version %d with partitioned tables and lower_case_table_names == 1 on a case sensitive file system may cause issues, and is therefore prohibited. To upgrade anyway, restart the new server version with the command line option 'upgrade=FORCE'. When upgrade is completed, please execute 'RENAME TABLE <part_table_name> TO <new_table_name>; RENAME TABLE <new_table_name> TO <part_table_name>;' for each of the partitioned tables. Please see the documentation for further information.

[ER_UPGRADE_WITH_PARTITIONED_TABLES_REJECTED](#) was added in 8.0.17, removed after 8.0.18.

- Error number: [MY-013485](#); Symbol: [ER_KEYRING_AWS_INCORRECT_PROXY](#); SQLSTATE: [HY000](#)

Message: Incorrect environment variable %s, invalid port: %s

[ER_KEYRING_AWS_INCORRECT_PROXY](#) was added in 8.0.18.

- Error number: [MY-013486](#); Symbol: [ER_GRP_RPL_SERVER_SET_TO_OFFLINE_MODE_DUE_TO_ERRORS](#); SQLSTATE: [HY000](#)

Message: The server was automatically set into offline mode after an error was detected.

[ER_GRP_RPL_SERVER_SET_TO_OFFLINE_MODE_DUE_TO_ERRORS](#) was added in 8.0.18.

- Error number: [MY-013487](#); Symbol: [ER_GRP_RPL_MESSAGE_SERVICE_FATAL_ERROR](#); SQLSTATE: [HY000](#)

Message: Message delivery error on message service of Group Replication. The server will now leave the group.

[ER_GRP_RPL_MESSAGE_SERVICE_FATAL_ERROR](#) was added in 8.0.18.

- Error number: [MY-013488](#); Symbol: [ER_WARN_WRONG_COMPRESSION_ALGORITHM_LOG](#); SQLSTATE: [HY000](#)

Message: Invalid MASTER_COMPRESSION_ALGORITHMS '%s' found in repository for channel '%s'. Resetting to 'uncompressed' (no compression).

[ER_WARN_WRONG_COMPRESSION_ALGORITHM_LOG](#) was added in 8.0.18.

- Error number: [MY-013489](#); Symbol: [ER_WARN_WRONG_COMPRESSION_LEVEL_LOG](#); SQLSTATE: [HY000](#)

Message: Invalid MASTER_ZSTD_COMPRESSION_LEVEL found in repository for channel '%s'. Resetting to %u.

[ER_WARN_WRONG_COMPRESSION_LEVEL_LOG](#) was added in 8.0.18.

- Error number: [MY-013490](#); Symbol: [ER_PROTOCOL_COMPRESSION_RESET_LOG](#); SQLSTATE: [HY000](#)

Message: Option --protocol-compression-algorithms is reset to default value.

[ER_PROTOCOL_COMPRESSION_RESET_LOG](#) was added in 8.0.18.

- Error number: [MY-013491](#); Symbol: [ER_XPLUGIN_COMPRESSION_ERROR](#); SQLSTATE: [HY000](#)

Message: Fatal error while compressing outgoing data - %s

`ER_XPLUGIN_COMPRESSION_ERROR` was added in 8.0.18.

- Error number: `MY-013492`; Symbol: `ER_MYSQLBACKUP_MSG`; SQLSTATE: `HY000`

Message: %s

`ER_MYSQLBACKUP_MSG` was added in 8.0.18.

- Error number: `MY-013493`; Symbol: `ER_WARN_UNKNOWN_KEYRING_AWS_REGION`; SQLSTATE: `HY000`

Message: Unknown keyring_aws_region '%s'. Connection to AWS KMS may fail.

`ER_WARN_UNKNOWN_KEYRING_AWS_REGION` was added in 8.0.18.

- Error number: `MY-013494`; Symbol: `ER_WARN_LOG_PRIVILEGE_CHECKS_USER_DOES_NOT_EXIST`; SQLSTATE: `HY000`

Message: PRIVILEGE_CHECKS_USER for replication channel '%s' was set to '%s'@'%s', but this is not an existing user. Correct this before starting replication threads.

`ER_WARN_LOG_PRIVILEGE_CHECKS_USER_DOES_NOT_EXIST` was added in 8.0.18.

- Error number: `MY-013495`; Symbol: `ER_WARN_LOG_PRIVILEGE_CHECKS_USER_CORRUPT`; SQLSTATE: `HY000`

Message: Invalid, corrupted PRIVILEGE_CHECKS_USER was found in the replication configuration repository for channel '%s'. Use CHANGE MASTER TO PRIVILEGE_CHECKS_USER to correct the configuration.

`ER_WARN_LOG_PRIVILEGE_CHECKS_USER_CORRUPT` was added in 8.0.18.

- Error number: `MY-013496`; Symbol: `ER_WARN_LOG_PRIVILEGE_CHECKS_USER_NEEDS_RPL_APPLIER_PRIV`; SQLSTATE: `HY000`

Message: PRIVILEGE_CHECKS_USER for replication channel '%s' was set to '%s'@'%s', but this user does not have REPLICATION_APPLIER privilege. Correct this before starting the replication threads.

`ER_WARN_LOG_PRIVILEGE_CHECKS_USER_NEEDS_RPL_APPLIER_PRIV` was added in 8.0.18.

- Error number: `MY-013497`; Symbol: `ER_FILE_PRIVILEGE_FOR_REPLICATION_CHECKS`; SQLSTATE: `HY000`

Message: The PRIVILEGE_CHECKS_USER for channel '%s' would need FILE privilege to execute a LOAD DATA INFILE statement replicated in statement format. Consider using binlog_format=ROW on master. If the replicated events are trusted, recover from the failure by temporarily granting FILE to the PRIVILEGE_CHECKS_USER.

`ER_FILE_PRIVILEGE_FOR_REPLICATION_CHECKS` was added in 8.0.18.

- Error number: `MY-013498`; Symbol: `ER_RPL_SLAVE_SQL_THREAD_STARTING_WITH_PRIVILEGE_CHECKS`; SQLSTATE: `HY000`

Message: Slave SQL thread%s initialized, starting replication in log '%s' at position %s, relay log '%s' position: %s, user: '%s'@'%s', roles: %s

`ER_RPL_SLAVE_SQL_THREAD_STARTING_WITH_PRIVILEGE_CHECKS` was added in 8.0.18.

- Error number: [MY-013499](#); Symbol: [ER_AUDIT_LOG_CANNOT_GENERATE_PASSWORD](#); SQLSTATE: [HY000](#)

Message: Cannot generate password: '%s'

[ER_AUDIT_LOG_CANNOT_GENERATE_PASSWORD](#) was added in 8.0.18.
- Error number: [MY-013500](#); Symbol: [ER_INIT_FAILED_TO_GENERATE_ROOT_PASSWORD](#); SQLSTATE: [HY000](#)

Message: Failed to generate a random password for root. Probabably not enough entropy.

[ER_INIT_FAILED_TO_GENERATE_ROOT_PASSWORD](#) was added in 8.0.18.
- Error number: [MY-013501](#); Symbol: [ER_PLUGIN_LOAD_OPTIONS_IGNORED](#); SQLSTATE: [HY000](#)

Message: Ignoring --plugin-load[_add] list as the server is running with --initialize(-insecure).

[ER_PLUGIN_LOAD_OPTIONS_IGNORED](#) was added in 8.0.18.
- Error number: [MY-013502](#); Symbol: [ER_WARN_AUTH_ID_WITH_SYSTEM_USER_PRIV_IN_MANDATORY_ROLES](#); SQLSTATE: [HY000](#)

Message: Cannot set mandatory_roles: AuthId '%s'@'%s' has '%s' privilege. AuthId(s) set in the mandatory_roles are ignored.

[ER_WARN_AUTH_ID_WITH_SYSTEM_USER_PRIV_IN_MANDATORY_ROLES](#) was added in 8.0.18.
- Error number: [MY-013503](#); Symbol: [ER_IB_MSG_SKIP_HIDDEN_DIR](#); SQLSTATE: [HY000](#)

Message: Directory '%s' will not be scanned because it is a hidden directory.

[ER_IB_MSG_SKIP_HIDDEN_DIR](#) was added in 8.0.18.
- Error number: [MY-013504](#); Symbol: [ER_WARN_RPL_RECOVERY_NO_ROTATE_EVENT_FROM_MASTER_EOF](#); SQLSTATE: [HY000](#)

Message: Server was not able to find a rotate event from master server to initialize relay log recovery for channel '%s'. Skipping relay log recovery for the channel.

[ER_WARN_RPL_RECOVERY_NO_ROTATE_EVENT_FROM_MASTER_EOF](#) was added in 8.0.19.
- Error number: [MY-013505](#); Symbol: [ER_IB_LOB_ROLLBACK_INDEX_LEN](#); SQLSTATE: [HY000](#)

Message: Rolling back LOB for transaction %llu undo number %llu : current index length %llu. (iteration %llu)

[ER_IB_LOB_ROLLBACK_INDEX_LEN](#) was added in 8.0.19.
- Error number: [MY-013506](#); Symbol: [ER_CANT_PROCESS_EXPRESSION_FOR_GENERATED_COLUMN_TO_DD](#); SQLSTATE: [HY000](#)

Message: Error in processing (possibly deprecated) expression or function '%s' for generated column %s.%s.%s

[ER_CANT_PROCESS_EXPRESSION_FOR_GENERATED_COLUMN_TO_DD](#) was added in 8.0.19.
- Error number: [MY-013507](#); Symbol: [ER_RPL_SLAVE_QUEUE_EVENT_FAILED_INVALID_NON_ROW_FORMAT](#); SQLSTATE: [HY000](#)

Message: The queue event failed for channel '%s' as an invalid event according to REQUIRE_ROW_FORMAT was found.

ER_RPL_SLAVE_QUEUE_EVENT_FAILED_INVALID_NON_ROW_FORMAT was added in 8.0.19.

- Error number: MY-013508; Symbol: ER_RPL_SLAVE_APPLY_LOG_EVENT_FAILED_INVALID_NON_ROW_FORMAT; SQLSTATE: HY000

Message: The application of relay events failed for channel '%s' as an invalid event according to REQUIRE_ROW_FORMAT was found.

ER_RPL_SLAVE_APPLY_LOG_EVENT_FAILED_INVALID_NON_ROW_FORMAT was added in 8.0.19.

- Error number: MY-013509; Symbol: ER_LOG_PRIV_CHECKS_REQUIRE_ROW_FORMAT_NOT_SET; SQLSTATE: HY000

Message: PRIVILEGE_CHECKS_USER for replication channel '%s' can't be set to '%s'@'%s' unless REQUIRE_ROW_FORMAT is also set to %d.

ER_LOG_PRIV_CHECKS_REQUIRE_ROW_FORMAT_NOT_SET was added in 8.0.19.

- Error number: MY-013510; Symbol: ER_RPL_SLAVE_SQL_THREAD_DETECTED_UNEXPECTED_EVENT_SEQUENCE; SQLSTATE: HY000

Message: An unexpected event sequence was detected by the SQL thread while applying an event.

ER_RPL_SLAVE_SQL_THREAD_DETECTED_UNEXPECTED_EVENT_SEQUENCE was added in 8.0.19.

- Error number: MY-013511; Symbol: ER_IB_MSG_UPGRADE_PARTITION_FILE; SQLSTATE: HY000

Message: Updating partition file name '%s' to '%s' and all other partition files during upgrade

ER_IB_MSG_UPGRADE_PARTITION_FILE was added in 8.0.19.

- Error number: MY-013512; Symbol: ER_IB_MSG_DOWNGRADE_PARTITION_FILE; SQLSTATE: HY000

Message: Updating partition file name '%s' to '%s' and all other partition files during downgrade

ER_IB_MSG_DOWNGRADE_PARTITION_FILE was added in 8.0.19.

- Error number: MY-013513; Symbol: ER_IB_MSG_UPGRADE_PARTITION_FILE_IMPORT; SQLSTATE: HY000

Message: Updating partition file name '%s' to '%s' for import

ER_IB_MSG_UPGRADE_PARTITION_FILE_IMPORT was added in 8.0.19.

