tables per replication channel to monitor a specific replication channel. See [Section 17.2.2, “Replication Channels”](#) and [Section 17.1.5.8, “Monitoring Multi-Source Replication”](#) for more information.

### 26.12.11.1 The replication\_connection\_configuration Table

This table shows the configuration parameters used by the replica for connecting to the source. Parameters stored in the table can be changed at runtime with the `CHANGE MASTER TO` statement, as indicated in the column descriptions.

Compared to the `replication_connection_status` table, `replication_connection_configuration` changes less frequently. It contains values that define how the replica connects to the source and that remain constant during the connection, whereas `replication_connection_status` contains values that change during the connection.

The `replication_connection_configuration` table has the following columns. The column descriptions indicate the corresponding `CHANGE MASTER TO` options from which the column values are taken, and the table given later in this section shows the correspondence between `replication_connection_configuration` columns and `SHOW SLAVE STATUS` columns.

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 17.2.2, “Replication Channels”](#) for more information. (`CHANGE MASTER TO` option: `FOR CHANNEL`)

- `HOST`

The host name of the source that the replica is connected to. (`CHANGE MASTER TO` option: `MASTER_HOST`)

- `PORT`

The port used to connect to the source. (`CHANGE MASTER TO` option: `MASTER_PORT`)

- `USER`

The user name of the replication user account used to connect to the source. (`CHANGE MASTER TO` option: `MASTER_USER`)

- `NETWORK_INTERFACE`

The network interface that the replica is bound to, if any. (`CHANGE MASTER TO` option: `MASTER_BIND`)

- `AUTO_POSITION`

1 if GTID auto-positioning is in use; otherwise 0. (`CHANGE MASTER TO` option: `MASTER_AUTO_POSITION`)

- `SSL_ALLOWED`, `SSL_CA_FILE`, `SSL_CA_PATH`, `SSL_CERTIFICATE`, `SSL_CIPHER`, `SSL_KEY`, `SSL_VERIFY_SERVER_CERTIFICATE`, `SSL_CRL_FILE`, `SSL_CRL_PATH`

These columns show the SSL parameters used by the replica to connect to the source, if any.

`SSL_ALLOWED` has these values:

- `Yes` if an SSL connection to the source is permitted
- `No` if an SSL connection to the source is not permitted

- `Ignored` if an SSL connection is permitted but the replica does not have SSL support enabled

`CHANGE MASTER TO` options for the other SSL columns: `MASTER_SSL_CA`, `MASTER_SSL_CAPATH`, `MASTER_SSL_CERT`, `MASTER_SSL_CIPHER`, `MASTER_SSL_CRL`, `MASTER_SSL_CRLPATH`, `MASTER_SSL_KEY`, `MASTER_SSL_VERIFY_SERVER_CERT`.

- `CONNECTION_RETRY_INTERVAL`

The number of seconds between connect retries. (`CHANGE MASTER TO` option: `MASTER_CONNECT_RETRY`)

- `CONNECTION_RETRY_COUNT`

The number of times the replica can attempt to reconnect to the source in the event of a lost connection. (`CHANGE MASTER TO` option: `MASTER_RETRY_COUNT`)

- `HEARTBEAT_INTERVAL`

The replication heartbeat interval on a replica, measured in seconds. (`CHANGE MASTER TO` option: `MASTER_HEARTBEAT_PERIOD`)

- `TLS_VERSION`

The list of TLS protocol versions that are permitted by the replica for the replication connection. For TLS version information, see [Section 6.3.2, “Encrypted Connection TLS Protocols and Ciphers”](#). (`CHANGE MASTER TO` option: `MASTER_TLS_VERSION`)

- `TLS_CIPHERSUITES`

The list of ciphersuites that are permitted by the replica for the replication connection. For TLS ciphersuite information, see [Section 6.3.2, “Encrypted Connection TLS Protocols and Ciphers”](#). (`CHANGE MASTER TO` option: `MASTER_TLS_CIPHERSUITES`)

- `PUBLIC_KEY_PATH`

The path name to a file containing a replica-side copy of the public key required by the source for RSA key pair-based password exchange. The file must be in PEM format. This column applies to replicas that authenticate with the `sha256_password` or `caching_sha2_password` authentication plugin. (`CHANGE MASTER TO` option: `MASTER_PUBLIC_KEY_PATH`)

If `PUBLIC_KEY_PATH` is given and specifies a valid public key file, it takes precedence over `GET_PUBLIC_KEY`.

- `GET_PUBLIC_KEY`

Whether to request from the source the public key required for RSA key pair-based password exchange. This column applies to replicas that authenticate with the `caching_sha2_password` authentication plugin. For that plugin, the source does not send the public key unless requested. (`CHANGE MASTER TO` option: `MASTER_GET_PUBLIC_KEY`)

If `PUBLIC_KEY_PATH` is given and specifies a valid public key file, it takes precedence over `GET_PUBLIC_KEY`.

- `COMPRESSION_ALGORITHMS`

The permitted compression algorithms for connections to the source. (`CHANGE MASTER TO` option: `MASTER_COMPRESSION_ALGORITHMS`)

For more information, see [Section 4.2.8, “Connection Compression Control”](#).

This column was added in MySQL 8.0.18.

- `ZSTD_COMPRESSION_LEVEL`

The compression level to use for connections to the source that use the `zstd` compression algorithm. (`CHANGE MASTER TO` option: `MASTER_ZSTD_COMPRESSION_LEVEL`)

For more information, see [Section 4.2.8, “Connection Compression Control”](#).

This column was added in MySQL 8.0.18.

The `replication_connection_configuration` table has these indexes:

- Primary key on (`CHANNEL_NAME`)

`TRUNCATE TABLE` is not permitted for the `replication_connection_configuration` table.

The following table shows the correspondence between `replication_connection_configuration` columns and `SHOW SLAVE STATUS` columns.

<code>replication_connection_configuration</code> Column	<code>SHOW SLAVE STATUS</code> Column
<code>CHANNEL_NAME</code>	<code>Channel_name</code>
<code>HOST</code>	<code>Master_Host</code>
<code>PORT</code>	<code>Master_Port</code>
<code>USER</code>	<code>Master_User</code>
<code>NETWORK_INTERFACE</code>	<code>Master_Bind</code>
<code>AUTO_POSITION</code>	<code>Auto_Position</code>
<code>SSL_ALLOWED</code>	<code>Master_SSL_Allowed</code>
<code>SSL_CA_FILE</code>	<code>Master_SSL_CA_File</code>
<code>SSL_CA_PATH</code>	<code>Master_SSL_CA_Path</code>
<code>SSL_CERTIFICATE</code>	<code>Master_SSL_Cert</code>
<code>SSL_CIPHER</code>	<code>Master_SSL_Cipher</code>
<code>SSL_KEY</code>	<code>Master_SSL_Key</code>
<code>SSL_VERIFY_SERVER_CERTIFICATE</code>	<code>Master_SSL_Verify_Server_Cert</code>
<code>SSL_CRL_FILE</code>	<code>Master_SSL_Crl</code>
<code>SSL_CRL_PATH</code>	<code>Master_SSL_Crlpath</code>
<code>CONNECTION_RETRY_INTERVAL</code>	<code>Connect_Retry</code>
<code>CONNECTION_RETRY_COUNT</code>	<code>Master_Retry_Count</code>
<code>HEARTBEAT_INTERVAL</code>	<code>None</code>
<code>TLS_VERSION</code>	<code>Master_TLS_Version</code>
<code>PUBLIC_KEY_PATH</code>	<code>Master_public_key_path</code>
<code>GET_PUBLIC_KEY</code>	<code>Get_master_public_key</code>
<code>COMPRESSION_ALGORITHMS</code>	<code>[None]</code>

<code>replication_connection_configuration</code> Column	<code>SHOW SLAVE STATUS</code> Column
<code>ZSTD_COMPRESSION_LEVEL</code>	[None]

### 26.12.11.2 The `replication_connection_status` Table

This table shows the current status of the I/O thread that handles the replica's connection to the source, information on the last transaction queued in the relay log, and information on the transaction currently being queued in the relay log.

Compared to the `replication_connection_configuration` table, `replication_connection_status` changes more frequently. It contains values that change during the connection, whereas `replication_connection_configuration` contains values which define how the replica connects to the source and that remain constant during the connection.

The `replication_connection_status` table has these columns:

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 17.2.2, “Replication Channels”](#) for more information.

- `GROUP_NAME`

If this server is a member of a group, shows the name of the group the server belongs to.

- `SOURCE_UUID`

The `server_uuid` value from the source.

- `THREAD_ID`

The I/O thread ID.

- `SERVICE_STATE`

`ON` (thread exists and is active or idle), `OFF` (thread no longer exists), or `CONNECTING` (thread exists and is connecting to the source).

- `RECEIVED_TRANSACTION_SET`

The set of global transaction IDs (GTIDs) corresponding to all transactions received by this replica. Empty if GTIDs are not in use. See [GTID Sets](#) for more information.

- `LAST_ERROR_NUMBER`, `LAST_ERROR_MESSAGE`

The error number and error message of the most recent error that caused the I/O thread to stop. An error number of 0 and message of the empty string mean “no error.” If the `LAST_ERROR_MESSAGE` value is not empty, the error values also appear in the replica's error log.

Issuing `RESET MASTER` or `RESET SLAVE` resets the values shown in these columns.

- `LAST_ERROR_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the most recent I/O error took place.

- `LAST_HEARTBEAT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the most recent heartbeat signal was received by a replica.

- `COUNT_RECEIVED_HEARTBEATS`

The total number of heartbeat signals that a replica received since the last time it was restarted or reset, or a `CHANGE MASTER TO` statement was issued.

- `LAST_QUEUED_TRANSACTION`

The global transaction ID (GTID) of the last transaction that was queued to the relay log.

- `LAST_QUEUED_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the last transaction queued in the relay log was committed on the original source.

- `LAST_QUEUED_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the last transaction queued in the relay log was committed on the immediate source.

- `LAST_QUEUED_TRANSACTION_START_QUEUE_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the last transaction was placed in the relay log queue by this I/O thread.

- `LAST_QUEUED_TRANSACTION_END_QUEUE_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the last transaction was queued to the relay log files.

- `QUEUEING_TRANSACTION`

The global transaction ID (GTID) of the currently queueing transaction in the relay log.

- `QUEUEING_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the currently queueing transaction was committed on the original source.

- `QUEUEING_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the currently queueing transaction was committed on the immediate source.

- `QUEUEING_TRANSACTION_START_QUEUE_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the first event of the currently queueing transaction was written to the relay log by this I/O thread.

When the Performance Schema is disabled, local timing information is not collected, so the fields showing the start and end timestamps for queued transactions are zero.

The `replication_connection_status` table has these indexes:

- Primary key on (`CHANNEL_NAME`)

- Index on ([THREAD\\_ID](#))

The following table shows the correspondence between [replication\\_connection\\_status](#) columns and [SHOW SLAVE STATUS](#) columns.

<a href="#">replication_connection_status</a> Column	<a href="#">SHOW SLAVE STATUS</a> Column
<a href="#">SOURCE_UUID</a>	<a href="#">Master_UUID</a>
<a href="#">THREAD_ID</a>	None
<a href="#">SERVICE_STATE</a>	<a href="#">Slave_IO_Running</a>
<a href="#">RECEIVED_TRANSACTION_SET</a>	<a href="#">Retrieved_Gtid_Set</a>
<a href="#">LAST_ERROR_NUMBER</a>	<a href="#">Last_IO_Errno</a>
<a href="#">LAST_ERROR_MESSAGE</a>	<a href="#">Last_IO_Error</a>
<a href="#">LAST_ERROR_TIMESTAMP</a>	<a href="#">Last_IO_Error_Timestamp</a>

### 26.12.11.3 The [replication\\_applier\\_configuration](#) Table

This table shows the configuration parameters that affect transactions applied by the replica. Parameters stored in the table can be changed at runtime with the [CHANGE MASTER TO](#) statement, as indicated in the column descriptions.

The [replication\\_applier\\_configuration](#) table has these columns:

- [CHANNEL\\_NAME](#)

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 17.2.2, “Replication Channels”](#) for more information.

- [DESIRED\\_DELAY](#)

The number of seconds that the replica must lag the source. ([CHANGE MASTER TO](#) option: [MASTER\\_DELAY](#)) See [Section 17.4.10, “Delayed Replication”](#) for more information.

- [PRIVILEGE\\_CHECKS\\_USER](#)

The user account that provides the security context for the channel ([CHANGE MASTER TO](#) option: [PRIVILEGE\\_CHECKS\\_USER](#)). This is escaped so that it can be copied into a SQL statement to execute individual transactions. See [Section 17.3.3, “Replication Privilege Checks”](#) for more information.

- [REQUIRE\\_ROW\\_FORMAT](#)

Whether the channel accepts only row-based events ([CHANGE MASTER TO](#) option: [REQUIRE\\_ROW\\_FORMAT](#)). See [Section 17.3.3, “Replication Privilege Checks”](#) for more information.

- [REQUIRE\\_TABLE\\_PRIMARY\\_KEY\\_CHECK](#)

Whether the channel requires primary keys always, never, or according to the source's setting ([CHANGE MASTER TO](#) option: [REQUIRE\\_TABLE\\_PRIMARY\\_KEY\\_CHECK](#)). See [Section 17.3.3, “Replication Privilege Checks”](#) for more information.

The [replication\\_applier\\_configuration](#) table has these indexes:

- Primary key on ([CHANNEL\\_NAME](#))

`TRUNCATE TABLE` is not permitted for the `replication_applier_configuration` table.

The following table shows the correspondence between `replication_applier_configuration` columns and `SHOW SLAVE STATUS` columns.

<code>replication_applier_configuration</code> Column	<code>SHOW SLAVE STATUS</code> Column
<code>DESIRED_DELAY</code>	<code>SQL_Delay</code>

#### 26.12.11.4 The `replication_applier_status` Table

This table shows the current general transaction execution status on the replica. The table provides information about general aspects of transaction applier status that are not specific to any thread involved. Thread-specific status information is available in the `replication_applier_status_by_coordinator` table (and `replication_applier_status_by_worker` if the replica is multithreaded).

The `replication_applier_status` table has these columns:

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 17.2.2, “Replication Channels”](#) for more information.

- `SERVICE_STATE`

Shows `ON` when the replication channel's applier threads are active or idle, `OFF` means that the applier threads are not active.

- `REMAINING_DELAY`

If the replica is waiting for `DESIRED_DELAY` seconds to pass since the source applied a transaction, this field contains the number of delay seconds remaining. At other times, this field is `NULL`. (The `DESIRED_DELAY` value is stored in the `replication_applier_configuration` table.) See [Section 17.4.10, “Delayed Replication”](#) for more information.

- `COUNT_TRANSACTIONS_RETRIES`

Shows the number of retries that were made because the replication SQL thread failed to apply a transaction. The maximum number of retries for a given transaction is set by the `slave_transaction_retries` system variable. The `replication_applier_status_by_worker` table shows detailed information on transaction retries for a single-threaded or multithreaded replica.

The `replication_applier_status` table has these indexes:

- Primary key on (`CHANNEL_NAME`)

`TRUNCATE TABLE` is not permitted for the `replication_applier_status` table.

The following table shows the correspondence between `replication_applier_status` columns and `SHOW SLAVE STATUS` columns.

<code>replication_applier_status</code> Column	<code>SHOW SLAVE STATUS</code> Column
<code>SERVICE_STATE</code>	None

<code>replication_applier_status</code> Column	<code>SHOW SLAVE STATUS</code> Column
<code>REMAINING_DELAY</code>	<code>SQL_Remaining_Delay</code>

### 26.12.11.5 The `replication_applier_status_by_coordinator` Table

For a multithreaded replica, the replica uses multiple worker threads and a coordinator thread to manage them, and this table shows the status of the coordinator thread. For a single-threaded replica, this table is empty. For a multithreaded replica, the `replication_applier_status_by_worker` table shows the status of the worker threads. This table provides information about the last transaction which was buffered by the coordinator thread to a worker's queue, as well as the transaction it is currently buffering. The start timestamp refers to when this thread read the first event of the transaction from the relay log to buffer it to a worker's queue, while the end timestamp refers to when the last event finished buffering to the worker's queue.

The `replication_applier_status_by_coordinator` table has these columns:

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 17.2.2, “Replication Channels”](#) for more information.

- `THREAD_ID`

The SQL/coordinator thread ID.

- `SERVICE_STATE`

`ON` (thread exists and is active or idle) or `OFF` (thread no longer exists).

- `LAST_ERROR_NUMBER`, `LAST_ERROR_MESSAGE`

The error number and error message of the most recent error that caused the SQL/coordinator thread to stop. An error number of 0 and message which is an empty string means “no error”. If the `LAST_ERROR_MESSAGE` value is not empty, the error values also appear in the replica's error log.

Issuing `RESET MASTER` or `RESET SLAVE` resets the values shown in these columns.

All error codes and messages displayed in the `LAST_ERROR_NUMBER` and `LAST_ERROR_MESSAGE` columns correspond to error values listed in [Server Error Message Reference](#).

- `LAST_ERROR_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the most recent SQL/coordinator error occurred.

- `LAST_PROCESSED_TRANSACTION`

The global transaction ID (GTID) of the last transaction processed by this coordinator.

- `LAST_PROCESSED_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the last transaction processed by this coordinator was committed on the original source.

- `LAST_PROCESSED_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the last transaction processed by this coordinator was committed on the immediate source.

- `LAST_PROCESSED_TRANSACTION_START_BUFFER_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when this coordinator thread started writing the last transaction to the buffer of a worker thread.

- `LAST_PROCESSED_TRANSACTION_END_BUFFER_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the last transaction was written to the buffer of a worker thread by this coordinator thread.

- `PROCESSING_TRANSACTION`

The global transaction ID (GTID) of the transaction that this coordinator thread is currently processing.

- `PROCESSING_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the currently processing transaction was committed on the original source.

- `PROCESSING_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the currently processing transaction was committed on the immediate source.

- `PROCESSING_TRANSACTION_START_BUFFER_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when this coordinator thread started writing the currently processing transaction to the buffer of a worker thread.

When the Performance Schema is disabled, local timing information is not collected, so the fields showing the start and end timestamps for buffered transactions are zero.

The `replication_applier_status_by_coordinator` table has these indexes:

- Primary key on (`CHANNEL_NAME`)
- Index on (`THREAD_ID`)

The following table shows the correspondence between `replication_applier_status_by_coordinator` columns and `SHOW SLAVE STATUS` columns.

<code>replication_applier_status_by_coordinator</code> Column	<code>SHOW SLAVE STATUS</code> Column
<code>THREAD_ID</code>	None
<code>SERVICE_STATE</code>	<code>Slave_SQL_Running</code>
<code>LAST_ERROR_NUMBER</code>	<code>Last_SQL_Errno</code>
<code>LAST_ERROR_MESSAGE</code>	<code>Last_SQL_Error</code>
<code>LAST_ERROR_TIMESTAMP</code>	<code>Last_SQL_Error_Timestamp</code>

### 26.12.11.6 The `replication_applier_status_by_worker` Table

This table provides details of the transactions handled by applier threads on a replica or Group Replication group member. For a single-threaded replica, data is shown for the replica's single applier thread. For a multithreaded replica, data is shown individually for each applier thread. The applier threads on a multithreaded replica are sometimes called workers. The number of applier threads on a replica or Group Replication group member is set by the `slave_parallel_workers` system variable, which is set to zero for a single-threaded replica. A multithreaded replica also has a coordinator thread to manage the applier threads, and the status of this thread is shown in the `replication_applier_status_by_coordinator` table.

All error codes and messages displayed in the columns relating to errors correspond to error values listed in [Server Error Message Reference](#).

When the Performance Schema is disabled, local timing information is not collected, so the fields showing the start and end timestamps for applied transactions are zero. The start timestamps in this table refer to when the worker started applying the first event, and the end timestamps refer to when the last event of the transaction was applied.

When a replica is restarted by a `START SLAVE` statement, the columns beginning `APPLYING_TRANSACTION` are reset. Before MySQL 8.0.13, these columns were not reset on a replica that was operating in single-threaded mode, only on a multithreaded replica.

The `replication_applier_status_by_worker` table has these columns:

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 17.2.2, “Replication Channels”](#) for more information.

- `WORKER_ID`

The worker identifier (same value as the `id` column in the `mysql.slave_worker_info` table). After `STOP SLAVE`, the `THREAD_ID` column becomes `NULL`, but the `WORKER_ID` value is preserved.

- `THREAD_ID`

The worker thread ID.

- `SERVICE_STATE`

`ON` (thread exists and is active or idle) or `OFF` (thread no longer exists).

- `LAST_ERROR_NUMBER`, `LAST_ERROR_MESSAGE`

The error number and error message of the most recent error that caused the worker thread to stop. An error number of 0 and message of the empty string mean “no error”. If the `LAST_ERROR_MESSAGE` value is not empty, the error values also appear in the replica's error log.

Issuing `RESET MASTER` or `RESET SLAVE` resets the values shown in these columns.

- `LAST_ERROR_TIMESTAMP`

A timestamp in `'YYYY-MM-DD hh:mm:ss[.fraction]'` format that shows when the most recent worker error occurred.

- `LAST_APPLIED_TRANSACTION`

The global transaction ID (GTID) of the last transaction applied by this worker.

- [LAST\\_APPLIED\\_TRANSACTION\\_ORIGINAL\\_COMMIT\\_TIMESTAMP](#)

A timestamp in '[YYYY-MM-DD hh:mm:ss\[.fraction\]](#)' format that shows when the last transaction applied by this worker was committed on the original source.

- [LAST\\_APPLIED\\_TRANSACTION\\_IMMEDIATE\\_COMMIT\\_TIMESTAMP](#)

A timestamp in '[YYYY-MM-DD hh:mm:ss\[.fraction\]](#)' format that shows when the last transaction applied by this worker was committed on the immediate source.

- [LAST\\_APPLIED\\_TRANSACTION\\_START\\_APPLY\\_TIMESTAMP](#)

A timestamp in '[YYYY-MM-DD hh:mm:ss\[.fraction\]](#)' format that shows when this worker started applying the last applied transaction.

- [LAST\\_APPLIED\\_TRANSACTION\\_END\\_APPLY\\_TIMESTAMP](#)

A timestamp in '[YYYY-MM-DD hh:mm:ss\[.fraction\]](#)' format that shows when this worker finished applying the last applied transaction.

- [APPLYING\\_TRANSACTION](#)

The global transaction ID (GTID) of the transaction this worker is currently applying.

- [APPLYING\\_TRANSACTION\\_ORIGINAL\\_COMMIT\\_TIMESTAMP](#)

A timestamp in '[YYYY-MM-DD hh:mm:ss\[.fraction\]](#)' format that shows when the transaction this worker is currently applying was committed on the original source.

- [APPLYING\\_TRANSACTION\\_IMMEDIATE\\_COMMIT\\_TIMESTAMP](#)

A timestamp in '[YYYY-MM-DD hh:mm:ss\[.fraction\]](#)' format that shows when the transaction this worker is currently applying was committed on the immediate source.

- [APPLYING\\_TRANSACTION\\_START\\_APPLY\\_TIMESTAMP](#)

A timestamp in '[YYYY-MM-DD hh:mm:ss\[.fraction\]](#)' format that shows when this worker started its first attempt to apply the transaction that is currently being applied. Before MySQL 8.0.13, this timestamp was refreshed when a transaction was retried due to a transient error, so it showed the timestamp for the most recent attempt to apply the transaction.

- [LAST\\_APPLIED\\_TRANSACTION\\_RETRIES\\_COUNT](#)

The number of times the last applied transaction was retried by the worker after the first attempt. If the transaction was applied at the first attempt, this number is zero.

- [LAST\\_APPLIED\\_TRANSACTION\\_LAST\\_TRANSIENT\\_ERROR\\_NUMBER](#)

The error number of the last transient error that caused the transaction to be retried.

- [LAST\\_APPLIED\\_TRANSACTION\\_LAST\\_TRANSIENT\\_ERROR\\_MESSAGE](#)

The message text for the last transient error that caused the transaction to be retried.

- [LAST\\_APPLIED\\_TRANSACTION\\_LAST\\_TRANSIENT\\_ERROR\\_TIMESTAMP](#)

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format for the last transient error that caused the transaction to be retried.

- `APPLYING_TRANSACTION_RETRIES_COUNT`

The number of times the transaction that is currently being applied was retried until this moment. If the transaction was applied at the first attempt, this number is zero.

- `APPLYING_TRANSACTION_LAST_TRANSIENT_ERROR_NUMBER`

The error number of the last transient error that caused the current transaction to be retried.

- `APPLYING_TRANSACTION_LAST_TRANSIENT_ERROR_MESSAGE`

The message text for the last transient error that caused the current transaction to be retried.

- `APPLYING_TRANSACTION_LAST_TRANSIENT_ERROR_TIMESTAMP`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format for the last transient error that caused the current transaction to be retried.

The `replication_applier_status_by_worker` table has these indexes:

- Primary key on (`CHANNEL_NAME`, `WORKER_ID`)
- Index on (`THREAD_ID`)

The following table shows the correspondence between `replication_applier_status_by_worker` columns and `SHOW SLAVE STATUS` columns.

<code>replication_applier_status_by_worker</code> Column	<code>SHOW SLAVE STATUS</code> Column
<code>WORKER_ID</code>	None
<code>THREAD_ID</code>	None
<code>SERVICE_STATE</code>	None
<code>LAST_ERROR_NUMBER</code>	<code>Last_SQL_Errno</code>
<code>LAST_ERROR_MESSAGE</code>	<code>Last_SQL_Error</code>
<code>LAST_ERROR_TIMESTAMP</code>	<code>Last_SQL_Error_Timestamp</code>

### 26.12.11.7 The `replication_applier_global_filters` Table

This table shows the global replication filters configured on this replica. The `replication_applier_global_filters` table has these columns:

- `FILTER_NAME`

The type of replication filter that has been configured.

- `FILTER_RULE`

The rules configured for the replication filter type using either `--replicate-*` command options or `CHANGE REPLICATION FILTER`.

- `CONFIGURED_BY`

The method used to configure the replication filter, can be one of:

- `CHANGE_REPLICATION_FILTER` configured by a global replication filter using a `CHANGE REPLICATION FILTER` statement.
- `STARTUP_OPTIONS` configured by a global replication filter using a `--replicate-*` option.
- `ACTIVE_SINCE`

Timestamp of when the replication filter was configured.

#### 26.12.11.8 The `replication_applier_filters` Table

This table shows the replication channel specific filters configured on this replica. Each row provides information on a replication channel's configured type of filter. The `replication_applier_filters` table has these columns:

- `CHANNEL_NAME`

The name of replication channel with a replication filter configured.

- `FILTER_NAME`

The type of replication filter that has been configured for this replication channel.

- `FILTER_RULE`

The rules configured for the replication filter type using either `--replicate-*` command options or `CHANGE REPLICATION FILTER`.

- `CONFIGURED_BY`

The method used to configure the replication filter, can be one of:

- `CHANGE_REPLICATION_FILTER` configured by a global replication filter using a `CHANGE REPLICATION FILTER` statement.
- `STARTUP_OPTIONS` configured by a global replication filter using a `--replicate-*` option.
- `CHANGE_REPLICATION_FILTER_FOR_CHANNEL` configured by a channel specific replication filter using a `CHANGE REPLICATION FILTER FOR CHANNEL` statement.
- `STARTUP_OPTIONS_FOR_CHANNEL` configured by a channel specific replication filter using a `--replicate-*` option.
- `ACTIVE_SINCE`

Timestamp of when the replication filter was configured.

- `COUNTER`

The number of times the replication filter has been used since it was configured.

#### 26.12.11.9 The `replication_group_members` Table

This table shows network and status information for replication group members. The network addresses shown are the addresses used to connect clients to the group, and should not be confused with the member's internal group communication address specified by `group_replication_local_address`.

The `replication_group_members` table has these columns:

- `CHANNEL_NAME`

Name of the Group Replication channel.

- `MEMBER_ID`

The member server UUID. This has a different value for each member in the group. This also serves as a key because it is unique to each member.

- `MEMBER_HOST`

Network address of this member (host name or IP address). Retrieved from the member's `hostname` variable. This is the address which clients connect to, unlike the `group_replication_local_address` which is used for internal group communication.

- `MEMBER_PORT`

Port on which the server is listening. Retrieved from the member's `port` variable.

- `MEMBER_STATE`

Current state of this member; can be any one of the following:

- `ONLINE`: The member is in a fully functioning state.
- `RECOVERING`: The server has joined a group from which it is retrieving data.
- `OFFLINE`: The group replication plugin is installed but has not been started.
- `ERROR`: The member has encountered an error, either during applying transactions or during the recovery phase, and is not participating in the group's transactions.
- `UNREACHABLE`: The failure detection process suspects that this member cannot be contacted, because the group messages have timed out.

See [Section 18.3.1, “Group Replication Server States”](#).

- `MEMBER_ROLE`

Role of the member in the group, either `PRIMARY` or `SECONDARY`.

- `MEMBER_VERSION`

MySQL version of the member.

The `replication_group_members` table has these indexes:

- None

`TRUNCATE TABLE` is not permitted for the `replication_group_members` table.

#### 26.12.11.10 The `replication_group_member_stats` Table

This table shows statistical information for replication group members. It is populated only when Group Replication is running.

The `replication_group_member_stats` table has these columns:

- [CHANNEL\\_NAME](#)

Name of the Group Replication channel

- [VIEW\\_ID](#)

Current view identifier for this group.

- [MEMBER\\_ID](#)

The member server UUID. This has a different value for each member in the group. This also serves as a key because it is unique to each member.

- [COUNT\\_TRANSACTIONS\\_IN\\_QUEUE](#)

The number of transactions in the queue pending conflict detection checks. Once the transactions have been checked for conflicts, if they pass the check, they are queued to be applied as well.

- [COUNT\\_TRANSACTIONS\\_CHECKED](#)

The number of transactions that have been checked for conflicts.

- [COUNT\\_CONFLICTS\\_DETECTED](#)

The number of transactions that have not passed the conflict detection check.

- [COUNT\\_TRANSACTIONS\\_ROWS\\_VALIDATING](#)

Number of transaction rows which can be used for certification, but have not been garbage collected. Can be thought of as the current size of the conflict detection database against which each transaction is certified.

- [TRANSACTIONS\\_COMMITTED\\_ALL\\_MEMBERS](#)

The transactions that have been successfully committed on all members of the replication group, shown as [GTID Sets](#). This is updated at a fixed time interval.

- [LAST\\_CONFLICT\\_FREE\\_TRANSACTION](#)

The transaction identifier of the last conflict free transaction which was checked.

- [COUNT\\_TRANSACTIONS\\_REMOTE\\_IN\\_APPLIER\\_QUEUE](#)

The number of transactions that this member has received from the replication group which are waiting to be applied.

- [COUNT\\_TRANSACTIONS\\_REMOTE\\_APPLIED](#)

Number of transactions this member has received from the group and applied.

- [COUNT\\_TRANSACTIONS\\_LOCAL\\_PROPOSED](#)

Number of transactions which originated on this member and were sent to the group.

- [COUNT\\_TRANSACTIONS\\_LOCAL\\_ROLLBACK](#)

Number of transactions which originated on this member and were rolled back by the group.

The [replication\\_group\\_member\\_stats](#) table has these indexes:

- None

`TRUNCATE TABLE` is not permitted for the `replication_group_member_stats` table.

#### 26.12.11.11 The `binary_log_transaction_compression_stats` Table

This table shows statistical information for transaction payloads written to the binary log and relay log, and can be used to calculate the effects of enabling binary log transaction compression. For information on binary log transaction compression, see [Section 5.4.4.5, “Binary Log Transaction Compression”](#).

The `binary_log_transaction_compression_stats` table is populated only when the server instance has a binary log, and the system variable `binlog_transaction_compression` is set to `ON`. The statistics cover all transactions written to the binary log and relay log from the time the server was started or the table was truncated. Compressed transactions are grouped by the compression algorithm used, and uncompressed transactions are grouped together with the compression algorithm stated as `NONE`, so the compression ratio can be calculated.

The `binary_log_transaction_compression_stats` table has these columns:

- `LOG_TYPE`

Whether these transactions were written to the binary log or relay log.

- `COMPRESSION_TYPE`

The compression algorithm used to compress the transaction payloads. `NONE` means the payloads for these transactions were not compressed, which is correct in a number of situations (see [Section 5.4.4.5, “Binary Log Transaction Compression”](#)).

- `TRANSACTION_COUNTER`

The number of transactions written to this log type with this compression type.

- `COMPRESSED_BYTES`

The total number of bytes that were compressed and then written to this log type with this compression type, counted after compression.

- `UNCOMPRESSED_BYTES`

The total number of bytes before compression for this log type and this compression type.

- `COMPRESSION_PERCENTAGE`

The compression ratio for this log type and this compression type, expressed as a percentage.

- `FIRST_TRANSACTION_ID`

The ID of the first transaction that was written to this log type with this compression type.

- `FIRST_TRANSACTION_COMPRESSED_BYTES`

The total number of bytes that were compressed and then written to the log for the first transaction, counted after compression.

- `FIRST_TRANSACTION_UNCOMPRESSED_BYTES`

The total number of bytes before compression for the first transaction.

- `FIRST_TRANSACTION_TIMESTAMP`

The timestamp when the first transaction was written to the log.

- `LAST_TRANSACTION_ID`

The ID of the most recent transaction that was written to this log type with this compression type.

- `LAST_TRANSACTION_COMPRESSED_BYTES`

The total number of bytes that were compressed and then written to the log for the most recent transaction, counted after compression.

- `LAST_TRANSACTION_UNCOMPRESSED_BYTES`

The total number of bytes before compression for the most recent transaction.

- `LAST_TRANSACTION_TIMESTAMP`

The timestamp when the most recent transaction was written to the log.

The `binary_log_transaction_compression_stats` table has these indexes:

- None

`TRUNCATE TABLE` is permitted for the `binary_log_transaction_compression_stats` table.

## 26.12.12 Performance Schema NDB Cluster Tables

Beginning with NDB 8.0.16, automatic synchronization in `NDB` attempts to detect and synchronize automatically all mismatches in metadata between the NDB Cluster's internal dictionary and the MySQL Server's datadictionary. This is done by default in the background at regular intervals as determined by the `ndb_metadata_check_interval` system variable, unless disabled using `ndb_metadata_check` or overridden by setting `ndb_metadata_sync`. Prior to NDB 8.0.21, the only information readily accessible to users about this process was in the form of logging messages and object counts available (beginning with NDB 8.0.18) as the status variables `Ndb_metadata_detected_count`, `Ndb_metadata_synced_count`, and `Ndb_metadata_excluded_count` (prior to NDB 8.0.22, this variable was named `Ndb_metadata_blacklist_size`). Beginning with NDB 8.0.21, more detailed information about the current state of automatic synchronization is exposed by a MySQL server acting as an SQL node in an NDB Cluster in these two Performance Schema tables:

- `ndb_sync_pending_objects`: Displays information about `NDB` database objects for which mismatches have been detected between the `NDB` dictionary and the MySQL data dictionary. When attempting to synchronize such objects, `NDB` removes the object from the queue awaiting synchronization, and from this table, and tries to reconcile the mismatch. If synchronization of the object fails due to a temporary error, it is picked up and added back to the queue (and to this table) the next time `NDB` performs mismatch detection; if the attempts fails due a permanent error, the object is added to the `ndb_sync_excluded_objects` table.
- `ndb_sync_excluded_objects`: Shows information about `NDB` database objects for which automatic synchronization has failed due to permanent errors resulting from mismatches which cannot be reconciled without manual intervention; these objects are blacklisted and not considered again for mismatch detection until this has been done.