- Error number: MY-013514; Symbol: ER_IB_WARN_OPEN_PARTITION_FILE; SQLSTATE: HY000

Message: Unable to open partition file with new name '%s'. Please check if innodb_directories is set to include all external file paths

ER_IB_WARN_OPEN_PARTITION_FILE was added in 8.0.19.

- Error number: MY-013515; Symbol: ER_IB_MSG_FIL_STATE_MOVED_CORRECTED; SQLSTATE: HY000

Message: %s DD ID: %llu - Partition tablespace %u, name '%s' is corrected to '%s'

[ER_IB_MSG_FIL_STATE_MOVED_CORRECTED](#) was added in 8.0.19.

- Error number: [MY-013516](#); Symbol: [ER_IB_MSG_FIL_STATE_MOVED_CHANGED_PATH](#); SQLSTATE: [HY000](#)

Message: %s DD ID: %llu - Tablespace %u, name '%s', '%s' is moved to '%s'

[ER_IB_MSG_FIL_STATE_MOVED_CHANGED_PATH](#) was added in 8.0.19.

- Error number: [MY-013517](#); Symbol: [ER_IB_MSG_FIL_STATE_MOVED_CHANGED_NAME](#); SQLSTATE: [HY000](#)

Message: %s DD ID: %llu - Partition tablespace %u, name '%s', '%s' is updated to '%s'

[ER_IB_MSG_FIL_STATE_MOVED_CHANGED_NAME](#) was added in 8.0.19.

- Error number: [MY-013518](#); Symbol: [ER_IB_MSG_FIL_STATE_MOVED_TOO_MANY](#); SQLSTATE: [HY000](#)

Message: Table Partition: %s is not found in InnoDB dictionary

[ER_IB_MSG_DICT_PARTITION_NOT_FOUND](#) was added in 8.0.19.

- Error number: [MY-013525](#); Symbol: [ER_ACCESS_DENIED_FOR_USER_ACCOUNT_BLOCKED_BY_PASSWORD_LOCK](#); SQLSTATE: [HY000](#)

Message: Access denied for user '%s'@'%s'. Account is blocked for %s day(s) (%s day(s) remaining) due to %u consecutive failed logins. Use FLUSH PRIVILEGES or ALTER USER to reset.

[ER_ACCESS_DENIED_FOR_USER_ACCOUNT_BLOCKED_BY_PASSWORD_LOCK](#) was added in 8.0.19.

- Error number: [MY-013526](#); Symbol: [ER_INNOODB_OUT_OF_RESOURCES](#); SQLSTATE: [HY000](#)

Message: %s

[ER_INNOODB_OUT_OF_RESOURCES](#) was added in 8.0.20.

- Error number: [MY-013527](#); Symbol: [ER_DD_UPGRADE_FOUND_PREPARED_XA_TRANSACTION](#); SQLSTATE: [HY000](#)

Message: Upgrade cannot proceed due to an existing prepared XA transaction.

[ER_DD_UPGRADE_FOUND_PREPARED_XA_TRANSACTION](#) was added in 8.0.19.

- Error number: [MY-013528](#); Symbol: [ER_MIGRATE_TABLE_TO_DD_OOM](#); SQLSTATE: [HY000](#)

Message: Could not allocate memory for key_info when migrating table %s.%s

[ER_MIGRATE_TABLE_TO_DD_OOM](#) was added in 8.0.19.

- Error number: [MY-013529](#); Symbol: [ER_RPL_RELAY_LOG_RECOVERY_INFO_AFTER_CLONE](#); SQLSTATE: [HY000](#)

Message: Relay log information for channel '%s' was found after a clone operation. Relay log recovery will be executed to adjust positions and file information for this new server. Should that automatic procedure fail please adjust the positions through 'CHANGE MASTER TO'

[ER_RPL_RELAY_LOG_RECOVERY_INFO_AFTER_CLONE](#) was added in 8.0.20.

- Error number: [MY-013530](#); Symbol: [ER_IB_MSG_57_UNDO_SPACE_DELETE_FAIL](#); SQLSTATE: [HY000](#)

Message: Failed to delete 5.7 undo tablespace: %s during upgrade

[ER_IB_MSG_57_UNDO_SPACE_DELETE_FAIL](#) was added in 8.0.20.

B.3.2 Client Error Message Reference

Client error messages originate from within the MySQL client library. Here is an example client error message, as displayed by the `mysql` client:

```
shell> mysql -h no-such-host
ERROR 2005 (HY000): Unknown MySQL server host 'no-such-host' (0)
```

Each client error message includes an error code, SQLSTATE value, and message string, as described in [Section B.1, “Error Message Sources and Components”](#). These components are available as described in [Section B.2, “Error Information Interfaces”](#). For client errors, the SQLSTATE value is always 'HY000' (general error), so it is not meaningful for distinguishing one client error from another.

The client library also makes available to host client programs any errors that originate on the server side and are received by the client from the server. For a list of server-side errors, see [Section B.3.1, “Server Error Message Reference”](#).

In addition to the errors in the following list, the client library can also produce error messages that have error codes in the range from 1 to 999. See [Section B.3.3, “Global Error Message Reference”](#)

- Error number: 2000; Symbol: `CR_UNKNOWN_ERROR`;
Message: Unknown MySQL error
- Error number: 2001; Symbol: `CR_SOCKET_CREATE_ERROR`;
Message: Can't create UNIX socket (%d)
- Error number: 2002; Symbol: `CR_CONNECTION_ERROR`;
Message: Can't connect to local MySQL server through socket '%s' (%d)
- Error number: 2003; Symbol: `CR_CONN_HOST_ERROR`;
Message: Can't connect to MySQL server on '%s' (%d)
- Error number: 2004; Symbol: `CR_IPSOCK_ERROR`;
Message: Can't create TCP/IP socket (%d)
- Error number: 2005; Symbol: `CR_UNKNOWN_HOST`;
Message: Unknown MySQL server host '%s' (%d)
- Error number: 2006; Symbol: `CR_SERVER_GONE_ERROR`;
Message: MySQL server has gone away
- Error number: 2007; Symbol: `CR_VERSION_ERROR`;
Message: Protocol mismatch; server version = %d, client version = %d
- Error number: 2008; Symbol: `CR_OUT_OF_MEMORY`;
Message: MySQL client ran out of memory
- Error number: 2009; Symbol: `CR_WRONG_HOST_INFO`;
Message: Wrong host info

- Error number: [2010](#); Symbol: [CR_LOCALHOST_CONNECTION](#);
Message: Localhost via UNIX socket
- Error number: [2011](#); Symbol: [CR_TCP_CONNECTION](#);
Message: %s via TCP/IP
- Error number: [2012](#); Symbol: [CR_SERVER_HANDSHAKE_ERR](#);
Message: Error in server handshake
- Error number: [2013](#); Symbol: [CR_SERVER_LOST](#);
Message: Lost connection to MySQL server during query
- Error number: [2014](#); Symbol: [CR_COMMANDS_OUT_OF_SYNC](#);
Message: Commands out of sync; you can't run this command now

Commands were executed in an improper order. This error occurs when a function is called that is not appropriate for the current state of the connection. For example, if `mysql_stmt_fetch()` is not called enough times to read an entire result set (that is, enough times to return `MYSQL_NO_DATA`), this error may occur for the following C API call.
- Error number: [2015](#); Symbol: [CR_NAMEDPIPE_CONNECTION](#);
Message: Named pipe: %s
- Error number: [2016](#); Symbol: [CR_NAMEDPIPEWAIT_ERROR](#);
Message: Can't wait for named pipe to host: %s pipe: %s (%lu)
- Error number: [2017](#); Symbol: [CR_NAMEDPIPEOPEN_ERROR](#);
Message: Can't open named pipe to host: %s pipe: %s (%lu)
- Error number: [2018](#); Symbol: [CR_NAMEDPIPESETSTATE_ERROR](#);
Message: Can't set state of named pipe to host: %s pipe: %s (%lu)
- Error number: [2019](#); Symbol: [CR_CANT_READ_CHARSET](#);
Message: Can't initialize character set %s (path: %s)
- Error number: [2020](#); Symbol: [CR_NET_PACKET_TOO_LARGE](#);
Message: Got packet bigger than 'max_allowed_packet' bytes
- Error number: [2021](#); Symbol: [CR_EMBEDDED_CONNECTION](#);
Message: Embedded server
- Error number: [2022](#); Symbol: [CR_PROBE_SLAVE_STATUS](#);
Message: Error on SHOW SLAVE STATUS:
- Error number: [2023](#); Symbol: [CR_PROBE_SLAVE_HOSTS](#);
Message: Error on SHOW SLAVE HOSTS:

- Error number: 2024; Symbol: CR_PROBE_SLAVE_CONNECT;
Message: Error connecting to slave:
- Error number: 2025; Symbol: CR_PROBE_MASTER_CONNECT;
Message: Error connecting to master:
- Error number: 2026; Symbol: CR_SSL_CONNECTION_ERROR;
Message: SSL connection error: %s
- Error number: 2027; Symbol: CR_MALFORMED_PACKET;
Message: Malformed packet
- Error number: 2028; Symbol: CR_WRONG_LICENSE;
Message: This client library is licensed only for use with MySQL servers having '%s' license
- Error number: 2029; Symbol: CR_NULL_POINTER;
Message: Invalid use of null pointer
- Error number: 2030; Symbol: CR_NO_PREPARE_STMT;
Message: Statement not prepared
- Error number: 2031; Symbol: CR_PARAMS_NOT_BOUND;
Message: No data supplied for parameters in prepared statement
- Error number: 2032; Symbol: CR_DATA_TRUNCATED;
Message: Data truncated
- Error number: 2033; Symbol: CR_NO_PARAMETERS_EXISTS;
Message: No parameters exist in the statement
- Error number: 2034; Symbol: CR_INVALID_PARAMETER_NO;
Message: Invalid parameter number

The column number for `mysql_stmt_fetch_column()` was invalid.

The parameter number for `mysql_stmt_send_long_data()` was invalid.

A key name was empty or the amount of connection attribute data for `mysql_options4()` exceeds the 64KB limit.
- Error number: 2035; Symbol: CR_INVALID_BUFFER_USE;
Message: Can't send long data for non-string/non-binary data types (parameter: %d)
- Error number: 2036; Symbol: CR_UNSUPPORTED_PARAM_TYPE;
Message: Using unsupported buffer type: %d (parameter: %d)
- Error number: 2037; Symbol: CR_SHARED_MEMORY_CONNECTION;

Message: Shared memory: %s

- Error number: 2038; Symbol: CR_SHARED_MEMORY_CONNECT_REQUEST_ERROR;

Message: Can't open shared memory; client could not create request event (%lu)

- Error number: 2039; Symbol: CR_SHARED_MEMORY_CONNECT_ANSWER_ERROR;

Message: Can't open shared memory; no answer event received from server (%lu)

- Error number: 2040; Symbol: CR_SHARED_MEMORY_CONNECT_FILE_MAP_ERROR;

Message: Can't open shared memory; server could not allocate file mapping (%lu)

- Error number: 2041; Symbol: CR_SHARED_MEMORY_CONNECT_MAP_ERROR;

Message: Can't open shared memory; server could not get pointer to file mapping (%lu)

- Error number: 2042; Symbol: CR_SHARED_MEMORY_FILE_MAP_ERROR;

Message: Can't open shared memory; client could not allocate file mapping (%lu)

- Error number: 2043; Symbol: CR_SHARED_MEMORY_MAP_ERROR;

Message: Can't open shared memory; client could not get pointer to file mapping (%lu)

- Error number: 2044; Symbol: CR_SHARED_MEMORY_EVENT_ERROR;

Message: Can't open shared memory; client could not create %s event (%lu)

- Error number: 2045; Symbol: CR_SHARED_MEMORY_CONNECT_ABANDONED_ERROR;

Message: Can't open shared memory; no answer from server (%lu)

- Error number: 2046; Symbol: CR_SHARED_MEMORY_CONNECT_SET_ERROR;

Message: Can't open shared memory; cannot send request event to server (%lu)

- Error number: 2047; Symbol: CR_CONN_UNKNOW_PROTOCOL;