The `ndb_sync_pending_objects` and `ndb_sync_excluded_objects` tables are present only if MySQL has support enabled for the `NDBCLUSTER` storage engine.

These tables are described in more detail in the following two sections.

### 26.12.12.1 The `ndb_sync_pending_objects` Table

This table provides information about [NDB](#) database objects for which mismatches have been detected and which are waiting to be synchronized between the [NDB](#) dictionary and the MySQL data dictionary.

Example information about [NDB](#) database objects awaiting synchronization:

```
mysql> SELECT * FROM performance_schema.ndb_sync_pending_objects;
+-----+-----+-----+
| SCHEMA_NAME | NAME | TYPE |
+-----+-----+-----+
| NULL | lg1 | LOGFILE GROUP |
| NULL | ts1 | TABLESPACE |
| db1 | NULL | SCHEMA |
| test | t1 | TABLE |
| test | t2 | TABLE |
| test | t3 | TABLE |
+-----+-----+-----+
```

The `ndb_sync_pending_objects` table has these columns:

- **SCHEMA\_NAME**: The name of the schema (database) in which the object awaiting synchronization resides; this is `NULL` for tablespaces and log file groups
- **NAME**: The name of the object awaiting synchronization; this is `NULL` if the object is a schema
- **TYPE**: The type of the object awaiting synchronization; this is one of `LOGFILE GROUP`, `TABLESPACE`, `SCHEMA`, or `TABLE`

The `ndb_sync_pending_objects` table was added in NDB 8.0.21.

### 26.12.12.2 The `ndb_sync_excluded_objects` Table

This table provides information about [NDB](#) database objects which cannot be automatically synchronized between NDB Cluster's dictionary and the MySQL data dictionary.

Example information about [NDB](#) database objects which cannot be synchronized with the MySQL data dictionary:

```
mysql> SELECT * FROM performance_schema.ndb_sync_excluded_objects\G
***** 1. row *****
SCHEMA_NAME: NULL
NAME: lg1
TYPE: LOGFILE GROUP
REASON: Injected failure
***** 2. row *****
SCHEMA_NAME: NULL
NAME: ts1
TYPE: TABLESPACE
REASON: Injected failure
***** 3. row *****
SCHEMA_NAME: db1
NAME: NULL
TYPE: SCHEMA
REASON: Injected failure
***** 4. row *****
SCHEMA_NAME: test
NAME: t1
TYPE: TABLE
```

```
REASON: Injected failure
***** 5. row *****
SCHEMA_NAME: test
NAME: t2
TYPE: TABLE
REASON: Injected failure
***** 6. row *****
SCHEMA_NAME: test
NAME: t3
TYPE: TABLE
REASON: Injected failure
```

The `ndb_sync_excluded_objects` table has these columns:

- **SCHEMA\_NAME**: The name of the schema (database) in which the object which has failed to synchronize resides; this is `NULL` for tablespaces and log file groups
- **NAME**: The name of the object which has failed to synchronize; this is `NULL` if the object is a schema
- **TYPE**: The type of the object has failed to synchronize; this is one of `LOGFILE GROUP`, `TABLESPACE`, `SCHEMA`, or `TABLE`
- **REASON**: The reason for exclusion (blacklisting) of the the object; that is, the reason for the failure to synchronize this object

Possible reasons include the following:

- `Injected failure`
- `Failed to determine if object existed in NDB`
- `Failed to determine if object existed in DD`
- `Failed to drop object in DD`
- `Failed to get undofiles assigned to logfile group`
- `Failed to get object id and version`
- `Failed to install object in DD`
- `Failed to get datafiles assigned to tablespace`
- `Failed to create schema`
- `Failed to determine if object was a local table`
- `Failed to invalidate table references`
- `Failed to set database name of NDB object`
- `Failed to get extra metadata of table`
- `Failed to migrate table with extra metadata version 1`
- `Failed to get object from DD`
- `Definition of table has changed in NDB Dictionary`
- `Failed to setup binlogging for table`

This list is not necessarily exhaustive, and is subject to change in future [NDB](#) releases.

The `ndb_sync_excluded_objects` table was added in NDB 8.0.21.

## 26.12.13 Performance Schema Lock Tables

The Performance Schema exposes lock information through these tables:

- `data_locks`: Data locks held and requested
- `data_lock_waits`: Relationships between data lock owners and data lock requestors blocked by those owners
- `metadata_locks`: Metadata locks held and requested
- `table_handles`: Table locks held and requested

The following sections describe these tables in more detail.

### 26.12.13.1 The `data_locks` Table

The `data_locks` table shows data locks held and requested. For information about which lock requests are blocked by which held locks, see [Section 26.12.13.2, “The `data\_lock\_waits` Table”](#).

Example data lock information:

```
mysql> SELECT * FROM performance_schema.data_locks\G
***** 1. row *****
ENGINE: INNODB
ENGINE_LOCK_ID: 139664434886512:1059:139664350547912
ENGINE_TRANSACTION_ID: 2569
THREAD_ID: 46
EVENT_ID: 12
OBJECT_SCHEMA: test
OBJECT_NAME: t1
PARTITION_NAME: NULL
SUBPARTITION_NAME: NULL
INDEX_NAME: NULL
OBJECT_INSTANCE_BEGIN: 139664350547912
LOCK_TYPE: TABLE
LOCK_MODE: IX
LOCK_STATUS: GRANTED
LOCK_DATA: NULL
***** 2. row *****
ENGINE: INNODB
ENGINE_LOCK_ID: 139664434886512:2:4:1:139664350544872
ENGINE_TRANSACTION_ID: 2569
THREAD_ID: 46
EVENT_ID: 12
OBJECT_SCHEMA: test
OBJECT_NAME: t1
PARTITION_NAME: NULL
SUBPARTITION_NAME: NULL
INDEX_NAME: GEN_CLUST_INDEX
OBJECT_INSTANCE_BEGIN: 139664350544872
LOCK_TYPE: RECORD
LOCK_MODE: X
LOCK_STATUS: GRANTED
LOCK_DATA: supremum pseudo-record
```

Unlike most Performance Schema data collection, there are no instruments for controlling whether data lock information is collected or system variables for controlling data lock table sizes. The Performance

Schema collects information that is already available in the server, so there is no memory or CPU overhead to generate this information or need for parameters that control its collection.

Use the `data_locks` table to help diagnose performance problems that occur during times of heavy concurrent load. For `InnoDB`, see the discussion of this topic at [Section 15.15.2, “InnoDB INFORMATION\\_SCHEMA Transaction and Locking Information”](#).

The `data_locks` table has these columns:

- `ENGINE`

The storage engine that holds or requested the lock.

- `ENGINE_LOCK_ID`

The ID of the lock held or requested by the storage engine. Tuples of (`ENGINE_LOCK_ID`, `ENGINE`) values are unique.

Lock ID formats are internal and subject to change at any time. Applications should not rely on lock IDs having a particular format.

- `ENGINE_TRANSACTION_ID`

The storage engine internal ID of the transaction that requested the lock. This can be considered the owner of the lock, although the lock might still be pending, not actually granted yet (`LOCK_STATUS= 'WAITING'`).

If the transaction has not yet performed any write operation (is still considered read only), the column contains internal data that users should not try to interpret. Otherwise, the column is the transaction ID.

For `InnoDB`, to obtain details about the transaction, join this column with the `TRX_ID` column of the `INFORMATION_SCHEMA INNODB_TRX` table.

- `THREAD_ID`

The thread ID of the session that created the lock. To obtain details about the thread, join this column with the `THREAD_ID` column of the Performance Schema `threads` table.

`THREAD_ID` can be used together with `EVENT_ID` to determine the event during which the lock data structure was created in memory. (This event might have occurred before this particular lock request occurred, if the data structure is used to store multiple locks.)

- `EVENT_ID`

The Performance Schema event that caused the lock. Tuples of (`THREAD_ID`, `EVENT_ID`) values implicitly identify a parent event in other Performance Schema tables:

- The parent wait event in the `events_waits_xxx` tables
- The parent stage event in the `events_stages_xxx` tables
- The parent statement event in the `events_statements_xxx` tables
- The parent transaction event in the `events_transactions_current` table

To obtain details about the parent event, join the `THREAD_ID` and `EVENT_ID` columns with the columns of like name in the appropriate parent event table. See [Section 26.19.2, “Obtaining Parent Event Information”](#).

- [OBJECT\\_SCHEMA](#)

The schema that contains the locked table.

- [OBJECT\\_NAME](#)

The name of the locked table.

- [PARTITION\\_NAME](#)

The name of the locked partition, if any; [NULL](#) otherwise.

- [SUBPARTITION\\_NAME](#)

The name of the locked subpartition, if any; [NULL](#) otherwise.

- [INDEX\\_NAME](#)

The name of the locked index, if any; [NULL](#) otherwise.

In practice, [InnoDB](#) always creates an index ([GEN\\_CLUST\\_INDEX](#)), so [INDEX\\_NAME](#) is non-[NULL](#) for [InnoDB](#) tables.

- [OBJECT\\_INSTANCE\\_BEGIN](#)

The address in memory of the lock.

- [LOCK\\_TYPE](#)

The type of lock.

The value is storage engine dependent. For [InnoDB](#), permitted values are [RECORD](#) for a row-level lock, [TABLE](#) for a table-level lock.

- [LOCK\\_MODE](#)

How the lock is requested.

The value is storage engine dependent. For [InnoDB](#), permitted values are [S\[ ,GAP\]](#), [X\[ ,GAP\]](#), [IS\[ ,GAP\]](#), [IX\[ ,GAP\]](#), [AUTO\\_INC](#), and [UNKNOWN](#). Lock modes other than [AUTO\\_INC](#) and [UNKNOWN](#) indicate gap locks, if present. For information about [S](#), [X](#), [IS](#), [IX](#), and gap locks, refer to [Section 15.7.1, “InnoDB Locking”](#).

- [LOCK\\_STATUS](#)

The status of the lock request.

The value is storage engine dependent. For [InnoDB](#), permitted values are [GRANTED](#) (lock is held) and [WAITING](#) (lock is being waited for).

- [LOCK\\_DATA](#)

The data associated with the lock, if any. The value is storage engine dependent. For [InnoDB](#), a value is shown if the [LOCK\\_TYPE](#) is [RECORD](#), otherwise the value is [NULL](#). Primary key values of the locked record are shown for a lock placed on the primary key index. Secondary index values of the locked record are shown with primary key values appended for a lock placed on a secondary index. If there is no primary key, [LOCK\\_DATA](#) shows either the key values of a selected unique index or the unique [InnoDB](#) internal row ID number, according to the rules governing [InnoDB](#) clustered index use (see

[Section 15.6.2.1, “Clustered and Secondary Indexes”](#)). `LOCK_DATA` reports “supremum pseudo-record” for a lock taken on a supremum pseudo-record. If the page containing the locked record is not in the buffer pool because it was written to disk while the lock was held, `InnoDB` does not fetch the page from disk. Instead, `LOCK_DATA` reports `NULL`.

The `data_locks` table has these indexes:

- Primary key on (`ENGINE_LOCK_ID`, `ENGINE`)
- Index on (`ENGINE_TRANSACTION_ID`, `ENGINE`)
- Index on (`THREAD_ID`, `EVENT_ID`)
- Index on (`OBJECT_SCHEMA`, `OBJECT_NAME`, `PARTITION_NAME`, `SUBPARTITION_NAME`)

`TRUNCATE TABLE` is not permitted for the `data_locks` table.

### 26.12.13.2 The `data_lock_waits` Table

The `data_lock_waits` table implements a many-to-many relationship showing which data lock requests in the `data_locks` table are blocked by which held data locks in the `data_locks` table. Held locks in `data_locks` appear in `data_lock_waits` only if they block some lock request.

This information enables you to understand data lock dependencies between sessions. The table exposes not only which lock a session or transaction is waiting for, but which session or transaction currently holds that lock.

Example data lock wait information:

```
mysql> SELECT * FROM performance_schema.data_lock_waits\G
***** 1. row *****
ENGINE: INNODB
REQUESTING_ENGINE_LOCK_ID: 140211201964816:2:4:2:140211086465800
REQUESTING_ENGINE_TRANSACTION_ID: 1555
REQUESTING_THREAD_ID: 47
REQUESTING_EVENT_ID: 5
REQUESTING_OBJECT_INSTANCE_BEGIN: 140211086465800
BLOCKING_ENGINE_LOCK_ID: 140211201963888:2:4:2:140211086459880
BLOCKING_ENGINE_TRANSACTION_ID: 1554
BLOCKING_THREAD_ID: 46
BLOCKING_EVENT_ID: 12
BLOCKING_OBJECT_INSTANCE_BEGIN: 140211086459880
```

Unlike most Performance Schema data collection, there are no instruments for controlling whether data lock information is collected or system variables for controlling data lock table sizes. The Performance Schema collects information that is already available in the server, so there is no memory or CPU overhead to generate this information or need for parameters that control its collection.

Use the `data_lock_waits` table to help diagnose performance problems that occur during times of heavy concurrent load. For `InnoDB`, see the discussion of this topic at [Section 15.15.2, “InnoDB INFORMATION\\_SCHEMA Transaction and Locking Information”](#).

Because the columns in the `data_lock_waits` table are similar to those in the `data_locks` table, the column descriptions here are abbreviated. For more detailed column descriptions, see [Section 26.12.13.1, “The `data\_locks` Table”](#).

The `data_lock_waits` table has these columns:

- `ENGINE`

The storage engine that requested the lock.

- [REQUESTING\\_ENGINE\\_LOCK\\_ID](#)

The ID of the lock requested by the storage engine. To obtain details about the lock, join this column with the [ENGINE\\_LOCK\\_ID](#) column of the [data\\_locks](#) table.

- [REQUESTING\\_ENGINE\\_TRANSACTION\\_ID](#)

The storage engine internal ID of the transaction that requested the lock.

- [REQUESTING\\_THREAD\\_ID](#)

The thread ID of the session that requested the lock.

- [REQUESTING\\_EVENT\\_ID](#)

The Performance Schema event that caused the lock request in the session that requested the lock.

- [REQUESTING\\_OBJECT\\_INSTANCE\\_BEGIN](#)

The address in memory of the requested lock.

- [BLOCKING\\_ENGINE\\_LOCK\\_ID](#)

The ID of the blocking lock. To obtain details about the lock, join this column with the [ENGINE\\_LOCK\\_ID](#) column of the [data\\_locks](#) table.

- [BLOCKING\\_ENGINE\\_TRANSACTION\\_ID](#)

The storage engine internal ID of the transaction that holds the blocking lock.

- [BLOCKING\\_THREAD\\_ID](#)

The thread ID of the session that holds the blocking lock.

- [BLOCKING\\_EVENT\\_ID](#)

The Performance Schema event that caused the blocking lock in the session that holds it.

- [BLOCKING\\_OBJECT\\_INSTANCE\\_BEGIN](#)

The address in memory of the blocking lock.

The [data\\_lock\\_waits](#) table has these indexes:

- Index on ([REQUESTING\\_ENGINE\\_LOCK\\_ID](#), [ENGINE](#))
- Index on ([BLOCKING\\_ENGINE\\_LOCK\\_ID](#), [ENGINE](#))
- Index on ([REQUESTING\\_ENGINE\\_TRANSACTION\\_ID](#), [ENGINE](#))
- Index on ([BLOCKING\\_ENGINE\\_TRANSACTION\\_ID](#), [ENGINE](#))
- Index on ([REQUESTING\\_THREAD\\_ID](#), [REQUESTING\\_EVENT\\_ID](#))
- Index on ([BLOCKING\\_THREAD\\_ID](#), [BLOCKING\\_EVENT\\_ID](#))

[TRUNCATE TABLE](#) is not permitted for the [data\\_lock\\_waits](#) table.

### 26.12.13.3 The metadata\_locks Table

MySQL uses metadata locking to manage concurrent access to database objects and to ensure data consistency; see [Section 8.11.4, “Metadata Locking”](#). Metadata locking applies not just to tables, but also to schemas, stored programs (procedures, functions, triggers, scheduled events), tablespaces, user locks acquired with the `GET_LOCK()` function (see [Section 12.15, “Locking Functions”](#)), and locks acquired with the locking service described in [Section 5.6.8.1, “The Locking Service”](#).

The Performance Schema exposes metadata lock information through the `metadata_locks` table:

- Locks that have been granted (shows which sessions own which current metadata locks).
- Locks that have been requested but not yet granted (shows which sessions are waiting for which metadata locks).
- Lock requests that have been killed by the deadlock detector.
- Lock requests that have timed out and are waiting for the requesting session's lock request to be discarded.

This information enables you to understand metadata lock dependencies between sessions. You can see not only which lock a session is waiting for, but which session currently holds that lock.

The `metadata_locks` table is read only and cannot be updated. It is autosized by default; to configure the table size, set the `performance_schema_max_metadata_locks` system variable at server startup.

Metadata lock instrumentation uses the `wait/lock/metadata/sql/mdl` instrument, which is enabled by default.

To control metadata lock instrumentation state at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='wait/lock/metadata/sql/mdl=ON'
```

- Disable:

```
[mysqld]
performance-schema-instrument='wait/lock/metadata/sql/mdl=OFF'
```

To control metadata lock instrumentation state at runtime, update the `setup_instruments` table:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME = 'wait/lock/metadata/sql/mdl';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME = 'wait/lock/metadata/sql/mdl';
```

The Performance Schema maintains `metadata_locks` table content as follows, using the `LOCK_STATUS` column to indicate the status of each lock:

- When a metadata lock is requested and obtained immediately, a row with a status of `GRANTED` is inserted.

- When a metadata lock is requested and not obtained immediately, a row with a status of `PENDING` is inserted.
- When a metadata lock previously requested is granted, its row status is updated to `GRANTED`.
- When a metadata lock is released, its row is deleted.
- When a pending lock request is canceled by the deadlock detector to break a deadlock (`ER_LOCK_DEADLOCK`), its row status is updated from `PENDING` to `VICTIM`.
- When a pending lock request times out (`ER_LOCK_WAIT_TIMEOUT`), its row status is updated from `PENDING` to `TIMEOUT`.
- When granted lock or pending lock request is killed, its row status is updated from `GRANTED` or `PENDING` to `KILLED`.
- The `VICTIM`, `TIMEOUT`, and `KILLED` status values are brief and signify that the lock row is about to be deleted.
- The `PRE_ACQUIRE_NOTIFY` and `POST_RELEASE_NOTIFY` status values are brief and signify that the metadata locking subsystem is notifying interested storage engines while entering lock acquisition operations or leaving lock release operations.

The `metadata_locks` table has these columns:

- `OBJECT_TYPE`

The type of lock used in the metadata lock subsystem. The value is one of `GLOBAL`, `SCHEMA`, `TABLE`, `FUNCTION`, `PROCEDURE`, `TRIGGER` (currently unused), `EVENT`, `COMMIT`, `USER_LEVEL_LOCK`, `TABLESPACE`, or `LOCKING_SERVICE`.

A value of `USER_LEVEL_LOCK` indicates a lock acquired with `GET_LOCK()`. A value of `LOCKING_SERVICE` indicates a lock acquired with the locking service described in [Section 5.6.8.1, “The Locking Service”](#).

- `OBJECT_SCHEMA`

The schema that contains the object.

- `OBJECT_NAME`

The name of the instrumented object.

- `OBJECT_INSTANCE_BEGIN`

The address in memory of the instrumented object.

- `LOCK_TYPE`

The lock type from the metadata lock subsystem. The value is one of `INTENTION_EXCLUSIVE`, `SHARED`, `SHARED_HIGH_PRIO`, `SHARED_READ`, `SHARED_WRITE`, `SHARED_UPGRADABLE`, `SHARED_NO_WRITE`, `SHARED_NO_READ_WRITE`, or `EXCLUSIVE`.

- `LOCK_DURATION`

The lock duration from the metadata lock subsystem. The value is one of `STATEMENT`, `TRANSACTION`, or `EXPLICIT`. The `STATEMENT` and `TRANSACTION` values signify locks that are released implicitly at statement or transaction end, respectively. The `EXPLICIT` value signifies locks that survive statement or

transaction end and are released by explicit action, such as global locks acquired with `FLUSH TABLES WITH READ LOCK`.

- `LOCK_STATUS`

The lock status from the metadata lock subsystem. The value is one of `PENDING`, `GRANTED`, `VICTIM`, `TIMEOUT`, `KILLED`, `PRE_ACQUIRE_NOTIFY`, or `POST_RELEASE_NOTIFY`. The Performance Schema assigns these values as described previously.

- `SOURCE`

The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved.

- `OWNER_THREAD_ID`

The thread requesting a metadata lock.

- `OWNER_EVENT_ID`

The event requesting a metadata lock.

The `metadata_locks` table has these indexes:

- Primary key on (`OBJECT_INSTANCE_BEGIN`)
- Index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)
- Index on (`OWNER_THREAD_ID`, `OWNER_EVENT_ID`)

`TRUNCATE TABLE` is not permitted for the `metadata_locks` table.

### 26.12.13.4 The `table_handles` Table

The Performance Schema exposes table lock information through the `table_handles` table to show the table locks currently in effect for each opened table handle. `table_handles` reports what is recorded by the table lock instrumentation. This information shows which table handles the server has open, how they are locked, and by which sessions.

The `table_handles` table is read only and cannot be updated. It is autosized by default; to configure the table size, set the `performance_schema_max_table_handles` system variable at server startup.

Table lock instrumentation uses the `wait/lock/table/sql/handler` instrument, which is enabled by default.

To control table lock instrumentation state at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='wait/lock/table/sql/handler=ON'
```

- Disable:

```
[mysqld]
performance-schema-instrument='wait/lock/table/sql/handler=OFF'
```

To control table lock instrumentation state at runtime, update the `setup_instruments` table:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME = 'wait/lock/table/sql/handler';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME = 'wait/lock/table/sql/handler';
```

The `table_handles` table has these columns:

- `OBJECT_TYPE`

The table opened by a table handle.

- `OBJECT_SCHEMA`

The schema that contains the object.

- `OBJECT_NAME`

The name of the instrumented object.

- `OBJECT_INSTANCE_BEGIN`

The table handle address in memory.

- `OWNER_THREAD_ID`

The thread owning the table handle.

- `OWNER_EVENT_ID`

The event which caused the table handle to be opened.

- `INTERNAL_LOCK`

The table lock used at the SQL level. The value is one of `READ`, `READ WITH SHARED LOCKS`, `READ HIGH PRIORITY`, `READ NO INSERT`, `WRITE ALLOW WRITE`, `WRITE CONCURRENT INSERT`, `WRITE LOW PRIORITY`, or `WRITE`. For information about these lock types, see the `include/thr_lock.h` source file.

- `EXTERNAL_LOCK`

The table lock used at the storage engine level. The value is one of `READ EXTERNAL` or `WRITE EXTERNAL`.

The `table_handles` table has these indexes:

- Primary key on (`OBJECT_INSTANCE_BEGIN`)
- Index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)
- Index on (`OWNER_THREAD_ID`, `OWNER_EVENT_ID`)

`TRUNCATE TABLE` is not permitted for the `table_handles` table.

## 26.12.14 Performance Schema System Variable Tables

The MySQL server maintains many system variables that indicate how it is configured (see [Section 5.1.8, “Server System Variables”](#)). System variable information is available in these Performance Schema tables:

- `global_variables`: Global system variables. An application that wants only global values should use this table.
- `session_variables`: System variables for the current session. An application that wants all system variable values for its own session should use this table. It includes the session variables for its session, as well as the values of global variables that have no session counterpart.
- `variables_by_thread`: Session system variables for each active session. An application that wants to know the session variable values for specific sessions should use this table. It includes session variables only, identified by thread ID.
- `persisted_variables`: Provides a SQL interface to the `mysqld-auto.cnf` file that stores persisted global system variable settings. See [Section 26.12.14.1, “Performance Schema persisted\\_variables Table”](#).
- `variables_info`: Shows, for each system variable, the source from which it was most recently set, and its range of values. See [Section 26.12.14.2, “Performance Schema variables\\_info Table”](#).

The session variable tables (`session_variables`, `variables_by_thread`) contain information only for active sessions, not terminated sessions.

The `global_variables` and `session_variables` tables have these columns:

- `VARIABLE_NAME`

The system variable name.

- `VARIABLE_VALUE`

The system variable value. For `global_variables`, this column contains the global value. For `session_variables`, this column contains the variable value in effect for the current session.

The `global_variables` and `session_variables` tables have these indexes:

- Primary key on (`VARIABLE_NAME`)

The `variables_by_thread` table has these columns:

- `THREAD_ID`

The thread identifier of the session in which the system variable is defined.

- `VARIABLE_NAME`

The system variable name.

- `VARIABLE_VALUE`

The session variable value for the session named by the `THREAD_ID` column.

The `variables_by_thread` table has these indexes:

- Primary key on (`THREAD_ID`, `VARIABLE_NAME`)

The `variables_by_thread` table contains system variable information only about foreground threads. If not all threads are instrumented by the Performance Schema, this table will miss some rows. In this case, the `Performance_schema_thread_instances_lost` status variable will be greater than zero.

`TRUNCATE TABLE` is not supported for Performance Schema system variable tables.

### 26.12.14.1 Performance Schema `persisted_variables` Table

The `persisted_variables` table provides an SQL interface to the `mysqld-auto.cnf` file that stores persisted global system variable settings, enabling the file contents to be inspected at runtime using `SELECT` statements. Variables are persisted using `SET PERSIST` or `PERSIST_ONLY` statements; see [Section 13.7.6.1, “SET Syntax for Variable Assignment”](#). The table contains a row for each persisted system variable in the file. Variables not persisted do not appear in the table.

For information about persisted system variables, see [Section 13.7.6.1, “SET Syntax for Variable Assignment”](#).

Suppose that `mysqld-auto.cnf` looks like this (slightly reformatted):

```
{
 "Version": 1,
 "mysql_server": {
 "max_connections": {
 "Value": "1000",
 "Metadata": {
 "Timestamp": 1.519921706e+15,
 "User": "root",
 "Host": "localhost"
 }
 }
 },
 "autocommit": {
 "Value": "ON",
 "Metadata": {
 "Timestamp": 1.519921707e+15,
 "User": "root",
 "Host": "localhost"
 }
 }
}
```

Then `persisted_variables` has these contents:

```
mysql> SELECT * FROM performance_schema.persisted_variables;
+-----+-----+
| VARIABLE_NAME | VARIABLE_VALUE |
+-----+-----+
| autocommit | ON |
| max_connections | 1000 |
+-----+-----+
```

The `persisted_variables` table has these columns:

- `VARIABLE_NAME`

The variable name listed in `mysqld-auto.cnf`.

- `VARIABLE_VALUE`

The value listed for the variable in `mysqld-auto.cnf`.

`persisted_variables` has these indexes:

- Primary key on ([VARIABLE\\_NAME](#))

[TRUNCATE TABLE](#) is not permitted for the [persisted\\_variables](#) table.

## 26.12.14.2 Performance Schema variables\_info Table

The [variables\\_info](#) table shows, for each system variable, the source from which it was most recently set, and its range of values.

The [variables\\_info](#) table has these columns:

- [VARIABLE\\_NAME](#)

The variable name.

- [VARIABLE\\_SOURCE](#)

The source from which the variable was most recently set:

- [COMMAND\\_LINE](#)

The variable was set on the command line.

- [COMPILED](#)

The variable has its compiled-in default value. [COMPILED](#) is the value used for variables not set any other way.

- [DYNAMIC](#)

The variable was set at runtime. This includes variables set within files specified using the [init\\_file](#) system variable.

- [EXPLICIT](#)

The variable was set from an option file named with the [--defaults-file](#) option.

- [EXTRA](#)

The variable was set from an option file named with the [--defaults-extra-file](#) option.

- [GLOBAL](#)

The variable was set from a global option file. This includes option files not covered by [EXPLICIT](#), [EXTRA](#), [LOGIN](#), [PERSISTED](#), [SERVER](#), or [USER](#).

- [LOGIN](#)

The variable was set from a user-specific login path file ([~/mylogin.cnf](#)).

- [PERSISTED](#)

The variable was set from a server-specific [mysqld-auto.cnf](#) option file. No row has this value if the server was started with [persisted\\_globals\\_load](#) disabled.

- [SERVER](#)

The variable was set from a server-specific [\\$MYSQL\\_HOME/my.cnf](#) option file. For details about how [MYSQL\\_HOME](#) is set, see [Section 4.2.2.2, “Using Option Files”](#).

- `USER`

The variable was set from a user-specific `~/.my.cnf` option file.

- `VARIABLE_PATH`

If the variable was set from an option file, `VARIABLE_PATH` is the path name of that file. Otherwise, the value is the empty string.

- `MIN_VALUE`, `MAX_VALUE`

The minimum and maximum permitted values for the variable. Both are 0 for variables that have no such values (that is, variables that are not numeric).

- `SET_TIME`

The time at which the variable was most recently set. The default is the time at which the server initialized global system variables during startup.

- `SET_USER`, `SET_HOST`

The user name and host name of the client user that most recently set the variable. If a client connects as `user17` from host `host34.example.com` using the account `'user17'@'%.example.com'`, `SET_USER` and `SET_HOST` will be `user17` and `host34.example.com`, respectively. For proxy user connections, these values correspond to the external (proxy) user, not the proxied user against which privilege checking is performed. The default for each column is the empty string, indicating that the variable has not been set since server startup.

The `variables_info` table has these indexes:

- None

`TRUNCATE TABLE` is not permitted for the `variables_info` table.

If a variable with a `VARIABLE_SOURCE` value other than `DYNAMIC` is set at runtime, `VARIABLE_SOURCE` becomes `DYNAMIC` and `VARIABLE_PATH` becomes the empty string.

A system variable that has only a session value (such as `debug_sync`) cannot be set at startup or persisted. For session-only system variables, `VARIABLE_SOURCE` can be only `COMPILED` or `DYNAMIC`.

If a system variable has an unexpected `VARIABLE_SOURCE` value, consider your server startup method. For example, `mysqld_safe` reads option files and passes certain options it finds there as part of the command line that it uses to start `mysqld`. Consequently, some system variables that you set in option files might display in `variables_info` as `COMMAND_LINE`, rather than as `GLOBAL` or `SERVER` as you might otherwise expect.

Some sample queries that use the `variables_info` table, with representative output:

- Display variables set on the command line:

```
mysql> SELECT VARIABLE_NAME
 FROM performance_schema.variables_info
 WHERE VARIABLE_SOURCE = 'COMMAND_LINE'
 ORDER BY VARIABLE_NAME;
+-----+
| VARIABLE_NAME |
+-----+
| basedir |
```

datadir
log_error
pid_file
plugin_dir
port

- Display variables set from persistent storage:

```
mysql> SELECT VARIABLE_NAME
 FROM performance_schema.variables_info
 WHERE VARIABLE_SOURCE = 'PERSISTED'
 ORDER BY VARIABLE_NAME;
```

VARIABLE_NAME
event_scheduler
max_connections
validate_password.policy

- Join `variables_info` with the `global_variables` table to display the current values of persisted variables, together with their range of values:

```
mysql> SELECT
 VI.VARIABLE_NAME, GV.VARIABLE_VALUE,
 VI.MIN_VALUE, VI.MAX_VALUE
 FROM performance_schema.variables_info AS VI
 INNER JOIN performance_schema.global_variables AS GV
 USING(VARIABLE_NAME)
 WHERE VI.VARIABLE_SOURCE = 'PERSISTED'
 ORDER BY VARIABLE_NAME;
```

VARIABLE_NAME	VARIABLE_VALUE	MIN_VALUE	MAX_VALUE
event_scheduler	ON	0	0
max_connections	200	1	100000
validate_password.policy	STRONG	0	0

## 26.12.15 Performance Schema Status Variable Tables

The MySQL server maintains many status variables that provide information about its operation (see [Section 5.1.10, “Server Status Variables”](#)). Status variable information is available in these Performance Schema tables:

- `global_status`: Global status variables. An application that wants only global values should use this table.
- `session_status`: Status variables for the current session. An application that wants all status variable values for its own session should use this table. It includes the session variables for its session, as well as the values of global variables that have no session counterpart.
- `status_by_thread`: Session status variables for each active session. An application that wants to know the session variable values for specific sessions should use this table. It includes session variables only, identified by thread ID.

There are also summary tables that provide status variable information aggregated by account, host name, and user name. See [Section 26.12.18.12, “Status Variable Summary Tables”](#).

The session variable tables (`session_status`, `status_by_thread`) contain information only for active sessions, not terminated sessions.

The Performance Schema collects statistics for global status variables only for threads for which the `INSTRUMENTED` value is `YES` in the `threads` table. Statistics for session status variables are always collected, regardless of the `INSTRUMENTED` value.

The Performance Schema does not collect statistics for `Com_xxx` status variables in the status variable tables. To obtain global and per-session statement execution counts, use the `events_statements_summary_global_by_event_name` and `events_statements_summary_by_thread_by_event_name` tables, respectively. For example:

```
SELECT EVENT_NAME, COUNT_STAR
FROM performance_schema.events_statements_summary_global_by_event_name
WHERE EVENT_NAME LIKE 'statement/sql/%';
```

The `global_status` and `session_status` tables have these columns:

- `VARIABLE_NAME`

The status variable name.

- `VARIABLE_VALUE`

The status variable value. For `global_status`, this column contains the global value. For `session_status`, this column contains the variable value for the current session.

The `global_status` and `session_status` tables have these indexes:

- Primary key on (`VARIABLE_NAME`)

The `status_by_thread` table contains the status of each active thread. It has these columns:

- `THREAD_ID`

The thread identifier of the session in which the status variable is defined.

- `VARIABLE_NAME`

The status variable name.

- `VARIABLE_VALUE`

The session variable value for the session named by the `THREAD_ID` column.

The `status_by_thread` table has these indexes:

- Primary key on (`THREAD_ID`, `VARIABLE_NAME`)

The `status_by_thread` table contains status variable information only about foreground threads. If the `performance_schema_max_thread_instances` system variable is not autoscaled (signified by a value of `-1`) and the maximum permitted number of instrumented thread objects is not greater than the number of background threads, the table will be empty.

The Performance Schema supports `TRUNCATE TABLE` for status variable tables as follows:

- `global_status`: Resets thread, account, host, and user status. Resets global status variables except those that the server never resets.
- `session_status`: Not supported.

- `status_by_thread`: Aggregates status for all threads to the global status and account status, then resets thread status. If account statistics are not collected, the session status is added to host and user status, if host and user status are collected.

Account, host, and user statistics are not collected if the `performance_schema_accounts_size`, `performance_schema_hosts_size`, and `performance_schema_users_size` system variables, respectively, are set to 0.

`FLUSH STATUS` adds the session status from all active sessions to the global status variables, resets the status of all active sessions, and resets account, host, and user status values aggregated from disconnected sessions.

## 26.12.16 Performance Schema Thread Pool Tables

### Note

The Performance Schema tables described here are available as of MySQL 8.0.14. Prior to MySQL 8.0.14, use the corresponding `INFORMATION_SCHEMA` tables instead; see [Section 25.52, “INFORMATION\\_SCHEMA Thread Pool Tables”](#).

The following sections describe the Performance Schema tables associated with the thread pool plugin (see [Section 5.6.3, “MySQL Enterprise Thread Pool”](#)). They provide information about thread pool operation:

- `tp_thread_group_state`: Information about thread pool thread group states
- `tp_thread_group_stats`: Thread group statistics
- `tp_thread_state`: Information about thread pool thread states

Rows in these tables represent snapshots in time. In the case of `tp_thread_state`, all rows for a thread group comprise a snapshot in time. Thus, the MySQL server holds the mutex of the thread group while producing the snapshot. But it does not hold mutexes on all thread groups at the same time, to prevent a statement against `tp_thread_state` from blocking the entire MySQL server.

The Performance Schema thread pool tables are implemented by the thread pool plugin and are loaded and unloaded when that plugin is loaded and unloaded (see [Section 5.6.3.2, “Thread Pool Installation”](#)). No special configuration step for the tables is needed. However, the tables depend on the thread pool plugin being enabled. If the thread pool plugin is loaded but disabled, the tables are not created.

### 26.12.16.1 The `tp_thread_group_state` Table

### Note

The Performance Schema table described here is available as of MySQL 8.0.14. Prior to MySQL 8.0.14, use the corresponding `INFORMATION_SCHEMA` table instead; see [Section 25.52.1, “The INFORMATION\\_SCHEMA TP\\_THREAD\\_GROUP\\_STATE Table”](#).

The `tp_thread_group_state` table has one row per thread group in the thread pool. Each row provides information about the current state of a group.

The `tp_thread_group_state` table has these columns:

- `TP_GROUP_ID`

The thread group ID. This is a unique key within the table.

- [CONSUMER\\_THREADS](#)

The number of consumer threads. There is at most one thread ready to start executing if the active threads become stalled or blocked.

- [RESERVE\\_THREADS](#)

The number of threads in the reserved state. This means that they will not be started until there is a need to wake a new thread and there is no consumer thread. This is where most threads end up when the thread group has created more threads than needed for normal operation. Often a thread group needs additional threads for a short while and then does not need them again for a while. In this case, they go into the reserved state and remain until needed again. They take up some extra memory resources, but no extra computing resources.

- [CONNECT\\_THREAD\\_COUNT](#)

The number of threads that are processing or waiting to process connection initialization and authentication. There can be a maximum of four connection threads per thread group; these threads expire after a period of inactivity.

- [CONNECTION\\_COUNT](#)

The number of connections using this thread group.

- [QUEUED\\_QUERIES](#)

The number of statements waiting in the high-priority queue.

- [QUEUED\\_TRANSACTIONS](#)

The number of statements waiting in the low-priority queue. These are the initial statements for transactions that have not started, so they also represent queued transactions.

- [STALL\\_LIMIT](#)

The value of the `thread_pool_stall_limit` system variable for the thread group. This is the same value for all thread groups.

- [PRIO\\_KICKUP\\_TIMER](#)

The value of the `thread_pool_prio_kickup_timer` system variable for the thread group. This is the same value for all thread groups.

- [ALGORITHM](#)

The value of the `thread_pool_algorithm` system variable for the thread group. This is the same value for all thread groups.

- [THREAD\\_COUNT](#)

The number of threads started in the thread pool as part of this thread group.

- [ACTIVE\\_THREAD\\_COUNT](#)

The number of threads active in executing statements.

- [STALLED\\_THREAD\\_COUNT](#)

The number of stalled statements in the thread group. A stalled statement could be executing, but from a thread pool perspective it is stalled and making no progress. A long-running statement quickly ends up in this category.

- [WAITING\\_THREAD\\_NUMBER](#)

If there is a thread handling the polling of statements in the thread group, this specifies the thread number within this thread group. It is possible that this thread could be executing a statement.

- [OLDEST\\_QUEUED](#)

How long in milliseconds the oldest queued statement has been waiting for execution.

- [MAX\\_THREAD\\_IDS\\_IN\\_GROUP](#)

The maximum thread ID of the threads in the group. This is the same as `MAX(TP_THREAD_NUMBER)` for the threads when selected from the `tp_thread_state` table. That is, these two queries are equivalent:

```
SELECT TP_GROUP_ID, MAX_THREAD_IDS_IN_GROUP
FROM tp_thread_group_state;

SELECT TP_GROUP_ID, MAX(TP_THREAD_NUMBER)
FROM tp_thread_state GROUP BY TP_GROUP_ID;
```

The `tp_thread_group_state` table has these indexes:

- Unique index on ([TP\\_GROUP\\_ID](#))

`TRUNCATE TABLE` is not permitted for the `tp_thread_group_state` table.

## 26.12.16.2 The `tp_thread_group_stats` Table

### Note

The Performance Schema table described here is available as of MySQL 8.0.14. Prior to MySQL 8.0.14, use the corresponding [INFORMATION\\_SCHEMA](#) table instead; see [Section 25.52.2, “The INFORMATION\\_SCHEMA TP\\_THREAD\\_GROUP\\_STATS Table”](#).

The `tp_thread_group_stats` table reports statistics per thread group. There is one row per group.

The `tp_thread_group_stats` table has these columns:

- [TP\\_GROUP\\_ID](#)

The thread group ID. This is a unique key within the table.

- [CONNECTIONS\\_STARTED](#)

The number of connections started.

- [CONNECTIONS\\_CLOSED](#)

The number of connections closed.

- [QUERIES\\_EXECUTED](#)

The number of statements executed. This number is incremented when a statement starts executing, not when it finishes.

- [QUERIES\\_QUEUED](#)

The number of statements received that were queued for execution. This does not count statements that the thread group was able to begin executing immediately without queuing, which can happen under the conditions described in [Section 5.6.3.3, “Thread Pool Operation”](#).

- [THREADS\\_STARTED](#)

The number of threads started.

- [PRIO\\_KICKUPS](#)

The number of statements that have been moved from low-priority queue to high-priority queue based on the value of the [thread\\_pool\\_prio\\_kickup\\_timer](#) system variable. If this number increases quickly, consider increasing the value of that variable. A quickly increasing counter means that the priority system is not keeping transactions from starting too early. For [InnoDB](#), this most likely means deteriorating performance due to too many concurrent transactions..

- [STALLED\\_QUERIES\\_EXECUTED](#)

The number of statements that have become defined as stalled due to executing for longer than the value of the [thread\\_pool\\_stall\\_limit](#) system variable.

- [BECOME\\_CONSUMER\\_THREAD](#)

The number of times thread have been assigned the consumer thread role.

- [BECOME\\_RESERVE\\_THREAD](#)

The number of times threads have been assigned the reserve thread role.

- [BECOME\\_WAITING\\_THREAD](#)

The number of times threads have been assigned the waiter thread role. When statements are queued, this happens very often, even in normal operation, so rapid increases in this value are normal in the case of a highly loaded system where statements are queued up.

- [WAKE\\_THREAD\\_STALL\\_CHECKER](#)

The number of times the stall check thread decided to wake or create a thread to possibly handle some statements or take care of the waiter thread role.

- [SLEEP\\_WAITS](#)

The number of [THD\\_WAIT\\_SLEEP](#) waits. These occur when threads go to sleep (for example, by calling the [SLEEP\( \)](#) function).

- [DISK\\_IO\\_WAITS](#)

The number of [THD\\_WAIT\\_DISKIO](#) waits. These occur when threads perform disk I/O that is likely to not hit the file system cache. Such waits occur when the buffer pool reads and writes data to disk, not for normal reads from and writes to files.

- [ROW\\_LOCK\\_WAITS](#)

The number of `THD_WAIT_ROW_LOCK` waits for release of a row lock by another transaction.

- `GLOBAL_LOCK_WAITS`

The number of `THD_WAIT_GLOBAL_LOCK` waits for a global lock to be released.

- `META_DATA_LOCK_WAITS`

The number of `THD_WAIT_META_DATA_LOCK` waits for a metadata lock to be released.

- `TABLE_LOCK_WAITS`

The number of `THD_WAIT_TABLE_LOCK` waits for a table to be unlocked that the statement needs to access.

- `USER_LOCK_WAITS`

The number of `THD_WAIT_USER_LOCK` waits for a special lock constructed by the user thread.

- `BINLOG_WAITS`

The number of `THD_WAIT_BINLOG_WAITS` waits for the binary log to become free.

- `GROUP_COMMIT_WAITS`

The number of `THD_WAIT_GROUP_COMMIT` waits. These occur when a group commit must wait for the other parties to complete their part of a transaction.

- `FSYNC_WAITS`

The number of `THD_WAIT_SYNC` waits for a file sync operation.

The `tp_thread_group_stats` table has these indexes:

- Unique index on (`TP_GROUP_ID`)

`TRUNCATE TABLE` is not permitted for the `tp_thread_group_stats` table.

### 26.12.16.3 The `tp_thread_state` Table

#### Note

The Performance Schema table described here is available as of MySQL 8.0.14. Prior to MySQL 8.0.14, use the corresponding `INFORMATION_SCHEMA` table instead; see [Section 25.52.3, “The INFORMATION\\_SCHEMA TP\\_THREAD\\_STATE Table”](#).

The `tp_thread_state` table has one row per thread created by the thread pool to handle connections.

The `tp_thread_state` table has these columns:

- `TP_GROUP_ID`

The thread group ID.

- `TP_THREAD_NUMBER`

The ID of the thread within its thread group. `TP_GROUP_ID` and `TP_THREAD_NUMBER` together provide a unique key within the table.

- `PROCESS_COUNT`

The 10ms interval in which the statement that uses this thread is currently executing. 0 means no statement is executing, 1 means it is in the first 10ms, and so forth.

- `WAIT_TYPE`

The type of wait for the thread. `NULL` means the thread is not blocked. Otherwise, the thread is blocked by a call to `thd_wait_begin()` and the value specifies the type of wait. The `xxx_WAIT` columns of the `tp_thread_group_stats` table accumulate counts for each wait type.

The `WAIT_TYPE` value is a string that describes the type of wait, as shown in the following table.

**Table 26.3 `tp_thread_state` Table `WAIT_TYPE` Values**

Wait Type	Meaning
<code>THD_WAIT_SLEEP</code>	Waiting for sleep
<code>THD_WAIT_DISKIO</code>	Waiting for Disk IO
<code>THD_WAIT_ROW_LOCK</code>	Waiting for row lock
<code>THD_WAIT_GLOBAL_LOCK</code>	Waiting for global lock
<code>THD_WAIT_META_DATA_LOCK</code>	Waiting for metadata lock
<code>THD_WAIT_TABLE_LOCK</code>	Waiting for table lock
<code>THD_WAIT_USER_LOCK</code>	Waiting for user lock
<code>THD_WAIT_BINLOG</code>	Waiting for binlog
<code>THD_WAIT_GROUP_COMMIT</code>	Waiting for group commit
<code>THD_WAIT_SYNC</code>	Waiting for fsync

The `tp_thread_state` table has these indexes:

- Unique index on (`TP_GROUP_ID`, `TP_THREAD_NUMBER`)

`TRUNCATE TABLE` is not permitted for the `tp_thread_state` table.

## 26.12.17 Performance Schema Clone Tables

### Note

The Performance Schema tables described here are available as of MySQL 8.0.17.

The following sections describe the Performance Schema tables associated with the clone plugin (see [Section 5.6.7, “The Clone Plugin”](#)). The tables provide information about cloning operations.

- `clone_status`: status information about the current or last executed cloning operation.
- `clone_progress`: progress information about the current or last executed cloning operation.

The Performance Schema clone tables are implemented by the clone plugin and are loaded and unloaded when that plugin is loaded and unloaded (see [Section 5.6.7.1, “Installing the Clone Plugin”](#)). No special configuration step for the tables is needed. However, the tables depend on the clone plugin being enabled. If the clone plugin is loaded but disabled, the tables are not created.

The Performance Schema clone plugin tables are used only on the recipient MySQL server instance. The data is persisted across server shutdown and restart.

### 26.12.17.1 The clone\_status Table

**Note**

The Performance Schema table described here is available as of MySQL 8.0.17.

The `clone_status` table shows the status of the current or last executed cloning operation only. The table only ever contains one row of data, or is empty.

The `clone_status` table has these columns:

- `ID`

A unique cloning operation identifier in the current MySQL server instance.

- `PID`

Process list ID of the session executing the cloning operation.

- `STATE`

Current state of the cloning operation. Values include `Not Started`, `In Progress`, `Completed`, and `Failed`.

- `BEGIN_TIME`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the cloning operation started.

- `END_TIME`

A timestamp in '`YYYY-MM-DD hh:mm:ss[.fraction]`' format that shows when the cloning operation finished. Reports NULL if the operation has not ended.

- `SOURCE`

The donor MySQL server address in '`HOST:PORT`' format. The column displays '`LOCAL INSTANCE`' for a local cloning operation.

- `DESTINATION`

The directory being cloned to.

- `ERROR_NO`

The error number reported for a failed cloning operation.

- `ERROR_MESSAGE`

The error message string for a failed cloning operation.

- `BINLOG_FILE`

The name of the binary log file up to which data is cloned.

- `BINLOG_POSITION`

The binary log file offset up to which data is cloned.

- `GTID_EXECUTED`

The GTID value for the last cloned transaction.

The `clone_status` table is read-only. DDL, including `TRUNCATE TABLE`, is not permitted.

### 26.12.17.2 The `clone_progress` Table

#### Note

The Performance Schema table described here is available as of MySQL 8.0.17.

The `clone_progress` table shows progress information for the current or last executed cloning operation only.

The stages of a cloning operation include `DROP DATA`, `FILE COPY`, `PAGE_COPY`, `REDO_COPY`, `FILE_SYNC`, `RESTART`, and `RECOVERY`. A cloning operation produces a record for each stage. The table therefore only ever contains seven rows of data, or is empty.

The `clone_progress` table has these columns:

- `ID`

A unique cloning operation identifier in the current MySQL server instance.

- `STAGE`

The name of the current cloning stage. Stages include `DROP DATA`, `FILE COPY`, `PAGE_COPY`, `REDO_COPY`, `FILE_SYNC`, `RESTART`, and `RECOVERY`.

- `STATE`

The current state of the cloning stage. States include `Not Started`, `In Progress`, and `Completed`.

- `BEGIN_TIME`

A timestamp in `'YYYY-MM-DD hh:mm:ss[.fraction]'` format that shows when the cloning stage started. Reports NULL if the stage has not started.

- `END_TIME`

A timestamp in `'YYYY-MM-DD hh:mm:ss[.fraction]'` format that shows when the cloning stage finished. Reports NULL if the stage has not ended.

- `THREADS`

The number of concurrent threads used in the stage.

- `ESTIMATE`

The estimated amount of data for the current stage, in bytes.

- `DATA`

The amount of data transferred in current state, in bytes.

- `NETWORK`

The amount of network data transferred in the current state, in bytes.

- [DATA\\_SPEED](#)

The current actual speed of data transfer, in bytes per second. This value may differ from the requested maximum data transfer rate defined by [clone\\_max\\_data\\_bandwidth](#).

- [NETWORK\\_SPEED](#)

The current speed of network transfer in bytes per second.

The [clone\\_progress](#) table is read-only. DDL, including [TRUNCATE TABLE](#), is not permitted.

## 26.12.18 Performance Schema Summary Tables

Summary tables provide aggregated information for terminated events over time. The tables in this group summarize event data in different ways.

### Wait Event Summaries

- [events\\_waits\\_summary\\_by\\_account\\_by\\_event\\_name](#): Wait events per account and event name
- [events\\_waits\\_summary\\_by\\_host\\_by\\_event\\_name](#): Wait events per host name and event name
- [events\\_waits\\_summary\\_by\\_instance](#): Wait events per instance
- [events\\_waits\\_summary\\_by\\_thread\\_by\\_event\\_name](#): Wait events per thread and event name
- [events\\_waits\\_summary\\_by\\_user\\_by\\_event\\_name](#): Wait events per user name and event name
- [events\\_waits\\_summary\\_global\\_by\\_event\\_name](#): Wait events per event name

### Stage Summaries

- [events\\_stages\\_summary\\_by\\_account\\_by\\_event\\_name](#): Stage events per account and event name
- [events\\_stages\\_summary\\_by\\_host\\_by\\_event\\_name](#): Stage events per host name and event name
- [events\\_stages\\_summary\\_by\\_thread\\_by\\_event\\_name](#): Stage waits per thread and event name
- [events\\_stages\\_summary\\_by\\_user\\_by\\_event\\_name](#): Stage events per user name and event name
- [events\\_stages\\_summary\\_global\\_by\\_event\\_name](#): Stage waits per event name

### Statement Summaries

- [events\\_statements\\_histogram\\_by\\_digest](#): Statement histograms per schema and digest value.
- [events\\_statements\\_histogram\\_global](#): Statement histogram summarized globally.
- [events\\_statements\\_summary\\_by\\_account\\_by\\_event\\_name](#): Statement events per account and event name
- [events\\_statements\\_summary\\_by\\_digest](#): Statement events per schema and digest value
- [events\\_statements\\_summary\\_by\\_host\\_by\\_event\\_name](#): Statement events per host name and event name
- [events\\_statements\\_summary\\_by\\_program](#): Statement events per stored program (stored procedures and functions, triggers, and events)

- `events_statements_summary_by_thread_by_event_name`: Statement events per thread and event name
- `events_statements_summary_by_user_by_event_name`: Statement events per user name and event name
- `events_statements_summary_global_by_event_name`: Statement events per event name
- `prepared_statements_instances`: Prepared statement instances and statistics

## Transaction Summaries

- `events_transactions_summary_by_account_by_event_name`: Transaction events per account and event name
- `events_transactions_summary_by_host_by_event_name`: Transaction events per host name and event name
- `events_transactions_summary_by_thread_by_event_name`: Transaction events per thread and event name
- `events_transactions_summary_by_user_by_event_name`: Transaction events per user name and event name
- `events_transactions_summary_global_by_event_name`: Transaction events per event name

## Object Wait Summaries

- `objects_summary_global_by_type`: Object summaries

## File I/O Summaries

- `file_summary_by_event_name`: File events per event name
- `file_summary_by_instance`: File events per file instance

## Table I/O and Lock Wait Summaries

- `table_io_waits_summary_by_index_usage`: Table I/O waits per index
- `table_io_waits_summary_by_table`: Table I/O waits per table
- `table_lock_waits_summary_by_table`: Table lock waits per table

## Socket Summaries

- `socket_summary_by_instance`: Socket waits and I/O per instance
- `socket_summary_by_event_name`: Socket waits and I/O per event name

## Memory Summaries

- `memory_summary_by_account_by_event_name`: Memory operations per account and event name
- `memory_summary_by_host_by_event_name`: Memory operations per host and event name
- `memory_summary_by_thread_by_event_name`: Memory operations per thread and event name
- `memory_summary_by_user_by_event_name`: Memory operations per user and event name

- [memory\\_summary\\_global\\_by\\_event\\_name](#): Memory operations globally per event name

## Error Summaries

- [events\\_errors\\_summary\\_by\\_account\\_by\\_error](#): Errors per error code and account
- [events\\_errors\\_summary\\_by\\_host\\_by\\_error](#): Errors per error code and host
- [events\\_errors\\_summary\\_by\\_thread\\_by\\_error](#): Errors per error code and thread
- [events\\_errors\\_summary\\_by\\_user\\_by\\_error](#): Errors per error code and user
- [events\\_errors\\_summary\\_global\\_by\\_error](#): Errors per error code

## Status Variable Summaries

- [status\\_by\\_account](#): Status variables per account
- [status\\_by\\_host](#): Status variables per host name
- [status\\_by\\_user](#): Status variables per user name

Each summary table has grouping columns that determine how to group the data to be aggregated, and summary columns that contain the aggregated values. Tables that summarize events in similar ways often have similar sets of summary columns and differ only in the grouping columns used to determine how events are aggregated.

Summary tables can be truncated with [TRUNCATE TABLE](#). Generally, the effect is to reset the summary columns to 0 or [NULL](#), not to remove rows. This enables you to clear collected values and restart aggregation. That might be useful, for example, after you have made a runtime configuration change. Exceptions to this truncation behavior are noted in individual summary table sections.

### 26.12.18.1 Wait Event Summary Tables

The Performance Schema maintains tables for collecting current and recent wait events, and aggregates that information in summary tables. [Section 26.12.4, “Performance Schema Wait Event Tables”](#) describes the events on which wait summaries are based. See that discussion for information about the content of wait events, the current and recent wait event tables, and how to control wait event collection, which is disabled by default.

Example wait event summary information:

```
mysql> SELECT *
 FROM performance_schema.events_waits_summary_global_by_event_name\G
...
***** 6. row *****
 EVENT_NAME: wait/synch/mutex/sql/BINARY_LOG::LOCK_index
 COUNT_STAR: 8
 SUM_TIMER_WAIT: 2119302
 MIN_TIMER_WAIT: 196092
 AVG_TIMER_WAIT: 264912
 MAX_TIMER_WAIT: 569421
...
***** 9. row *****
 EVENT_NAME: wait/synch/mutex/sql/hash_filo::lock
 COUNT_STAR: 69
 SUM_TIMER_WAIT: 16848828
 MIN_TIMER_WAIT: 0
 AVG_TIMER_WAIT: 244185
 MAX_TIMER_WAIT: 735345
...
```

Each wait event summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `events_waits_summary_by_account_by_event_name` has `EVENT_NAME`, `USER`, and `HOST` columns. Each row summarizes events for a given account (user and host combination) and event name.
- `events_waits_summary_by_host_by_event_name` has `EVENT_NAME` and `HOST` columns. Each row summarizes events for a given host and event name.
- `events_waits_summary_by_instance` has `EVENT_NAME` and `OBJECT_INSTANCE_BEGIN` columns. Each row summarizes events for a given event name and object. If an instrument is used to create multiple instances, each instance has a unique `OBJECT_INSTANCE_BEGIN` value and is summarized separately in this table.
- `events_waits_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `events_waits_summary_by_user_by_event_name` has `EVENT_NAME` and `USER` columns. Each row summarizes events for a given user and event name.
- `events_waits_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name. An instrument might be used to create multiple instances of the instrumented object. For example, if there is an instrument for a mutex that is created for each connection, there are as many instances as there are connections. The summary row for the instrument summarizes over all these instances.

Each wait event summary table has these summary columns containing aggregated values:

- `COUNT_STAR`

The number of summarized events. This value includes all events, whether timed or nontimed.

- `SUM_TIMER_WAIT`

The total wait time of the summarized timed events. This value is calculated only for timed events because nontimed events have a wait time of `NULL`. The same is true for the other `xxx_TIMER_WAIT` values.

- `MIN_TIMER_WAIT`

The minimum wait time of the summarized timed events.

- `AVG_TIMER_WAIT`

The average wait time of the summarized timed events.

- `MAX_TIMER_WAIT`

The maximum wait time of the summarized timed events.

The wait event summary tables have these indexes:

- `events_waits_summary_by_account_by_event_name`:
  - Primary key on (`USER`, `HOST`, `EVENT_NAME`)
- `events_waits_summary_by_host_by_event_name`:

- Primary key on ([HOST](#), [EVENT\\_NAME](#))
- [events\\_waits\\_summary\\_by\\_instance](#):
  - Primary key on ([OBJECT\\_INSTANCE\\_BEGIN](#))
  - Index on ([EVENT\\_NAME](#))
- [events\\_waits\\_summary\\_by\\_thread\\_by\\_event\\_name](#):
  - Primary key on ([THREAD\\_ID](#), [EVENT\\_NAME](#))
- [events\\_waits\\_summary\\_by\\_user\\_by\\_event\\_name](#):
  - Primary key on ([USER](#), [EVENT\\_NAME](#))
- [events\\_waits\\_summary\\_global\\_by\\_event\\_name](#):
  - Primary key on ([EVENT\\_NAME](#))

[TRUNCATE TABLE](#) is permitted for wait summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each wait summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of [events\\_waits\\_summary\\_global\\_by\\_event\\_name](#). For details, see [Section 26.12.8, “Performance Schema Connection Tables”](#).

## 26.12.18.2 Stage Summary Tables

The Performance Schema maintains tables for collecting current and recent stage events, and aggregates that information in summary tables. [Section 26.12.5, “Performance Schema Stage Event Tables”](#) describes the events on which stage summaries are based. See that discussion for information about the content of stage events, the current and historical stage event tables, and how to control stage event collection, which is disabled by default.

Example stage event summary information:

```
mysql> SELECT *
 FROM performance_schema.events_stages_summary_global_by_event_name\G
...
***** 5. row *****
 EVENT_NAME: stage/sql/checking permissions
 COUNT_STAR: 57
 SUM_TIMER_WAIT: 26501888880
 MIN_TIMER_WAIT: 7317456
 AVG_TIMER_WAIT: 464945295
 MAX_TIMER_WAIT: 12858936792
...
***** 9. row *****
 EVENT_NAME: stage/sql/closing tables
 COUNT_STAR: 37
 SUM_TIMER_WAIT: 662606568
 MIN_TIMER_WAIT: 1593864
 AVG_TIMER_WAIT: 17907891
```

```
MAX_TIMER_WAIT: 437977248
...
```

Each stage summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `events_stages_summary_by_account_by_event_name` has `EVENT_NAME`, `USER`, and `HOST` columns. Each row summarizes events for a given account (user and host combination) and event name.
- `events_stages_summary_by_host_by_event_name` has `EVENT_NAME` and `HOST` columns. Each row summarizes events for a given host and event name.
- `events_stages_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `events_stages_summary_by_user_by_event_name` has `EVENT_NAME` and `USER` columns. Each row summarizes events for a given user and event name.
- `events_stages_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

Each stage summary table has these summary columns containing aggregated values: `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, and `MAX_TIMER_WAIT`. These columns are analogous to the columns of the same names in the wait event summary tables (see [Section 26.12.18.1, “Wait Event Summary Tables”](#)), except that the stage summary tables aggregate events from `events_stages_current` rather than `events_waits_current`.

The stage summary tables have these indexes:

- `events_stages_summary_by_account_by_event_name`:
  - Primary key on (`USER`, `HOST`, `EVENT_NAME`)
- `events_stages_summary_by_host_by_event_name`:
  - Primary key on (`HOST`, `EVENT_NAME`)
- `events_stages_summary_by_thread_by_event_name`:
  - Primary key on (`THREAD_ID`, `EVENT_NAME`)
- `events_stages_summary_by_user_by_event_name`:
  - Primary key on (`USER`, `EVENT_NAME`)
- `events_stages_summary_global_by_event_name`:
  - Primary key on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for stage summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each stage summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of

[events\\_stages\\_summary\\_global\\_by\\_event\\_name](#). For details, see [Section 26.12.8, “Performance Schema Connection Tables”](#).

### 26.12.18.3 Statement Summary Tables

The Performance Schema maintains tables for collecting current and recent statement events, and aggregates that information in summary tables. [Section 26.12.6, “Performance Schema Statement Event Tables”](#) describes the events on which statement summaries are based. See that discussion for information about the content of statement events, the current and historical statement event tables, and how to control statement event collection, which is partially disabled by default.

Example statement event summary information:

```
mysql> SELECT *
 FROM performance_schema.events_statements_summary_global_by_event_name\G
***** 1. row *****
 EVENT_NAME: statement/sql/select
 COUNT_STAR: 25
 SUM_TIMER_WAIT: 1535983999000
 MIN_TIMER_WAIT: 209823000
 AVG_TIMER_WAIT: 61439359000
 MAX_TIMER_WAIT: 1363397650000
 SUM_LOCK_TIME: 20186000000
 SUM_ERRORS: 0
 SUM_WARNINGS: 0
 SUM_ROWS_AFFECTED: 0
 SUM_ROWS_SENT: 388
 SUM_ROWS_EXAMINED: 370
SUM_CREATED_TMP_DISK_TABLES: 0
 SUM_CREATED_TMP_TABLES: 0
 SUM_SELECT_FULL_JOIN: 0
 SUM_SELECT_FULL_RANGE_JOIN: 0
 SUM_SELECT_RANGE: 0
 SUM_SELECT_RANGE_CHECK: 0
 SUM_SELECT_SCAN: 6
 SUM_SORT_MERGE_PASSES: 0
 SUM_SORT_RANGE: 0
 SUM_SORT_ROWS: 0
 SUM_SORT_SCAN: 0
 SUM_NO_INDEX_USED: 6
 SUM_NO_GOOD_INDEX_USED: 0
 ...
```

Each statement summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the [setup\\_instruments](#) table:

- [events\\_statements\\_summary\\_by\\_account\\_by\\_event\\_name](#) has [EVENT\\_NAME](#), [USER](#), and [HOST](#) columns. Each row summarizes events for a given account (user and host combination) and event name.
- [events\\_statements\\_summary\\_by\\_digest](#) has [SCHEMA\\_NAME](#) and [DIGEST](#) columns. Each row summarizes events per schema and digest value. (The [DIGEST\\_TEXT](#) column contains the corresponding normalized statement digest text, but is neither a grouping nor a summary column. The [QUERY\\_SAMPLE\\_TEXT](#), [QUERY\\_SAMPLE\\_SEEN](#), and [QUERY\\_SAMPLE\\_TIMER\\_WAIT](#) columns also are neither grouping nor summary columns; they support statement sampling.)

The maximum number of rows in the table is autosized at server startup. To set this maximum explicitly, set the [performance\\_schema\\_digests\\_size](#) system variable at server startup.

- [events\\_statements\\_summary\\_by\\_host\\_by\\_event\\_name](#) has [EVENT\\_NAME](#) and [HOST](#) columns. Each row summarizes events for a given host and event name.

- `events_statements_summary_by_program` has `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME` columns. Each row summarizes events for a given stored program (stored procedure or function, trigger, or event).
- `events_statements_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `events_statements_summary_by_user_by_event_name` has `EVENT_NAME` and `USER` columns. Each row summarizes events for a given user and event name.
- `events_statements_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.
- `prepared_statements_instances` has an `OBJECT_INSTANCE_BEGIN` column. Each row summarizes events for a given prepared statement.

Each statement summary table has these summary columns containing aggregated values (with exceptions as noted):

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns are analogous to the columns of the same names in the wait event summary tables (see [Section 26.12.18.1, “Wait Event Summary Tables”](#)), except that the statement summary tables aggregate events from `events_statements_current` rather than `events_waits_current`.

The `prepared_statements_instances` table does not have these columns.

- `SUM_xxx`

The aggregate of the corresponding `xxx` column in the `events_statements_current` table. For example, the `SUM_LOCK_TIME` and `SUM_ERRORS` columns in statement summary tables are the aggregates of the `LOCK_TIME` and `ERRORS` columns in `events_statements_current` table.

The `events_statements_summary_by_digest` table has these additional summary columns:

- `FIRST_SEEN`, `LAST_SEEN`

Timestamps indicating when statements with the given digest value were first seen and most recently seen.

- `QUANTILE_95`: The 95th percentile of the statement latency, in picoseconds. This percentile is a high estimate, computed from the histogram data collected. In other words, for a given digest, 95% of the statements measured have a latency lower than `QUANTILE_95`.

For access to the histogram data, use the tables described in [Section 26.12.18.4, “Statement Histogram Summary Tables”](#).

- `QUANTILE_99`: Similar to `QUANTILE_95`, but for the 99th percentile.
- `QUANTILE_999`: Similar to `QUANTILE_95`, but for the 99.9th percentile.

The `events_statements_summary_by_digest` table contains the following columns. These are neither grouping nor summary columns; they support statement sampling:

- `QUERY_SAMPLE_TEXT`

A sample SQL statement that produces the digest value in the row. This column enables applications to access, for a given digest value, a statement actually seen by the server that produces that digest.

One use for this might be to run [EXPLAIN](#) on the statement to examine the execution plan for a representative statement associated with a frequently occurring digest.

When the [QUERY\\_SAMPLE\\_TEXT](#) column is assigned a value, the [QUERY\\_SAMPLE\\_SEEN](#) and [QUERY\\_SAMPLE\\_TIMER\\_WAIT](#) columns are assigned values as well.

The maximum space available for statement display is 1024 bytes by default. To change this value, set the [performance\\_schema\\_max\\_sql\\_text\\_length](#) system variable at server startup. (Changing this value affects columns in other Performance Schema tables as well. See [Section 26.10, “Performance Schema Statement Digests and Sampling”](#).)

For information about statement sampling, see [Section 26.10, “Performance Schema Statement Digests and Sampling”](#).

- [QUERY\\_SAMPLE\\_SEEN](#)

A timestamp indicating when the statement in the [QUERY\\_SAMPLE\\_TEXT](#) column was seen.

- [QUERY\\_SAMPLE\\_TIMER\\_WAIT](#)

The wait time for the sample statement in the [QUERY\\_SAMPLE\\_TEXT](#) column.

The [events\\_statements\\_summary\\_by\\_program](#) table has these additional summary columns:

- [COUNT\\_STATEMENTS](#), [SUM\\_STATEMENTS\\_WAIT](#), [MIN\\_STATEMENTS\\_WAIT](#), [AVG\\_STATEMENTS\\_WAIT](#), [MAX\\_STATEMENTS\\_WAIT](#)

Statistics about nested statements invoked during stored program execution.

The [prepared\\_statements\\_instances](#) table has these additional summary columns:

- [COUNT\\_EXECUTE](#), [SUM\\_TIMER\\_EXECUTE](#), [MIN\\_TIMER\\_EXECUTE](#), [AVG\\_TIMER\\_EXECUTE](#), [MAX\\_TIMER\\_EXECUTE](#)

Aggregated statistics for executions of the prepared statement.