Message: Wrong or unknown protocol

- Error number: 2048; Symbol: CR_INVALID_CONN_HANDLE;

Message: Invalid connection handle

- Error number: 2049; Symbol: CR_UNUSED_1;

Message: Connection using old (pre-4.1.1) authentication protocol refused (client option 'secure_auth' enabled)

- Error number: 2050; Symbol: CR_FETCH_CANCELED;

Message: Row retrieval was canceled by mysql_stmt_close() call

- Error number: 2051; Symbol: CR_NO_DATA;

Message: Attempt to read column without prior row fetch

- Error number: 2052; Symbol: `CR_NO_STMT_METADATA`;
Message: Prepared statement contains no metadata
- Error number: 2053; Symbol: `CR_NO_RESULT_SET`;
Message: Attempt to read a row while there is no result set associated with the statement
- Error number: 2054; Symbol: `CR_NOT_IMPLEMENTED`;
Message: This feature is not implemented yet
- Error number: 2055; Symbol: `CR_SERVER_LOST_EXTENDED`;
Message: Lost connection to MySQL server at '%s', system error: %d
- Error number: 2056; Symbol: `CR_STMT_CLOSED`;
Message: Statement closed indirectly because of a preceding %s() call
- Error number: 2057; Symbol: `CR_NEW_STMT_METADATA`;
Message: The number of columns in the result set differs from the number of bound buffers. You must reset the statement, rebind the result set columns, and execute the statement again
- Error number: 2058; Symbol: `CR_ALREADY_CONNECTED`;
Message: This handle is already connected. Use a separate handle for each connection.
- Error number: 2059; Symbol: `CR_AUTH_PLUGIN_CANNOT_LOAD`;
Message: Authentication plugin '%s' cannot be loaded: %s
- Error number: 2060; Symbol: `CR_DUPLICATE_CONNECTION_ATTR`;
Message: There is an attribute with the same name already
A duplicate connection attribute name was specified for `mysql_options4()`.
- Error number: 2061; Symbol: `CR_AUTH_PLUGIN_ERR`;
Message: Authentication plugin '%s' reported error: %s
- Error number: 2062; Symbol: `CR_INSECURE_API_ERR`;
Message: Insecure API function call: '%s' Use instead: '%s'
An insecure function call was detected. Modify the application to use the suggested alternative function instead.
- Error number: 2063; Symbol: `CR_FILE_NAME_TOO_LONG`;
Message: File name is too long
`CR_FILE_NAME_TOO_LONG` was added in 8.0.1.
- Error number: 2064; Symbol: `CR_SSL_FIPS_MODE_ERR`;
Message: Set FIPS mode ON/STRICT failed

[CR_SSL_FIPS_MODE_ERR](#) was added in 8.0.11.

- Error number: [2065](#); Symbol: [CR_COMPRESSION_NOT_SUPPORTED](#);
Message: Compression protocol not supported with asynchronous protocol

[CR_COMPRESSION_NOT_SUPPORTED](#) was added in 8.0.16.

- Error number: [2066](#); Symbol: [CR_COMPRESSION_WRONGLY_CONFIGURED](#);
Message: Connection failed due to wrongly configured compression algorithm

[CR_COMPRESSION_WRONGLY_CONFIGURED](#) was added in 8.0.18.

B.3.3 Global Error Message Reference

This section lists “global” error messages that are shared in the sense that they can be produced by the MySQL server or by MySQL client programs. These errors have error codes in the range from 1 to 999.

Each global error message includes an error code, SQLSTATE value, and message string, as described in [Section B.1, “Error Message Sources and Components”](#). These components are available as described in [Section B.2, “Error Information Interfaces”](#). For global errors, the SQLSTATE value is always 'HY000' (general error), so it is not meaningful for distinguishing one client error from another.

If the server writes a message to the error log that has a global error code, it pads the error code with leading zeros to six digits and adds a prefix of [MY-](#) (example: [MY-000022](#)). The following list displays error codes in that format.

If a client returns a message with a global error code, it adds no zero-padding or prefix to the error code.

- Error number: [1](#); Symbol: [EE_CANTCREATEFILE](#);
Message: Can't create/write to file '%s' (OS errno %d - %s)
- Error number: [2](#); Symbol: [EE_READ](#);
Message: Error reading file '%s' (OS errno %d - %s)
- Error number: [3](#); Symbol: [EE_WRITE](#);
Message: Error writing file '%s' (OS errno %d - %s)
- Error number: [4](#); Symbol: [EE_BADCLOSE](#);
Message: Error on close of '%s' (OS errno %d - %s)
- Error number: [5](#); Symbol: [EE_OUTOFMEMORY](#);
Message: Out of memory (Needed %u bytes)
- Error number: [6](#); Symbol: [EE_DELETE](#);
Message: Error on delete of '%s' (OS errno %d - %s)
- Error number: [7](#); Symbol: [EE_LINK](#);
Message: Error on rename of '%s' to '%s' (OS errno %d - %s)

- Error number: 9; Symbol: `EE_EOFERR`;
Message: Unexpected EOF found when reading file '%s' (OS errno %d - %s)
- Error number: 10; Symbol: `EE_CANTLOCK`;
Message: Can't lock file (OS errno %d - %s)
- Error number: 11; Symbol: `EE_CANTUNLOCK`;
Message: Can't unlock file (OS errno %d - %s)
- Error number: 12; Symbol: `EE_DIR`;
Message: Can't read dir of '%s' (OS errno %d - %s)
- Error number: 13; Symbol: `EE_STAT`;
Message: Can't get stat of '%s' (OS errno %d - %s)
- Error number: 14; Symbol: `EE_CANT_CHSIZE`;
Message: Can't change size of file (OS errno %d - %s)
- Error number: 15; Symbol: `EE_CANT_OPEN_STREAM`;
Message: Can't open stream from handle (OS errno %d - %s)
- Error number: 16; Symbol: `EE_GETWD`;
Message: Can't get working directory (OS errno %d - %s)
- Error number: 17; Symbol: `EE_SETWD`;
Message: Can't change dir to '%s' (OS errno %d - %s)
- Error number: 18; Symbol: `EE_LINK_WARNING`;
Message: Warning: '%s' had %d links
- Error number: 19; Symbol: `EE_OPEN_WARNING`;
Message: Warning: %d files and %d streams are left open
- Error number: 20; Symbol: `EE_DISK_FULL`;
Message: Disk is full writing '%s' (OS errno %d - %s). Waiting for someone to free space...
- Error number: 21; Symbol: `EE_CANT_MKDIR`;
Message: Can't create directory '%s' (OS errno %d - %s)
- Error number: 22; Symbol: `EE_UNKNOWN_CHARSET`;
Message: Character set '%s' is not a compiled character set and is not specified in the '%s' file
- Error number: 23; Symbol: `EE_OUT_OF_FILERESOURCES`;
Message: Out of resources when opening file '%s' (OS errno %d - %s)

- Error number: 24; Symbol: `EE_CANT_READLINK`;
Message: Can't read value for symlink '%s' (Error %d - %s)
- Error number: 25; Symbol: `EE_CANT_SYMLINK`;
Message: Can't create symlink '%s' pointing at '%s' (Error %d - %s)
- Error number: 26; Symbol: `EE_REALPATH`;
Message: Error on realpath() on '%s' (Error %d - %s)
- Error number: 27; Symbol: `EE_SYNC`;
Message: Can't sync file '%s' to disk (OS errno %d - %s)
- Error number: 28; Symbol: `EE_UNKNOWN_COLLATION`;
Message: Collation '%s' is not a compiled collation and is not specified in the '%s' file
- Error number: 29; Symbol: `EE_FILENOTFOUND`;
Message: File '%s' not found (OS errno %d - %s)
- Error number: 30; Symbol: `EE_FILE_NOT_CLOSED`;
Message: File '%s' (fileno: %d) was not closed
- Error number: 31; Symbol: `EE_CHANGE_OWNERSHIP`;
Message: Cannot change ownership of the file '%s' (OS errno %d - %s)
- Error number: 32; Symbol: `EE_CHANGE_PERMISSIONS`;
Message: Cannot change permissions of the file '%s' (OS errno %d - %s)
- Error number: 33; Symbol: `EE_CANT_SEEK`;
Message: Cannot seek in file '%s' (OS errno %d - %s)
- Error number: 34; Symbol: `EE_CAPACITY_EXCEEDED`;
Message: Memory capacity exceeded (capacity %llu bytes)
- Error number: 35; Symbol: `EE_DISK_FULL_WITH_RETRY_MSG`;
Message: Disk is full writing '%s' (OS errno %d - %s). Waiting for someone to free space... Retry in %d secs. Message reprinted in %d secs.

`EE_DISK_FULL_WITH_RETRY_MSG` was added in 8.0.13.
- Error number: 36; Symbol: `EE_FAILED_TO_CREATE_TIMER`;
Message: Failed to create timer (OS errno %d).

`EE_FAILED_TO_CREATE_TIMER` was added in 8.0.13.
- Error number: 37; Symbol: `EE_FAILED_TO_DELETE_TIMER`;
Message: Failed to delete timer (OS errno %d).

`EE_FAILED_TO_DELETE_TIMER` was added in 8.0.13.

- Error number: 38; Symbol: `EE_FAILED_TO_CREATE_TIMER_QUEUE`;

Message: Failed to create timer queue (OS errno %d).

`EE_FAILED_TO_CREATE_TIMER_QUEUE` was added in 8.0.13.

- Error number: 39; Symbol: `EE_FAILED_TO_START_TIMER_NOTIFY_THREAD`;

Message: Failed to start timer notify thread.

`EE_FAILED_TO_START_TIMER_NOTIFY_THREAD` was added in 8.0.13.

- Error number: 40; Symbol: `EE_FAILED_TO_CREATE_TIMER_NOTIFY_THREAD_INTERRUPT_EVENT`;

Message: Failed to create event to interrupt timer notifier thread (OS errno %d).

`EE_FAILED_TO_CREATE_TIMER_NOTIFY_THREAD_INTERRUPT_EVENT` was added in 8.0.13.

- Error number: 41; Symbol: `EE_EXITING_TIMER_NOTIFY_THREAD`;

Message: Failed to register timer event with queue (OS errno %d), exiting timer notifier thread.

`EE_EXITING_TIMER_NOTIFY_THREAD` was added in 8.0.13.

- Error number: 42; Symbol: `EE_WIN_LIBRARY_LOAD_FAILED`;

Message: LoadLibrary("kernel32.dll") failed: GetLastError returns %lu.

`EE_WIN_LIBRARY_LOAD_FAILED` was added in 8.0.13.

- Error number: 43; Symbol: `EE_WIN_RUN_TIME_ERROR_CHECK`;

Message: %s.

`EE_WIN_RUN_TIME_ERROR_CHECK` was added in 8.0.13.

- Error number: 44; Symbol: `EE_FAILED_TO_DETERMINE_LARGE_PAGE_SIZE`;

Message: Failed to determine large page size.

`EE_FAILED_TO_DETERMINE_LARGE_PAGE_SIZE` was added in 8.0.13.

- Error number: 45; Symbol: `EE_FAILED_TO_KILL_ALL_THREADS`;

Message: Error in my_thread_global_end(): %d thread(s) did not exit.

`EE_FAILED_TO_KILL_ALL_THREADS` was added in 8.0.13.

- Error number: 46; Symbol: `EE_FAILED_TO_CREATE_IO_COMPLETION_PORT`;

Message: Failed to create IO completion port (OS errno %d).

`EE_FAILED_TO_CREATE_IO_COMPLETION_PORT` was added in 8.0.13.

- Error number: 47; Symbol: `EE_FAILED_TO_OPEN_DEFAULTS_FILE`;

Message: Failed to open required defaults file: %s

`EE_FAILED_TO_OPEN_DEFAULTS_FILE` was added in 8.0.13.

- Error number: 48; Symbol: `EE_FAILED_TO_HANDLE_DEFAULTS_FILE`;

Message: Fatal error in defaults handling. Program aborted!

`EE_FAILED_TO_HANDLE_DEFAULTS_FILE` was added in 8.0.13.