The statement summary tables have these indexes:

- [events\\_transactions\\_summary\\_by\\_account\\_by\\_event\\_name](#):
  - Primary key on ([USER](#), [HOST](#), [EVENT\\_NAME](#))
- [events\\_statements\\_summary\\_by\\_digest](#):
  - Primary key on ([SCHEMA\\_NAME](#), [DIGEST](#))
- [events\\_transactions\\_summary\\_by\\_host\\_by\\_event\\_name](#):
  - Primary key on ([HOST](#), [EVENT\\_NAME](#))
- [events\\_statements\\_summary\\_by\\_program](#):
  - Primary key on ([OBJECT\\_TYPE](#), [OBJECT\\_SCHEMA](#), [OBJECT\\_NAME](#))
- [events\\_statements\\_summary\\_by\\_thread\\_by\\_event\\_name](#):
  - Primary key on ([THREAD\\_ID](#), [EVENT\\_NAME](#))
- [events\\_transactions\\_summary\\_by\\_user\\_by\\_event\\_name](#):

- Primary key on ([USER](#), [EVENT\\_NAME](#))
- [events\\_statements\\_summary\\_global\\_by\\_event\\_name](#):
  - Primary key on ([EVENT\\_NAME](#))

[TRUNCATE TABLE](#) is permitted for statement summary tables. It has these effects:

- For [events\\_statements\\_summary\\_by\\_digest](#), it removes the rows.
- For other summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For other summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each statement summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of [events\\_statements\\_summary\\_global\\_by\\_event\\_name](#). For details, see [Section 26.12.8, “Performance Schema Connection Tables”](#).

In addition, truncating [events\\_statements\\_summary\\_by\\_digest](#) implicitly truncates [events\\_statements\\_histogram\\_by\\_digest](#), and truncating [events\\_statements\\_summary\\_global\\_by\\_event\\_name](#) implicitly truncates [events\\_statements\\_histogram\\_global](#).

## Statement Digest Aggregation Rules

If the [statements\\_digest](#) consumer is enabled, aggregation into [events\\_statements\\_summary\\_by\\_digest](#) occurs as follows when a statement completes. Aggregation is based on the [DIGEST](#) value computed for the statement.

- If a [events\\_statements\\_summary\\_by\\_digest](#) row already exists with the digest value for the statement that just completed, statistics for the statement are aggregated to that row. The [LAST\\_SEEN](#) column is updated to the current time.
- If no row has the digest value for the statement that just completed, and the table is not full, a new row is created for the statement. The [FIRST\\_SEEN](#) and [LAST\\_SEEN](#) columns are initialized with the current time.
- If no row has the statement digest value for the statement that just completed, and the table is full, the statistics for the statement that just completed are added to a special “catch-all” row with [DIGEST = NULL](#), which is created if necessary. If the row is created, the [FIRST\\_SEEN](#) and [LAST\\_SEEN](#) columns are initialized with the current time. Otherwise, the [LAST\\_SEEN](#) column is updated with the current time.

The row with [DIGEST = NULL](#) is maintained because Performance Schema tables have a maximum size due to memory constraints. The [DIGEST = NULL](#) row permits digests that do not match other rows to be counted even if the summary table is full, using a common “other” bucket. This row helps you estimate whether the digest summary is representative:

- A [DIGEST = NULL](#) row that has a [COUNT\\_STAR](#) value that represents 5% of all digests shows that the digest summary table is very representative; the other rows cover 95% of the statements seen.
- A [DIGEST = NULL](#) row that has a [COUNT\\_STAR](#) value that represents 50% of all digests shows that the digest summary table is not very representative; the other rows cover only half the statements seen. Most likely the DBA should increase the maximum table size so that more of the rows counted

in the `DIGEST = NULL` row would be counted using more specific rows instead. To do this, set the `performance_schema_digests_size` system variable to a larger value at server startup. The default size is 200.

## Stored Program Instrumentation Behavior

For stored program types for which instrumentation is enabled in the `setup_objects` table, `events_statements_summary_by_program` maintains statistics for stored programs as follows:

- A row is added for an object when it is first used in the server.
- The row for an object is removed when the object is dropped.
- Statistics are aggregated in the row for an object as it executes.

See also [Section 26.4.3, “Event Pre-Filtering”](#).

## 26.12.18.4 Statement Histogram Summary Tables

The Performance Schema maintains statement event summary tables that contain information about minimum, maximum, and average statement latency (see [Section 26.12.18.3, “Statement Summary Tables”](#)). Those tables permit high-level assessment of system performance. To permit assessment at a more fine-grained level, the Performance Schema also collects histogram data for statement latencies. These histograms provide additional insight into latency distributions.

[Section 26.12.6, “Performance Schema Statement Event Tables”](#) describes the events on which statement summaries are based. See that discussion for information about the content of statement events, the current and historical statement event tables, and how to control statement event collection, which is partially disabled by default.

Example statement histogram information:

```
mysql> SELECT *
FROM performance_schema.events_statements_histogram_by_digest
WHERE SCHEMA_NAME = 'mydb' AND DIGEST = 'bb3f69453119b2d7b3ae40673a9d4c7c'
AND COUNT_BUCKET > 0 ORDER BY BUCKET_NUMBER\G

 DIGEST: bb3f69453119b2d7b3ae40673a9d4c7c
 BUCKET_NUMBER: 45
 BUCKET_TIMER_LOW: 75857757
 BUCKET_TIMER_HIGH: 79432823
 COUNT_BUCKET: 6
COUNT_BUCKET_AND_LOWER: 10
 BUCKET_QUANTILE: 0.625000
...

```

For example, in row 3, these values indicate that 23.52% of queries run in under 75.86 microseconds:

```

BUCKET_TIMER_HIGH: 75857757
 BUCKET_QUANTILE: 0.235294

```

In row 4, these values indicate that 62.50% of queries run in under 79.44 microseconds:

```

BUCKET_TIMER_HIGH: 79432823
 BUCKET_QUANTILE: 0.625000

```

Each statement histogram summary table has one or more grouping columns to indicate how the table aggregates events:

- `events_statements_histogram_by_digest` has `SCHEMA_NAME`, `DIGEST`, and `BUCKET_NUMBER` columns:
  - The `SCHEMA_NAME` and `DIGEST` columns identify a statement digest row in the `events_statements_summary_by_digest` table.
  - The `events_statements_histogram_by_digest` rows with the same `SCHEMA_NAME` and `DIGEST` values comprise the histogram for that schema/digest combination.
  - Within a given histogram, the `BUCKET_NUMBER` column indicates the bucket number.
- `events_statements_histogram_global` has a `BUCKET_NUMBER` column. This table summarizes latencies globally across schema name and digest values, using a single histogram. The `BUCKET_NUMBER` column indicates the bucket number within this global histogram.

A histogram consists of *N* buckets, where each row represents one bucket, with the bucket number indicated by the `BUCKET_NUMBER` column. Bucket numbers begin with 0.

Each statement histogram summary table has these summary columns containing aggregated values:

- `BUCKET_TIMER_LOW`, `BUCKET_TIMER_HIGH`

A bucket counts statements that have a latency, in picoseconds, measured between `BUCKET_TIMER_LOW` and `BUCKET_TIMER_HIGH`:

- The value of `BUCKET_TIMER_LOW` for the first bucket (`BUCKET_NUMBER = 0`) is 0.
- The value of `BUCKET_TIMER_LOW` for a bucket (`BUCKET_NUMBER = k`) is the same as `BUCKET_TIMER_HIGH` for the previous bucket (`BUCKET_NUMBER = k-1`)
- The last bucket is a catchall for statements that have a latency exceeding previous buckets in the histogram.
- `COUNT_BUCKET`

The number of statements measured with a latency in the interval from `BUCKET_TIMER_LOW` up to but not including `BUCKET_TIMER_HIGH`.

- `COUNT_BUCKET_AND_LOWER`

The number of statements measured with a latency in the interval from 0 up to but not including `BUCKET_TIMER_HIGH`.

- `BUCKET_QUANTILE`

The proportion of statements that fall into this or a lower bucket. This proportion corresponds by definition to `COUNT_BUCKET_AND_LOWER / SUM(COUNT_BUCKET)` and is displayed as a convenience column.

The statement histogram summary tables have these indexes:

- `events_statements_histogram_by_digest`:
  - Unique index on (`SCHEMA_NAME`, `DIGEST`, `BUCKET_NUMBER`)
- `events_statements_histogram_global`:
  - Primary key on (`BUCKET_NUMBER`)

`TRUNCATE TABLE` is permitted for statement histogram summary tables. Truncation sets the `COUNT_BUCKET` and `COUNT_BUCKET_AND_LOWER` columns to 0.

In addition, truncating `events_statements_summary_by_digest` implicitly truncates `events_statements_histogram_by_digest`, and truncating `events_statements_summary_global_by_event_name` implicitly truncates `events_statements_histogram_global`.

## 26.12.18.5 Transaction Summary Tables

The Performance Schema maintains tables for collecting current and recent transaction events, and aggregates that information in summary tables. [Section 26.12.7, “Performance Schema Transaction Tables”](#) describes the events on which transaction summaries are based. See that discussion for information about the content of transaction events, the current and historical transaction event tables, and how to control transaction event collection, which is disabled by default.

Example transaction event summary information:

```
mysql> SELECT *
 FROM performance_schema.events_transactions_summary_global_by_event_name
 LIMIT 1\G
***** 1. row *****
 EVENT_NAME: transaction
 COUNT_STAR: 5
 SUM_TIMER_WAIT: 19550092000
 MIN_TIMER_WAIT: 2954148000
 AVG_TIMER_WAIT: 3910018000
 MAX_TIMER_WAIT: 5486275000
 COUNT_READ_WRITE: 5
 SUM_TIMER_READ_WRITE: 19550092000
 MIN_TIMER_READ_WRITE: 2954148000
 AVG_TIMER_READ_WRITE: 3910018000
 MAX_TIMER_READ_WRITE: 5486275000
 COUNT_READ_ONLY: 0
 SUM_TIMER_READ_ONLY: 0
 MIN_TIMER_READ_ONLY: 0
```

```
AVG_TIMER_READ_ONLY: 0
MAX_TIMER_READ_ONLY: 0
```

Each transaction summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the [setup\\_instruments](#) table:

- [events\\_transactions\\_summary\\_by\\_account\\_by\\_event\\_name](#) has [USER](#), [HOST](#), and [EVENT\\_NAME](#) columns. Each row summarizes events for a given account (user and host combination) and event name.
- [events\\_transactions\\_summary\\_by\\_host\\_by\\_event\\_name](#) has [HOST](#) and [EVENT\\_NAME](#) columns. Each row summarizes events for a given host and event name.
- [events\\_transactions\\_summary\\_by\\_thread\\_by\\_event\\_name](#) has [THREAD\\_ID](#) and [EVENT\\_NAME](#) columns. Each row summarizes events for a given thread and event name.
- [events\\_transactions\\_summary\\_by\\_user\\_by\\_event\\_name](#) has [USER](#) and [EVENT\\_NAME](#) columns. Each row summarizes events for a given user and event name.
- [events\\_transactions\\_summary\\_global\\_by\\_event\\_name](#) has an [EVENT\\_NAME](#) column. Each row summarizes events for a given event name.

Each transaction summary table has these summary columns containing aggregated values:

- [COUNT\\_STAR](#), [SUM\\_TIMER\\_WAIT](#), [MIN\\_TIMER\\_WAIT](#), [AVG\\_TIMER\\_WAIT](#), [MAX\\_TIMER\\_WAIT](#)

These columns are analogous to the columns of the same names in the wait event summary tables (see [Section 26.12.18.1, “Wait Event Summary Tables”](#)), except that the transaction summary tables aggregate events from [events\\_transactions\\_current](#) rather than [events\\_waits\\_current](#). These columns summarize read-write and read-only transactions.

- [COUNT\\_READ\\_WRITE](#), [SUM\\_TIMER\\_READ\\_WRITE](#), [MIN\\_TIMER\\_READ\\_WRITE](#), [AVG\\_TIMER\\_READ\\_WRITE](#), [MAX\\_TIMER\\_READ\\_WRITE](#)

These are similar to the [COUNT\\_STAR](#) and [xxx\\_TIMER\\_WAIT](#) columns, but summarize read-write transactions only. The transaction access mode specifies whether transactions operate in read/write or read-only mode.

- [COUNT\\_READ\\_ONLY](#), [SUM\\_TIMER\\_READ\\_ONLY](#), [MIN\\_TIMER\\_READ\\_ONLY](#), [AVG\\_TIMER\\_READ\\_ONLY](#), [MAX\\_TIMER\\_READ\\_ONLY](#)

These are similar to the [COUNT\\_STAR](#) and [xxx\\_TIMER\\_WAIT](#) columns, but summarize read-only transactions only. The transaction access mode specifies whether transactions operate in read/write or read-only mode.

The transaction summary tables have these indexes:

- [events\\_transactions\\_summary\\_by\\_account\\_by\\_event\\_name](#):
  - Primary key on ([USER](#), [HOST](#), [EVENT\\_NAME](#))
- [events\\_transactions\\_summary\\_by\\_host\\_by\\_event\\_name](#):
  - Primary key on ([HOST](#), [EVENT\\_NAME](#))
- [events\\_transactions\\_summary\\_by\\_thread\\_by\\_event\\_name](#):
  - Primary key on ([THREAD\\_ID](#), [EVENT\\_NAME](#))

- `events_transactions_summary_by_user_by_event_name`:
  - Primary key on (`USER`, `EVENT_NAME`)
- `events_transactions_summary_global_by_event_name`:
  - Primary key on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for transaction summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each transaction summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `events_transactions_summary_global_by_event_name`. For details, see [Section 26.12.8, “Performance Schema Connection Tables”](#).

## Transaction Aggregation Rules

Transaction event collection occurs without regard to isolation level, access mode, or autocommit mode.

Transaction event collection occurs for all non-aborted transactions initiated by the server, including empty transactions.

Read-write transactions are generally more resource intensive than read-only transactions, therefore transaction summary tables include separate aggregate columns for read-write and read-only transactions.

Resource requirements may also vary with transaction isolation level. However, presuming that only one isolation level would be used per server, aggregation by isolation level is not provided.

### 26.12.18.6 Object Wait Summary Table

The Performance Schema maintains the `objects_summary_global_by_type` table for aggregating object wait events.

Example object wait event summary information:

```
mysql> SELECT * FROM performance_schema.objects_summary_global_by_type\G
...
***** 3. row *****
 OBJECT_TYPE: TABLE
 OBJECT_SCHEMA: test
 OBJECT_NAME: t
 COUNT_STAR: 3
 SUM_TIMER_WAIT: 263126976
 MIN_TIMER_WAIT: 1522272
 AVG_TIMER_WAIT: 87708678
 MAX_TIMER_WAIT: 258428280
...
***** 10. row *****
 OBJECT_TYPE: TABLE
 OBJECT_SCHEMA: mysql
 OBJECT_NAME: user
 COUNT_STAR: 14
 SUM_TIMER_WAIT: 365567592
 MIN_TIMER_WAIT: 1141704
 AVG_TIMER_WAIT: 26111769
 MAX_TIMER_WAIT: 334783032
```

The `objects_summary_global_by_type` table has these grouping columns to indicate how the table aggregates events: `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME`. Each row summarizes events for the given object.

`objects_summary_global_by_type` has the same summary columns as the `events_waits_summary_by_xxx` tables. See [Section 26.12.18.1, “Wait Event Summary Tables”](#).

The `objects_summary_global_by_type` table has these indexes:

- Primary key on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)

`TRUNCATE TABLE` is permitted for the object summary table. It resets the summary columns to zero rather than removing rows.

### 26.12.18.7 File I/O Summary Tables

The Performance Schema maintains file I/O summary tables that aggregate information about I/O operations.

Example file I/O event summary information:

```
mysql> SELECT * FROM performance_schema.file_summary_by_event_name\G
...
***** 2. row *****
 EVENT_NAME: wait/io/file/sql/binlog
 COUNT_STAR: 31
 SUM_TIMER_WAIT: 8243784888
 MIN_TIMER_WAIT: 0
 AVG_TIMER_WAIT: 265928484
 MAX_TIMER_WAIT: 6490658832
...
mysql> SELECT * FROM performance_schema.file_summary_by_instance\G
...
***** 2. row *****
 FILE_NAME: /var/mysql/share/english/errmsg.sys
 EVENT_NAME: wait/io/file/sql/ERRMSG
 EVENT_NAME: wait/io/file/sql/ERRMSG
 OBJECT_INSTANCE_BEGIN: 4686193384
 COUNT_STAR: 5
 SUM_TIMER_WAIT: 13990154448
 MIN_TIMER_WAIT: 26349624
 AVG_TIMER_WAIT: 2798030607
 MAX_TIMER_WAIT: 8150662536
...
```

Each file I/O summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `file_summary_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.
- `file_summary_by_instance` has `FILE_NAME`, `EVENT_NAME`, and `OBJECT_INSTANCE_BEGIN` columns. Each row summarizes events for a given file and event name.

Each file I/O summary table has the following summary columns containing aggregated values. Some columns are more general and have values that are the same as the sum of the values of more fine-grained columns. In this way, aggregations at higher levels are available directly without the need for user-defined views that sum lower-level columns.

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns aggregate all I/O operations.

- `COUNT_READ`, `SUM_TIMER_READ`, `MIN_TIMER_READ`, `AVG_TIMER_READ`, `MAX_TIMER_READ`, `SUM_NUMBER_OF_BYTES_READ`

These columns aggregate all read operations, including `FGETS`, `FGETC`, `FREAD`, and `READ`.

- `COUNT_WRITE`, `SUM_TIMER_WRITE`, `MIN_TIMER_WRITE`, `AVG_TIMER_WRITE`, `MAX_TIMER_WRITE`, `SUM_NUMBER_OF_BYTES_WRITE`

These columns aggregate all write operations, including `FPUTS`, `FPUTC`, `FPRINTF`, `VFPRINTF`, `FWRITE`, and `PWRITE`.

- `COUNT_MISC`, `SUM_TIMER_MISC`, `MIN_TIMER_MISC`, `AVG_TIMER_MISC`, `MAX_TIMER_MISC`

These columns aggregate all other I/O operations, including `CREATE`, `DELETE`, `OPEN`, `CLOSE`, `STREAM_OPEN`, `STREAM_CLOSE`, `SEEK`, `TELL`, `FLUSH`, `STAT`, `FSTAT`, `CHSIZE`, `RENAME`, and `SYNC`. There are no byte counts for these operations.

The file I/O summary tables have these indexes:

- `file_summary_by_event_name`:
  - Primary key on (`EVENT_NAME`)
- `file_summary_by_instance`:
  - Primary key on (`OBJECT_INSTANCE_BEGIN`)
  - Index on (`FILE_NAME`)
  - Index on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for file I/O summary tables. It resets the summary columns to zero rather than removing rows.

The MySQL server uses several techniques to avoid I/O operations by caching information read from files, so it is possible that statements you might expect to result in I/O events will not. You may be able to ensure that I/O does occur by flushing caches or restarting the server to reset its state.

## 26.12.18.8 Table I/O and Lock Wait Summary Tables

The following sections describe the table I/O and lock wait summary tables:

- `table_io_waits_summary_by_index_usage`: Table I/O waits per index
- `table_io_waits_summary_by_table`: Table I/O waits per table
- `table_lock_waits_summary_by_table`: Table lock waits per table

### The `table_io_waits_summary_by_table` Table

The `table_io_waits_summary_by_table` table aggregates all table I/O wait events, as generated by the `wait/io/table/sql/handler` instrument. The grouping is by table.

The `table_io_waits_summary_by_table` table has these grouping columns to indicate how the table aggregates events: `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME`. These columns have the same meaning as in the `events_waits_current` table. They identify the table to which the row applies.

`table_io_waits_summary_by_table` has the following summary columns containing aggregated values. As indicated in the column descriptions, some columns are more general and have values that are the same as the sum of the values of more fine-grained columns. For example, columns that aggregate all writes hold the sum of the corresponding columns that aggregate inserts, updates, and deletes. In this way, aggregations at higher levels are available directly without the need for user-defined views that sum lower-level columns.

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns aggregate all I/O operations. They are the same as the sum of the corresponding `xxx_READ` and `xxx_WRITE` columns.

- `COUNT_READ`, `SUM_TIMER_READ`, `MIN_TIMER_READ`, `AVG_TIMER_READ`, `MAX_TIMER_READ`

These columns aggregate all read operations. They are the same as the sum of the corresponding `xxx_FETCH` columns.

- `COUNT_WRITE`, `SUM_TIMER_WRITE`, `MIN_TIMER_WRITE`, `AVG_TIMER_WRITE`, `MAX_TIMER_WRITE`

These columns aggregate all write operations. They are the same as the sum of the corresponding `xxx_INSERT`, `xxx_UPDATE`, and `xxx_DELETE` columns.

- `COUNT_FETCH`, `SUM_TIMER_FETCH`, `MIN_TIMER_FETCH`, `AVG_TIMER_FETCH`, `MAX_TIMER_FETCH`

These columns aggregate all fetch operations.

- `COUNT_INSERT`, `SUM_TIMER_INSERT`, `MIN_TIMER_INSERT`, `AVG_TIMER_INSERT`, `MAX_TIMER_INSERT`

These columns aggregate all insert operations.

- `COUNT_UPDATE`, `SUM_TIMER_UPDATE`, `MIN_TIMER_UPDATE`, `AVG_TIMER_UPDATE`, `MAX_TIMER_UPDATE`

These columns aggregate all update operations.

- `COUNT_DELETE`, `SUM_TIMER_DELETE`, `MIN_TIMER_DELETE`, `AVG_TIMER_DELETE`, `MAX_TIMER_DELETE`

These columns aggregate all delete operations.

The `table_io_waits_summary_by_table` table has these indexes:

- Unique index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)

`TRUNCATE TABLE` is permitted for table I/O summary tables. It resets the summary columns to zero rather than removing rows. Truncating this table also truncates the `table_io_waits_summary_by_index_usage` table.

## The `table_io_waits_summary_by_index_usage` Table

The `table_io_waits_summary_by_index_usage` table aggregates all table index I/O wait events, as generated by the `wait/io/table/sql/handler` instrument. The grouping is by table index.

The columns of `table_io_waits_summary_by_index_usage` are nearly identical to `table_io_waits_summary_by_table`. The only difference is the additional group column, `INDEX_NAME`, which corresponds to the name of the index that was used when the table I/O wait event was recorded:

- A value of `PRIMARY` indicates that table I/O used the primary index.
- A value of `NULL` means that table I/O used no index.
- Inserts are counted against `INDEX_NAME = NULL`.

The `table_io_waits_summary_by_index_usage` table has these indexes:

- Unique index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`, `INDEX_NAME`)

`TRUNCATE TABLE` is permitted for table I/O summary tables. It resets the summary columns to zero rather than removing rows. This table is also truncated by truncation of the `table_io_waits_summary_by_table` table. A DDL operation that changes the index structure of a table may cause the per-index statistics to be reset.

## The `table_lock_waits_summary_by_table` Table

The `table_lock_waits_summary_by_table` table aggregates all table lock wait events, as generated by the `wait/lock/table/sql/handler` instrument. The grouping is by table.

This table contains information about internal and external locks:

- An internal lock corresponds to a lock in the SQL layer. This is currently implemented by a call to `thr_lock()`. In event rows, these locks are distinguished by the `OPERATION` column, which has one of these values:

```
read normal
read with shared locks
read high priority
read no insert
write allow write
write concurrent insert
write delayed
write low priority
write normal
```

- An external lock corresponds to a lock in the storage engine layer. This is currently implemented by a call to `handler::external_lock()`. In event rows, these locks are distinguished by the `OPERATION` column, which has one of these values:

```
read external
write external
```

The `table_lock_waits_summary_by_table` table has these grouping columns to indicate how the table aggregates events: `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME`. These columns have the same meaning as in the `events_waits_current` table. They identify the table to which the row applies.

`table_lock_waits_summary_by_table` has the following summary columns containing aggregated values. As indicated in the column descriptions, some columns are more general and have values that are the same as the sum of the values of more fine-grained columns. For example, columns that aggregate all locks hold the sum of the corresponding columns that aggregate read and write locks. In this way, aggregations at higher levels are available directly without the need for user-defined views that sum lower-level columns.

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns aggregate all lock operations. They are the same as the sum of the corresponding `xxx_READ` and `xxx_WRITE` columns.

- `COUNT_READ`, `SUM_TIMER_READ`, `MIN_TIMER_READ`, `AVG_TIMER_READ`, `MAX_TIMER_READ`

These columns aggregate all read-lock operations. They are the same as the sum of the corresponding `xxx_READ_NORMAL`, `xxx_READ_WITH_SHARED_LOCKS`, `xxx_READ_HIGH_PRIORITY`, and `xxx_READ_NO_INSERT` columns.

- `COUNT_WRITE`, `SUM_TIMER_WRITE`, `MIN_TIMER_WRITE`, `AVG_TIMER_WRITE`, `MAX_TIMER_WRITE`

These columns aggregate all write-lock operations. They are the same as the sum of the corresponding `xxx_WRITE_ALLOW_WRITE`, `xxx_WRITE_CONCURRENT_INSERT`, `xxx_WRITE_LOW_PRIORITY`, and `xxx_WRITE_NORMAL` columns.

- `COUNT_READ_NORMAL`, `SUM_TIMER_READ_NORMAL`, `MIN_TIMER_READ_NORMAL`, `AVG_TIMER_READ_NORMAL`, `MAX_TIMER_READ_NORMAL`

These columns aggregate internal read locks.

- `COUNT_READ_WITH_SHARED_LOCKS`, `SUM_TIMER_READ_WITH_SHARED_LOCKS`, `MIN_TIMER_READ_WITH_SHARED_LOCKS`, `AVG_TIMER_READ_WITH_SHARED_LOCKS`, `MAX_TIMER_READ_WITH_SHARED_LOCKS`

These columns aggregate internal read locks.

- `COUNT_READ_HIGH_PRIORITY`, `SUM_TIMER_READ_HIGH_PRIORITY`, `MIN_TIMER_READ_HIGH_PRIORITY`, `AVG_TIMER_READ_HIGH_PRIORITY`, `MAX_TIMER_READ_HIGH_PRIORITY`

These columns aggregate internal read locks.

- `COUNT_READ_NO_INSERT`, `SUM_TIMER_READ_NO_INSERT`, `MIN_TIMER_READ_NO_INSERT`, `AVG_TIMER_READ_NO_INSERT`, `MAX_TIMER_READ_NO_INSERT`

These columns aggregate internal read locks.

- `COUNT_READ_EXTERNAL`, `SUM_TIMER_READ_EXTERNAL`, `MIN_TIMER_READ_EXTERNAL`, `AVG_TIMER_READ_EXTERNAL`, `MAX_TIMER_READ_EXTERNAL`

These columns aggregate external read locks.

- `COUNT_WRITE_ALLOW_WRITE`, `SUM_TIMER_WRITE_ALLOW_WRITE`, `MIN_TIMER_WRITE_ALLOW_WRITE`, `AVG_TIMER_WRITE_ALLOW_WRITE`, `MAX_TIMER_WRITE_ALLOW_WRITE`

These columns aggregate internal write locks.

- `COUNT_WRITE_CONCURRENT_INSERT`, `SUM_TIMER_WRITE_CONCURRENT_INSERT`, `MIN_TIMER_WRITE_CONCURRENT_INSERT`, `AVG_TIMER_WRITE_CONCURRENT_INSERT`, `MAX_TIMER_WRITE_CONCURRENT_INSERT`

These columns aggregate internal write locks.

- `COUNT_WRITE_LOW_PRIORITY`, `SUM_TIMER_WRITE_LOW_PRIORITY`, `MIN_TIMER_WRITE_LOW_PRIORITY`, `AVG_TIMER_WRITE_LOW_PRIORITY`, `MAX_TIMER_WRITE_LOW_PRIORITY`

These columns aggregate internal write locks.

- `COUNT_WRITE_NORMAL`, `SUM_TIMER_WRITE_NORMAL`, `MIN_TIMER_WRITE_NORMAL`, `AVG_TIMER_WRITE_NORMAL`, `MAX_TIMER_WRITE_NORMAL`

These columns aggregate internal write locks.

- `COUNT_WRITE_EXTERNAL`, `SUM_TIMER_WRITE_EXTERNAL`, `MIN_TIMER_WRITE_EXTERNAL`, `AVG_TIMER_WRITE_EXTERNAL`, `MAX_TIMER_WRITE_EXTERNAL`

These columns aggregate external write locks.

The `table_lock_waits_summary_by_table` table has these indexes:

- Unique index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)

`TRUNCATE TABLE` is permitted for table lock summary tables. It resets the summary columns to zero rather than removing rows.

## 26.12.18.9 Socket Summary Tables

These socket summary tables aggregate timer and byte count information for socket operations:

- `socket_summary_by_event_name`: Aggregate timer and byte count statistics generated by the `wait/io/socket/*` instruments for all socket I/O operations, per socket instrument.
- `socket_summary_by_instance`: Aggregate timer and byte count statistics generated by the `wait/io/socket/*` instruments for all socket I/O operations, per socket instance. When a connection terminates, the row in `socket_summary_by_instance` corresponding to it is deleted.

The socket summary tables do not aggregate waits generated by `idle` events while sockets are waiting for the next request from the client. For `idle` event aggregations, use the wait-event summary tables; see [Section 26.12.18.1, “Wait Event Summary Tables”](#).

Each socket summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `socket_summary_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.
- `socket_summary_by_instance` has an `OBJECT_INSTANCE_BEGIN` column. Each row summarizes events for a given object.

Each socket summary table has these summary columns containing aggregated values:

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns aggregate all operations.

- `COUNT_READ`, `SUM_TIMER_READ`, `MIN_TIMER_READ`, `AVG_TIMER_READ`, `MAX_TIMER_READ`, `SUM_NUMBER_OF_BYTES_READ`

These columns aggregate all receive operations (`RECV`, `RECVFROM`, and `RECVMSG`).

- `COUNT_WRITE`, `SUM_TIMER_WRITE`, `MIN_TIMER_WRITE`, `AVG_TIMER_WRITE`, `MAX_TIMER_WRITE`, `SUM_NUMBER_OF_BYTES_WRITE`

These columns aggregate all send operations (`SEND`, `SENDTO`, and `SENDMSG`).

- `COUNT_MISC`, `SUM_TIMER_MISC`, `MIN_TIMER_MISC`, `AVG_TIMER_MISC`, `MAX_TIMER_MISC`

These columns aggregate all other socket operations, such as `CONNECT`, `LISTEN`, `ACCEPT`, `CLOSE`, and `SHUTDOWN`. There are no byte counts for these operations.

The `socket_summary_by_instance` table also has an `EVENT_NAME` column that indicates the class of the socket: `client_connection`, `server_tcpip_socket`, `server_unix_socket`. This column can be grouped on to isolate, for example, client activity from that of the server listening sockets.

The socket summary tables have these indexes:

- `socket_summary_by_event_name`:
  - Primary key on (`EVENT_NAME`)
- `socket_summary_by_instance`:
  - Primary key on (`OBJECT_INSTANCE_BEGIN`)
  - Index on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for socket summary tables. Except for `events_statements_summary_by_digest`, it resets the summary columns to zero rather than removing rows.

## 26.12.18.10 Memory Summary Tables

The Performance Schema instruments memory usage and aggregates memory usage statistics, detailed by these factors:

- Type of memory used (various caches, internal buffers, and so forth)
- Thread, account, user, host indirectly performing the memory operation

The Performance Schema instruments the following aspects of memory use

- Memory sizes used
- Operation counts
- Low and high water marks

Memory sizes help to understand or tune the memory consumption of the server.

Operation counts help to understand or tune the overall pressure the server is putting on the memory allocator, which has an impact on performance. Allocating a single byte one million times is not the same as allocating one million bytes a single time; tracking both sizes and counts can expose the difference.

Low and high water marks are critical to detect workload spikes, overall workload stability, and possible memory leaks.

Memory summary tables do not contain timing information because memory events are not timed.

For information about collecting memory usage data, see [Memory Instrumentation Behavior](#).

Example memory event summary information:

```
mysql> SELECT *
 FROM performance_schema.memory_summary_global_by_event_name
 WHERE EVENT_NAME = 'memory/sql/TABLE'\G
***** 1. row *****
 EVENT_NAME: memory/sql/TABLE
 COUNT_ALLOC: 1381
 COUNT_FREE: 924
 SUM_NUMBER_OF_BYTES_ALLOC: 2059873
```

```

SUM_NUMBER_OF_BYTES_FREE: 1407432
LOW_COUNT_USED: 0
CURRENT_COUNT_USED: 457
HIGH_COUNT_USED: 461
LOW_NUMBER_OF_BYTES_USED: 0
CURRENT_NUMBER_OF_BYTES_USED: 652441
HIGH_NUMBER_OF_BYTES_USED: 669269

```

Each memory summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the [setup\\_instruments](#) table:

- [memory\\_summary\\_by\\_account\\_by\\_event\\_name](#) has [USER](#), [HOST](#), and [EVENT\\_NAME](#) columns. Each row summarizes events for a given account (user and host combination) and event name.
- [memory\\_summary\\_by\\_host\\_by\\_event\\_name](#) has [HOST](#) and [EVENT\\_NAME](#) columns. Each row summarizes events for a given host and event name.
- [memory\\_summary\\_by\\_thread\\_by\\_event\\_name](#) has [THREAD\\_ID](#) and [EVENT\\_NAME](#) columns. Each row summarizes events for a given thread and event name.
- [memory\\_summary\\_by\\_user\\_by\\_event\\_name](#) has [USER](#) and [EVENT\\_NAME](#) columns. Each row summarizes events for a given user and event name.
- [memory\\_summary\\_global\\_by\\_event\\_name](#) has an [EVENT\\_NAME](#) column. Each row summarizes events for a given event name.

Each memory summary table has these summary columns containing aggregated values:

- [COUNT\\_ALLOC](#), [COUNT\\_FREE](#)

The aggregated numbers of calls to memory-allocation and memory-free functions.

- [SUM\\_NUMBER\\_OF\\_BYTES\\_ALLOC](#), [SUM\\_NUMBER\\_OF\\_BYTES\\_FREE](#)

The aggregated sizes of allocated and freed memory blocks.

- [CURRENT\\_COUNT\\_USED](#)

The aggregated number of currently allocated blocks that have not been freed yet. This is a convenience column, equal to [COUNT\\_ALLOC](#) – [COUNT\\_FREE](#).

- [CURRENT\\_NUMBER\\_OF\\_BYTES\\_USED](#)

The aggregated size of currently allocated memory blocks that have not been freed yet. This is a convenience column, equal to [SUM\\_NUMBER\\_OF\\_BYTES\\_ALLOC](#) – [SUM\\_NUMBER\\_OF\\_BYTES\\_FREE](#).

- [LOW\\_COUNT\\_USED](#), [HIGH\\_COUNT\\_USED](#)

The low and high water marks corresponding to the [CURRENT\\_COUNT\\_USED](#) column.

- [LOW\\_NUMBER\\_OF\\_BYTES\\_USED](#), [HIGH\\_NUMBER\\_OF\\_BYTES\\_USED](#)

The low and high water marks corresponding to the [CURRENT\\_NUMBER\\_OF\\_BYTES\\_USED](#) column.