- Error number: 49; Symbol: `EE_WRONG_DIRECTIVE_IN_CONFIG_FILE`;

Message: Wrong '!%s' directive in config file %s at line %d.

`EE_WRONG_DIRECTIVE_IN_CONFIG_FILE` was added in 8.0.13.

- Error number: 50; Symbol: `EE_SKIPPING_DIRECTIVE_DUE_TO_MAX_INCLUDE_RECURSION`;

Message: Skipping '%s' directive as maximum include recursion level was reached in file %s at line %d.

`EE_SKIPPING_DIRECTIVE_DUE_TO_MAX_INCLUDE_RECURSION` was added in 8.0.13.

- Error number: 51; Symbol: `EE_INCORRECT_GRP_DEFINITION_IN_CONFIG_FILE`;

Message: Wrong group definition in config file %s at line %d.

`EE_INCORRECT_GRP_DEFINITION_IN_CONFIG_FILE` was added in 8.0.13.

- Error number: 52; Symbol: `EE_OPTION_WITHOUT_GRP_IN_CONFIG_FILE`;

Message: Found option without preceding group in config file %s at line %d.

`EE_OPTION_WITHOUT_GRP_IN_CONFIG_FILE` was added in 8.0.13.

- Error number: 53; Symbol: `EE_CONFIG_FILE_PERMISSION_ERROR`;

Message: %s should be readable/writable only by current user.

`EE_CONFIG_FILE_PERMISSION_ERROR` was added in 8.0.13.

- Error number: 54; Symbol: `EE_IGNORE_WORLD_WRITABLE_CONFIG_FILE`;

Message: World-writable config file '%s' is ignored.

`EE_IGNORE_WORLD_WRITABLE_CONFIG_FILE` was added in 8.0.13.

- Error number: 55; Symbol: `EE_USING_DISABLED_OPTION`;

Message: %s: Option '%s' was used, but is disabled.

`EE_USING_DISABLED_OPTION` was added in 8.0.13.

- Error number: 56; Symbol: `EE_USING_DISABLED_SHORT_OPTION`;

Message: %s: Option '-%c' was used, but is disabled.

`EE_USING_DISABLED_SHORT_OPTION` was added in 8.0.13.

- Error number: 57; Symbol: `EE_USING_PASSWORD_ON_CLI_IS_INSECURE`;

Message: Using a password on the command line interface can be insecure.

`EE_USING_PASSWORD_ON_CLI_IS_INSECURE` was added in 8.0.13.

- Error number: 58; Symbol: `EE_UNKNOWN_SUFFIX_FOR_VARIABLE`;
Message: Unknown suffix '%c' used for variable '%s' (value '%s').

`EE_UNKNOWN_SUFFIX_FOR_VARIABLE` was added in 8.0.13.

- Error number: 59; Symbol: `EE_SSL_ERROR_FROM_FILE`;
Message: SSL error: %s from '%s'.

`EE_SSL_ERROR_FROM_FILE` was added in 8.0.13.

- Error number: 60; Symbol: `EE_SSL_ERROR`;
Message: SSL error: %s.

`EE_SSL_ERROR` was added in 8.0.13.

- Error number: 61; Symbol: `EE_NET_SEND_ERROR_IN_BOOTSTRAP`;
Message: %d %s.

`EE_NET_SEND_ERROR_IN_BOOTSTRAP` was added in 8.0.13.

- Error number: 62; Symbol: `EE_PACKETS_OUT_OF_ORDER`;
Message: Packets out of order (found %u, expected %u).

`EE_PACKETS_OUT_OF_ORDER` was added in 8.0.13.

- Error number: 63; Symbol: `EE_UNKNOWN_PROTOCOL_OPTION`;
Message: Unknown option to protocol: %s.

`EE_UNKNOWN_PROTOCOL_OPTION` was added in 8.0.13.

- Error number: 64; Symbol: `EE_FAILED_TO_LOCATE_SERVER_PUBLIC_KEY`;
Message: Failed to locate server public key '%s'.

`EE_FAILED_TO_LOCATE_SERVER_PUBLIC_KEY` was added in 8.0.13.

- Error number: 65; Symbol: `EE_PUBLIC_KEY_NOT_IN_PEM_FORMAT`;
Message: Public key is not in Privacy Enhanced Mail format: '%s'.

`EE_PUBLIC_KEY_NOT_IN_PEM_FORMAT` was added in 8.0.13.

- Error number: 66; Symbol: `EE_DEBUG_INFO`;
Message: %s.

`EE_DEBUG_INFO` was added in 8.0.13.

- Error number: 67; Symbol: `EE_UNKNOWN_VARIABLE`;
Message: unknown variable '%s'.

`EE_UNKNOWN_VARIABLE` was added in 8.0.13.

- Error number: 68; Symbol: `EE_UNKNOWN_OPTION`;

Message: unknown option '--%s'.

`EE_UNKNOWN_OPTION` was added in 8.0.13.

- Error number: 69; Symbol: `EE_UNKNOWN_SHORT_OPTION`;

Message: %s: unknown option '-%c'.

`EE_UNKNOWN_SHORT_OPTION` was added in 8.0.13.

- Error number: 70; Symbol: `EE_OPTION_WITHOUT_ARGUMENT`;

Message: %s: option '--%s' cannot take an argument.

`EE_OPTION_WITHOUT_ARGUMENT` was added in 8.0.13.

- Error number: 71; Symbol: `EE_OPTION_REQUIRES_ARGUMENT`;

Message: %s: option '--%s' requires an argument.

`EE_OPTION_REQUIRES_ARGUMENT` was added in 8.0.13.

- Error number: 72; Symbol: `EE_SHORT_OPTION_REQUIRES_ARGUMENT`;

Message: %s: option '-%c' requires an argument.

`EE_SHORT_OPTION_REQUIRES_ARGUMENT` was added in 8.0.13.

- Error number: 73; Symbol: `EE_OPTION_IGNORED_DUE_TO_INVALID_VALUE`;

Message: %s: ignoring option '--%s' due to invalid value '%s'.

`EE_OPTION_IGNORED_DUE_TO_INVALID_VALUE` was added in 8.0.13.

- Error number: 74; Symbol: `EE_OPTION_WITH_EMPTY_VALUE`;

Message: %s: Empty value for '%s' specified.

`EE_OPTION_WITH_EMPTY_VALUE` was added in 8.0.13.

- Error number: 75; Symbol: `EE_FAILED_TO_ASSIGN_MAX_VALUE_TO_OPTION`;

Message: %s: Maximum value of '%s' cannot be set.

`EE_FAILED_TO_ASSIGN_MAX_VALUE_TO_OPTION` was added in 8.0.13.

- Error number: 76; Symbol: `EE_INCORRECT_BOOLEAN_VALUE_FOR_OPTION`;

Message: option '%s': boolean value '%s' was not recognized. Set to OFF.

`EE_INCORRECT_BOOLEAN_VALUE_FOR_OPTION` was added in 8.0.13.

- Error number: 77; Symbol: `EE_FAILED_TO_SET_OPTION_VALUE`;

Message: %s: Error while setting value '%s' to '%s'.

`EE_FAILED_TO_SET_OPTION_VALUE` was added in 8.0.13.

- Error number: 78; Symbol: `EE_INCORRECT_INT_VALUE_FOR_OPTION`;
Message: Incorrect integer value: '%s'.

`EE_INCORRECT_INT_VALUE_FOR_OPTION` was added in 8.0.13.

- Error number: 79; Symbol: `EE_INCORRECT_UINT_VALUE_FOR_OPTION`;
Message: Incorrect unsigned integer value: '%s'.

`EE_INCORRECT_UINT_VALUE_FOR_OPTION` was added in 8.0.13.

- Error number: 80; Symbol: `EE_ADJUSTED_SIGNED_VALUE_FOR_OPTION`;
Message: option '%s': signed value %s adjusted to %s.

`EE_ADJUSTED_SIGNED_VALUE_FOR_OPTION` was added in 8.0.13.

- Error number: 81; Symbol: `EE_ADJUSTED_UNSIGNED_VALUE_FOR_OPTION`;
Message: option '%s': unsigned value %s adjusted to %s.

`EE_ADJUSTED_UNSIGNED_VALUE_FOR_OPTION` was added in 8.0.13.

- Error number: 82; Symbol: `EE_ADJUSTED_ULONGLONG_VALUE_FOR_OPTION`;
Message: option '%s': value %s adjusted to %s.

`EE_ADJUSTED_ULONGLONG_VALUE_FOR_OPTION` was added in 8.0.13.

- Error number: 83; Symbol: `EE_ADJUSTED_DOUBLE_VALUE_FOR_OPTION`;
Message: option '%s': value %g adjusted to %g.

`EE_ADJUSTED_DOUBLE_VALUE_FOR_OPTION` was added in 8.0.13.

- Error number: 84; Symbol: `EE_INVALID_DECIMAL_VALUE_FOR_OPTION`;
Message: Invalid decimal value for option '%s'.

`EE_INVALID_DECIMAL_VALUE_FOR_OPTION` was added in 8.0.13.

- Error number: 85; Symbol: `EE_COLLATION_PARSER_ERROR`;
Message: %s.

`EE_COLLATION_PARSER_ERROR` was added in 8.0.13.

- Error number: 86; Symbol: `EE_FAILED_TO_RESET_BEFORE_PRIMARY_IGNOREABLE_CHAR`;
Message: Failed to reset before a primary ignorable character %s.

`EE_FAILED_TO_RESET_BEFORE_PRIMARY_IGNOREABLE_CHAR` was added in 8.0.13.

- Error number: 87; Symbol: `EE_FAILED_TO_RESET_BEFORE_TERTIARY_IGNOREABLE_CHAR`;
Message: Failed to reset before a tertiary ignorable character %s.

[EE_FAILED_TO_RESET_BEFORE_TERTIARY_IGNOREABLE_CHAR](#) was added in 8.0.13.

- Error number: 88; Symbol: [EE_SHIFT_CHAR_OUT_OF_RANGE](#);

Message: Shift character out of range: %s.

[EE_SHIFT_CHAR_OUT_OF_RANGE](#) was added in 8.0.13.

- Error number: 89; Symbol: [EE_RESET_CHAR_OUT_OF_RANGE](#);

Message: Reset character out of range: %s.

[EE_RESET_CHAR_OUT_OF_RANGE](#) was added in 8.0.13.

- Error number: 90; Symbol: [EE_UNKNOWN_LDML_TAG](#);

Message: Unknown LDML tag: '%.*s'.

[EE_UNKNOWN_LDML_TAG](#) was added in 8.0.13.

- Error number: 91; Symbol: [EE_FAILED_TO_RESET_BEFORE_SECONDARY_IGNOREABLE_CHAR](#);

Message: Failed to reset before a secondary ignorable character %s.

[EE_FAILED_TO_RESET_BEFORE_SECONDARY_IGNOREABLE_CHAR](#) was added in 8.0.16.

B.4 Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

B.4.1 How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:
 - The keyboard does not work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light does not change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
 - The mouse pointer does not move.
 - The machine does not answer to a remote machine's pings.
 - Other programs that are not related to MySQL do not behave correctly.
 - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as [glibc](#)) are up to date.

It is always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.
- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See [Section 5.4, “MySQL Server Logs”](#).
- If you do not think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it does not want to die, there is probably a bug in the operating system.

If you have examined all other possibilities and concluded that the MySQL server or a MySQL client is causing the problem, it is time to create a bug report, see [Section 1.7, “How to Report Bugs or Problems”](#). In the bug report, try to give a complete description of how the system is behaving and what you think is happening. Also state why you think that MySQL is causing the problem. Take into consideration all the situations described in this chapter. State any problems exactly how they appear when you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system does not work.” This provides us with no information about what could be the problem.

If a program fails, it is always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in [Section 1.7, “How to Report Bugs or Problems”](#).

B.4.2 Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

B.4.2.1 Access denied

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server permits client programs to use when connecting. See [Section 6.2, “Access Control and Account Management”](#), and [Section 6.2.21, “Troubleshooting Problems Connecting to MySQL”](#).

B.4.2.2 Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the file system (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you do not specify a host name or if you specify the special host name `localhost`.

If the MySQL server is running on Windows, you can connect using TCP/IP. If the server is started with the `named_pipe` system variable enabled, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you do not give a host name when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that does not work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the host name.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket file name or TCP/IP port number when trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See [Section 2.10.2, "Starting the Server"](#).

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket file name might be different in your setup. `host_ip` represents the IP address of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=SOCKET --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotation marks with the `hostname` command; these cause the output of `hostname` (that is, the current host name) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the host name of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with the `skip_networking` system variable enabled, it will not accept TCP/IP connections at all. If the server was started with the `bind_address` system variable set to `127.0.0.1`, it will listen for TCP/IP connections only locally on the loopback interface and will not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or Windows Firewall may need to be configured not to block the MySQL port.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running on the local host. Check your operating system's process list to ensure the `mysqld` process is present.
- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: [Connection to MySQL Server Failing on Windows](#).
- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See [Section B.4.3.6, "How to Protect or Change the MySQL Unix Socket File"](#).
- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket path name for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

```
shell> netstat -ln | grep mysql
```

See [Section B.4.3.6, "How to Protect or Change the MySQL Unix Socket File"](#).

- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill`) before you can restart the MySQL server. See [Section B.4.3.3, "What to Do If MySQL Keeps Crashing"](#).
- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket file name in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.
- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)
- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, see [Set SELinux context for MySQL Server](#).

Set SELinux context for MySQL Server

The MySQL server reads from and writes to many files, and if the SELinux context is not set correctly on these files then the `mysqld` process may block access to MySQL files. In some cases, this may stop `mysqld` from logging errors.

Required Tools

The semanage binary is used in this guide to manage context; on Enterprise Linux it's part of the [polycoreutils-python](#) package:

```
shell> yum install polycoreutils-python
```

Note

RHEL 6 with Python 2.6: to use semanage with early versions of RHEL 6 with python 2.6, you may need to install a backport of the OrderedDict python collection module using python-pip from the EPEL repository.

List Current MySQL Context

List them using the following:

```
shell> semanage fcontext -l | grep -i mysql
```

Set MySQL Data Directory Context

The default data directory location is [/var/lib/mysql/](#); and the SELinux context used is [mysqld_db_t](#).

If you edit the configuration file to use a different location for the data directory, or for any of the files normally in the data directory (such as the binary logs) you may need to set the context for the new location. For example:

```
shell> semanage fcontext -a -t mysqld_db_t "/path/to/my/custom/datadir(/.*)?"
shell> restorecon -Rv /path/to/my/custom/datadir

shell> semanage fcontext -a -t mysqld_db_t "/path/to/my/custom/logdir(/.*)?"
shell> restorecon -Rv /path/to/my/custom/logdir
```

Set MySQL Error Log File Context

The default location for RedHat RPMs is [/var/log/mysqld.log](#); and the SELinux context used is [mysqld_log_t](#).

If you edit the configuration file to use a different location then you may need to set the context for the new location. For example:

```
shell> semanage fcontext -a -t mysqld_log_t "/path/to/my/custom/error.log"
shell> restorecon -Rv /path/to/my/custom/error.log
```

Set PID File Context

The default location for the PID file is [/var/run/mysqld/mysqld.pid](#); and the SELinux context used is [mysqld_var_run_t](#).

If you edit the configuration file to use a different location then you may need to set the context for the new location. For example:

```
shell> semanage fcontext -a -t mysqld_var_run_t "/path/to/my/custom/pidfile/directory/.*)"
shell> restorecon -Rv /path/to/my/custom/pidfile/directory
```

Set unix-domain Socket Context

The default location for the unix-domain socket is [/var/lib/mysql/mysql.sock](#); and the SELinux context used is [mysqld_var_run_t](#).

If you edit the configuration file to use a different location then you may need to set the context for the new location. For example:

```
shell> semanage fcontext -a -t mysqld_var_run_t "/path/to/my/custom/mysql\.sock"  
shell> restorecon -Rv /path/to/my/custom/mysql.sock
```

Set TCP Port Context

The default TCP port is 3306; and the SELinux context used is `mysqld_port_t`.

If you edit the configuration file to use a different TCP port, or you enable Group Replication which uses an additional port (typically port 13306), you may need to set the context for the new port. For example:

```
shell> semanage port -a -t mysqld_port_t -p tcp 13306  
shell> restorecon
```

Set `secure_file_priv` Directory Context

For MySQL versions since 5.5.53, 5.6.34, 5.7.16, and 8.0.11.

Installing the MySQL server RPM creates a `/var/lib/mysql-files/` directory, but does not set the SELinux context on this directory. This directory is intended to be used for operations such as `SELECT ... INTO OUTFILE`.

If you enabled the use of this directory by setting `secure_file_priv`, you may need to set the context like so:

```
shell> semanage fcontext -a -t mysqld_db_t "/var/lib/mysql-files/(.*)?"  
shell> restorecon -Rv /var/lib/mysql-files
```

Edit this path if you used a different location. For security purposes, this directory should never be within the data directory.

For more information about this variable, see the `secure_file_priv` documentation.

Connection to MySQL Server Failing on Windows

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows does not allow for enough ephemeral (short-lived) ports to serve those connections.

The purpose of `TIME_WAIT` is to keep a connection accepting packets even after the connection has been closed. This is because Internet routing can cause a packet to take a slow route to its destination and it may arrive after both sides have agreed to close. If the port is in use for a new connection, that packet from the old connection could break the protocol or compromise personal information from the original connection. The `TIME_WAIT` delay prevents this by ensuring that the port cannot be reused until after some time has been permitted for those delayed packets to arrive.

It is safe to reduce `TIME_WAIT` greatly on LAN connections because there is little chance of packets arriving at very long delays, as they could through the Internet with its comparatively large distances and latencies.

Windows permits ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a `TIME_WAIT` status for 120 seconds. The port will not be available again until this time expires. The default range of port numbers depends on the version of Windows, with a more limited number of ports in older versions:

- Windows through Server 2003: Ports in range 1025–5000
- Windows Vista, Server 2008, and newer: Ports in range 49152–65535

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

Important

The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore it if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: <http://support.microsoft.com/kb/256986/EN-US/>.

1. Start Registry Editor (`Regedt32.exe`).
2. Locate the following key in the registry:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
```

3. On the **Edit** menu, click **Add Value**, and then add the following registry value:

```
Value Name: MaxUserPort
Data Type: REG_DWORD
Value: 65534
```

This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the **Edit** menu, click **Add Value**, and then add the following registry value:

```
Value Name: TcpTimedWaitDelay
Data Type: REG_DWORD
Value: 30
```

This sets the number of seconds to hold a TCP port connection in `TIME_WAIT` state before closing. The valid range is between 30 and 300 decimal, although you may wish to check with Microsoft for the latest permitted values. The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

B.4.2.3 Lost connection to MySQL server

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes “during query,” this is probably the case you are experiencing.

Sometimes the “during query” form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing `net_read_timeout` from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your `connect_timeout` value is set to only a few seconds, you may be able to resolve the problem by increasing it to ten seconds, perhaps more if you have a very long distance or slow connection. You can determine whether you are experiencing this more uncommon cause by using `SHOW GLOBAL STATUS LIKE 'Aborted_connects'`. It will increase by one for each initial connection attempt that the server aborts. You may see “reading authorization packet” as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with `BLOB` values that are larger than `max_allowed_packet`, which can cause this error with some clients. Sometime you may see an `ER_NET_PACKET_TOO_LARGE` error, and that confirms that you need to increase `max_allowed_packet`.

B.4.2.4 Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

B.4.2.5 Host 'host_name' is blocked

If the following error occurs, it means that `mysqld` has received many connection requests from the given host that were interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.
Unblock with 'mysqladmin flush-hosts'
```

The value of the `max_connect_errors` system variable determines how many successive interrupted connection requests are permitted. After `max_connect_errors` failed requests without a successful connection, `mysqld` assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you flush the host cache by executing a `FLUSH HOSTS` statement, a `TRUNCATE TABLE` statement that truncates the Performance Schema `host_cache` table, or a `mysqladmin flush-hosts` command.

To adjust the permitted number of successive connection errors, set `max_connect_errors` at server startup. For example, put these lines in the server `my.cnf` file:

```
[mysqld]
max_connect_errors=10000
```

The value can also be set at runtime:

```
SET GLOBAL max_connect_errors=10000;
```

If you get the `Host 'host_name' is blocked` error message for a given host, you should first verify that there is nothing wrong with TCP/IP connections from that host. If you are having network problems, it does no good to increase the value of `max_connect_errors`.

For more information about how the host cache works, see [Section 8.12.4.2, “DNS Lookup Optimization and the Host Cache”](#).

B.4.2.6 Too many connections

If clients encounter `Too many connections` errors when attempting to connect to the `mysqld` server, all available connections are in use by other clients.

The permitted number of connections is controlled by the `max_connections` system variable. The default value is 151 to improve performance when MySQL is used with the Apache Web server. To support more connections, set `max_connections` to a larger value.

`mysqld` actually permits `max_connections` + 1 client connections. The extra connection is reserved for use by accounts that have the `CONNECTION_ADMIN` or `SUPER` privilege. By granting the privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See [Section 13.7.7.29, “SHOW PROCESSLIST Statement”](#).

The server also permits administrative connections on a dedicated interface. For more information about how the server handles client connections, see [Section 8.12.4.1, “How MySQL Handles Client Connections”](#).

B.4.2.7 Out of memory

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

B.4.2.8 MySQL server has gone away

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent).

Error Code	Description
<code>CR_SERVER_GONE_ERROR</code>	The client couldn't send a question to the server.
<code>CR_SERVER_LOST</code>	The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See [Section 5.1.8, “Server System Variables”](#).

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` expired) before the command was issued.

The problem on Windows is that in some cases MySQL does not get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

The solution to this is to either do a `mysql_ping()` on the connection if there has been a long time since the last query (this is what Connector/ODBC does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` variable, which has a default value of 64MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in [Section B.4.2.9, "Packet Too Large"](#).

An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.

- It is also possible to see this error if host name lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working—from MySQL's point of view the problem is indistinguishable from any other network timeout.

You may also see the `MySQL server has gone away` error if MySQL is started with the `skip_networking` system variable enabled.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See [Section B.4.3.3, “What to Do If MySQL Keeps Crashing”](#).

You can obtain more information about lost connections by starting `mysqld` with the `log_error_verbosity` system variable set to 3. This logs some of the disconnection messages in the `hostname.err` file. See [Section 5.4.2, “The Error Log”](#).

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See [Section B.4.3.3, “What to Do If MySQL Keeps Crashing”](#).
- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See [Section 29.5, “Debugging and Porting MySQL”](#).
- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the general query log enabled to determine whether the problem query appears in the log? (See [Section 5.4.3, “The General Query Log”](#).)

See also [Section B.4.2.10, “Communication Errors and Aborted Connections”](#), and [Section 1.7, “How to Report Bugs or Problems”](#).

B.4.2.9 Packet Too Large

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a master replication server to a slave.

The largest possible packet that can be transmitted to or from a MySQL 8.0 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues an `ER_NET_PACKET_TOO_LARGE` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 64MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 128MB, start the server like this:

```
shell> mysqld --max_allowed_packet=128M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 128MB, add the following lines in an option file:

```
[mysqld]  
max_allowed_packet=128M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

B.4.2.10 Communication Errors and Aborted Connections

If connection problems occur such as communication errors or aborted connections, use these sources of information to diagnose problems:

- The error log. See [Section 5.4.2, “The Error Log”](#).
- The general query log. See [Section 5.4.3, “The General Query Log”](#).
- The `Aborted_xxx` and `Connection_errors_xxx` status variables. See [Section 5.1.10, “Server Status Variables”](#).
- The host cache, which is accessible using the Performance Schema `host_cache` table. See [Section 8.12.4.2, “DNS Lookup Optimization and the Host Cache”](#), and [Section 26.12.18.1, “The host_cache Table”](#).