The memory summary tables have these indexes:

- [memory\\_summary\\_by\\_account\\_by\\_event\\_name](#):
  - Primary key on ([USER](#), [HOST](#), [EVENT\\_NAME](#))

- `memory_summary_by_host_by_event_name`:
  - Primary key on (`HOST`, `EVENT_NAME`)
- `memory_summary_by_thread_by_event_name`:
  - Primary key on (`THREAD_ID`, `EVENT_NAME`)
- `memory_summary_by_user_by_event_name`:
  - Primary key on (`USER`, `EVENT_NAME`)
- `memory_summary_global_by_event_name`:
  - Primary key on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for memory summary tables. It has these effects:

- In general, truncation resets the baseline for statistics, but does not change the server state. That is, truncating a memory table does not free memory.
- `COUNT_ALLOC` and `COUNT_FREE` are reset to a new baseline, by reducing each counter by the same value.
- Likewise, `SUM_NUMBER_OF_BYTES_ALLOC` and `SUM_NUMBER_OF_BYTES_FREE` are reset to a new baseline.
- `LOW_COUNT_USED` and `HIGH_COUNT_USED` are reset to `CURRENT_COUNT_USED`.
- `LOW_NUMBER_OF_BYTES_USED` and `HIGH_NUMBER_OF_BYTES_USED` are reset to `CURRENT_NUMBER_OF_BYTES_USED`.

In addition, each memory summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `memory_summary_global_by_event_name`. For details, see [Section 26.12.8, “Performance Schema Connection Tables”](#).

## Memory Instrumentation Behavior

Memory instruments are listed in the `setup_instruments` table and have names of the form `memory/code_area/instrument_name`. Memory instrumentation is enabled by default.

Instruments named with the prefix `memory/performance_schema/` expose how much memory is allocated for internal buffers in the Performance Schema itself. The `memory/performance_schema/` instruments are built in, always enabled, and cannot be disabled at startup or runtime. Built-in memory instruments are displayed only in the `memory_summary_global_by_event_name` table.

To control memory instrumentation state at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='memory/%=ON'
```

- Disable:

```
[mysqld]
performance-schema-instrument='memory/%=OFF'
```

To control memory instrumentation state at runtime, update the [ENABLED](#) column of the relevant instruments in the [setup\\_instruments](#) table:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES'
WHERE NAME LIKE 'memory/%';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO'
WHERE NAME LIKE 'memory/%';
```

For memory instruments, the [TIMED](#) column in [setup\\_instruments](#) is ignored because memory operations are not timed.

When a thread in the server executes a memory allocation that has been instrumented, these rules apply:

- If the thread is not instrumented or the memory instrument is not enabled, the memory block allocated is not instrumented.
- Otherwise (that is, both the thread and the instrument are enabled), the memory block allocated is instrumented.

For deallocation, these rules apply:

- If a memory allocation operation was instrumented, the corresponding free operation is instrumented, regardless of the current instrument or thread enabled status.
- If a memory allocation operation was not instrumented, the corresponding free operation is not instrumented, regardless of the current instrument or thread enabled status.

For the per-thread statistics, the following rules apply.

When an instrumented memory block of size *N* is allocated, the Performance Schema makes these updates to memory summary table columns:

- [COUNT\\_ALLOC](#): Increased by 1
- [CURRENT\\_COUNT\\_USED](#): Increased by 1
- [HIGH\\_COUNT\\_USED](#): Increased if [CURRENT\\_COUNT\\_USED](#) is a new maximum
- [SUM\\_NUMBER\\_OF\\_BYTES\\_ALLOC](#): Increased by *N*
- [CURRENT\\_NUMBER\\_OF\\_BYTES\\_USED](#): Increased by *N*
- [HIGH\\_NUMBER\\_OF\\_BYTES\\_USED](#): Increased if [CURRENT\\_NUMBER\\_OF\\_BYTES\\_USED](#) is a new maximum

When an instrumented memory block is deallocated, the Performance Schema makes these updates to memory summary table columns:

- [COUNT\\_FREE](#): Increased by 1
- [CURRENT\\_COUNT\\_USED](#): Decreased by 1
- [LOW\\_COUNT\\_USED](#): Decreased if [CURRENT\\_COUNT\\_USED](#) is a new minimum
- [SUM\\_NUMBER\\_OF\\_BYTES\\_FREE](#): Increased by *N*

- `CURRENT_NUMBER_OF_BYTES_USED`: Decreased by *N*
- `LOW_NUMBER_OF_BYTES_USED`: Decreased if `CURRENT_NUMBER_OF_BYTES_USED` is a new minimum

For higher-level aggregates (global, by account, by user, by host), the same rules apply as expected for low and high water marks.

- `LOW_COUNT_USED` and `LOW_NUMBER_OF_BYTES_USED` are lower estimates. The value reported by the Performance Schema is guaranteed to be less than or equal to the lowest count or size of memory effectively used at runtime.
- `HIGH_COUNT_USED` and `HIGH_NUMBER_OF_BYTES_USED` are higher estimates. The value reported by the Performance Schema is guaranteed to be greater than or equal to the highest count or size of memory effectively used at runtime.

For lower estimates in summary tables other than `memory_summary_global_by_event_name`, it is possible for values to go negative if memory ownership is transferred between threads.

Here is an example of estimate computation; but note that estimate implementation is subject to change:

Thread 1 uses memory in the range from 1MB to 2MB during execution, as reported by the `LOW_NUMBER_OF_BYTES_USED` and `HIGH_NUMBER_OF_BYTES_USED` columns of the `memory_summary_by_thread_by_event_name` table.

Thread 2 uses memory in the range from 10MB to 12MB during execution, as reported likewise.

When these two threads belong to the same user account, the per-account summary estimates that this account used memory in the range from 11MB to 14MB. That is, the `LOW_NUMBER_OF_BYTES_USED` for the higher level aggregate is the sum of each `LOW_NUMBER_OF_BYTES_USED` (assuming the worst case). Likewise, the `HIGH_NUMBER_OF_BYTES_USED` for the higher level aggregate is the sum of each `HIGH_NUMBER_OF_BYTES_USED` (assuming the worst case).

11MB is a lower estimate that can occur only if both threads hit the low usage mark at the same time.

14MB is a higher estimate that can occur only if both threads hit the high usage mark at the same time.

The real memory usage for this account could have been in the range from 11.5MB to 13.5MB.

For capacity planning, reporting the worst case is actually the desired behavior, as it shows what can potentially happen when sessions are uncorrelated, which is typically the case.

## 26.12.18.11 Error Summary Tables

The Performance Schema maintains summary tables for aggregating statistical information about server errors (and warnings). For a list of server errors, see [Server Error Message Reference](#).

Collection of error information is controlled by the `error` instrument, which is enabled by default. Timing information is not collected.

Each error summary table has three columns that identify the error:

- `ERROR_NUMBER` is the numeric error value. The value is unique.
- `ERROR_NAME` is the symbolic error name corresponding to the `ERROR_NUMBER` value. The value is unique.
- `SQLSTATE` is the SQLSTATE value corresponding to the `ERROR_NUMBER` value. The value is not necessarily unique.

For example, if `ERROR_NUMBER` is 1050, `ERROR_NAME` is `ER_TABLE_EXISTS_ERROR` and `SQLSTATE` is `42S01`.

Example error event summary information:

```
mysql> SELECT *
 FROM performance_schema.events_errors_summary_global_by_error
 WHERE SUM_ERROR_RAISED <> 0\G
***** 1. row *****
 ERROR_NUMBER: 1064
 ERROR_NAME: ER_PARSE_ERROR
 SQL_STATE: 42000
 SUM_ERROR_RAISED: 1
 SUM_ERROR_HANDLED: 0
 FIRST_SEEN: 2016-06-28 07:34:02
 LAST_SEEN: 2016-06-28 07:34:02
***** 2. row *****
 ERROR_NUMBER: 1146
 ERROR_NAME: ER_NO_SUCH_TABLE
 SQL_STATE: 42S02
 SUM_ERROR_RAISED: 2
 SUM_ERROR_HANDLED: 0
 FIRST_SEEN: 2016-06-28 07:34:05
 LAST_SEEN: 2016-06-28 07:36:18
***** 3. row *****
 ERROR_NUMBER: 1317
 ERROR_NAME: ER_QUERY_INTERRUPTED
 SQL_STATE: 70100
 SUM_ERROR_RAISED: 1
 SUM_ERROR_HANDLED: 0
 FIRST_SEEN: 2016-06-28 11:01:49
 LAST_SEEN: 2016-06-28 11:01:49
```

Each error summary table has one or more grouping columns to indicate how the table aggregates errors:

- `events_errors_summary_by_account_by_error` has `USER`, `HOST`, and `ERROR_NUMBER` columns. Each row summarizes events for a given account (user and host combination) and error.
- `events_errors_summary_by_host_by_error` has `HOST` and `ERROR_NUMBER` columns. Each row summarizes events for a given host and error.
- `events_errors_summary_by_thread_by_error` has `THREAD_ID` and `ERROR_NUMBER` columns. Each row summarizes events for a given thread and error.
- `events_errors_summary_by_user_by_error` has `USER` and `ERROR_NUMBER` columns. Each row summarizes events for a given user and error.
- `events_errors_summary_global_by_error` has an `ERROR_NUMBER` column. Each row summarizes events for a given error.

Each error summary table has these summary columns containing aggregated values:

- `SUM_ERROR_RAISED`

This column aggregates the number of times the error occurred.

- `SUM_ERROR_HANDLED`

This column aggregates the number of times the error was handled by an SQL exception handler.

- `FIRST_SEEN`, `LAST_SEEN`

Timestamp indicating when the error was first seen and most recently seen.

A `NULL` row in each error summary table is used to aggregate statistics for all errors that lie out of range of the instrumented errors. For example, if MySQL Server errors lie in the range from `M` to `N` and an error is raised with number `Q` not in that range, the error is aggregated in the `NULL` row. The `NULL` row is the row with `ERROR_NUMBER=0`, `ERROR_NAME=NULL`, and `SQLSTATE=NULL`.

The error summary tables have these indexes:

- `events_errors_summary_by_account_by_error`:
  - Primary key on (`USER`, `HOST`, `ERROR_NUMBER`)
- `events_errors_summary_by_host_by_error`:
  - Primary key on (`HOST`, `ERROR_NUMBER`)
- `events_errors_summary_by_thread_by_error`:
  - Primary key on (`THREAD_ID`, `ERROR_NUMBER`)
- `events_errors_summary_by_user_by_error`:
  - Primary key on (`USER`, `ERROR_NUMBER`)
- `events_errors_summary_global_by_error`:
  - Primary key on (`ERROR_NUMBER`)

`TRUNCATE TABLE` is permitted for error summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero or `NULL` rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero or `NULL` for the remaining rows.

In addition, each error summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `events_errors_summary_global_by_error`. For details, see [Section 26.12.8, “Performance Schema Connection Tables”](#).

### 26.12.18.12 Status Variable Summary Tables

The Performance Schema makes status variable information available in the tables described in [Section 26.12.15, “Performance Schema Status Variable Tables”](#). It also makes aggregated status variable information available in summary tables, described here. Each status variable summary table has one or more grouping columns to indicate how the table aggregates status values:

- `status_by_account` has `USER`, `HOST`, and `VARIABLE_NAME` columns to summarize status variables by account.
- `status_by_host` has `HOST` and `VARIABLE_NAME` columns to summarize status variables by the host from which clients connected.
- `status_by_user` has `USER` and `VARIABLE_NAME` columns to summarize status variables by client user name.

Each status variable summary table has this summary column containing aggregated values:

- `VARIABLE_VALUE`

The aggregated status variable value for active and terminated sessions.

The status variable summary tables have these indexes:

- `status_by_account`:
  - Primary key on (`USER`, `HOST`, `VARIABLE_NAME`)
- `status_by_host`:
  - Primary key on (`HOST`, `VARIABLE_NAME`)
- `status_by_user`:
  - Primary key on (`USER`, `VARIABLE_NAME`)

The meaning of “account” in these tables is similar to its meaning in the MySQL grant tables in the `mysql` system database, in the sense that the term refers to a combination of user and host values. They differ in that, for grant tables, the host part of an account can be a pattern, whereas for Performance Schema tables, the host value is always a specific nonpattern host name.

Account status is collected when sessions terminate. The session status counters are added to the global status counters and the corresponding account status counters. If account statistics are not collected, the session status is added to host and user status, if host and user status are collected.

Account, host, and user statistics are not collected if the `performance_schema_accounts_size`, `performance_schema_hosts_size`, and `performance_schema_users_size` system variables, respectively, are set to 0.

The Performance Schema supports `TRUNCATE TABLE` for status variable summary tables as follows; in all cases, status for active sessions is unaffected:

- `status_by_account`: Aggregates account status from terminated sessions to user and host status, then resets account status.
- `status_by_host`: Resets aggregated host status from terminated sessions.
- `status_by_user`: Resets aggregated user status from terminated sessions.

`FLUSH STATUS` adds the session status from all active sessions to the global status variables, resets the status of all active sessions, and resets account, host, and user status values aggregated from disconnected sessions.

## 26.12.19 Performance Schema Miscellaneous Tables

The following sections describe tables that do not fall into the table categories discussed in the preceding sections:

- `error_log`: The most recent events written to the error log.
- `host_cache`: Information from the internal host cache.
- `keyring_keys`: Metadata for keys in the MySQL keyring.
- `log_status`: Information about server logs for backup purposes.
- `performance_timers`: Which event timers are available.

- `threads`: Information about server threads.
- `tls_channel_status`: TLS context properties for connection interfaces.
- `user_defined_functions`: User-defined functions registered by a server component, plugin, or `CREATE FUNCTION` statement.

### 26.12.19.1 The `error_log` Table

Of the logs the MySQL server maintains, one is the error log to which it writes diagnostic messages (see [Section 5.4.2, “The Error Log”](#)). Typically, the server writes diagnostics to a file on the server host or to a system log service. As of MySQL 8.0.22, depending on error log configuration, the server can also write the most recent error events to the Performance Schema `error_log` table. Granting the `SELECT` privilege for the `error_log` table thus gives clients and applications access to error log contents using SQL queries, enabling DBAs to provide access to the log without the need to permit direct file system access on the server host.

The `error_log` table supports focused queries based on its more structured columns. It also includes the full text of error messages to support more free-form analysis.

The table implementation uses a fixed-size, in-memory ring buffer, with old events automatically discarded as necessary to make room for new ones.

Example `error_log` contents:

```
mysql> SELECT * FROM performance_schema.error_log\G
***** 1. row *****
 LOGGED: 2020-08-06 09:25:00.338624
 THREAD_ID: 0
 PRIO: System
 ERROR_CODE: MY-010116
 SUBSYSTEM: Server
 DATA: mysqld (mysqld 8.0.23) starting as process 96344
***** 2. row *****
 LOGGED: 2020-08-06 09:25:00.363521
 THREAD_ID: 1
 PRIO: System
 ERROR_CODE: MY-013576
 SUBSYSTEM: InnoDB
 DATA: InnoDB initialization has started.
...
***** 65. row *****
 LOGGED: 2020-08-06 09:25:02.936146
 THREAD_ID: 0
 PRIO: Warning
 ERROR_CODE: MY-010068
 SUBSYSTEM: Server
 DATA: CA certificate /var/mysql/sslinfo/cacert.pem is self signed.
...
***** 89. row *****
 LOGGED: 2020-08-06 09:25:03.112801
 THREAD_ID: 0
 PRIO: System
 ERROR_CODE: MY-013292
 SUBSYSTEM: Server
 DATA: Admin interface ready for connections, address: '127.0.0.1' port: 33062
```

The `error_log` table has the following columns. As indicated in the descriptions, all but the `DATA` column correspond to fields of the underlying error event structure, which is described in [Section 5.4.2.3, “Error Event Fields”](#).

- `LOGGED`

The event timestamp, with microsecond precision. `LOGGED` corresponds to the `time` field of error events, although with certain potential differences:

- `time` values in the error log are displayed according to the `log_timestamps` system variable setting; see [Early-Startup Logging Output Format](#).
- The `LOGGED` column stores values using the `TIMESTAMP` data type, for which values are stored in UTC but displayed when retrieved in the current session time zone; see [Section 11.2.2, “The DATE, DATETIME, and TIMESTAMP Types”](#).

To display `LOGGED` values in the same time zone as displayed in the error log file, first set the session time zone as follows:

```
SET @@session.time_zone = @@global.log_timestamps;
```

If the `log_timestamps` value is `UTC` and your system does not have named time zone support installed (see [Section 5.1.14, “MySQL Server Time Zone Support”](#)), set the time zone like this:

```
SET @@session.time_zone = '+00:00';
```

- `THREAD_ID`

The MySQL thread ID. `THREAD_ID` corresponds to the `thread` field of error events.

Within the Performance Schema, the `THREAD_ID` column in the `error_log` table is most similar to the `PROCESSLIST_ID` column of the `threads` table:

- For foreground threads, `THREAD_ID` and `PROCESSLIST_ID` represent a connection identifier. This is the same value displayed in the `ID` column of the `INFORMATION_SCHEMA.PROCESSLIST` table, displayed in the `Id` column of `SHOW PROCESSLIST` output, and returned by the `CONNECTION_ID()` function within the thread.
- For background threads, `THREAD_ID` is 0 and `PROCESSLIST_ID` is `NULL`.

Many Performance Schema tables other than `error_log` has a column named `THREAD_ID`, but in those tables, the `THREAD_ID` column is a value assigned internally by the Performance Schema.

- `PRIO`

The event priority. Permitted values are `System`, `Error`, `Warning`, `Note`. The `PRIO` column is based on the `label` field of error events, which itself is based on the underlying numeric `prio` field value.

- `ERROR_CODE`

The numeric event error code. `ERROR_CODE` corresponds to the `error_code` field of error events.

- `SUBSYSTEM`

The subsystem in which the event occurred. `SUBSYSTEM` corresponds to the `subsystem` field of error events.

- `DATA`

The text representation of the error event. The format of this value depends on the format produced by the log sink component that generates the `error_log` row. For example, if the log sink is `log_sink_internal` or `log_sink_json`, `DATA` values represent error events in traditional or JSON format, respectively. (See [Section 5.4.2.9, “Error Log Output Format”](#).)

Because the error log can be reconfigured to change the log sink component that supplies rows to the `error_log` table, and because different sinks produce different output formats, it is possible for rows written to the `error_log` table at different times to have different `DATA` formats.

The `error_log` table has these indexes:

- Primary key on (`LOGGED`)
- Index on (`THREAD_ID`)
- Index on (`PRIO`)
- Index on (`ERROR_CODE`)
- Index on (`SUBSYSTEM`)

`TRUNCATE TABLE` is not permitted for the `error_log` table.

## Implementation and Configuration of the `error_log` Table

The Performance Schema `error_log` table is populated by error log sink components that write to the table in addition to writing formatted error events to the error log. Performance Schema support by log sinks has two parts:

- A log sink can write new error events to the `error_log` table as they occur.
- A log sink can provide a parser for extraction of previously written error messages. This enables a server instance to read messages written to an error log file by the previous instance and store them in the `error_log` table. Messages written during shutdown by the previous instance may be useful for diagnosing why shutdown occurred.

Currently, the traditional-format `log_sink_internal` and JSON-format `log_sink_json` sinks support writing new events to the `error_log` table and provide a parser for reading previously written error log files.

The `log_error_services` system variable controls which log components to enable for error logging. Its value is a pipeline of log filter and log sink components to be executed in left-to-right order when error events occur. The `log_error_services` value pertains to populating the `error_log` table as follows:

- At startup, the server examines the `log_error_services` value and chooses from it the leftmost log sink that satisfies these conditions:
  - A sink that supports the `error_log` table and provides a parser.
  - If none, a sink that supports the `error_log` table but provides no parser.

If no log sink satisfies those conditions, the `error_log` table remains empty. Otherwise, if the sink provides a parser and log configuration enables a previously written error log file to be found, the server uses the sink parser to read the last part of the file and writes the old events it contains to the table. The sink then writes new error events to the table as they occur.

- At runtime, if the value of `log_error_services` changes, the server again examines it, this time looking for the leftmost enabled log sink that supports the `error_log` table, regardless of whether it provides a parser.

If no such log sink exists, no additional error events are written to the `error_log` table. Otherwise, the newly configured sink writes new error events to the table as they occur.

Any configuration that affects output written to the error log affects `error_log` table contents. This includes settings such as those for verbosity, message suppression, and message filtering. It also applies to information read at startup from a previous log file. For example, messages not written during a previous server instance configured with low verbosity do not become available if the file is read by a current instance configured with higher verbosity.

The `error_log` table is a view on a fixed-size, in-memory ring buffer, with old events automatically discarded as necessary to make room for new ones. As shown in the following table, several status variables provide information about ongoing `error_log` operation.

Status Variable	Meaning
<code>Error_log_buffered_bytes</code>	Bytes used in table
<code>Error_log_buffered_events</code>	Events present in table
<code>Error_log_expired_events</code>	Events discarded from table
<code>Error_log_latest_write</code>	Time of last write to table

## 26.12.19.2 The `host_cache` Table

The `host_cache` table provides access to the contents of the host cache, which contains client host name and IP address information and is used to avoid Domain Name System (DNS) lookups. The `host_cache_size` system variable controls the size of the host cache, as well as the size of the `host_cache` table that exposes the cache contents. For operational and configuration information about the host cache, see [Section 5.1.12.3, “DNS Lookups and the Host Cache”](#).

Because the `host_cache` table exposes the contents of the host cache, it can be examined using `SELECT` statements. This may help you diagnose the causes of connection problems. The Performance Schema must be enabled or this table is empty.

The `host_cache` table has these columns:

- `IP`

The IP address of the client that connected to the server, expressed as a string.

- `HOST`

The resolved DNS host name for that client IP, or `NULL` if the name is unknown.

- `HOST_VALIDATED`

Whether the IP-to-host name-to-IP DNS resolution was performed successfully for the client IP. If `HOST_VALIDATED` is `YES`, the `HOST` column is used as the host name corresponding to the IP so that additional calls to DNS can be avoided. While `HOST_VALIDATED` is `NO`, DNS resolution is attempted for each connection attempt, until it eventually completes with either a valid result or a permanent error. This information enables the server to avoid caching bad or missing host names during temporary DNS failures, which would negatively affect clients forever.

- `SUM_CONNECT_ERRORS`

The number of connection errors that are deemed “blocking” (assessed against the `max_connect_errors` system variable). Only protocol handshake errors are counted, and only for hosts that passed validation (`HOST_VALIDATED = YES`).

Once `SUM_CONNECT_ERRORS` for a given host reaches the value of `max_connect_errors`, new connections from that host are blocked. The `SUM_CONNECT_ERRORS` value can exceed the `max_connect_errors` value because multiple connection attempts from a host can occur

simultaneously while the host is not blocked. Any or all of them can fail, independently incrementing `SUM_CONNECT_ERRORS`, possibly beyond the value of `max_connect_errors`.

Suppose that `max_connect_errors` is 200 and `SUM_CONNECT_ERRORS` for a given host is 199. If 10 clients attempt to connect from that host simultaneously, none of them are blocked because `SUM_CONNECT_ERRORS` has not reached 200. If blocking errors occur for five of the clients, `SUM_CONNECT_ERRORS` is increased by one for each client, for a resulting `SUM_CONNECT_ERRORS` value of 204. The other five clients succeed and are not blocked because the value of `SUM_CONNECT_ERRORS` when their connection attempts began had not reached 200. New connections from the host that begin after `SUM_CONNECT_ERRORS` reaches 200 are blocked.

- `COUNT_HOST_BLOCKED_ERRORS`

The number of connections that were blocked because `SUM_CONNECT_ERRORS` exceeded the value of the `max_connect_errors` system variable.

- `COUNT_NAMEINFO_TRANSIENT_ERRORS`

The number of transient errors during IP-to-host name DNS resolution.

- `COUNT_NAMEINFO_PERMANENT_ERRORS`

The number of permanent errors during IP-to-host name DNS resolution.

- `COUNT_FORMAT_ERRORS`

The number of host name format errors. MySQL does not perform matching of `Host` column values in the `mysql.user` system table against host names for which one or more of the initial components of the name are entirely numeric, such as `1.2.example.com`. The client IP address is used instead. For the rationale why this type of matching does not occur, see [Section 6.2.4, “Specifying Account Names”](#).

- `COUNT_ADDRINFO_TRANSIENT_ERRORS`

The number of transient errors during host name-to-IP reverse DNS resolution.

- `COUNT_ADDRINFO_PERMANENT_ERRORS`

The number of permanent errors during host name-to-IP reverse DNS resolution.

- `COUNT_FCRDNS_ERRORS`

The number of forward-confirmed reverse DNS errors. These errors occur when IP-to-host name-to-IP DNS resolution produces an IP address that does not match the client originating IP address.

- `COUNT_HOST_ACL_ERRORS`

The number of errors that occur because no users are permitted to connect from the client host. In such cases, the server returns `ER_HOST_NOT_PRIVILEGED` and does not even ask for a user name or password.

- `COUNT_NO_AUTH_PLUGIN_ERRORS`

The number of errors due to requests for an unavailable authentication plugin. A plugin can be unavailable if, for example, it was never loaded or a load attempt failed.

- `COUNT_AUTH_PLUGIN_ERRORS`

The number of errors reported by authentication plugins.

An authentication plugin can report different error codes to indicate the root cause of a failure. Depending on the type of error, one of these columns is incremented: [COUNT\\_AUTHENTICATION\\_ERRORS](#), [COUNT\\_AUTH\\_PLUGIN\\_ERRORS](#), [COUNT\\_HANDSHAKE\\_ERRORS](#). New return codes are an optional extension to the existing plugin API. Unknown or unexpected plugin errors are counted in the [COUNT\\_AUTH\\_PLUGIN\\_ERRORS](#) column.

- [COUNT\\_HANDSHAKE\\_ERRORS](#)

The number of errors detected at the wire protocol level.

- [COUNT\\_PROXY\\_USER\\_ERRORS](#)

The number of errors detected when proxy user A is proxied to another user B who does not exist.

- [COUNT\\_PROXY\\_USER\\_ACL\\_ERRORS](#)

The number of errors detected when proxy user A is proxied to another user B who does exist but for whom A does not have the [PROXY](#) privilege.

- [COUNT\\_AUTHENTICATION\\_ERRORS](#)

The number of errors caused by failed authentication.

- [COUNT\\_SSL\\_ERRORS](#)

The number of errors due to SSL problems.

- [COUNT\\_MAX\\_USER\\_CONNECTIONS\\_ERRORS](#)

The number of errors caused by exceeding per-user connection quotas. See [Section 6.2.20, “Setting Account Resource Limits”](#).

- [COUNT\\_MAX\\_USER\\_CONNECTIONS\\_PER\\_HOUR\\_ERRORS](#)

The number of errors caused by exceeding per-user connections-per-hour quotas. See [Section 6.2.20, “Setting Account Resource Limits”](#).

- [COUNT\\_DEFAULT\\_DATABASE\\_ERRORS](#)

The number of errors related to the default database. For example, the database does not exist or the user has no privileges to access it.

- [COUNT\\_INIT\\_CONNECT\\_ERRORS](#)

The number of errors caused by execution failures of statements in the [init\\_connect](#) system variable value.

- [COUNT\\_LOCAL\\_ERRORS](#)

The number of errors local to the server implementation and not related to the network, authentication, or authorization. For example, out-of-memory conditions fall into this category.

- [COUNT\\_UNKNOWN\\_ERRORS](#)

The number of other, unknown errors not accounted for by other columns in this table. This column is reserved for future use, in case new error conditions must be reported, and if preserving the backward compatibility and structure of the [host\\_cache](#) table is required.

- `FIRST_SEEN`

The timestamp of the first connection attempt seen from the client in the `IP` column.

- `LAST_SEEN`

The timestamp of the most recent connection attempt seen from the client in the `IP` column.

- `FIRST_ERROR_SEEN`

The timestamp of the first error seen from the client in the `IP` column.

- `LAST_ERROR_SEEN`

The timestamp of the most recent error seen from the client in the `IP` column.

The `host_cache` table has these indexes:

- Primary key on (`IP`)
- Index on (`HOST`)

The `FLUSH HOSTS` statement, `TRUNCATE TABLE host_cache` statement, and `mysqladmin flush-hosts` command have the same effect: They clear the host cache, remove all rows from the `host_cache` table that exposes the cache contents, and unblock any blocked hosts (see [Section B.3.2.5, “Host 'host\\_name' is blocked”](#)). `FLUSH HOSTS` and `mysqladmin flush-hosts` require the `RELOAD` privilege. `TRUNCATE TABLE` requires the `DROP` privilege for the `host_cache` table.

### 26.12.19.3 The `keyring_keys` table

MySQL Server supports a keyring that enables internal server components and plugins to securely store sensitive information for later retrieval. See [Section 6.4.4, “The MySQL Keyring”](#).

As of MySQL 8.0.16, the `keyring_keys` table exposes metadata for keys in the keyring. Key metadata includes key IDs, key owners, and backend key IDs. The `keyring_keys` table does *not* expose any sensitive keyring data such as key contents.

The `keyring_keys` table has these columns:

- `KEY_ID`

The key identifier.

- `KEY_OWNER`

The owner of the key.

- `BACKEND_KEY_ID`

The ID used for the key by the keyring backend.

The `keyring_keys` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `keyring_keys` table.

### 26.12.19.4 The `log_status` Table

The `log_status` table provides information that enables an online backup tool to copy the required log files without locking those resources for the duration of the copy process.

When the `log_status` table is queried, the server blocks logging and related administrative changes for just long enough to populate the table, then releases the resources. The `log_status` table informs the online backup which point it should copy up to in the source's binary log and `gtid_executed` record, and the relay log for each replication channel. It also provides relevant information for individual storage engines, such as the last log sequence number (LSN) and the LSN of the last checkpoint taken for the `InnoDB` storage engine.

The `log_status` table has these columns:

- `SERVER_UUID`

The server UUID for this server instance. This is the generated unique value of the read-only system variable `server_uuid`.

- `LOCAL`

The log position state information from the source, provided as a single JSON object with the following keys:

<code>binary_log_file</code>	The name of the current binary log file.
<code>binary_log_position</code>	The current binary log position at the time the <code>log_status</code> table was accessed.
<code>gtid_executed</code>	The current value of the global server variable <code>gtid_executed</code> at the time the <code>log_status</code> table was accessed. This information is consistent with the <code>binary_log_file</code> and <code>binary_log_position</code> keys.

- `REPLICATION`

A JSON array of channels, each with the following information:

<code>channel_name</code>	The name of the replication channel. The default replication channel's name is the empty string ("").
<code>relay_log_file</code>	The name of the current relay log file for the replication channel.
<code>relay_log_pos</code>	The current relay log position at the time the <code>log_status</code> table was accessed.

- `STORAGE_ENGINES`

Relevant information from individual storage engines, provided as a JSON object with one key for each applicable storage engine.

The `log_status` table has no indexes.

The `BACKUP_ADMIN` privilege, as well as the `SELECT` privilege, is required for access to the `log_status` table.

`TRUNCATE TABLE` is not permitted for the `log_status` table.

## 26.12.19.5 The `performance_timers` Table

The `performance_timers` table shows which event timers are available:

```
mysql> SELECT * FROM performance_schema.performance_timers;
```

TIMER_NAME	TIMER_FREQUENCY	TIMER_RESOLUTION	TIMER_OVERHEAD
CYCLE	2389029850	1	72
NANOSECOND	1000000000	1	112
MICROSECOND	1000000	1	136
MILLISECOND	1036	1	168

If the values associated with a given timer name are `NULL`, that timer is not supported on your platform. For an explanation of how event timing occurs, see [Section 26.4.1, “Performance Schema Event Timing”](#).

The `performance_timers` table has these columns:

- `TIMER_NAME`

The timer name.

- `TIMER_FREQUENCY`

The number of timer units per second. For a cycle timer, the frequency is generally related to the CPU speed. For example, on a system with a 2.4GHz processor, the `CYCLE` may be close to 2400000000.

- `TIMER_RESOLUTION`

Indicates the number of timer units by which timer values increase. If a timer has a resolution of 10, its value increases by 10 each time.

- `TIMER_OVERHEAD`

The minimal number of cycles of overhead to obtain one timing with the given timer. The Performance Schema determines this value by invoking the timer 20 times during initialization and picking the smallest value. The total overhead really is twice this amount because the instrumentation invokes the timer at the start and end of each event. The timer code is called only for timed events, so this overhead does not apply for nontimed events.

The `performance_timers` table has these indexes:

- None

`TRUNCATE TABLE` is not permitted for the `performance_timers` table.

## 26.12.19.6 The processlist Table

The MySQL process list indicates the operations currently being performed by the set of threads executing within the server. The `processlist` table is one source of process information. For a comparison of this table with other sources, see [Sources of Process Information](#).

The `processlist` table can be queried directly. If you have the `PROCESS` privilege, you can see all threads, even those belonging to other users. Otherwise (without the `PROCESS` privilege), nonanonymous users have access to information about their own threads but not threads for other users, and anonymous users have no access to thread information.

### Note

If the `performance_schema_show_processlist` system variable is enabled, the `processlist` table also serves as the basis for an alternative implementation underlying the `SHOW PROCESSLIST` statement. For details, see later in this section.

The `processlist` table contains a row for each server process:

```
mysql> SELECT * FROM performance_schema.processlist\G
***** 1. row *****
 ID: 5
 USER: event_scheduler
 HOST: localhost
 DB: NULL
COMMAND: Daemon
 TIME: 137
 STATE: Waiting on empty queue
 INFO: NULL
***** 2. row *****
 ID: 9
 USER: me
 HOST: localhost:58812
 DB: NULL
COMMAND: Sleep
 TIME: 95
 STATE:
 INFO: NULL
***** 3. row *****
 ID: 10
 USER: me
 HOST: localhost:58834
 DB: test
COMMAND: Query
 TIME: 0
 STATE: executing
 INFO: SELECT * FROM performance_schema.processlist
...
```

The `processlist` table has these columns:

- `ID`

The connection identifier. This is the same value displayed in the `Id` column of the `SHOW PROCESSLIST` statement, displayed in the `PROCESSLIST_ID` column of the Performance Schema `threads` table, and returned by the `CONNECTION_ID()` function within the thread.

- `USER`

The MySQL user who issued the statement. A value of `system user` refers to a nonclient thread spawned by the server to handle tasks internally, for example, a delayed-row handler thread or an I/O or SQL thread used on replica hosts. For `system user`, there is no host specified in the `Host` column. `unauthenticated user` refers to a thread that has become associated with a client connection but for which authentication of the client user has not yet occurred. `event_scheduler` refers to the thread that monitors scheduled events (see [Section 24.4, “Using the Event Scheduler”](#)).

#### Note

A `USER` value of `system user` is distinct from the `SYSTEM_USER` privilege. The former designates internal threads. The latter distinguishes the system user and regular user account categories (see [Section 6.2.11, “Account Categories”](#)).

- `HOST`

The host name of the client issuing the statement (except for `system user`, for which there is no host). The host name for TCP/IP connections is reported in `host_name:client_port` format to make it easier to determine which client is doing what.