If the `log_error_verbosity` system variable is set to 3, you might find messages like this in your error log:

```
[Note] Aborted connection 854 to db: 'employees' user: 'josh'
```

If a client is unable even to connect, the server increments the `Aborted_connects` status variable. Unsuccessful connection attempts can occur for the following reasons:

- A client attempts to access a database but has no privileges for it.
- A client uses an incorrect password.
- A connection packet does not contain the right information.
- It takes more than `connect_timeout` seconds to obtain a connect packet. See [Section 5.1.8, “Server System Variables”](#).

If these kinds of things happen, it might indicate that someone is trying to break into your server! If the general query log is enabled, messages for these types of problems are logged to it.

If a client successfully connects but later disconnects improperly or is terminated, the server increments the `Aborted_clients` status variable, and logs an `Aborted connection` message to the error log. The cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See [Section 5.1.8, “Server System Variables”](#).
- The client program ended abruptly in the middle of a data transfer.

Other reasons for problems with aborted connections or aborted clients:

- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See [Section B.4.2.9, “Packet Too Large”](#).
- Use of Ethernet protocol with Linux, both half and full duplex. Some Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file using FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. Switch the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and test the results to determine the best setting.
- A problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.

See also [Section B.4.2.8, “MySQL server has gone away”](#).

B.4.2.11 The table is full

If a table-full error occurs, it may be that the disk is full or that the table has reached its maximum size. The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. See [Section 8.4.6, “Limits on Table Size”](#).

B.4.2.12 Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '...\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See [Section 4.2.2.2, “Using Option Files”](#).

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `perror`. One reason the server cannot write to a table is that the file system is full:

```
shell> perror 28
OS error code 28: No space left on device
```

If you get an error of the following type during startup, it indicates that the file system or directory used for storing data files is write protected. Provided that the write error is to a test file, the error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

B.4.2.13 Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

B.4.2.14 Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

```
Found wrong password for user 'some_user'@'some_host'; ignoring user
```

As a result, the account is simply ignored by the permission system. To fix this problem, assign a new, valid password to the account.

B.4.2.15 Table 'tbl_name' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a file system that has case-sensitive file names.
- Even for file systems that are not case-sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See [Section 13.7.7, “SHOW Statements”](#).

B.4.2.16 Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multibyte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `CMake` with the `-DDEFAULT_CHARSET=charset_name` option. See [Section 2.9.7, “MySQL Source-Configuration Options”](#).

All standard MySQL binaries are compiled with support for all multibyte character sets.

- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

In this case, you need to use one of the following methods to solve the problem:

- Recompile the client with support for the character set. See [Section 2.9.7, “MySQL Source-Configuration Options”](#).
- Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
- Copy the character definition files to the path where the client expects them to be.

B.4.2.17 File Not Found and Similar Errors

If you get `ERROR 'file_name' not found (errno: 23), Can't open file: file_name (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you have not allocated enough file descriptors for the MySQL server. You can use the `pererror` utility to get a description of what the error number means:

```
shell> pererror 23
OS error code 23: File table overflow
shell> pererror 24
OS error code 24: Too many open files
shell> pererror 11
OS error code 11: Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` system variable (the default value is 64). This may not entirely prevent running out of file descriptors because in some circumstances the server may attempt to extend the cache size temporarily, as described in [Section 8.4.3.1, “How MySQL Opens and Closes Tables”](#). Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or set the `open_files_limit` system variable. See [Section 5.1.8, “Server System Variables”](#). The easiest way to set these values is to add an option to your option file. See [Section 4.2.2.2, “Using Option Files”](#). If you have an old version of `mysqld` that does not support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the `#` character to uncomment this line, and change the number 256 to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

Note

If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

B.4.2.18 Table-Corruption Issues

If you have started `mysqld` with the `myisam_recover_options` system variable set, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or

'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file `'Warning: Checking table ...'` which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further.

When the server detects `MyISAM` table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: `Got an error from thread_id=1, mi_dynrec.c:368`. This is useful information to include in bug reports.

See also [Section 5.1.7, “Server Command Options”](#), and [Section 29.5.1.7, “Making a Test Case If You Experience Table Corruption”](#).

B.4.3 Administration-Related Issues

B.4.3.1 Problems with File Permissions

If you have problems with file permissions, the `UMASK` or `UMASK_DIR` environment variable might be set incorrectly when `mysqld` starts. For example, `mysqld` might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/file_name' (Errcode: 13)
```

The default `UMASK` and `UMASK_DIR` values are `0640` and `0750`, respectively. `mysqld` assumes that the value for `UMASK` or `UMASK_DIR` is in octal if it starts with a zero. For example, setting `UMASK=0600` is equivalent to `UMASK=384` because `0600` octal is `384` decimal.

Assuming that you start `mysqld` using `mysqld_safe`, change the default `UMASK` value as follows:

```
UMASK=384 # = 600 in octal
export UMASK
mysqld_safe &
```

Note

An exception applies for the error log file if you start `mysqld` using `mysqld_safe`, which does not respect `UMASK`: `mysqld_safe` may create the error log file if it does not exist prior to starting `mysqld`, and `mysqld_safe` uses a umask set to a strict value of `0137`. If this is unsuitable, create the error file manually with the desired access mode prior to executing `mysqld_safe`.

By default, `mysqld` creates database directories with an access permission value of `0750`. To modify this behavior, set the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, to give group access to all new directories, start `mysqld_safe` as follows:

```
UMASK_DIR=504 # = 770 in octal
export UMASK_DIR
mysqld_safe &
```

For additional details, see [Section 4.9, “Environment Variables”](#).

B.4.3.2 How to Reset the Root Password

If you have never assigned a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, this is insecure. For instructions on assigning a password, see [Section 2.10.4, “Securing the Initial MySQL Account”](#).

If you know the `root` password and want to change it, see [Section 13.7.1.1, “ALTER USER Statement”](#), and [Section 13.7.1.10, “SET PASSWORD Statement”](#).

If you assigned a `root` password previously but have forgotten it, you can assign a new password. The following sections provide instructions for Windows and Unix and Unix-like systems, as well as generic instructions that apply to any system.

Resetting the Root Password: Windows Systems

On Windows, use the following procedure to reset the password for the MySQL `'root'@'localhost'` account. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

1. Log on to your system as Administrator.
2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager: From the **Start** menu, select **Control Panel**, then **Administrative Tools**, then **Services**. Find the MySQL service in the list and stop it.

If your server is not running as a service, you may need to use the Task Manager to force it to stop.

3. Create a text file containing the password-assignment statement on a single line. Replace the password with the password that you want to use.

```
ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

4. Save the file. This example assumes that you name the file `C:\mysql-init.txt`.
5. Open a console window to get to the command prompt: From the **Start** menu, select **Run**, then enter `cmd` as the command to be run.
6. Start the MySQL server with the `init_file` system variable set to name the file (notice that the backslash in the option value is doubled):

```
C:\> cd "C:\Program Files\MySQL\MySQL Server 8.0\bin"
C:\> mysql --init-file=C:\mysql-init.txt
```

If you installed MySQL to a different location, adjust the `cd` command accordingly.

The server executes the contents of the file named by the `init_file` system variable at startup, changing the `'root'@'localhost'` account password.

To have server output to appear in the console window rather than in a log file, add the `--console` option to the `mysql` command.

If you installed MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option. For example:

```
C:\> mysql
      --defaults-file="C:\\ProgramData\\MySQL\\MySQL Server 8.0\\my.ini"
      --init-file=C:\\mysql-init.txt
```

The appropriate `--defaults-file` setting can be found using the Services Manager: From the **Start** menu, select **Control Panel**, then **Administrative Tools**, then **Services**. Find the MySQL service in the list, right-click it, and choose the **Properties** option. The **Path to executable** field contains the `--defaults-file` setting.

7. After the server has started successfully, delete `C:\mysql-init.txt`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the MySQL server and restart it normally. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

Resetting the Root Password: Unix and Unix-Like Systems

On Unix, use the following procedure to reset the password for the MySQL `'root'@'localhost'` account. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

The instructions assume that you will start the MySQL server from the Unix login account that you normally use for running it. For example, if you run the server using the `mysql` login account, you should log in as `mysql` before using the instructions. Alternatively, you can log in as `root`, but in this case you *must* start `mysqld` with the `--user=mysql` option. If you start the server as `root` without using `--user=mysql`, the server may create `root`-owned files in the data directory, such as log files, and these may cause permission-related problems for future server startups. If that happens, you will need to either change the ownership of the files to `mysql` or remove them.

1. Log on to your system as the Unix user that the MySQL server runs as (for example, `mysql`).
2. Stop the MySQL server if it is running. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, host name, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the file name has an extension of `.pid` and begins with either `mysqld` or your system's host name.

Stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process. Use the actual path name of the `.pid` file in the following command:

```
shell> kill `cat /mysql-data-directory/host_name.pid`
```

Use backticks (not forward quotation marks) with the `cat` command. These cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file containing the password-assignment statement on a single line. Replace the password with the password that you want to use.

```
ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

4. Save the file. This example assumes that you name the file `/home/me/mysql-init`. The file contains the password, so do not save it where it can be read by other users. If you are not logged in as `mysql` (the user the server runs as), make sure that the file has permissions that permit `mysql` to read it.
5. Start the MySQL server with the `init_file` system variable set to name the file:

```
shell> mysqld --init-file=/home/me/mysql-init &
```

The server executes the contents of the file named by the `init_file` system variable at startup, changing the `'root'@'localhost'` account password.

Other options may be necessary as well, depending on how you normally start your server. For example, `--defaults-file` may be needed before the `init_file` argument.

6. After the server has started successfully, delete `/home/me/mysql-init`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally.

Resetting the Root Password: Generic Instructions

The preceding sections provide password-resetting instructions specifically for Windows and Unix and Unix-like systems. Alternatively, on any platform, you can reset the password using the `mysql` client (but this approach is less secure):

1. Stop the MySQL server if necessary, then restart it with the `--skip-grant-tables` option. This enables anyone to connect without a password and with all privileges, and disables account-management statements such as `ALTER USER` and `SET PASSWORD`. Because this is insecure, if the server is started with the `--skip-grant-tables` option, it also disables remote connections by enabling `skip_networking`.
2. Connect to the MySQL server using the `mysql` client; no password is necessary because the server was started with `--skip-grant-tables`:

```
shell> mysql
```

3. In the `mysql` client, tell the server to reload the grant tables so that account-management statements work:

```
mysql> FLUSH PRIVILEGES;
```

Then change the `'root'@'localhost'` account password. Replace the password with the password that you want to use. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

```
mysql> ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally (without the `--skip-grant-tables` option and without enabling the `skip_networking` system variable).

B.4.3.3 What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This does not mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See [Section 5.4.2, “The Error Log”](#).

On some systems, you can find in the error log a stack trace of where `mysqld` died. Note that the variable values written in the error log may not always be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with the `delay_key_write` system variable enabled, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that does not support good file system locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it is at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all `MyISAM` tables, and restart `mysqld`. This ensures that you are running from a clean state. See [Chapter 5, MySQL Server Administration](#).
- Start `mysqld` with the general query log enabled (see [Section 5.4.3, “The General Query Log”](#)). Then try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See [Section 5.4.3, “The General Query Log”](#). If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have isolated the bug and should submit a bug report for it. See [Section 1.7, “How to Report Bugs or Problems”](#).
- Try to make a test case that we can use to repeat the problem. See [Section 29.5, “Debugging and Porting MySQL”](#).
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- Configuring MySQL for debugging makes it much easier to gather information about possible errors if something goes wrong. Reconfigure MySQL with the `-DWITH_DEBUG=1` option to `CMake` and then recompile. See [Section 29.5, “Debugging and Porting MySQL”](#).
- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- If `mysqld` appears to be running but not responding, try `mysqladmin -u root processlist`. Sometimes `mysqld` is not hung even though it seems unresponsive. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while running other queries.
- Try the following:

1. Start `mysqld` from `gdb` (or another debugger). See [Section 29.5, “Debugging and Porting MySQL”](#).
2. Run your test scripts.
3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

```
backtrace
info local
up
info local
up
info local
```

With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where `N` is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to crash or misbehave.
- Send a normal bug report. See [Section 1.7, “How to Report Bugs or Problems”](#). Be even more detailed than usual. Because MySQL works for many people, the crash might result from something that exists only on your computer (for example, an error that is related to your particular system libraries).
- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

The current dynamic row code has been in use for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Consider the possibility of hardware faults when diagnosing problems. Defective hardware can be the cause of data corruption. Pay particular attention to your memory and disk subsystems when troubleshooting hardware.

B.4.3.4 How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- Alternatively, to abort the thread, use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).

- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition enables the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for `ALTER TABLE`, the old table is left unchanged.

B.4.3.5 Where MySQL Stores Temporary Files

On Unix, MySQL uses the value of the `TMPDIR` environment variable as the path name of the directory in which to store temporary files. If `TMPDIR` is not set, MySQL uses the system default, which is usually `/tmp`, `/var/tmp`, or `/usr/tmp`.

On Windows, MySQL checks in order the values of the `TMPDIR`, `TEMP`, and `TMP` environment variables. For the first one found to be set, MySQL uses it and does not check those remaining. If none of `TMPDIR`, `TEMP`, or `TMP` are set, MySQL uses the Windows system default, which is usually `C:\windows\temp\`.

If the file system containing your temporary file directory is too small, you can use the `mysqld --tmpdir` option to specify a directory in a file system where you have enough space.

The `--tmpdir` option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (:) on Unix and semicolon characters (;) on Windows.

Note

To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you can set the `slave_load_tmpdir` system variable to specify a separate directory for holding temporary files when replicating `LOAD DATA` statements. This directory should be in a disk-based file system (not a memory-based file system) so that the temporary files used to replicate `LOAD DATA` can survive machine restarts. The directory also should not be one that is cleared by the operating system during the system startup process. However, replication can now continue after a restart if the temporary files have been removed.

MySQL arranges that temporary files are removed if `mysqld` is terminated. On platforms that support it (such as Unix), this is done by unlinking the file after opening it. The disadvantage of this is that the name does not appear in directory listings and you do not see a big temporary file that fills up the file system in which the temporary file directory is located. (In such cases, `ls -l` may be helpful in identifying large files associated with `mysqld`.)

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some statements, MySQL creates temporary SQL tables that are not hidden and have names that begin with `#sql`.

Some `SELECT` queries creates temporary SQL tables to hold intermediate results.

DDL operations that rebuild the table and are not performed online using the `ALGORITHM=INPLACE` technique create a temporary copy of the original table in the same directory as the original table.

Online DDL operations may use temporary log files for recording concurrent DML, temporary sort files when creating an index, and temporary intermediate tables files when rebuilding the table. For more information, see [Section 15.12.3, “Online DDL Space Requirements”](#).

InnoDB user-created temporary tables and on-disk internal temporary tables are created in a temporary tablespace file named `ibtmp1` in the MySQL data directory. For more information, see [Section 15.6.3.5, “Temporary Tablespaces”](#).

See also [Section 15.15.7, “InnoDB INFORMATION_SCHEMA Temporary Table Info Table”](#).

The optional `EXTENDED` modifier causes `SHOW TABLES` to list hidden tables created by failed `ALTER TABLE` statements. See [Section 13.7.7.37, “SHOW TABLES Statement”](#).

B.4.3.6 How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the `sticky` bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

```
[mysqld]
socket=/path/to/socket

[client]
socket=/path/to/socket
```

See [Section 4.2.2.2, “Using Option Files”](#).

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.
- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.
- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `MYSQL_UNIX_ADDR` option when you run `CMake`. See [Section 2.9.7, “MySQL Source-Configuration Options”](#).

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

B.4.3.7 Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs (for example, in `mysqld_safe` or `mysql.server`). See [Section 4.9, “Environment Variables”](#).

You can set the time zone for the server with the `--timezone=timezone_name` option to `mysqld_safe`. You can also set it by setting the `TZ` environment variable before you start `mysqld`.

The permissible values for `--timezone` or `TZ` are system dependent. Consult your operating system documentation to see what values are acceptable.

B.4.4 Query-Related Issues

B.4.4.1 Case Sensitivity in String Searches

For nonbinary strings (`CHAR`, `VARCHAR`, `TEXT`), string searches use the collation of the comparison operands. For binary strings (`BINARY`, `VARBINARY`, `BLOB`), comparisons use the numeric values of the bytes in the operands; this means that for alphabetic characters, comparisons will be case-sensitive.

A comparison between a nonbinary string and binary string is treated as a comparison of binary strings.

Simple comparison operations (`>=`, `>`, `=`, `<`, `<=`, sorting, and grouping) are based on each character's “sort value.” Characters with the same sort value are treated as the same character. For example, if `e` and `é` have the same sort value in a given collation, they compare as equal.

The default character set and collation are `utf8mb4` and `utf8mb4_0900_ai_ci`, so nonbinary string comparisons are case-insensitive by default. This means that if you search with `col_name LIKE 'a%'`, you get all column values that start with `A` or `a`. To make this search case-sensitive, make sure that one of the operands has a case-sensitive or binary collation. For example, if you are comparing a column and a string that both have the `utf8mb4` character set, you can use the `COLLATE` operator to cause either operand to have the `utf8mb4_0900_as_cs` or `utf8mb4_bin` collation:

```
col_name COLLATE utf8mb4_0900_as_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE utf8mb4_0900_as_cs
col_name COLLATE utf8mb4_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE utf8mb4_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case-sensitive or binary collation. See [Section 13.1.20, “CREATE TABLE Statement”](#).

To cause a case-sensitive comparison of nonbinary strings to be case-insensitive, use `COLLATE` to name a case-insensitive collation. The strings in the following example normally are case-sensitive, but `COLLATE` changes the comparison to be case-insensitive:

```
mysql> SET NAMES 'utf8mb4';
mysql> SET @s1 = 'MySQL' COLLATE utf8mb4_bin,
        @s2 = 'mysql' COLLATE utf8mb4_bin;
mysql> SELECT @s1 = @s2;
+-----+
| @s1 = @s2 |
+-----+
|          0 |
+-----+
mysql> SELECT @s1 COLLATE utf8mb4_0900_ai_ci = @s2;
```

```
+-----+
| @s1 COLLATE utf8mb4_0900_ai_ci = @s2 |
+-----+
|                                     1 |
+-----+
```

A binary string is case-sensitive in comparisons. To compare the string as case-insensitive, convert it to a nonbinary string and use `COLLATE` to name a case-insensitive collation:

```
mysql> SET @s = BINARY 'MySQL';
mysql> SELECT @s = 'mysql';
+-----+
| @s = 'mysql' |
+-----+
|             0 |
+-----+
mysql> SELECT CONVERT(@s USING utf8mb4) COLLATE utf8mb4_0900_ai_ci = 'mysql';
+-----+
| CONVERT(@s USING utf8mb4) COLLATE utf8mb4_0900_ai_ci = 'mysql' |
+-----+
|                                     1 |
+-----+
```

To determine whether a value will compare as a nonbinary or binary string, use the `COLLATION()` function. This example shows that `VERSION()` returns a string that has a case-insensitive collation, so comparisons are case-insensitive:

```
mysql> SELECT COLLATION(VERSION());
+-----+
| COLLATION(VERSION()) |
+-----+
| utf8_general_ci      |
+-----+
```

For binary strings, the collation value is `binary`, so comparisons will be case sensitive. One context in which you will see `binary` is for compression functions, which return binary strings as a general rule: string:

```
mysql> SELECT COLLATION(COMPRESS('x'));
+-----+
| COLLATION(COMPRESS('x')) |
+-----+
| binary                   |
+-----+
```

To check the sort value of a string, the `WEIGHT_STRING()` may be helpful. See [Section 12.5, “String Functions and Operators”](#).

B.4.4.2 Problems Using DATE Columns

The format of a `DATE` value is `'YYYY-MM-DD'`. According to standard SQL, no other format is permitted. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
SELECT * FROM t1 WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in a numeric context and vice versa. MySQL also permits a “relaxed” string format when updating and in a `WHERE` clause that compares a date to a `DATE`, `DATETIME`, or `TIMESTAMP` column. “Relaxed” format means that any punctuation character may be used as the separator between parts. For example, `'2004-08-15'` and `'2004#08#15'` are equivalent. MySQL can also convert a string containing no separators (such as `'20040815'`), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any comparison method other than those just listed, such as `IN` or `STRCMP()`.

For those exceptions, the comparison is done by converting the objects to strings and performing a string comparison.

To be on the safe side, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special “zero” date `'0000-00-00'` can be stored and retrieved as `'0000-00-00'`. When a `'0000-00-00'` date is used through Connector/ODBC, it is automatically converted to `NULL` because ODBC cannot handle that kind of date.

Because MySQL performs the conversions just described, the following statements work (assume that `idate` is a `DATE` column):

```
INSERT INTO t1 (idate) VALUES (19970505);
INSERT INTO t1 (idate) VALUES ('19970505');
INSERT INTO t1 (idate) VALUES ('97-05-05');
INSERT INTO t1 (idate) VALUES ('1997.05.05');
INSERT INTO t1 (idate) VALUES ('1997 05 05');
INSERT INTO t1 (idate) VALUES ('0000-00-00');

SELECT idate FROM t1 WHERE idate >= '1997-05-05';
SELECT idate FROM t1 WHERE idate >= 19970505;
SELECT MOD(idate,100) FROM t1 WHERE idate >= 19970505;
SELECT idate FROM t1 WHERE idate >= '19970505';
```

However, the following statement does not work:

```
SELECT idate FROM t1 WHERE STRCMP(idate,'20030505')=0;
```

`STRCMP()` is a string function, so it converts `idate` to a string in `'YYYY-MM-DD'` format and performs a string comparison. It does not convert `'20030505'` to the date `'2003-05-05'` and perform a date comparison.

If you enable the `ALLOW_INVALID_DATES` SQL mode, MySQL permits you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12. This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

MySQL permits you to store dates where the day or month and day are zero. This is convenient if you want to store a birthdate in a `DATE` column and you know only part of the date. To disallow zero month or day parts in dates, enable the `NO_ZERO_IN_DATE` mode.

MySQL permits you to store a “zero” value of `'0000-00-00'` as a “dummy date.” This is in some cases more convenient than using `NULL` values. If a date to be stored in a `DATE` column cannot be converted to any reasonable value, MySQL stores `'0000-00-00'`. To disallow `'0000-00-00'`, enable the `NO_ZERO_DATE` mode.

To have MySQL check all dates and accept only legal dates (unless overridden by `IGNORE`), set the `sql_mode` system variable to `"NO_ZERO_IN_DATE,NO_ZERO_DATE"`.

B.4.4.3 Problems with NULL Values

The concept of the `NULL` value is a common source of confusion for newcomers to SQL, who often think that `NULL` is the same thing as an empty string `' '`. This is not the case. For example, the following statements are completely different:

```
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the `phone` column, but the first inserts a `NULL` value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the person is known to have no phone, and thus no phone number.”

To help with `NULL` handling, you can use the `IS NULL` and `IS NOT NULL` operators and the `IFNULL()` function.

In SQL, the `NULL` value is never true in comparison to any other value, even `NULL`. An expression that contains `NULL` always produces a `NULL` value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return `NULL`:

```
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

To search for column values that are `NULL`, you cannot use an `expr = NULL` test. The following statement returns no rows, because `expr = NULL` is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for `NULL` values, you must use the `IS NULL` test. The following statements show how to find the `NULL` phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See [Section 3.3.4.6, “Working with NULL Values”](#), for additional information and examples.

You can add an index on a column that can have `NULL` values if you are using the `MyISAM`, `InnoDB`, or `MEMORY` storage engine. Otherwise, you must declare an indexed column `NOT NULL`, and you cannot insert `NULL` into the column.

When reading data with `LOAD DATA`, empty or missing columns are updated with `' '`. To load a `NULL` value into a column, use `\N` in the data file. The literal word `NULL` may also be used under some circumstances. See [Section 13.2.7, “LOAD DATA Statement”](#).

When using `DISTINCT`, `GROUP BY`, or `ORDER BY`, all `NULL` values are regarded as equal.

When using `ORDER BY`, `NULL` values are presented first, or last if you specify `DESC` to sort in descending order.