- `DB`

The default database for the thread, or `NULL` if none has been selected.

- `COMMAND`

The type of command the thread is executing on behalf of the client, or `SLEEP` if the session is idle. For descriptions of thread commands, see [Section 8.14, “Examining Server Thread \(Process\) Information”](#). The value of this column corresponds to the `COM_XXX` commands of the client/server protocol and `Com_XXX` status variables. See [Section 5.1.10, “Server Status Variables”](#)

- `TIME`

The time in seconds that the thread has been in its current state. For a replica SQL thread, the value is the number of seconds between the timestamp of the last replicated event and the real time of the replica host. See [Section 17.2.3, “Replication Threads”](#).

- `STATE`

An action, event, or state that indicates what the thread is doing. For descriptions of `STATE` values, see [Section 8.14, “Examining Server Thread \(Process\) Information”](#).

Most states correspond to very quick operations. If a thread stays in a given state for many seconds, there might be a problem that needs to be investigated.

- `INFO`

The statement the thread is executing, or `NULL` if it is executing no statement. The statement might be the one sent to the server, or an innermost statement if the statement executes other statements. For example, if a `CALL` statement executes a stored procedure that is executing a `SELECT` statement, the `INFO` value shows the `SELECT` statement.

The `processlist` table has these indexes:

- Primary key on (`ID`)

`TRUNCATE TABLE` is not permitted for the `processlist` table.

As mentioned previously, if the `performance_schema_show_processlist` system variable is enabled, the `processlist` table serves as the basis for an alternative implementation of other process information sources:

- The `SHOW PROCESSLIST` statement.
- The `mysqladmin processlist` command (which uses `SHOW PROCESSLIST` statement).

The default `SHOW PROCESSLIST` implementation iterates across active threads from within the thread manager while holding a global mutex. This has negative performance consequences, particularly on busy systems. The alternative `SHOW PROCESSLIST` implementation is based on the Performance Schema `processlist` table. This implementation queries active thread data from the Performance Schema rather than the thread manager and does not require a mutex.

MySQL configuration affects `processlist` table contents as follows:

- Minimum required configuration:
  - The MySQL server must be configured and built with thread instrumentation enabled. This is true by default; it is controlled using the `DISABLE_PSI_THREAD` CMake option.

- The Performance Schema must be enabled at server startup. This is true by default; it is controlled using the `performance_schema` system variable.

With that configuration satisfied, `performance_schema_show_processlist` enables or disables the alternative `SHOW PROCESSLIST` implementation. If the minimum configuration is not satisfied, the `processlist` table (and thus `SHOW PROCESSLIST`) may not return all data.

- Recommended configuration:
  - To avoid having some threads ignored:
    - Leave the `performance_schema_max_thread_instances` system variable set to its default or set it at least as great as the `max_connections` system variable.
    - Leave the `performance_schema_max_thread_classes` system variable set to its default.
  - To avoid having some `STATE` column values be empty, leave the `performance_schema_max_stage_classes` system variable set to its default.

The default for those configuration parameters is `-1`, which causes the Performance Schema to autosize them at server startup. With the parameters set as indicated, the `processlist` table (and thus `SHOW PROCESSLIST`) produce complete process information.

The preceding configuration parameters affect the contents of the `processlist` table. For a given configuration, however, the `processlist` contents are unaffected by the `performance_schema_show_processlist` setting.

The alternative process list implementation does not apply to the `INFORMATION_SCHEMA PROCESSLIST` table or the `COM_PROCESS_INFO` command of the MySQL client/server protocol.

## 26.12.19.7 The threads Table

The `threads` table contains a row for each server thread. Each row contains information about a thread and indicates whether monitoring and historical event logging are enabled for it:

```
mysql> SELECT * FROM performance_schema.threads\G
***** 1. row *****
 THREAD_ID: 1
 NAME: thread/sql/main
 TYPE: BACKGROUND
PROCESSLIST_ID: NULL
PROCESSLIST_USER: NULL
PROCESSLIST_HOST: NULL
PROCESSLIST_DB: NULL
PROCESSLIST_COMMAND: NULL
PROCESSLIST_TIME: 80284
PROCESSLIST_STATE: NULL
PROCESSLIST_INFO: NULL
PARENT_THREAD_ID: NULL
 ROLE: NULL
 INSTRUMENTED: YES
 HISTORY: YES
CONNECTION_TYPE: NULL
 THREAD_OS_ID: 489803
RESOURCE_GROUP: SYS_default
...
***** 4. row *****
 THREAD_ID: 51
 NAME: thread/sql/one_connection
 TYPE: FOREGROUND
```

```

PROCESSLIST_ID: 34
PROCESSLIST_USER: isabella
PROCESSLIST_HOST: localhost
PROCESSLIST_DB: performance_schema
PROCESSLIST_COMMAND: Query
PROCESSLIST_TIME: 0
PROCESSLIST_STATE: Sending data
PROCESSLIST_INFO: SELECT * FROM performance_schema.threads
PARENT_THREAD_ID: 1
 ROLE: NULL
 INSTRUMENTED: YES
 HISTORY: YES
CONNECTION_TYPE: SSL/TLS
THREAD_OS_ID: 755399
RESOURCE_GROUP: USR_default
...

```

When the Performance Schema initializes, it populates the `threads` table based on the threads in existence then. Thereafter, a new row is added each time the server creates a thread.

The `INSTRUMENTED` and `HISTORY` column values for new threads are determined by the contents of the `setup_actors` table. For information about how to use the `setup_actors` table to control these columns, see [Section 26.4.6, “Pre-Filtering by Thread”](#).

Removal of rows from the `threads` table occurs when threads end. For a thread associated with a client session, removal occurs when the session ends. If a client has auto-reconnect enabled and the session reconnects after a disconnect, the session becomes associated with a new row in the `threads` table that has a different `PROCESSLIST_ID` value. The initial `INSTRUMENTED` and `HISTORY` values for the new thread may be different from those of the original thread: The `setup_actors` table may have changed in the meantime, and if the `INSTRUMENTED` or `HISTORY` value for the original thread was changed after the row was initialized, the change does not carry over to the new thread.

You can enable or disable thread monitoring (that is, whether events executed by the thread are instrumented) and historical event logging. To control the initial `INSTRUMENTED` and `HISTORY` values for new foreground threads, use the `setup_actors` table. To control these aspects of existing threads, set the `INSTRUMENTED` and `HISTORY` columns of `threads` table rows. (For more information about the conditions under which thread monitoring and historical event logging occur, see the descriptions of the `INSTRUMENTED` and `HISTORY` columns.)

For a comparison of the `threads` table columns with names having a prefix of `PROCESSLIST_` to other process information sources, see [Sources of Process Information](#).

### Important

For thread information sources other than the `threads` table, information about threads for other users is shown only if the current user has the `PROCESS` privilege. That is not true of the `threads` table; all rows are shown to any user who has the `SELECT` privilege for the table. Users who should not be able to see threads for other users by accessing the `threads` table should not be given the `SELECT` privilege for it.

The `threads` table has these columns:

- `THREAD_ID`

A unique thread identifier.

- `NAME`

The name associated with the thread instrumentation code in the server. For example, `thread/sql/one_connection` corresponds to the thread function in the code responsible for handling a user connection, and `thread/sql/main` stands for the `main()` function of the server.

- **TYPE**

The thread type, either `FOREGROUND` or `BACKGROUND`. User connection threads are foreground threads. Threads associated with internal server activity are background threads. Examples are internal `InnoDB` threads, “binlog dump” threads sending information to replicas, and replication I/O and SQL threads.

- **PROCESSLIST\_ID**

For a foreground thread (associated with a user connection), this is the connection identifier. This is the same value displayed in the `ID` column of the `INFORMATION_SCHEMA.PROCESSLIST` table, displayed in the `Id` column of `SHOW PROCESSLIST` output, and returned by the `CONNECTION_ID()` function within the thread.

For a background thread (not associated with a user connection), `PROCESSLIST_ID` is `NULL`, so the values are not unique.

- **PROCESSLIST\_USER**

The user associated with a foreground thread, `NULL` for a background thread.

- **PROCESSLIST\_HOST**

The host name of the client associated with a foreground thread, `NULL` for a background thread.

Unlike the `HOST` column of the `INFORMATION_SCHEMA.PROCESSLIST` table or the `Host` column of `SHOW PROCESSLIST` output, the `PROCESSLIST_HOST` column does not include the port number for TCP/IP connections. To obtain this information from the Performance Schema, enable the socket instrumentation (which is not enabled by default) and examine the `socket_instances` table:

```
mysql> SELECT NAME, ENABLED, TIMED
 FROM performance_schema.setup_instruments
 WHERE NAME LIKE 'wait/io/socket%';
+-----+-----+-----+
| NAME | ENABLED | TIMED |
+-----+-----+-----+
| wait/io/socket/sql/server_tcpip_socket | NO | NO |
| wait/io/socket/sql/server_unix_socket | NO | NO |
| wait/io/socket/sql/client_connection | NO | NO |
+-----+-----+-----+
3 rows in set (0.01 sec)

mysql> UPDATE performance_schema.setup_instruments
 SET ENABLED='YES'
 WHERE NAME LIKE 'wait/io/socket%';
Query OK, 3 rows affected (0.00 sec)
Rows matched: 3 Changed: 3 Warnings: 0

mysql> SELECT * FROM performance_schema.socket_instances\G
***** 1. row *****
 EVENT_NAME: wait/io/socket/sql/client_connection
OBJECT_INSTANCE_BEGIN: 140612577298432
 THREAD_ID: 31
 SOCKET_ID: 53
 IP: ::ffff:127.0.0.1
 PORT: 55642
 STATE: ACTIVE
...

```

- [PROCESSLIST\\_DB](#)

The default database for the thread, or [NULL](#) if none has been selected.

- [PROCESSLIST\\_COMMAND](#)

For foreground threads, the type of command the thread is executing on behalf of the client, or [Sleep](#) if the session is idle. For descriptions of thread commands, see [Section 8.14, “Examining Server Thread \(Process\) Information”](#). The value of this column corresponds to the [COM\\_xxx](#) commands of the client/server protocol and [Com\\_xxx](#) status variables. See [Section 5.1.10, “Server Status Variables”](#)

Background threads do not execute commands on behalf of clients, so this column may be [NULL](#).

- [PROCESSLIST\\_TIME](#)

The time in seconds that the thread has been in its current state. For a replica SQL thread, the value is the number of seconds between the timestamp of the last replicated event and the real time of the replica host. See [Section 17.2.3, “Replication Threads”](#).

- [PROCESSLIST\\_STATE](#)

An action, event, or state that indicates what the thread is doing. For descriptions of [PROCESSLIST\\_STATE](#) values, see [Section 8.14, “Examining Server Thread \(Process\) Information”](#). If the value is [NULL](#), the thread may correspond to an idle client session or the work it is doing is not instrumented with stages.

Most states correspond to very quick operations. If a thread stays in a given state for many seconds, there might be a problem that bears investigation.

- [PROCESSLIST\\_INFO](#)

The statement the thread is executing, or [NULL](#) if it is executing no statement. The statement might be the one sent to the server, or an innermost statement if the statement executes other statements. For example, if a [CALL](#) statement executes a stored procedure that is executing a [SELECT](#) statement, the [PROCESSLIST\\_INFO](#) value shows the [SELECT](#) statement.

- [PARENT\\_THREAD\\_ID](#)

If this thread is a subthread (spawned by another thread), this is the [THREAD\\_ID](#) value of the spawning thread.

- [ROLE](#)

Unused.

- [INSTRUMENTED](#)

Whether events executed by the thread are instrumented. The value is [YES](#) or [NO](#).

- For foreground threads, the initial [INSTRUMENTED](#) value is determined by whether the user account associated with the thread matches any row in the [setup\\_actors](#) table. Matching is based on the values of the [PROCESSLIST\\_USER](#) and [PROCESSLIST\\_HOST](#) columns.

If the thread spawns a subthread, matching occurs again for the [threads](#) table row created for the subthread.

- For background threads, [INSTRUMENTED](#) is [YES](#) by default. [setup\\_actors](#) is not consulted because there is no associated user for background threads.

- For any thread, its `INSTRUMENTED` value can be changed during the lifetime of the thread.

For monitoring of events executed by the thread to occur, these things must be true:

- The `thread_instrumentation` consumer in the `setup_consumers` table must be `YES`.
- The `threads.INSTRUMENTED` column must be `YES`.
- Monitoring occurs only for those thread events produced from instruments that have the `ENABLED` column set to `YES` in the `setup_instruments` table.

- `HISTORY`

Whether to log historical events for the thread. The value is `YES` or `NO`.

- For foreground threads, the initial `HISTORY` value is determined by whether the user account associated with the thread matches any row in the `setup_actors` table. Matching is based on the values of the `PROCESSLIST_USER` and `PROCESSLIST_HOST` columns.

If the thread spawns a subthread, matching occurs again for the `threads` table row created for the subthread.

- For background threads, `HISTORY` is `YES` by default. `setup_actors` is not consulted because there is no associated user for background threads.
- For any thread, its `HISTORY` value can be changed during the lifetime of the thread.

For historical event logging for the thread to occur, these things must be true:

- The appropriate history-related consumers in the `setup_consumers` table must be enabled. For example, wait event logging in the `events_waits_history` and `events_waits_history_long` tables requires the corresponding `events_waits_history` and `events_waits_history_long` consumers to be `YES`.
- The `threads.HISTORY` column must be `YES`.
- Logging occurs only for those thread events produced from instruments that have the `ENABLED` column set to `YES` in the `setup_instruments` table.

- `CONNECTION_TYPE`

The protocol used to establish the connection, or `NULL` for background threads. Permitted values are `TCP/IP` (TCP/IP connection established without encryption), `SSL/TLS` (TCP/IP connection established with encryption), `Socket` (Unix socket file connection), `Named Pipe` (Windows named pipe connection), and `Shared Memory` (Windows shared memory connection).

- `THREAD_OS_ID`

The thread or task identifier as defined by the underlying operating system, if there is one:

- When a MySQL thread is associated with the same operating system thread for its lifetime, `THREAD_OS_ID` contains the operating system thread ID.
- When a MySQL thread is not associated with the same operating system thread for its lifetime, `THREAD_OS_ID` contains `NULL`. This is typical for user sessions when the thread pool plugin is used (see [Section 5.6.3, “MySQL Enterprise Thread Pool”](#)).

For Windows, `THREAD_OS_ID` corresponds to the thread ID visible in Process Explorer (<https://technet.microsoft.com/en-us/sysinternals/bb896653.aspx>).

For Linux, `THREAD_OS_ID` corresponds to the value of the `gettid()` function. This value is exposed, for example, using the `perf` or `ps -L` commands, or in the `proc` file system (`/proc/[pid]/task/[tid]`). For more information, see the `perf-stat(1)`, `ps(1)`, and `proc(5)` man pages.

- `RESOURCE_GROUP`

The resource group label. This value is `NULL` if resource groups are not supported on the current platform or server configuration (see [Resource Group Restrictions](#)).

The `threads` table has these indexes:

- Primary key on (`THREAD_ID`)
- Index on (`NAME`)
- Index on (`PROCESSLIST_ID`)
- Index on (`PROCESSLIST_USER`, `PROCESSLIST_HOST`)
- Index on (`PROCESSLIST_HOST`)
- Index on (`THREAD_OS_ID`)
- Index on (`RESOURCE_GROUP`)

`TRUNCATE TABLE` is not permitted for the `threads` table.

## 26.12.19.8 The `tls_channel_status` Table

Connection interface TLS properties are set at server startup, and can be updated at runtime using the `ALTER INSTANCE RELOAD TLS` statement. See [Server-Side Runtime Configuration and Monitoring for Encrypted Connections](#).

The `tls_channel_status` table (available as of MySQL 8.0.21) provides information about connection interface TLS properties:

```
mysql> SELECT * FROM performance_schema.tls_channel_status\G
***** 1. row *****
CHANNEL: mysql_main
PROPERTY: Enabled
VALUE: Yes
***** 2. row *****
CHANNEL: mysql_main
PROPERTY: ssl_accept_renegotiates
VALUE: 0
***** 3. row *****
```

```

CHANNEL: mysql_main
PROPERTY: Ssl_accepts
VALUE: 2
...
***** 29. row *****
CHANNEL: mysql_admin
PROPERTY: Enabled
VALUE: No
***** 30. row *****
CHANNEL: mysql_admin
PROPERTY: ssl_accept_renegotiates
VALUE: 0
***** 31. row *****
CHANNEL: mysql_admin
PROPERTY: Ssl_accepts
VALUE: 0
...

```

The `tls_channel_status` table has these columns:

- **CHANNEL**

The name of the connection interface to which the TLS property row applies. `mysql_main` and `mysql_admin` are the channel names for the main and administrative connection interfaces, respectively. For information about the different interfaces, see [Section 5.1.12.1, “Connection Interfaces”](#).

- **PROPERTY**

The TLS property name. The row for the `Enabled` property indicates overall interface status, where the interface and its status are named in the `CHANNEL` and `VALUE` columns, respectively. Other property names indicate particular TLS properties. These often correspond to the names of TLS-related status variables.

- **VALUE**

The TLS property value.

The properties exposed by this table are not fixed and depend on the instrumentation implemented by each channel.

For each channel, the row with a `PROPERTY` value of `Enabled` indicates whether the channel supports encrypted connections, and other channel rows indicate TLS context properties:

- For `mysql_main`, the `Enabled` property is `yes` or `no` to indicate whether the main interface supports encrypted connections. Other channel rows display TLS context properties for the main interface.

For the main interface, similar status information can be obtained using these statements:

```

SHOW GLOBAL STATUS LIKE 'current_tls%';
SHOW GLOBAL STATUS LIKE 'ssl%';

```

- For `mysql_admin`, the `Enabled` property is `no` if the administrative interface is not enabled or it is enabled but does not support encrypted connections. `Enabled` is `yes` if the interface is enabled and supports encrypted connections.

When `Enabled` is `yes`, the other `mysql_admin` rows indicate channel properties for the administrative interface TLS context only if some nondefault TLS parameter value is configured for that interface. (This is the case if any `admin_tls_xxx` or `admin_ssl_xxx` system variable is set to a value different from its default.) Otherwise, the administrative interface uses the same TLS context as the main interface.

The `tls_channel_status` table has these indexes:

- None

`TRUNCATE TABLE` is not permitted for the `tls_channel_status` table.

### 26.12.19.9 The `user_defined_functions` Table

The `user_defined_functions` table contains a row for each user-defined function (UDF) registered automatically by a server component or plugin, or manually by a `CREATE FUNCTION` statement. For information about operations that add or remove table rows, see [Section 5.7.1, “Installing and Uninstalling User-Defined Functions”](#).

The `user_defined_functions` table has these columns:

- `UDF_NAME`

The UDF name as referred to in SQL statements. The value is `NULL` if the function was registered by a `CREATE FUNCTION` statement and is in the process of unloading.

- `UDF_RETURN_TYPE`

The UDF return value type. The value is one of `int`, `decimal`, `real`, `char`, or `row`.

- `UDF_TYPE`

The UDF type. The value is one of `function` (scalar) or `aggregate`.

- `UDF_LIBRARY`

The name of the library file containing the executable UDF code. The file is located in the directory named by the `plugin_dir` system variable. The value is `NULL` if the UDF was registered by a server component or plugin rather than by a `CREATE FUNCTION` statement.

- `UDF_USAGE_COUNT`

The current UDF usage count. This is used to tell whether statements currently are accessing the UDF.

The `user_defined_functions` table has these indexes:

- Primary key on (`UDF_NAME`)

`TRUNCATE TABLE` is not permitted for the `user_defined_functions` table.

## 26.13 Performance Schema Option and Variable Reference

**Table 26.4 Performance Schema Variable Reference**

Name	Cmd-Line	Option File	System Var	Status Var	Var Scope	Dynam
<code>performance_schema</code>	Yes	Yes	Yes		Global	No
<code>Performance_schema_accounts_lost</code>				Yes	Global	No
<code>performance_schema_accounts_size</code>	Yes	Yes	Yes		Global	No
<code>Performance_schema_cond_classes_lost</code>				Yes	Global	No
<code>Performance_schema_cond_instances_lost</code>				Yes	Global	No

Name	Cmd-Line	Option File	System Var	Status Var	Var Scope	Dy
<a href="#">performance-schema-consumer-events-stages-current</a>	Yes	Yes

performance_schema	Yes	Yes	Yes		Global	No

## 26.14 Performance Schema Command Options

Performance Schema parameters can be specified at server startup on the command line or in option files to configure Performance Schema instruments and consumers. Runtime configuration is also possible in many cases (see [Section 26.4, “Performance Schema Runtime Configuration”](#)), but startup configuration must be used when runtime configuration is too late to affect instruments that have already been initialized during the startup process.

Performance Schema consumers and instruments can be configured at startup using the following syntax. For additional details, see [Section 26.3, “Performance Schema Startup Configuration”](#).

- `--performance-schema-consumer-consumer_name=value`

Configure a Performance Schema consumer. Consumer names in the `setup_consumers` table use underscores, but for consumers set at startup, dashes and underscores within the name are equivalent. Options for configuring individual consumers are detailed later in this section.

- `--performance-schema-instrument=instrument_name=value`

Configure a Performance Schema instrument. The name may be given as a pattern to configure instruments that match the pattern.

The following items configure individual consumers:

- `--performance-schema-consumer-events-stages-current=value`

Configure the `events-stages-current` consumer.

- `--performance-schema-consumer-events-stages-history=value`

Configure the `events-stages-history` consumer.

- `--performance-schema-consumer-events-stages-history-long=value`

Configure the `events-stages-history-long` consumer.

- `--performance-schema-consumer-events-statements-current=value`

Configure the `events-statements-current` consumer.

- `--performance-schema-consumer-events-statements-history=value`

Configure the `events-statements-history` consumer.

- `--performance-schema-consumer-events-statements-history-long=value`

Configure the `events-statements-history-long` consumer.

- `--performance-schema-consumer-events-transactions-current=value`

Configure the Performance Schema `events-transactions-current` consumer.

- `--performance-schema-consumer-events-transactions-history=value`

Configure the Performance Schema `events-transactions-history` consumer.

- `--performance-schema-consumer-events-transactions-history-long=value`

Configure the Performance Schema `events-transactions-history-long` consumer.

- `--performance-schema-consumer-events-waits-current=value`

Configure the `events-waits-current` consumer.

- `--performance-schema-consumer-events-waits-history=value`

Configure the `events-waits-history` consumer.

- `--performance-schema-consumer-events-waits-history-long=value`

Configure the `events-waits-history-long` consumer.

- `--performance-schema-consumer-global-instrumentation=value`

Configure the `global-instrumentation` consumer.

- `--performance-schema-consumer-statements-digest=value`

Configure the `statements-digest` consumer.

- `--performance-schema-consumer-thread-instrumentation=value`

Configure the `thread-instrumentation` consumer.

## 26.15 Performance Schema System Variables

The Performance Schema implements several system variables that provide configuration information:

```
mysql> SHOW VARIABLES LIKE 'perf%';
```

Variable_name	Value
performance_schema	ON
performance_schema_accounts_size	-1
performance_schema_digests_size	10000
performance_schema_events_stages_history_long_size	10000
performance_schema_events_stages_history_size	10
performance_schema_events_statements_history_long_size	10000
performance_schema_events_statements_history_size	10
performance_schema_events_transactions_history_long_size	10000
performance_schema_events_transactions_history_size	10
performance_schema_events_waits_history_long_size	10000
performance_schema_events_waits_history_size	10
performance_schema_hosts_size	-1
performance_schema_max_cond_classes	80
performance_schema_max_cond_instances	-1
performance_schema_max_digest_length	1024
performance_schema_max_file_classes	50
performance_schema_max_file_handles	32768
performance_schema_max_file_instances	-1
performance_schema_max_index_stat	-1
performance_schema_max_memory_classes	320
performance_schema_max_metadata_locks	-1
performance_schema_max_mutex_classes	220
performance_schema_max_mutex_instances	-1
performance_schema_max_prepared_statements_instances	-1
performance_schema_max_program_instances	-1
performance_schema_max_rwlock_classes	40
performance_schema_max_rwlock_instances	-1
performance_schema_max_socket_classes	10
performance_schema_max_socket_instances	-1
performance_schema_max_sql_text_length	1024
performance_schema_max_stage_classes	150
performance_schema_max_statement_classes	192
performance_schema_max_statement_stack	10
performance_schema_max_table_handles	-1
performance_schema_max_table_instances	-1
performance_schema_max_table_lock_stat	-1
performance_schema_max_thread_classes	50
performance_schema_max_thread_instances	-1
performance_schema_session_connect_attrs_size	512
performance_schema_setup_actors_size	-1
performance_schema_setup_objects_size	-1
performance_schema_users_size	-1

Performance Schema system variables can be set at server startup on the command line or in option files, and many can be set at runtime. See [Section 26.13, “Performance Schema Option and Variable Reference”](#).

The Performance Schema automatically sizes the values of several of its parameters at server startup if they are not set explicitly. For more information, see [Section 26.3, “Performance Schema Startup Configuration”](#).

Performance Schema system variables have the following meanings:

- `performance_schema`

Command-Line Format	<code>--performance-schema[={OFF ON}]</code>
System Variable	<code>performance_schema</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Boolean
Default Value	<code>ON</code>

The value of this variable is `ON` or `OFF` to indicate whether the Performance Schema is enabled. By default, the value is `ON`. At server startup, you can specify this variable with no value or a value of `ON` or 1 to enable it, or with a value of `OFF` or 0 to disable it.

Even when the Performance Schema is disabled, it continues to populate the `global_variables`, `session_variables`, `global_status`, and `session_status` tables. This occurs as necessary to permit the results for the `SHOW VARIABLES` and `SHOW STATUS` statements to be drawn from those tables. The Performance Schema also populates some of the replication tables when disabled.

- `performance_schema_accounts_size`

Command-Line Format	<code>--performance-schema-accounts-size=#</code>
System Variable	<code>performance_schema_accounts_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Minimum Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)
Maximum Value	<code>1048576</code>

The number of rows in the `accounts` table. If this variable is 0, the Performance Schema does not maintain connection statistics in the `accounts` table or status variable information in the `status_by_account` table.

- `performance_schema_digests_size`

Command-Line Format	<code>--performance-schema-digests-size=#</code>
System Variable	<code>performance_schema_digests_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No

Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)
Minimum Value	-1
Maximum Value	1048576

The maximum number of rows in the `events_statements_summary_by_digest` table. If this maximum is exceeded such that a digest cannot be instrumented, the Performance Schema increments the `Performance_schema_digest_lost` status variable.

For more information about statement digesting, see [Section 26.10, “Performance Schema Statement Digests and Sampling”](#).

- `performance_schema_error_size`

Command-Line Format	<code>--performance-schema-error-size=#</code>
System Variable	<code>performance_schema_error_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	number of server error codes
Minimum Value	0
Maximum Value	1048576

The number of instrumented server error codes. The default value is the actual number of server error codes. Although the value can be set anywhere from 0 to its maximum, the intended use is to set it to either its default (to instrument all errors) or 0 (to instrument no errors).

Error information is aggregated in summary tables; see [Section 26.12.18.11, “Error Summary Tables”](#). If an error occurs that is not instrumented, information for the occurrence is aggregated to the `NULL` row in each summary table; that is, to the row with `ERROR_NUMBER=0`, `ERROR_NAME=NULL`, and `SQLSTATE=NULL`.

- `performance_schema_events_stages_history_long_size`

Command-Line Format	<code>--performance-schema-events-stages-history-long-size=#</code>
System Variable	<code>performance_schema_events_stages_history_long_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)

The number of rows in the `events_stages_history_long` table.

- `performance_schema_events_stages_history_size`

Command-Line Format	<code>--performance-schema-events-stages-history-size=#</code>
System Variable	<code>performance_schema_events_stages_history_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)

The number of rows per thread in the `events_stages_history` table.

- `performance_schema_events_statements_history_long_size`

Command-Line Format	<code>--performance-schema-events-statements-history-long-size=#</code>
System Variable	<code>performance_schema_events_statements_history_long_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)

The number of rows in the `events_statements_history_long` table.

- `performance_schema_events_statements_history_size`

Command-Line Format	<code>--performance-schema-events-statements-history-size=#</code>
System Variable	<code>performance_schema_events_statements_history_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)

The number of rows per thread in the `events_statements_history` table.

- `performance_schema_events_transactions_history_long_size`

Command-Line Format	<code>--performance-schema-events-transactions-history-long-size=#</code>
System Variable	<code>performance_schema_events_transactions_history_long_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer

Default Value	-1 (signifies autosizing; do not assign this literal value)
---------------	-------------------------------------------------------------

The number of rows in the `events_transactions_history_long` table.

- `performance_schema_events_transactions_history_size`

Command-Line Format	<code>--performance-schema-events-transactions-history-size=#</code>
System Variable	<code>performance_schema_events_transactions_history_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)

The number of rows per thread in the `events_transactions_history` table.

- `performance_schema_events_waits_history_long_size`

Command-Line Format	<code>--performance-schema-events-waits-history-long-size=#</code>
System Variable	<code>performance_schema_events_waits_history_long_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)

The number of rows in the `events_waits_history_long` table.

- `performance_schema_events_waits_history_size`

Command-Line Format	<code>--performance-schema-events-waits-history-size=#</code>
System Variable	<code>performance_schema_events_waits_history_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)

The number of rows per thread in the `events_waits_history` table.

- `performance_schema_hosts_size`

Command-Line Format	<code>--performance-schema-hosts-size=#</code>
System Variable	<code>performance_schema_hosts_size</code>
Scope	Global

## Performance Schema System Variables

Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autoscaling; do not assign this literal value)
Minimum Value	-1 (signifies autoscaling; do not assign this literal value)
Maximum Value	1048576

The number of rows in the [hosts](#) table. If this variable is 0, the Performance Schema does not maintain connection statistics in the [hosts](#) table or status variable information in the [status\\_by\\_host](#) table.

- [performance\\_schema\\_max\\_cond\\_classes](#)

Command-Line Format	<code>--performance-schema-max-cond-classes=#</code>
System Variable	<a href="#">performance_schema_max_cond_classes</a>
Scope	Global
Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value (≥ 8.0.13)	100
Default Value (≤ 8.0.12)	80
Minimum Value	0
Maximum Value (≥ 8.0.12)	1024
Maximum Value (8.0.11)	256

The maximum number of condition instruments. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

- [performance\\_schema\\_max\\_cond\\_instances](#)

Command-Line Format	<code>--performance-schema-max-cond-instances=#</code>
System Variable	<a href="#">performance_schema_max_cond_instances</a>
Scope	Global
Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autoscaling; do not assign this literal value)

The maximum number of instrumented condition objects. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

- [performance\\_schema\\_max\\_digest\\_length](#)

Command-Line Format	<code>--performance-schema-max-digest-length=#</code>
System Variable	<a href="#">performance_schema_max_digest_length</a>
Scope	Global

Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value	1024
Minimum Value	0
Maximum Value	1048576

The maximum number of bytes of memory reserved per statement for computation of normalized statement digest values in the Performance Schema. This variable is related to [max\\_digest\\_length](#); see the description of that variable in [Section 5.1.8, “Server System Variables”](#).

For more information about statement digesting, including considerations regarding memory use, see [Section 26.10, “Performance Schema Statement Digests and Sampling”](#).

- [performance\\_schema\\_max\\_digest\\_sample\\_age](#)

Command-Line Format	<code>--performance-schema-max-digest-sample-age=#</code>
System Variable	<a href="#">performance_schema_max_digest_sample_age</a>
Scope	Global
Dynamic	Yes
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value	60
Minimum Value	0
Maximum Value	1048576

This variable affects statement sampling for the [events\\_statements\\_summary\\_by\\_digest](#) table. When a new table row is inserted, the statement that produced the row digest value is stored as the current sample statement associated with the digest. Thereafter, when the server sees other statements with the same digest value, it determines whether to use the new statement to replace the current sample statement (that is, whether to resample). Resampling policy is based on the comparative wait times of the current sample statement and new statement and, optionally, the age of the current sample statement:

- Resampling based on wait times: If the new statement wait time has a wait time greater than that of the current sample statement, it becomes the current sample statement.
- Resampling based on age: If the [performance\\_schema\\_max\\_digest\\_sample\\_age](#) system variable has a value greater than zero and the current sample statement is more than that many seconds old, the current statement is considered “too old” and the new statement replaces it. This occurs even if the new statement wait time is less than that of the current sample statement.

For information about statement sampling, see [Section 26.10, “Performance Schema Statement Digests and Sampling”](#).

- [performance\\_schema\\_max\\_file\\_classes](#)

Command-Line Format	<code>--performance-schema-max-file-classes=#</code>
System Variable	<a href="#">performance_schema_max_file_classes</a>

Scope	Global
Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value	80
Minimum Value	0
Maximum Value (≥ 8.0.12)	1024
Maximum Value (8.0.11)	256

The maximum number of file instruments. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

- [performance\\_schema\\_max\\_file\\_handles](#)

Command-Line Format	<code>--performance-schema-max-file-handles=#</code>
System Variable	<a href="#">performance_schema_max_file_handles</a>
Scope	Global
Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value	32768

The maximum number of opened file objects. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

The value of [performance\\_schema\\_max\\_file\\_handles](#) should be greater than the value of [open\\_files\\_limit](#): [open\\_files\\_limit](#) affects the maximum number of open file handles the server can support and [performance\\_schema\\_max\\_file\\_handles](#) affects how many of these file handles can be instrumented.

- [performance\\_schema\\_max\\_file\\_instances](#)

Command-Line Format	<code>--performance-schema-max-file-instances=#</code>
System Variable	<a href="#">performance_schema_max_file_instances</a>
Scope	Global
Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autoscaling; do not assign this literal value)

The maximum number of instrumented file objects. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

- [performance\\_schema\\_max\\_index\\_stat](#)

Command-Line Format	<code>--performance-schema-max-index-stat=#</code>
System Variable	<a href="#">performance_schema_max_index_stat</a>

Scope	Global
Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)

The maximum number of indexes for which the Performance Schema maintains statistics. If this maximum is exceeded such that index statistics are lost, the Performance Schema increments the [Performance\\_schema\\_index\\_stat\\_lost](#) status variable. The default value is autosized using the value of [performance\\_schema\\_max\\_table\\_instances](#).

- [performance\\_schema\\_max\\_memory\\_classes](#)

Command-Line Format	<code>--performance-schema-max-memory-classes=#</code>
System Variable	<a href="#">performance_schema_max_memory_classes</a>
Scope	Global
Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value	450

The maximum number of memory instruments. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

- [performance\\_schema\\_max\\_metadata\\_locks](#)

Command-Line Format	<code>--performance-schema-max-metadata-locks=#</code>
System Variable	<a href="#">performance_schema_max_metadata_locks</a>
Scope	Global
Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autoscaling; do not assign this literal value)

The maximum number of metadata lock instruments. This value controls the size of the [metadata\\_locks](#) table. If this maximum is exceeded such that a metadata lock cannot be instrumented, the Performance Schema increments the [Performance\\_schema\\_metadata\\_lock\\_lost](#) status variable.

- [performance\\_schema\\_max\\_mutex\\_classes](#)

Command-Line Format	<code>--performance-schema-max-mutex-classes=#</code>
System Variable	<a href="#">performance_schema_max_mutex_classes</a>
Scope	Global
Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No

## Performance Schema System Variables

Type	Integer
Default Value (≥ 8.0.12)	300
Default Value (8.0.11)	250
Minimum Value	0
Maximum Value (≥ 8.0.12)	1024
Maximum Value (8.0.11)	256

The maximum number of mutex instruments. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_mutex_instances`

Command-Line Format	<code>--performance-schema-max-mutex-instances=#</code>
System Variable	<code>performance_schema_max_mutex_instances</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autoscaling; do not assign this literal value)

The maximum number of instrumented mutex objects. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_prepared_statements_instances`

Command-Line Format	<code>--performance-schema-max-prepared-statements-instances=#</code>
System Variable	<code>performance_schema_max_prepared_statements_instances</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autoscaling; do not assign this literal value)

The maximum number of rows in the `prepared_statements_instances` table. If this maximum is exceeded such that a prepared statement cannot be instrumented, the Performance Schema increments the `performance_schema_prepared_statements_lost` status variable. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

The default value of this variable is autosized based on the value of the `max_prepared_stmt_count` system variable.

- `performance_schema_max_rwlock_classes`

Command-Line Format	<code>--performance-schema-max-rwlock-classes=#</code>
System Variable	<code>performance_schema_max_rwlock_classes</code>
Scope	Global

Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value	60
Minimum Value	0
Maximum Value ( $\geq$ 8.0.12)	1024
Maximum Value (8.0.11)	256

The maximum number of rwlock instruments. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

- [performance\\_schema\\_max\\_program\\_instances](#)

Command-Line Format	<code>--performance-schema-max-program-instances=#</code>
System Variable	<a href="#">performance_schema_max_program_instances</a>
Scope	Global
Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autoscaling; do not assign this literal value)

The maximum number of stored programs for which the Performance Schema maintains statistics. If this maximum is exceeded, the Performance Schema increments the [Performance\\_schema\\_program\\_lost](#) status variable. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

- [performance\\_schema\\_max\\_rwlock\\_instances](#)

Command-Line Format	<code>--performance-schema-max-rwlock-instances=#</code>
System Variable	<a href="#">performance_schema_max_rwlock_instances</a>
Scope	Global
Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autoscaling; do not assign this literal value)

The maximum number of instrumented rwlock objects. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

- [performance\\_schema\\_max\\_socket\\_classes](#)

Command-Line Format	<code>--performance-schema-max-socket-classes=#</code>
System Variable	<a href="#">performance_schema_max_socket_classes</a>
Scope	Global
Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No

Type	Integer
Default Value	10
Minimum Value	0
Maximum Value (≥ 8.0.12)	1024
Maximum Value (8.0.11)	256

The maximum number of socket instruments. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_socket_instances`

Command-Line Format	<code>--performance-schema-max-socket-instances=#</code>
System Variable	<code>performance_schema_max_socket_instances</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autoscaling; do not assign this literal value)

The maximum number of instrumented socket objects. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_sql_text_length`

Command-Line Format	<code>--performance-schema-max-sql-text-length=#</code>
System Variable	<code>performance_schema_max_sql_text_length</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	1024
Minimum Value	0
Maximum Value	1048576

The maximum number of bytes used to store SQL statements. The value applies to storage required for these columns:

- The `SQL_TEXT` column of the `events_statements_current`, `events_statements_history`, and `events_statements_history_long` statement event tables.

- The `QUERY_SAMPLE_TEXT` column of the `events_statements_summary_by_digest` summary table.

Any bytes in excess of `performance_schema_max_sql_text_length` are discarded and do not appear in the column. Statements differing only after that many initial bytes are indistinguishable in the column.

Decreasing the `performance_schema_max_sql_text_length` value reduces memory use but causes more statements to become indistinguishable if they differ only at the end. Increasing the value increases memory use but permits longer statements to be distinguished.

- `performance_schema_max_stage_classes`

Command-Line Format	<code>--performance-schema-max-stage-classes=#</code>
System Variable	<code>performance_schema_max_stage_classes</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value ( $\geq 8.0.13$ )	175
Default Value ( $\leq 8.0.12$ )	150
Minimum Value	0
Maximum Value ( $\geq 8.0.12$ )	1024
Maximum Value (8.0.11)	256

The maximum number of stage instruments. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_statement_classes`

Command-Line Format	<code>--performance-schema-max-statement-classes=#</code>
System Variable	<code>performance_schema_max_statement_classes</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)

The maximum number of statement instruments. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

The default value is calculated at server build time based on the number of commands in the client/server protocol and the number of SQL statement types supported by the server.

This variable should not be changed, unless to set it to 0 to disable all statement instrumentation and save all memory associated with it. Setting the variable to nonzero values other than the default has no benefit; in particular, values larger than the default cause more memory to be allocated than is needed.

- `performance_schema_max_statement_stack`

Command-Line Format	<code>--performance-schema-max-statement-stack=#</code>
System Variable	<code>performance_schema_max_statement_stack</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	10

The maximum depth of nested stored program calls for which the Performance Schema maintains statistics. When this maximum is exceeded, the Performance Schema increments the `performance_schema_nested_statement_lost` status variable for each stored program statement executed.

- `performance_schema_max_table_handles`

Command-Line Format	<code>--performance-schema-max-table-handles=#</code>
System Variable	<code>performance_schema_max_table_handles</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autoscaling; do not assign this literal value)

The maximum number of opened table objects. This value controls the size of the `table_handles` table. If this maximum is exceeded such that a table handle cannot be instrumented, the Performance Schema increments the `performance_schema_table_handles_lost` status variable. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_table_instances`

Command-Line Format	<code>--performance-schema-max-table-instances=#</code>
System Variable	<code>performance_schema_max_table_instances</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autoscaling; do not assign this literal value)

The maximum number of instrumented table objects. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_table_lock_stat`

Command-Line Format	<code>--performance-schema-max-table-lock-stat=#</code>
---------------------	---------------------------------------------------------

System Variable	<code>performance_schema_max_table_lock_stat</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autosizing; do not assign this literal value)

The maximum number of tables for which the Performance Schema maintains lock statistics. If this maximum is exceeded such that table lock statistics are lost, the Performance Schema increments the `performance_schema_table_lock_stat_lost` status variable.

- `performance_schema_max_thread_classes`

Command-Line Format	<code>--performance-schema-max-thread-classes=#</code>
System Variable	<code>performance_schema_max_thread_classes</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>100</code>
Minimum Value	<code>0</code>
Maximum Value ( $\geq 8.0.12$ )	<code>1024</code>
Maximum Value (8.0.11)	<code>256</code>

The maximum number of thread instruments. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

- `performance_schema_max_thread_instances`

Command-Line Format	<code>--performance-schema-max-thread-instances=#</code>
System Variable	<code>performance_schema_max_thread_instances</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autoscaling; do not assign this literal value)

The maximum number of instrumented thread objects. The value controls the size of the `threads` table. If this maximum is exceeded such that a thread cannot be instrumented, the Performance Schema

increments the `Performance_schema_thread_instances_lost` status variable. For information about how to set and use this variable, see [Section 26.7, “Performance Schema Status Monitoring”](#).

The `max_connections` system variable affects how many threads can run in the server. `performance_schema_max_thread_instances` affects how many of these running threads can be instrumented.

The `variables_by_thread` and `status_by_thread` tables contain system and status variable information only about foreground threads. If not all threads are instrumented by the Performance Schema, this table will miss some rows. In this case, the `Performance_schema_thread_instances_lost` status variable will be greater than zero.

- `performance_schema_session_connect_attrs_size`

Command-Line Format	<code>--performance-schema-session-connect-attrs-size=#</code>
System Variable	<code>performance_schema_session_connect_attrs_size</code>
Scope	Global
Dynamic	No
<code>SET_VAR</code> Hint Applies	No
Type	Integer
Default Value	<code>-1</code> (signifies autosizing; do not assign this literal value)
Minimum Value	<code>-1</code>
Maximum Value	<code>1048576</code>

The amount of preallocated memory per thread reserved to hold connection attribute key-value pairs. If the aggregate size of connection attribute data sent by a client is larger than this amount, the Performance Schema truncates the attribute data, increments the `Performance_schema_session_connect_attrs_lost` status variable, and writes a message to the error log indicating that truncation occurred if the `log_error_verbosity` system variable is greater than 1. A `_truncated` attribute is also added to the session attributes with a value indicating how many bytes were lost, if the attribute buffer has sufficient space. This enables the Performance Schema to expose per-connection truncation information in the connection attribute tables. This information can be examined without having to check the error log.

The default value of `performance_schema_session_connect_attrs_size` is autosized at server startup. This value may be small, so if truncation occurs (`Performance_schema_session_connect_attrs_lost` becomes nonzero), you may wish to set `performance_schema_session_connect_attrs_size` explicitly to a larger value.

Although the maximum permitted `performance_schema_session_connect_attrs_size` value is 1MB, the effective maximum is 64KB because the server imposes a limit of 64KB on the aggregate size of connection attribute data it will accept. If a client attempts to send more than 64KB of attribute data, the server rejects the connection. For more information, see [Section 26.12.9, “Performance Schema Connection Attribute Tables”](#).

- `performance_schema_setup_actors_size`

Command-Line Format	<code>--performance-schema-setup-actors-size=#</code>
System Variable	<code>performance_schema_setup_actors_size</code>
Scope	Global

Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autoscaling; do not assign this literal value)

The number of rows in the [setup\\_actors](#) table.

- [performance\\_schema\\_setup\\_objects\\_size](#)

Command-Line Format	<code>--performance-schema-setup-objects-size=#</code>
System Variable	<a href="#">performance_schema_setup_objects_size</a>
Scope	Global
Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autoscaling; do not assign this literal value)

The number of rows in the [setup\\_objects](#) table.

- [performance\\_schema\\_show\\_processlist](#)

Command-Line Format	<code>--performance-schema-show-processlist[={OFF ON}]</code>
Introduced	8.0.22
System Variable	<a href="#">performance_schema_show_processlist</a>
Scope	Global
Dynamic	Yes
<a href="#">SET_VAR</a> Hint Applies	No
Type	Boolean
Default Value	<code>OFF</code>

The `SHOW PROCESSLIST` statement provides process information by collecting thread data from all active threads. The [performance\\_schema\\_show\\_processlist](#) variable determines which `SHOW PROCESSLIST` implementation to use:

- The default implementation iterates across active threads from within the thread manager while holding a global mutex. This has negative performance consequences, particularly on busy systems.
- The alternative `SHOW PROCESSLIST` implementation is based on the Performance Schema [processlist](#) table. This implementation queries active thread data from the Performance Schema rather than the thread manager and does not require a mutex.

To enable the alternative implementation, enable the [performance\\_schema\\_show\\_processlist](#) system variable. To ensure that the default and alternative implementations yield the same information, certain configuration requirements must be met; see [Section 26.12.19.6, “The processlist Table”](#).

- [performance\\_schema\\_users\\_size](#)

Command-Line Format	<code>--performance-schema-users-size=#</code>
---------------------	------------------------------------------------

System Variable	<a href="#">performance_schema_users_size</a>
Scope	Global
Dynamic	No
<a href="#">SET_VAR</a> Hint Applies	No
Type	Integer
Default Value	-1 (signifies autoscaling; do not assign this literal value)
Minimum Value	-1 (signifies autoscaling; do not assign this literal value)
Maximum Value	1048576

The number of rows in the [users](#) table. If this variable is 0, the Performance Schema does not maintain connection statistics in the [users](#) table or status variable information in the [status\\_by\\_user](#) table.

## 26.16 Performance Schema Status Variables

The Performance Schema implements several status variables that provide information about instrumentation that could not be loaded or created due to memory constraints:

```
mysql> SHOW STATUS LIKE 'perf%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| Performance_schema_accounts_lost | 0 |
| Performance_schema_cond_classes_lost | 0 |
| Performance_schema_cond_instances_lost | 0 |
| Performance_schema_file_classes_lost | 0 |
| Performance_schema_file_handles_lost | 0 |
| Performance_schema_file_instances_lost | 0 |
| Performance_schema_hosts_lost | 0 |
| Performance_schema_locker_lost | 0 |
| Performance_schema_mutex_classes_lost | 0 |
| Performance_schema_mutex_instances_lost | 0 |
| Performance_schema_rwlock_classes_lost | 0 |
| Performance_schema_rwlock_instances_lost | 0 |
| Performance_schema_socket_classes_lost | 0 |
| Performance_schema_socket_instances_lost | 0 |
| Performance_schema_stage_classes_lost | 0 |
| Performance_schema_statement_classes_lost | 0 |
| Performance_schema_table_handles_lost | 0 |
| Performance_schema_table_instances_lost | 0 |
| Performance_schema_thread_classes_lost | 0 |
| Performance_schema_thread_instances_lost | 0 |
| Performance_schema_users_lost | 0 |
+-----+-----+
```

For information on using these variables to check Performance Schema status, see [Section 26.7, “Performance Schema Status Monitoring”](#).

Performance Schema status variables have the following meanings:

- [Performance\\_schema\\_accounts\\_lost](#)

The number of times a row could not be added to the [accounts](#) table because it was full.

- [Performance\\_schema\\_cond\\_classes\\_lost](#)

How many condition instruments could not be loaded.

- [Performance\\_schema\\_cond\\_instances\\_lost](#)

How many condition instrument instances could not be created.

- `Performance_schema_digest_lost`

The number of digest instances that could not be instrumented in the `events_statements_summary_by_digest` table. This can be nonzero if the value of `performance_schema_digests_size` is too small.

- `Performance_schema_file_classes_lost`

How many file instruments could not be loaded.

- `Performance_schema_file_handles_lost`

How many file instrument instances could not be opened.

- `Performance_schema_file_instances_lost`

How many file instrument instances could not be created.

- `Performance_schema_hosts_lost`

The number of times a row could not be added to the `hosts` table because it was full.

- `Performance_schema_index_stat_lost`

The number of indexes for which statistics were lost. This can be nonzero if the value of `performance_schema_max_index_stat` is too small.

- `Performance_schema_locker_lost`

How many events are “lost” or not recorded, due to the following conditions:

- Events are recursive (for example, waiting for A caused a wait on B, which caused a wait on C).
- The depth of the nested events stack is greater than the limit imposed by the implementation.

Events recorded by the Performance Schema are not recursive, so this variable should always be 0.

- `Performance_schema_memory_classes_lost`

The number of times a memory instrument could not be loaded.

- `Performance_schema_metadata_lock_lost`

The number of metadata locks that could not be instrumented in the `metadata_locks` table. This can be nonzero if the value of `performance_schema_max_metadata_locks` is too small.

- `Performance_schema_mutex_classes_lost`

How many mutex instruments could not be loaded.

- `Performance_schema_mutex_instances_lost`

How many mutex instrument instances could not be created.

- `Performance_schema_nested_statement_lost`

The number of stored program statements for which statistics were lost. This can be nonzero if the value of `performance_schema_max_statement_stack` is too small.

- `Performance_schema_prepared_statements_lost`

The number of prepared statements that could not be instrumented in the `prepared_statements_instances` table. This can be nonzero if the value of `performance_schema_max_prepared_statements_instances` is too small.

- `Performance_schema_program_lost`

The number of stored programs for which statistics were lost. This can be nonzero if the value of `performance_schema_max_program_instances` is too small.

- `Performance_schema_rwlock_classes_lost`

How many rwlock instruments could not be loaded.

- `Performance_schema_rwlock_instances_lost`

How many rwlock instrument instances could not be created.

- `Performance_schema_session_connect_attrs_longest_seen`

In addition to the connection attribute size-limit check performed by the Performance Schema against the value of the `performance_schema_session_connect_attrs_size` system variable, the server performs a preliminary check, imposing a limit of 64KB on the aggregate size of connection attribute data it will accept. If a client attempts to send more than 64KB of attribute data, the server rejects the connection. Otherwise, the server considers the attribute buffer valid and tracks the size of the longest such buffer in the `Performance_schema_session_connect_attrs_longest_seen` status variable. If this value is larger than `performance_schema_session_connect_attrs_size`, DBAs may wish to increase the latter value, or, alternatively, investigate which clients are sending large amounts of attribute data.

For more information about connection attributes, see [Section 26.12.9, “Performance Schema Connection Attribute Tables”](#).

- `Performance_schema_session_connect_attrs_lost`

The number of connections for which connection attribute truncation has occurred. For a given connection, if the client sends connection attribute key-value pairs for which the aggregate size is larger than the reserved storage permitted by the value of the `performance_schema_session_connect_attrs_size` system variable, the Performance Schema truncates the attribute data and increments `Performance_schema_session_connect_attrs_lost`. If this value is nonzero, you may wish to set `performance_schema_session_connect_attrs_size` to a larger value.

For more information about connection attributes, see [Section 26.12.9, “Performance Schema Connection Attribute Tables”](#).

- `Performance_schema_socket_classes_lost`

How many socket instruments could not be loaded.

- `Performance_schema_socket_instances_lost`

How many socket instrument instances could not be created.

- `Performance_schema_stage_classes_lost`

How many stage instruments could not be loaded.

- `Performance_schema_statement_classes_lost`

How many statement instruments could not be loaded.

- `Performance_schema_table_handles_lost`

How many table instrument instances could not be opened. This can be nonzero if the value of `performance_schema_max_table_handles` is too small.

- `Performance_schema_table_instances_lost`

How many table instrument instances could not be created.

- `Performance_schema_table_lock_stat_lost`

The number of tables for which lock statistics were lost. This can be nonzero if the value of `performance_schema_max_table_lock_stat` is too small.

- `Performance_schema_thread_classes_lost`

How many thread instruments could not be loaded.

- `Performance_schema_thread_instances_lost`

The number of thread instances that could not be instrumented in the `threads` table. This can be nonzero if the value of `performance_schema_max_thread_instances` is too small.

- `Performance_schema_users_lost`

The number of times a row could not be added to the `users` table because it was full.

## 26.17 The Performance Schema Memory-Allocation Model

The Performance Schema uses this memory allocation model:

- May allocate memory at server startup
- May allocate additional memory during server operation
- Never free memory during server operation (although it might be recycled)
- Free all memory used at shutdown

The result is to relax memory constraints so that the Performance Schema can be used with less configuration, and to decrease the memory footprint so that consumption scales with server load. Memory used depends on the load actually seen, not the load estimated or explicitly configured for.

Several Performance Schema sizing parameters are autoscaled and need not be configured explicitly unless you want to establish an explicit limit on memory allocation:

```
performance_schema_accounts_size
```

```
performance_schema_hosts_size
performance_schema_max_cond_instances
performance_schema_max_file_instances
performance_schema_max_index_stat
performance_schema_max_metadata_locks
performance_schema_max_mutex_instances
performance_schema_max_prepared_statements_instances
performance_schema_max_program_instances
performance_schema_max_rwlock_instances
performance_schema_max_socket_instances
performance_schema_max_table_handles
performance_schema_max_table_instances
performance_schema_max_table_lock_stat
performance_schema_max_thread_instances
performance_schema_users_size
```

For an autoscaled parameter, configuration works like this:

- With the value set to -1 (the default), the parameter is autoscaled:
  - The corresponding internal buffer is empty initially and no memory is allocated.
  - As the Performance Schema collects data, memory is allocated in the corresponding buffer. The buffer size is unbounded, and may grow with the load.
- With the value set to 0:
  - The corresponding internal buffer is empty initially and no memory is allocated.
- With the value set to *N* > 0:
  - The corresponding internal buffer is empty initially and no memory is allocated.
  - As the Performance Schema collects data, memory is allocated in the corresponding buffer, until the buffer size reaches *N*.
  - Once the buffer size reaches *N*, no more memory is allocated. Data collected by the Performance Schema for this buffer is lost, and any corresponding “lost instance” counters are incremented.

To see how much memory the Performance Schema is using, check the instruments designed for that purpose. The Performance Schema allocates memory internally and associates each buffer with a dedicated instrument so that memory consumption can be traced to individual buffers. Instruments named with the prefix `memory/performance_schema/` expose how much memory is allocated for these internal buffers. The buffers are global to the server, so the instruments are displayed only in the `memory_summary_global_by_event_name` table, and not in other `memory_summary_by_XXX_by_event_name` tables.

This query shows the information associated with the memory instruments:

```
SELECT * FROM performance_schema.memory_summary_global_by_event_name
WHERE EVENT_NAME LIKE 'memory/performance_schema/%';
```

## 26.18 Performance Schema and Plugins

Removing a plugin with `UNINSTALL PLUGIN` does not affect information already collected for code in that plugin. Time spent executing the code while the plugin was loaded was still spent even if the plugin is unloaded later. The associated event information, including aggregate information, remains readable in `performance_schema` database tables. For additional information about the effect of plugin installation and removal, see [Section 26.7, “Performance Schema Status Monitoring”](#).

A plugin implementor who instruments plugin code should document its instrumentation characteristics to enable those who load the plugin to account for its requirements. For example, a third-party storage engine should include in its documentation how much memory the engine needs for mutex and other instruments.

## 26.19 Using the Performance Schema to Diagnose Problems

The Performance Schema is a tool to help a DBA do performance tuning by taking real measurements instead of “wild guesses.” This section demonstrates some ways to use the Performance Schema for this purpose. The discussion here relies on the use of event filtering, which is described in [Section 26.4.2, “Performance Schema Event Filtering”](#).

The following example provides one methodology that you can use to analyze a repeatable problem, such as investigating a performance bottleneck. To begin, you should have a repeatable use case where performance is deemed “too slow” and needs optimization, and you should enable all instrumentation (no pre-filtering at all).

1. Run the use case.
2. Using the Performance Schema tables, analyze the root cause of the performance problem. This analysis will rely heavily on post-filtering.
3. For problem areas that are ruled out, disable the corresponding instruments. For example, if analysis shows that the issue is not related to file I/O in a particular storage engine, disable the file I/O instruments for that engine. Then truncate the history and summary tables to remove previously collected events.
4. Repeat the process at step 1.

At each iteration, the Performance Schema output, particularly the `events_waits_history_long` table, will contain less and less “noise” caused by nonsignificant instruments, and given that this table has a fixed size, will contain more and more data relevant to the analysis of the problem at hand.

At each iteration, investigation should lead closer and closer to the root cause of the problem, as the “signal/noise” ratio will improve, making analysis easier.

5. Once a root cause of performance bottleneck is identified, take the appropriate corrective action, such as:
  - Tune the server parameters (cache sizes, memory, and so forth).
  - Tune a query by writing it differently,
  - Tune the database schema (tables, indexes, and so forth).
  - Tune the code (this applies to storage engine or server developers only).
6. Start again at step 1, to see the effects of the changes on performance.

The `mutex_instances.LOCKED_BY_THREAD_ID` and `rwlock_instances.WRITE_LOCKED_BY_THREAD_ID` columns are extremely important for investigating performance bottlenecks or deadlocks. This is made possible by Performance Schema instrumentation as follows:

1. Suppose that thread 1 is stuck waiting for a mutex.
2. You can determine what the thread is waiting for:

```
SELECT * FROM performance_schema.events_waits_current
WHERE THREAD_ID = thread_1;
```

Say the query result identifies that the thread is waiting for mutex A, found in `events_waits_current.OBJECT_INSTANCE_BEGIN`.

3. You can determine which thread is holding mutex A:

```
SELECT * FROM performance_schema.mutex_instances
WHERE OBJECT_INSTANCE_BEGIN = mutex_A;
```

Say the query result identifies that it is thread 2 holding mutex A, as found in `mutex_instances.LOCKED_BY_THREAD_ID`.

4. You can see what thread 2 is doing:

```
SELECT * FROM performance_schema.events_waits_current
WHERE THREAD_ID = thread_2;
```

## 26.19.1 Query Profiling Using Performance Schema

The following example demonstrates how to use Performance Schema statement events and stage events to retrieve data comparable to profiling information provided by `SHOW PROFILES` and `SHOW PROFILE` statements.

The `setup_actors` table can be used to limit the collection of historical events by host, user, or account to reduce runtime overhead and the amount of data collected in history tables. The first step of the example shows how to limit collection of historical events to a specific user.

Performance Schema displays event timer information in picoseconds (trillionths of a second) to normalize timing data to a standard unit. In the following example, `TIMER_WAIT` values are divided by 1000000000000 to show data in units of seconds. Values are also truncated to 6 decimal places to display data in the same format as `SHOW PROFILES` and `SHOW PROFILE` statements.

1. Limit the collection of historical events to the user that will run the query. By default, `setup_actors` is configured to allow monitoring and historical event collection for all foreground threads:

```
mysql> SELECT * FROM performance_schema.setup_actors;
+-----+-----+-----+-----+-----+
| HOST | USER | ROLE | ENABLED | HISTORY |
+-----+-----+-----+-----+-----+
| % | % | % | YES | YES |
+-----+-----+-----+-----+-----+
```

Update the default row in the `setup_actors` table to disable historical event collection and monitoring for all foreground threads, and insert a new row that enables monitoring and historical event collection for the user that will run the query:

```
mysql> UPDATE performance_schema.setup_actors
 SET ENABLED = 'NO', HISTORY = 'NO'
 WHERE HOST = '%' AND USER = '%';

mysql> INSERT INTO performance_schema.setup_actors
 (HOST,USER,ROLE,ENABLED,HISTORY)
 VALUES('localhost','test_user','%','YES','YES');
```

Data in the `setup_actors` table should now appear similar to the following:

```
mysql> SELECT * FROM performance_schema.setup_actors;
+-----+-----+-----+-----+-----+
| HOST | USER | ROLE | ENABLED | HISTORY |
+-----+-----+-----+-----+-----+
```

HOST	USER	ROLE	ENABLED	HISTORY
%	%	%	NO	NO
localhost	test_user	%	YES	YES

2. Ensure that statement and stage instrumentation is enabled by updating the `setup_instruments` table. Some instruments may already be enabled by default.

```
mysql> UPDATE performance_schema.setup_instruments
 SET ENABLED = 'YES', TIMED = 'YES'
 WHERE NAME LIKE '%statement/%';

mysql> UPDATE performance_schema.setup_instruments
 SET ENABLED = 'YES', TIMED = 'YES'
 WHERE NAME LIKE '%stage/%';
```

3. Ensure that `events_statements_*` and `events_stages_*` consumers are enabled. Some consumers may already be enabled by default.

```
mysql> UPDATE performance_schema.setup_consumers
 SET ENABLED = 'YES'
 WHERE NAME LIKE '%events_statements_%';

mysql> UPDATE performance_schema.setup_consumers
 SET ENABLED = 'YES'
 WHERE NAME LIKE '%events_stages_%';
```

4. Under the user account you are monitoring, run the statement that you want to profile. For example:

```
mysql> SELECT * FROM employees.employees WHERE emp_no = 10001;

+-----+-----+-----+-----+-----+-----+
| emp_no | birth_date | first_name | last_name | gender | hire_date |
+-----+-----+-----+-----+-----+-----+
| 10001 | 1953-09-02 | Georgi | Facello | M | 1986-06-26 |
+-----+-----+-----+-----+-----+-----+
```

5. Identify the `EVENT_ID` of the statement by querying the `events_statements_history_long` table. This step is similar to running `SHOW PROFILES` to identify the `Query_ID`. The following query produces output similar to `SHOW PROFILES`:

```
mysql> SELECT EVENT_ID, TRUNCATE(TIMER_WAIT/1000000000000,6) as Duration, SQL_TEXT
 FROM performance_schema.events_statements_history_long WHERE SQL_TEXT like '%10001%';

+-----+-----+-----+
| event_id | duration | sql_text |
+-----+-----+-----+
| 31 | 0.028310 | SELECT * FROM employees.employees WHERE emp_no = 10001 |
+-----+-----+-----+
```

6. Query the `events_stages_history_long` table to retrieve the statement's stage events. Stages are linked to statements using event nesting. Each stage event record has a `NESTING_EVENT_ID` column that contains the `EVENT_ID` of the parent statement.

```
mysql> SELECT event_name AS Stage, TRUNCATE(TIMER_WAIT/1000000000000,6) AS Duration
 FROM performance_schema.events_stages_history_long WHERE NESTING_EVENT_ID=31;

+-----+-----+
| Stage | Duration |
+-----+-----+
| stage/sql/starting | 0.000080 |
| stage/sql/checking permissions | 0.000005 |
| stage/sql/Opening tables | 0.027759 |
| stage/sql/init | 0.000052 |
| stage/sql/System lock | 0.000009 |
| stage/sql/optimizing | 0.000006 |
| stage/sql/statistics | 0.000082 |
+-----+-----+
```

stage/sql/preparing	0.000008
stage/sql/executing	0.000000
stage/sql/Sending data	0.000017
stage/sql/end	0.000001
stage/sql/query end	0.000004
stage/sql/closing tables	0.000006
stage/sql/freeing items	0.000272
stage/sql/cleaning up	0.000001

## 26.19.2 Obtaining Parent Event Information

The `data_locks` table shows data locks held and requested. Rows of this table have a `THREAD_ID` column indicating the thread ID of the session that owns the lock, and an `EVENT_ID` column indicating the Performance Schema event that caused the lock. Tuples of (`THREAD_ID`, `EVENT_ID`) values implicitly identify a parent event in other Performance Schema tables:

- The parent wait event in the `events_waits_xxx` tables
- The parent stage event in the `events_stages_xxx` tables
- The parent statement event in the `events_statements_xxx` tables
- The parent transaction event in the `events_transactions_current` table

To obtain details about the parent event, join the `THREAD_ID` and `EVENT_ID` columns with the columns of like name in the appropriate parent event table. The relation is based on a nested set data model, so the join has several clauses. Given parent and child tables represented by `parent` and `child`, respectively, the join looks like this:

```
WHERE
 parent.THREAD_ID = child.THREAD_ID /* 1 */
 AND parent.EVENT_ID < child.EVENT_ID /* 2 */
 AND (
 child.EVENT_ID <= parent.END_EVENT_ID /* 3a */
 OR parent.END_EVENT_ID IS NULL /* 3b */
)
```

The conditions for the join are:

1. The parent and child events are in the same thread.
2. The child event begins after the parent event, so its `EVENT_ID` value is greater than that of the parent.
3. The parent event has either completed or is still running.

To find lock information, `data_locks` is the table containing child events.

The `data_locks` table shows only existing locks, so these considerations apply regarding which table contains the parent event:

- For transactions, the only choice is `events_transactions_current`. If a transaction is completed, it may be in the transaction history tables, but the locks are gone already.
- For statements, it all depends on whether the statement that took a lock is a statement in a transaction that has already completed (use `events_statements_history`) or the statement is still running (use `events_statements_current`).
- For stages, the logic is similar to that for statements; use `events_stages_history` or `events_stages_current`.

- For waits, the logic is similar to that for statements; use `events_waits_history` or `events_waits_current`. However, so many waits are recorded that the wait that caused a lock is most likely gone from the history tables already.

Wait, stage, and statement events disappear quickly from the history. If a statement that executed a long time ago took a lock but is in a still-open transaction, it might not be possible to find the statement, but it is possible to find the transaction.

This is why the nested set data model works better for locating parent events. Following links in a parent/child relationship (data lock -> parent wait -> parent stage -> parent transaction) does not work well when intermediate nodes are already gone from the history tables.

The following scenario illustrates how to find the parent transaction of a statement in which a lock was taken:

Session A:

```
[1] START TRANSACTION;
[2] SELECT * FROM t1 WHERE pk = 1;
[3] SELECT 'Hello, world';
```

Session B:

```
SELECT ...
FROM performance_schema.events_transactions_current AS parent
 INNER JOIN performance_schema.data_locks AS child
WHERE
 parent.THREAD_ID = child.THREAD_ID
 AND parent.EVENT_ID < child.EVENT_ID
 AND (
 child.EVENT_ID <= parent.END_EVENT_ID
 OR parent.END_EVENT_ID IS NULL
);
```

The query for session B should show statement [2] as owning a data lock on the record with `pk=1`.

If session A executes more statements, [2] fades out of the history table.

The query should show the transaction that started in [1], regardless of how many statements, stages, or waits were executed.

To see more data, you can also use the `events_xxx_history_long` tables, except for transactions, assuming no other query runs in the server (so that history is preserved).

## 26.20 Restrictions on Performance Schema

The Performance Schema avoids using mutexes to collect or produce data, so there are no guarantees of consistency and results can sometimes be incorrect. Event values in `performance_schema` tables are nondeterministic and nonrepeatable.

If you save event information in another table, you should not assume that the original events will still be available later. For example, if you select events from a `performance_schema` table into a temporary table, intending to join that table with the original table later, there might be no matches.

`mysqldump` and `BACKUP DATABASE` ignore tables in the `performance_schema` database.

Tables in the `performance_schema` database cannot be locked with `LOCK TABLES`, except the `setup_xxx` tables.

Tables in the `performance_schema` database cannot be indexed.

Tables in the `performance_schema` database are not replicated.

The types of timers might vary per platform. The `performance_timers` table shows which event timers are available. If the values in this table for a given timer name are `NULL`, that timer is not supported on your platform.

Instruments that apply to storage engines might not be implemented for all storage engines. Instrumentation of each third-party engine is the responsibility of the engine maintainer.

27.4.3 sys Schema Views .....	4885
27.4.4 sys Schema Stored Procedures .....	4927
27.4.5 sys Schema Stored Functions .....	4946

MySQL 8.0 includes the `sys` schema, a set of objects that helps DBAs and developers interpret data collected by the Performance Schema. `sys` schema objects can be used for typical tuning and diagnosis use cases. Objects in this schema include:

- Views that summarize Performance Schema data into more easily understandable form.
- Stored procedures that perform operations such as Performance Schema configuration and generating diagnostic reports.
- Stored functions that query Performance Schema configuration and provide formatting services.

For new installations, the `sys` schema is installed by default during data directory initialization if you use `mysqld` with the `--initialize` or `--initialize-insecure` option. If this is not desired, you can drop the `sys` schema manually after initialization if it is unneeded.

The MySQL upgrade procedure produces an error if a `sys` schema exists but has no `version` view, on the assumption that absence of this view indicates a user-created `sys` schema. To upgrade in this case, remove or rename the existing `sys` schema first.

`sys` schema objects have a `DEFINER` of `'mysql.sys'@'localhost'`. Use of the dedicated `mysql.sys` account avoids problems that occur if a DBA renames or removes the `root` account.

### 27.1 Prerequisites for Using the sys Schema

Before using the `sys` schema, the prerequisites described in this section must be satisfied.

Because the `sys` schema provides an alternative means of accessing the Performance Schema, the Performance Schema must be enabled for the `sys` schema to work. See [Section 26.3, “Performance Schema Startup Configuration”](#).