Aggregate (summary) functions such as `COUNT()`, `MIN()`, and `SUM()` ignore `NULL` values. The exception to this is `COUNT(*)`, which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-`NULL` values in the `age` column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles `NULL` values specially. If you insert `NULL` into a `TIMESTAMP` column, the current date and time is inserted. If you insert `NULL` into an integer or floating-point column that has the `AUTO_INCREMENT` attribute, the next number in the sequence is inserted.

B.4.4.4 Problems with Column Aliases

An alias can be used in a query select list to give a column a different name. You can use the alias in `GROUP BY`, `ORDER BY`, or `HAVING` clauses to refer to the column:

```
SELECT SQRT(a*b) AS root FROM tbl_name
  GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name
  GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL disallows references to column aliases in a `WHERE` clause. This restriction is imposed because when the `WHERE` clause is evaluated, the column value may not yet have been determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name
  WHERE cnt > 0 GROUP BY id;
```

The `WHERE` clause determines which rows should be included in the `GROUP BY` clause, but it refers to the alias of a column value that is not known until after the rows have been selected, and grouped by the `GROUP BY`.

In the select list of a query, a quoted column alias can be specified using identifier or string quoting characters:

```
SELECT 1 AS `one`, 2 AS 'two';
```

Elsewhere in the statement, quoted references to the alias must use identifier quoting or the reference is treated as a string literal. For example, this statement groups by the values in column `id`, referenced using the alias ``a``:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
  GROUP BY `a`;
```

But this statement groups by the literal string `'a'` and will not work as expected:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
  GROUP BY 'a';
```

B.4.4.5 Rollback Failure for Nontransactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These nontransactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and nontransactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` does not support a storage engine, it instead creates the table as a `MyISAM` table, which is nontransactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';
```

```
SHOW CREATE TABLE tbl_name;
```

See [Section 13.7.7.36, “SHOW TABLE STATUS Statement”](#), and [Section 13.7.7.10, “SHOW CREATE TABLE Statement”](#).

To check which storage engines your `mysqld` server supports, use this statement:

```
SHOW ENGINES;
```

See [Section 13.7.7.16, “SHOW ENGINES Statement”](#) for full details.

B.4.4.6 Deleting Rows from Related Tables

If the total length of the `DELETE` statement for `related_table` is more than the default value of the `max_allowed_packet` system variable, you should split it into smaller parts and execute multiple `DELETE` statements. You probably get the fastest `DELETE` by specifying only 100 to 1,000 `related_column` values per statement if the `related_column` is indexed. If the `related_column` isn't indexed, the speed is independent of the number of arguments in the `IN` clause.

B.4.4.7 Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that returns no rows, you should use the following procedure to find out what is wrong:

1. Test the query with `EXPLAIN` to check whether you can find something that is obviously wrong. See [Section 13.8.2, “EXPLAIN Statement”](#).
2. Select only those columns that are used in the `WHERE` clause.
3. Remove one table at a time from the query until it returns some rows. If the tables are large, it is a good idea to use `LIMIT 10` with the query.
4. Issue a `SELECT` for the column that should have matched a row against the table that was last removed from the query.
5. If you are comparing `FLOAT` or `DOUBLE` columns with numbers that have decimals, you cannot use equality (`=`) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the `FLOAT` to a `DOUBLE` fixes this. See [Section B.4.4.8, “Problems with Floating-Point Values”](#).
6. If you still cannot figure out what is wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your `SELECT` statement at the end of the file.

Verify that the test file demonstrates the problem by executing these commands:

```
shell> mysqladmin create test2
shell> mysql test2 < query.sql
```

Attach the test file to a bug report, which you can file using the instructions in [Section 1.7, “How to Report Bugs or Problems”](#).

B.4.4.8 Problems with Floating-Point Values

Floating-point numbers sometimes cause confusion because they are approximate and not stored as exact values. A floating-point value as written in an SQL statement may not be the same as the value

represented internally. Attempts to treat floating-point values as exact in comparisons may lead to problems. They are also subject to platform or implementation dependencies. The `FLOAT` and `DOUBLE` data types are subject to these issues. For `DECIMAL` columns, MySQL performs operations with a precision of 65 decimal digits, which should solve most common inaccuracy problems.

The following example uses `DOUBLE` to demonstrate how calculations that are done using floating-point operations are subject to floating-point error.

```
mysql> CREATE TABLE t1 (i INT, d1 DOUBLE, d2 DOUBLE);
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
-> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
-> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
-> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
-> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
-> (6, 0.00, 0.00), (6, -51.40, 0.00);

mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;
```

i	a	b
1	21.4	21.4
2	76.8	76.8
3	7.4	7.4
4	15.4	15.4
5	7.2	7.2
6	-51.4	0

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

If columns `d1` and `d2` had been defined as `DECIMAL` rather than `DOUBLE`, the result of the `SELECT` query would have contained only one row—the last one shown above.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) > 0.0001;

+-----+-----+-----+
| i    | a      | b      |
+-----+-----+-----+
| 6    | -51.4  | 0      |
+-----+-----+-----+
1 row in set (0.00 sec)
```

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) <= 0.0001;

+-----+-----+-----+
| i    | a      | b      |
+-----+-----+-----+
```

1	21.4	21.4
2	76.8	76.8
3	7.4	7.4
4	15.4	15.4
5	7.2	7.2

+-----+-----+-----+
5 rows in set (0.03 sec)

Floating-point values are subject to platform or implementation dependencies. Suppose that you execute the following statements:

```
CREATE TABLE t1(c1 FLOAT(53,0), c2 FLOAT(53,0));
INSERT INTO t1 VALUES('1e+52', '-1e+52');
SELECT * FROM t1;
```

On some platforms, the `SELECT` statement returns `inf` and `-inf`. On others, it returns `0` and `-0`.

An implication of the preceding issues is that if you attempt to create a replication slave by dumping table contents with `mysqldump` on the master and reloading the dump file into the slave, tables containing floating-point columns might differ between the two hosts.

B.4.5 Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL does not have enough information about the data at hand and has to make “educated” guesses about the data.

For the cases when MySQL does not do the “right” thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `EXPLAIN` to the front of your `SELECT` statement:

```
mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
```

`EXPLAIN` is discussed in more detail in [Section 13.8.2, “EXPLAIN Statement”](#).

- Use `ANALYZE TABLE tbl_name` to update the key distributions for the scanned table. See [Section 13.7.3.1, “ANALYZE TABLE Statement”](#).
- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

```
SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
WHERE t1.col_name=t2.col_name;
```

`USE INDEX` and `IGNORE INDEX` may also be useful. See [Section 8.9.4, “Index Hints”](#).

- Global and table-level `STRAIGHT_JOIN`. See [Section 13.2.10, “SELECT Statement”](#).
- You can tune global or thread-specific system variables. For example, start `mysqld` with the `--max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See [Section 5.1.8, “Server System Variables”](#).

B.4.6 Table Definition-Related Issues

B.4.6.1 Problems with ALTER TABLE

If you get a duplicate-key error when using `ALTER TABLE` to change the character set or collation of a character column, the cause is either that the new column collation maps two keys to the same value or

that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table. `REPAIR TABLE` works for `MyISAM`, `ARCHIVE`, and `CSV` tables.

If you use `ALTER TABLE` on a transactional table or if you are using Windows, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

B.4.6.2 TEMPORARY Table Problems

Temporary tables created with `CREATE TEMPORARY TABLE` have the following limitations:

- `TEMPORARY` tables are supported only by the `InnoDB`, `MEMORY`, `MyISAM`, and `MERGE` storage engines.
- Temporary tables are not supported for NDB Cluster.
- The `SHOW TABLES` statement does not list `TEMPORARY` tables.
- To rename `TEMPORARY` tables, `RENAME TABLE` does not work. Use `ALTER TABLE` instead:

```
ALTER TABLE old_name RENAME new_name;
```

- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
SELECT * FROM temp_table JOIN temp_table AS t2;
```

The statement produces this error:

```
ERROR 1137: Can't reopen table: 'temp_table'
```

You can work around this issue if your query permits use of a common table expression (CTE) rather than a `TEMPORARY` table. For example, this fails with the `Can't reopen table` error:

```
CREATE TEMPORARY TABLE t SELECT 1 AS col_a, 2 AS col_b;
SELECT * FROM t AS t1 JOIN t AS t2;
```

To avoid the error, use a `WITH` clause that defines a CTE, rather than the `TEMPORARY` table:

```
WITH cte AS (SELECT 1 AS col_a, 2 AS col_b)
SELECT * FROM cte AS t1 JOIN cte AS t2;
```

- The `Can't reopen table` error also occurs if you refer to a temporary table multiple times in a stored function under different aliases, even if the references occur in different statements within the function. It may occur for temporary tables created outside stored functions and referred to across multiple calling and callee functions.
- If a `TEMPORARY` is created with the same name as an existing non-`TEMPORARY` table, the non-`TEMPORARY` table is hidden until the `TEMPORARY` table is dropped, even if the tables use different storage engines.
- There are known issues in using temporary tables with replication. See [Section 17.5.1.30, “Replication and Temporary Tables”](#), for more information.

B.4.7 Known Issues in MySQL

This section lists known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in [Section 2.1, “General Installation Guidance”](#), and [Section 29.5, “Debugging and Porting MySQL”](#).

The following problems are known:

- Subquery optimization for `IN` is not as effective as for `=`.
- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` or within the various logs (on case-insensitive systems).
- Dropping a `FOREIGN KEY` constraint does not work in replication because the constraint may have another name on the slave.
- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.
- `DISTINCT` with `ORDER BY` does not work inside `GROUP_CONCAT()` if you do not use all and only those columns that are in the `DISTINCT` list.
- When inserting a big integer value (between 2^{63} and $2^{64}-1$) into a decimal or string column, it is inserted as a negative value because the number is evaluated in a signed integer context.
- With statement-based binary logging, the master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases. However, it is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is nondeterministic (generally not a recommended practice, even outside of replication).

For example:

- `CREATE TABLE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
- `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
- `REPLACE ... SELECT, INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic order.

For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the master and slave.

A query is optimized differently on the master and slave only if:

- The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use `InnoDB` on the master, but `MyISAM` on the slave if the slave has less available disk space.)
- MySQL buffer sizes (`key_buffer_size`, and so on) are different on the master and slave.
- The master and slave run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using `mysqlbinlog|mysql`.

The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned nondeterministic queries to ensure that the rows are always stored or modified in the same order. Using row-based or mixed logging format also avoids the problem.

- Log file names are based on the server host name if you do not specify a file name with the startup option. To retain the same log file names if you change your host name to something else, you must explicitly use options such as `--log-bin=old_host_name-bin`. See [Section 5.1.7, “Server Command Options”](#). Alternatively, rename the old files to reflect your host name change. If these are binary logs, you must edit the binary log index file and fix the binary log file names there as well. (The same is true for the relay logs on a slave server.)
- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA` statement. See [Section 4.6.8, “mysqlbinlog — Utility for Processing Binary Log Files”](#).
- `RENAME` does not work with `TEMPORARY` tables or tables used in a `MERGE` table.
- When using `SET CHARACTER SET`, you cannot use translated characters in database, table, and column names.
- Prior to MySQL 8.0.17, you cannot use `_` or `%` with `ESCAPE` in `LIKE ... ESCAPE`.
- The server uses only the first `max_sort_length` bytes when comparing data values. This means that values cannot reliably be used in `GROUP BY`, `ORDER BY`, or `DISTINCT` if they differ only after the first `max_sort_length` bytes. To work around this, increase the variable value. The default value of `max_sort_length` is 1024 and can be changed at server startup time or at runtime.
- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF()` and `ELT()` with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.
- You can have up to 255 `ENUM` and `SET` columns in one table.
- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.
- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by 2, not 1:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;  
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns do not participate in the `DISTINCT` comparison.

An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads  
WHERE userid = 9 ORDER BY id DESC;
```

and

```
SELECT DISTINCT band_downloads.mp3id  
FROM band_downloads,band_mp3  
WHERE band_downloads.userid = 9
```

```
AND band_mp3.id = band_downloads.mp3id  
ORDER BY band_downloads.id DESC;
```

In the second case, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

Note that this happens only for queries that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` does not check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.