For full access to the `sys` schema, a user must have these privileges:

- `SELECT` on all `sys` tables and views
- `EXECUTE` on all `sys` stored procedures and functions
- `INSERT` and `UPDATE` for the `sys_config` table, if changes are to be made to it
- Additional privileges for certain `sys` schema stored procedures and functions, as noted in their descriptions (for example, the `ps_setup_save()` procedure)

It is also necessary to have privileges for the objects underlying the `sys` schema objects:

- `SELECT` on any Performance Schema tables accessed by `sys` schema objects, and `UPDATE` for any tables to be updated using `sys` schema objects
- `PROCESS` for the `INFORMATION_SCHEMA INNODB_BUFFER_PAGE` table

Certain Performance Schema instruments and consumers must be enabled and (for instruments) timed to take full advantage of `sys` schema capabilities:

- All `wait` instruments
- All `stage` instruments
- All `statement` instruments
- `xxx_current` and `xxx_history_long` consumers for all events

You can use the `sys` schema itself to enable all of the additional instruments and consumers:

```
CALL sys.ps_setup_enable_instrument('wait');
CALL sys.ps_setup_enable_instrument('stage');
CALL sys.ps_setup_enable_instrument('statement');
CALL sys.ps_setup_enable_consumer('current');
CALL sys.ps_setup_enable_consumer('history_long');
```

#### Note

For many uses of the `sys` schema, the default Performance Schema is sufficient for data collection. Enabling all the instruments and consumers just mentioned has a performance impact, so it is preferable to enable only the additional configuration you need. Also, remember that if you enable additional configuration, you can easily restore the default configuration like this:

```
CALL sys.ps_setup_reset_to_default(TRUE);
```

## 27.2 Using the sys Schema

You can make the `sys` schema the default schema so that references to its objects need not be qualified with the schema name:

```
mysql> USE sys;
Database changed
mysql> SELECT * FROM version;
+-----+-----+
| sys_version | mysql_version |
+-----+-----+
| 2.0.0 | 8.0.13-debug |
+-----+-----+
```

(The `version` view shows the `sys` schema and MySQL server versions.)

To access `sys` schema objects while a different schema is the default (or simply to be explicit), qualify object references with the schema name:

```
mysql> SELECT * FROM sys.version;
+-----+-----+
| sys_version | mysql_version |
+-----+-----+
| 2.0.0 | 8.0.13-debug |
+-----+-----+
```

The `sys` schema contains many views that summarize Performance Schema tables in various ways. Most of these views come in pairs, such that one member of the pair has the same name as the other member, plus a `x$` prefix. For example, the `host_summary_by_file_io` view summarizes file I/O grouped by host and displays latencies converted from picoseconds to more readable values (with units);

```
mysql> SELECT * FROM sys.host_summary_by_file_io;
```

host	ios	io_latency
localhost	67570	5.38 s
background	3468	4.18 s

The `x$host_summary_by_file_io` view summarizes the same data but displays unformatted picosecond latencies:

```
mysql> SELECT * FROM sys.x$host_summary_by_file_io;
```

host	ios	io_latency
localhost	67574	5380678125144
background	3474	4758696829416

The view without the `x$` prefix is intended to provide output that is more user friendly and easier for humans to read. The view with the `x$` prefix that displays the same values in raw form is intended more for use with other tools that perform their own processing on the data. For additional information about the differences between non-`x$` and `x$` views, see [Section 27.4.3, “sys Schema Views”](#).

To examine `sys` schema object definitions, use the appropriate `SHOW` statement or `INFORMATION_SCHEMA` query. For example, to examine the definitions of the `session` view and `format_bytes()` function, use these statements:

```
mysql> SHOW CREATE VIEW sys.session;
mysql> SHOW CREATE FUNCTION sys.format_bytes;
```

However, those statements display the definitions in relatively unformatted form. To view object definitions with more readable formatting, access the individual `.sql` files found under the `scripts/sys_schema` in MySQL source distributions. Prior to MySQL 8.0.18, the sources are maintained in a separate distribution available from the `sys` schema development website at <https://github.com/mysql/mysql-sys>.

Neither `mysqldump` nor `mysqlpump` dump the `sys` schema by default. To generate a dump file, name the `sys` schema explicitly on the command line using either of these commands:

```
mysqldump --databases --routines sys > sys_dump.sql
mysqlpump sys > sys_dump.sql
```

To reinstall the schema from the dump file, use this command:

```
mysql < sys_dump.sql
```

## 27.3 sys Schema Progress Reporting

The following `sys` schema views provide progress reporting for long-running transactions:

```
processlist
session
x$processlist
x$session
```

Assuming that the required instruments and consumers are enabled, the `progress` column of these views shows the percentage of work completed for stages that support progress reporting.

Stage progress reporting requires that the `events_stages_current` consumer be enabled, as well as the instruments for which progress information is desired. Instruments for these stages currently support progress reporting:

```
stage/sql/Copying to tmp table
stage/innodb/alter table (end)
stage/innodb/alter table (flush)
stage/innodb/alter table (insert)
stage/innodb/alter table (log apply index)
stage/innodb/alter table (log apply table)
stage/innodb/alter table (merge sort)
stage/innodb/alter table (read PK and internal sort)
stage/innodb/buffer pool load
```

For stages that do not support estimated and completed work reporting, or if the required instruments or consumers are not enabled, the `progress` column is `NULL`.

## 27.4 sys Schema Object Reference

The `sys` schema includes tables and triggers, views, and stored procedures and functions. The following sections provide details for each of these objects.

### 27.4.1 sys Schema Object Index

The following tables list `sys` schema objects and provide a short description of each one.

**Table 27.1 sys Schema Tables and Triggers**

Table or Trigger Name	Description
<code>sys_config</code>	<code>sys</code> schema configuration options
<code>sys_config_insert_set_user</code>	<code>sys_config</code> insert trigger
<code>sys_config_update_set_user</code>	<code>sys_config</code> update trigger

**Table 27.2 sys Schema Views**

View Name	Description
<code>host_summary, x\$host_summary</code>	Statement activity, file I/O, and connections, grouped by host
<code>host_summary_by_file_io, x\$host_summary_by_file_io</code>	File I/O, grouped by host
<code>host_summary_by_file_io_type, x\$host_summary_by_file_io_type</code>	File I/O, grouped by host and event type
<code>host_summary_by_stages, x\$host_summary_by_stages</code>	Statement stages, grouped by host
<code>host_summary_by_statement_latency, x\$host_summary_by_statement_latency</code>	Statement statistics, grouped by host
<code>host_summary_by_statement_type, x\$host_summary_by_statement_type</code>	Statements executed, grouped by host and statement
<code>innodb_buffer_stats_by_schema, x\$innodb_buffer_stats_by_schema</code>	InnoDB buffer information, grouped by schema
<code>innodb_buffer_stats_by_table, x\$innodb_buffer_stats_by_table</code>	InnoDB buffer information, grouped by schema and table
<code>innodb_lock_waits, x\$innodb_lock_waits</code>	InnoDB lock information

View Name	Description
<code>io_by_thread_by_latency, x \$io_by_thread_by_latency</code>	I/O consumers, grouped by thread
<code>io_global_by_file_by_bytes, x \$io_global_by_file_by_bytes</code>	Global I/O consumers, grouped by file and bytes
<code>io_global_by_file_by_latency, x \$io_global_by_file_by_latency</code>	Global I/O consumers, grouped by file and latency
<code>io_global_by_wait_by_bytes, x \$io_global_by_wait_by_bytes</code>	Global I/O consumers, grouped by bytes
<code>io_global_by_wait_by_latency, x \$io_global_by_wait_by_latency</code>	Global I/O consumers, grouped by latency
<code>latest_file_io, x\$latest_file_io</code>	Most recent I/O, grouped by file and thread
<code>memory_by_host_by_current_bytes, x \$memory_by_host_by_current_bytes</code>	Memory use, grouped by host
<code>memory_by_thread_by_current_bytes, x \$memory_by_thread_by_current_bytes</code>	Memory use, grouped by thread
<code>memory_by_user_by_current_bytes, x \$memory_by_user_by_current_bytes</code>	Memory use, grouped by user
<code>memory_global_by_current_bytes, x \$memory_global_by_current_bytes</code>	Memory use, grouped by allocation type
<code>memory_global_total, x\$memory_global_total</code>	Total memory use
<code>metrics</code>	Server metrics
<code>processlist, x\$processlist</code>	Processlist information
<code>ps_check_lost_instrumentation</code>	Variables that have lost instruments
<code>schema_auto_increment_columns</code>	<a href="#">AUTO_INCREMENT</a> column information
<code>schema_index_statistics, x \$schema_index_statistics</code>	Index statistics
<code>schema_object_overview</code>	Types of objects within each schema
<code>schema_redundant_indexes</code>	Duplicate or redundant indexes
<code>schema_table_lock_waits, x \$schema_table_lock_waits</code>	Sessions waiting for metadata locks
<code>schema_table_statistics, x \$schema_table_statistics</code>	Table statistics
<code>schema_table_statistics_with_buffer, x \$schema_table_statistics_with_buffer</code>	Table statistics, including <a href="#">InnoDB</a> buffer pool statistics
<code>schema_tables_with_full_table_scans, x \$schema_tables_with_full_table_scans</code>	Tables being accessed with full scans
<code>schema_unused_indexes</code>	Indexes not in active use
<code>session, x\$session</code>	Processlist information for user sessions
<code>session_ssl_status</code>	Connection SSL information
<code>statement_analysis, x\$statement_analysis</code>	Statement aggregate statistics

View Name	Description
<code>statements_with_errors_or_warnings, x</code> <code>\$statements_with_errors_or_warnings</code>	Statements that have produced errors or warnings
<code>statements_with_full_table_scans, x</code> <code>\$statements_with_full_table_scans</code>	Statements that have done full table scans
<code>statements_with_runtimes_in_95th_percentile, x</code> <code>\$statements_with_runtimes_in_95th_percentile</code>	Statements with highest average runtime
<code>statements_with_sorting, x</code> <code>\$statements_with_sorting</code>	Statements that performed sorts
<code>statements_with_temp_tables, x</code> <code>\$statements_with_temp_tables</code>	Statements that used temporary tables
<code>user_summary, x</code> <code>\$user_summary</code>	User statement and connection activity
<code>user_summary_by_file_io, x</code> <code>\$user_summary_by_file_io</code>	File I/O, grouped by user
<code>user_summary_by_file_io_type, x</code> <code>\$user_summary_by_file_io_type</code>	File I/O, grouped by user and event
<code>user_summary_by_stages, x</code> <code>\$user_summary_by_stages</code>	Stage events, grouped by user
<code>user_summary_by_statement_latency, x</code> <code>\$user_summary_by_statement_latency</code>	Statement statistics, grouped by user
<code>user_summary_by_statement_type, x</code> <code>\$user_summary_by_statement_type</code>	Statements executed, grouped by user and statement
<code>version</code>	Current <code>sys</code> schema and MySQL server versions
<code>wait_classes_global_by_avg_latency, x</code> <code>\$wait_classes_global_by_avg_latency</code>	Wait class average latency, grouped by event class
<code>wait_classes_global_by_latency, x</code> <code>\$wait_classes_global_by_latency</code>	Wait class total latency, grouped by event class
<code>waits_by_host_by_latency, x</code> <code>\$waits_by_host_by_latency</code>	Wait events, grouped by host and event
<code>waits_by_user_by_latency, x</code> <code>\$waits_by_user_by_latency</code>	Wait events, grouped by user and event
<code>waits_global_by_latency, x</code> <code>\$waits_global_by_latency</code>	Wait events, grouped by event
<code>x\$ps_digest_95th_percentile_by_avg_us</code>	Helper view for 95th-percentile views
<code>x\$ps_digest_avg_latency_distribution</code>	Helper view for 95th-percentile views
<code>x\$ps_schema_table_statistics_io</code>	Helper view for table-statistics views
<code>x\$schema_flattened_keys</code>	Helper view for <code>schema_redundant_indexes</code>

Table 27.3 sys Schema Stored Procedures

Procedure Name	Description
<code>create_synonym_db()</code>	Create synonym for schema
<code>diagnostics()</code>	Collect system diagnostic information

Procedure Name	Description
<code>execute_prepared_stmt()</code>	Execute prepared statement
<code>ps_setup_disable_background_threads()</code>	Disable background thread instrumentation
<code>ps_setup_disable_consumer()</code>	Disable consumers
<code>ps_setup_disable_instrument()</code>	Disable instruments
<code>ps_setup_disable_thread()</code>	Disable instrumentation for thread
<code>ps_setup_enable_background_threads()</code>	Enable background thread instrumentation
<code>ps_setup_enable_consumer()</code>	Enable consumers
<code>ps_setup_enable_instrument()</code>	Enable instruments
<code>ps_setup_enable_thread()</code>	Enable instrumentation for thread
<code>ps_setup_reload_saved()</code>	Reload saved Performance Schema configuration
<code>ps_setup_reset_to_default()</code>	Reset saved Performance Schema configuration
<code>ps_setup_save()</code>	Save Performance Schema configuration
<code>ps_setup_show_disabled()</code>	Display disabled Performance Schema configuration
<code>ps_setup_show_disabled_consumers()</code>	Display disabled Performance Schema consumers
<code>ps_setup_show_disabled_instruments()</code>	Display disabled Performance Schema instruments
<code>ps_setup_show_enabled()</code>	Display enabled Performance Schema configuration
<code>ps_setup_show_enabled_consumers()</code>	Display enabled Performance Schema consumers
<code>ps_setup_show_enabled_instruments()</code>	Display enabled Performance Schema instruments
<code>ps_statement_avg_latency_histogram()</code>	Display statement latency histogram
<code>ps_trace_statement_digest()</code>	Trace Performance Schema instrumentation for digest
<code>ps_trace_thread()</code>	Dump Performance Schema data for thread
<code>ps_truncate_all_tables()</code>	Truncate Performance Schema summary tables
<code>statement_performance_analyzer()</code>	Report of statements running on server
<code>table_exists()</code>	Whether a table exists

Table 27.4 sys Schema Stored Functions

Function Name	Description
<code>extract_schema_from_file_name()</code>	Extract schema name from file path name
<code>extract_table_from_file_name()</code>	Extract table name from file path name

Function Name	Description
<code>format_bytes()</code>	Convert byte count to value with units
<code>format_path()</code>	Replace data and temp-file directories in path name with symbolic values
<code>format_statement()</code>	Truncate long statement to fixed length
<code>format_time()</code>	Convert picoseconds value to value with units
<code>list_add()</code>	Add item to list
<code>list_drop()</code>	Remove item from list
<code>ps_is_account_enabled()</code>	Check whether account instrumentation is enabled
<code>ps_is_consumer_enabled()</code>	Check whether consumer is enabled
<code>ps_is_instrument_default_enabled()</code>	Check whether instrument is enabled
<code>ps_is_instrument_default_timed()</code>	Check whether instrument is timed
<code>ps_is_thread_instrumented()</code>	Check whether thread is instrumented
<code>ps_thread_account()</code>	Return account for thread ID
<code>ps_thread_id()</code>	Return thread ID for connection ID
<code>ps_thread_stack()</code>	Return event information for thread ID
<code>ps_thread_trx_info()</code>	Return transaction information for thread ID
<code>quote_identifier()</code>	Return string as quoted identifier
<code>sys_get_config()</code>	Return <code>sys</code> schema configuration option
<code>version_major()</code>	MySQL server major version number
<code>version_minor()</code>	MySQL server minor version number
<code>version_patch()</code>	MySQL server patch release version number

## 27.4.2 sys Schema Tables and Triggers

The following sections describe `sys` schema tables and triggers.

### 27.4.2.1 The `sys_config` Table

This table contains `sys` schema configuration options, one row per option. Configuration changes made by updating this table persist across client sessions and server restarts.

The `sys_config` table has these columns:

- `variable`

The configuration option name.

- `value`

The configuration option value.

- `set_time`

The timestamp of the most recent modification to the row.

- `set_by`

The account that made the most recent modification to the row. The value is `NULL` if the row has not been changed since the `sys` schema was installed.

As an efficiency measure to minimize the number of direct reads from the `sys_config` table, `sys` schema functions that use a value from this table check for a user-defined variable with a corresponding name, which is the user-defined variable having the same name plus a `@sys.` prefix. (For example, the variable corresponding to the `diagnostics.include_raw` option is `@sys.diagnostics.include_raw`.) If the user-defined variable exists in the current session and is non-`NULL`, the function uses its value in preference to the value in the `sys_config` table. Otherwise, the function reads and uses the value from the table. In the latter case, the calling function conventionally also sets the corresponding user-defined variable to the table value so that further references to the configuration option within the same session use the variable and need not read the table again.

For example, the `statement_truncate_len` option controls the maximum length of statements returned by the `format_statement()` function. The default is 64. To temporarily change the value to 32 for your current session, set the corresponding `@sys.statement_truncate_len` user-defined variable:

```
mysql> SET @stmt = 'SELECT variable, value, set_time, set_by FROM sys_config';
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
| SELECT variable, value, set_time, set_by FROM sys_config |
+-----+
mysql> SET @sys.statement_truncate_len = 32;
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
| SELECT variabl ... ROM sys_config |
+-----+
```

Subsequent invocations of `format_statement()` within the session continue to use the user-defined variable value (32), rather than the value stored in the table (64).

To stop using the user-defined variable and revert to using the value in the table, set the variable to `NULL` within your session:

```
mysql> SET @sys.statement_truncate_len = NULL;
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
| SELECT variable, value, set_time, set_by FROM sys_config |
+-----+
```

Alternatively, end your current session (causing the user-defined variable to no longer exist) and begin a new session.

The conventional relationship just described between options in the `sys_config` table and user-defined variables can be exploited to make temporary configuration changes that end when your session ends. However, if you set a user-defined variable and then subsequently change the corresponding table value within the same session, the changed table value will not be used in that session as long as the user-defined variable exists with a non-`NULL` value. (The changed table value *will* be used in other sessions that do not have the user-defined variable assigned.)

The following list describes the options in the `sys_config` table and the corresponding user-defined variables:

- `diagnostics.allow_i_s_tables, @sys.diagnostics.allow_i_s_tables`

If this option is `ON`, the `diagnostics()` procedure is permitted to perform table scans on the `INFORMATION_SCHEMA.TABLES` table. This can be expensive if there are many tables. The default is `OFF`.

- `diagnostics.include_raw, @sys.diagnostics.include_raw`

If this option is `ON`, the `diagnostics()` procedure includes the raw output from querying the `metrics` view. The default is `OFF`.

- `ps_thread_trx_info.max_length, @sys.ps_thread_trx_info.max_length`

The maximum length for JSON output produced by the `ps_thread_trx_info()` function. The default is 65535.

- `statement_performance_analyzer.limit, @sys.statement_performance_analyzer.limit`

The maximum number of rows to return for views that have no built-in limit. (For example, the `statements_with_runtimes_in_95th_percentile` view has a built-in limit in the sense that it returns only statements with average execution time in the 95th percentile.) The default is 100.

- `statement_performance_analyzer.view, @sys.statement_performance_analyzer.view`

The custom query or view to be used by the `statement_performance_analyzer()` procedure (which is itself invoked by the `diagnostics()` procedure). If the option value contains a space, it is interpreted as a query. Otherwise, it must be the name of an existing view that queries the Performance Schema `events_statements_summary_by_digest` table. There cannot be any `LIMIT` clause in the query or view definition if the `statement_performance_analyzer.limit` configuration option is greater than 0. The default is `NULL` (no custom view defined).

- `statement_truncate_len, @sys.statement_truncate_len`

The maximum length of statements returned by the `format_statement()` function. Longer statements are truncated to this length. The default is 64.

Other options can be added to the `sys_config` table. For example, the `diagnostics()` and `execute_prepared_stmt()` procedures use the `debug` option if it exists, but this option is not part of the `sys_config` table by default because debug output normally is enabled only temporarily, by setting the corresponding `@sys.debug` user-defined variable. To enable debug output without having to set that variable in individual sessions, add the option to the table:

```
mysql> INSERT INTO sys.sys_config (variable, value) VALUES('debug', 'ON');
```

To change the debug setting in the table, do two things. First, modify the value in the table itself:

```
mysql> UPDATE sys.sys_config
 SET value = 'OFF'
 WHERE variable = 'debug';
```

Second, to also ensure that procedure invocations within the current session use the changed value from the table, set the corresponding user-defined variable to `NULL`:

```
mysql> SET @sys.debug = NULL;
```

### 27.4.2.2 The sys\_config\_insert\_set\_user Trigger

For rows added to the `sys_config` table by `INSERT` statements, the `sys_config_insert_set_user` trigger sets the `set_by` column to the current user.

### 27.4.2.3 The sys\_config\_update\_set\_user Trigger

The `sys_config_update_set_user` trigger for the `sys_config` table is similar to the `sys_config_insert_set_user` trigger, but for `UPDATE` statements.

## 27.4.3 sys Schema Views

The following sections describe `sys` schema views.

The `sys` schema contains many views that summarize Performance Schema tables in various ways. Most of these views come in pairs, such that one member of the pair has the same name as the other member, plus a `x$` prefix. For example, the `host_summary_by_file_io` view summarizes file I/O grouped by host and displays latencies converted from picoseconds to more readable values (with units);

```
mysql> SELECT * FROM sys.host_summary_by_file_io;
```

host	ios	io_latency
localhost	67570	5.38 s
background	3468	4.18 s

The `x$host_summary_by_file_io` view summarizes the same data but displays unformatted picosecond latencies:

```
mysql> SELECT * FROM sys.x$host_summary_by_file_io;
```

host	ios	io_latency
localhost	67574	5380678125144
background	3474	4758696829416

The view without the `x$` prefix is intended to provide output that is more user friendly and easier to read. The view with the `x$` prefix that displays the same values in raw form is intended more for use with other tools that perform their own processing on the data.

Views without the `x$` prefix differ from the corresponding `x$` views in these ways:

- Byte counts are formatted with size units using `format_bytes()`.
- Time values are formatted with temporal units using `format_time()`.
- SQL statements are truncated to a maximum display width using `format_statement()`.
- Path name are shortened using `format_path()`.

### 27.4.3.1 The host\_summary and x\$host\_summary Views

These views summarize statement activity, file I/O, and connections, grouped by host.

The `host_summary` and `x$host_summary` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statements`

The total number of statements for the host.

- `statement_latency`

The total wait time of timed statements for the host.

- `statement_avg_latency`

The average wait time per timed statement for the host.

- `table_scans`

The total number of table scans for the host.

- `file_ios`

The total number of file I/O events for the host.

- `file_io_latency`

The total wait time of timed file I/O events for the host.

- `current_connections`

The current number of connections for the host.

- `total_connections`

The total number of connections for the host.

- `unique_users`

The number of distinct users for the host.

- `current_memory`

The current amount of allocated memory for the host.

- `total_memory_allocated`

The total amount of allocated memory for the host.

### 27.4.3.2 The `host_summary_by_file_io` and `x$host_summary_by_file_io` Views

These views summarize file I/O, grouped by host. By default, rows are sorted by descending total file I/O latency.

The `host_summary_by_file_io` and `x$host_summary_by_file_io` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `ios`

The total number of file I/O events for the host.

- `io_latency`

The total wait time of timed file I/O events for the host.

### 27.4.3.3 The `host_summary_by_file_io_type` and `x$host_summary_by_file_io_type` Views

These views summarize file I/O, grouped by host and event type. By default, rows are sorted by host and descending total I/O latency.

The `host_summary_by_file_io_type` and `x$host_summary_by_file_io_type` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

The file I/O event name.

- `total`

The total number of occurrences of the file I/O event for the host.

- `total_latency`

The total wait time of timed occurrences of the file I/O event for the host.

- `max_latency`

The maximum single wait time of timed occurrences of the file I/O event for the host.

### 27.4.3.4 The `host_summary_by_stages` and `x$host_summary_by_stages` Views

These views summarize statement stages, grouped by host. By default, rows are sorted by host and descending total latency.

The `host_summary_by_stages` and `x$host_summary_by_stages` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

The stage event name.

- `total`

The total number of occurrences of the stage event for the host.

- `total_latency`

The total wait time of timed occurrences of the stage event for the host.

- `avg_latency`

The average wait time per timed occurrence of the stage event for the host.

### 27.4.3.5 The `host_summary_by_statement_latency` and `x$host_summary_by_statement_latency` Views

These views summarize overall statement statistics, grouped by host. By default, rows are sorted by descending total latency.

The `host_summary_by_statement_latency` and `x$host_summary_by_statement_latency` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `total`

The total number of statements for the host.

- `total_latency`

The total wait time of timed statements for the host.

- `max_latency`

The maximum single wait time of timed statements for the host.

- `lock_latency`

The total time waiting for locks by timed statements for the host.

- `rows_sent`

The total number of rows returned by statements for the host.

- `rows_examined`

The total number of rows read from storage engines by statements for the host.

- `rows_affected`

The total number of rows affected by statements for the host.

- `full_scans`

The total number of full table scans by statements for the host.

### 27.4.3.6 The `host_summary_by_statement_type` and `x$host_summary_by_statement_type` Views

These views summarize information about statements executed, grouped by host and statement type. By default, rows are sorted by host and descending total latency.

The `host_summary_by_statement_type` and `x$host_summary_by_statement_type` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statement`

The final component of the statement event name.

- `total`

The total number of occurrences of the statement event for the host.

- `total_latency`

The total wait time of timed occurrences of the statement event for the host.

- `max_latency`

The maximum single wait time of timed occurrences of the statement event for the host.

- `lock_latency`

The total time waiting for locks by timed occurrences of the statement event for the host.

- `rows_sent`

The total number of rows returned by occurrences of the statement event for the host.

- `rows_examined`

The total number of rows read from storage engines by occurrences of the statement event for the host.

- `rows_affected`

The total number of rows affected by occurrences of the statement event for the host.

- `full_scans`

The total number of full table scans by occurrences of the statement event for the host.

### 27.4.3.7 The `innodb_buffer_stats_by_schema` and `x$innodb_buffer_stats_by_schema` Views

These views summarize the information in the `INFORMATION_SCHEMA INNODB_BUFFER_PAGE` table, grouped by schema. By default, rows are sorted by descending buffer size.

### Warning

Querying views that access the `INNODB_BUFFER_PAGE` table can affect performance. Do not query these views on a production system unless you are aware of the performance impact and have determined it to be acceptable. To avoid impacting performance on a production system, reproduce the issue you want to investigate and query buffer pool statistics on a test instance.

The `innodb_buffer_stats_by_schema` and `x$innodb_buffer_stats_by_schema` views have these columns:

- `object_schema`

The schema name for the object, or `InnoDB System` if the table belongs to the `InnoDB` storage engine.

- `allocated`

The total number of bytes allocated for the schema.

- `data`

The total number of data bytes allocated for the schema.

- `pages`

The total number of pages allocated for the schema.

- `pages_hashed`

The total number of hashed pages allocated for the schema.

- `pages_old`

The total number of old pages allocated for the schema.

- `rows_cached`

The total number of cached rows for the schema.

### 27.4.3.8 The `innodb_buffer_stats_by_table` and `x$innodb_buffer_stats_by_table` Views

These views summarize the information in the `INFORMATION_SCHEMA INNODB_BUFFER_PAGE` table, grouped by schema and table. By default, rows are sorted by descending buffer size.

### Warning

Querying views that access the `INNODB_BUFFER_PAGE` table can affect performance. Do not query these views on a production system unless you are aware of the performance impact and have determined it to be acceptable. To avoid impacting performance on a production system, reproduce the issue you want to investigate and query buffer pool statistics on a test instance.

The `innodb_buffer_stats_by_table` and `x$innodb_buffer_stats_by_table` views have these columns:

- `object_schema`

The schema name for the object, or `InnoDB System` if the table belongs to the `InnoDB` storage engine.

- `object_name`  
The table name.
- `allocated`  
The total number of bytes allocated for the table.
- `data`  
The number of data bytes allocated for the table.
- `pages`  
The total number of pages allocated for the table.
- `pages_hashed`  
The number of hashed pages allocated for the table.
- `pages_old`  
The number of old pages allocated for the table.
- `rows_cached`  
The number of cached rows for the table.

#### 27.4.3.9 The `innodb_lock_waits` and `x$innodb_lock_waits` Views

These views summarize the `InnoDB` locks that transactions are waiting for. By default, rows are sorted by descending lock age.

The `innodb_lock_waits` and `x$innodb_lock_waits` views have these columns:

- `wait_started`  
The time at which the lock wait started.
- `wait_age`  
How long the lock has been waited for, as a `TIME` value.
- `wait_age_secs`  
How long the lock has been waited for, in seconds.
- `locked_table_schema`  
The schema that contains the locked table.
- `locked_table_name`  
The name of the locked table.
- `locked_table_partition`  
The name of the locked partition, if any; `NULL` otherwise.
- `locked_table_subpartition`

The name of the locked subpartition, if any; `NULL` otherwise.

- `locked_index`

The name of the locked index.

- `locked_type`

The type of the waiting lock.

- `waiting_trx_id`

The ID of the waiting transaction.

- `waiting_trx_started`

The time at which the waiting transaction started.

- `waiting_trx_age`

How long the waiting transaction has been waiting, as a `TIME` value.

- `waiting_trx_rows_locked`

The number of rows locked by the waiting transaction.

- `waiting_trx_rows_modified`

The number of rows modified by the waiting transaction.

- `waiting_pid`

The processlist ID of the waiting transaction.

- `waiting_query`

The statement that is waiting for the lock.

- `waiting_lock_id`

The ID of the waiting lock.

- `waiting_lock_mode`

The mode of the waiting lock.

- `blocking_trx_id`

The ID of the transaction that is blocking the waiting lock.

- `blocking_pid`

The processlist ID of the blocking transaction.

- `blocking_query`

The statement the blocking transaction is executing. This field reports `NULL` if the session that issued the blocking query becomes idle. For more information, see [Identifying a Blocking Query After the Issuing Session Becomes Idle](#).

- `blocking_lock_id`  
The ID of the lock that is blocking the waiting lock.
- `blocking_lock_mode`  
The mode of the lock that is blocking the waiting lock.
- `blocking_trx_started`  
The time at which the blocking transaction started.
- `blocking_trx_age`  
How long the blocking transaction has been executing, as a `TIME` value.
- `blocking_trx_rows_locked`  
The number of rows locked by the blocking transaction.
- `blocking_trx_rows_modified`  
The number of rows modified by the blocking transaction.
- `sql_kill_blocking_query`  
The `KILL` statement to execute to kill the blocking statement.
- `sql_kill_blocking_connection`  
The `KILL` statement to execute to kill the session running the blocking statement.

#### 27.4.3.10 The `io_by_thread_by_latency` and `x$io_by_thread_by_latency` Views

These views summarize I/O consumers to display time waiting for I/O, grouped by thread. By default, rows are sorted by descending total I/O latency.

The `io_by_thread_by_latency` and `x$io_by_thread_by_latency` views have these columns:

- `user`  
For foreground threads, the account associated with the thread. For background threads, the thread name.
- `total`  
The total number of I/O events for the thread.
- `total_latency`  
The total wait time of timed I/O events for the thread.
- `min_latency`  
The minimum single wait time of timed I/O events for the thread.
- `avg_latency`  
The average wait time per timed I/O event for the thread.

- `max_latency`

The maximum single wait time of timed I/O events for the thread.

- `thread_id`

The thread ID.

- `processlist_id`

For foreground threads, the processlist ID of the thread. For background threads, `NULL`.

#### 27.4.3.11 The `io_global_by_file_by_bytes` and `x$io_global_by_file_by_bytes` Views

These views summarize global I/O consumers to display amount of I/O, grouped by file. By default, rows are sorted by descending total I/O (bytes read and written).

The `io_global_by_file_by_bytes` and `x$io_global_by_file_by_bytes` views have these columns:

- `file`

The file path name.

- `count_read`

The total number of read events for the file.

- `total_read`

The total number of bytes read from the file.

- `avg_read`

The average number of bytes per read from the file.

- `count_write`

The total number of write events for the file.

- `total_written`

The total number of bytes written to the file.

- `avg_write`

The average number of bytes per write to the file.

- `total`

The total number of bytes read and written for the file.

- `write_pct`

The percentage of total bytes of I/O that were writes.

#### 27.4.3.12 The `io_global_by_file_by_latency` and `x$io_global_by_file_by_latency` Views

These views summarize global I/O consumers to display time waiting for I/O, grouped by file. By default, rows are sorted by descending total latency.

The `io_global_by_file_by_latency` and `x$io_global_by_file_by_latency` views have these columns:

- `file`

The file path name.

- `total`

The total number of I/O events for the file.

- `total_latency`

The total wait time of timed I/O events for the file.

- `count_read`

The total number of read I/O events for the file.

- `read_latency`

The total wait time of timed read I/O events for the file.

- `count_write`

The total number of write I/O events for the file.

- `write_latency`

The total wait time of timed write I/O events for the file.

- `count_misc`

The total number of other I/O events for the file.

- `misc_latency`

The total wait time of timed other I/O events for the file.

### 27.4.3.13 The `io_global_by_wait_by_bytes` and `x$io_global_by_wait_by_bytes` Views

These views summarize global I/O consumers to display amount of I/O and time waiting for I/O, grouped by event. By default, rows are sorted by descending total I/O (bytes read and written).

The `io_global_by_wait_by_bytes` and `x$io_global_by_wait_by_bytes` views have these columns:

- `event_name`

The I/O event name, with the `wait/io/file/` prefix stripped.

- `total`

The total number of occurrences of the I/O event.

- `total_latency`

The total wait time of timed occurrences of the I/O event.

- `min_latency`

The minimum single wait time of timed occurrences of the I/O event.

- `avg_latency`

The average wait time per timed occurrence of the I/O event.

- `max_latency`

The maximum single wait time of timed occurrences of the I/O event.

- `count_read`

The number of read requests for the I/O event.

- `total_read`

The number of bytes read for the I/O event.

- `avg_read`

The average number of bytes per read for the I/O event.

- `count_write`

The number of write requests for the I/O event.

- `total_written`

The number of bytes written for the I/O event.

- `avg_written`

The average number of bytes per write for the I/O event.

- `total_requested`

The total number of bytes read and written for the I/O event.

#### 27.4.3.14 The `io_global_by_wait_by_latency` and `x$io_global_by_wait_by_latency` Views

These views summarize global I/O consumers to display amount of I/O and time waiting for I/O, grouped by event. By default, rows are sorted by descending total latency.

The `io_global_by_wait_by_latency` and `x$io_global_by_wait_by_latency` views have these columns:

- `event_name`

The I/O event name, with the `wait/io/file/` prefix stripped.

- `total`

The total number of occurrences of the I/O event.

- `total_latency`

The total wait time of timed occurrences of the I/O event.

- `avg_latency`  
The average wait time per timed occurrence of the I/O event.
- `max_latency`  
The maximum single wait time of timed occurrences of the I/O event.
- `read_latency`  
The total wait time of timed read occurrences of the I/O event.
- `write_latency`  
The total wait time of timed write occurrences of the I/O event.
- `misc_latency`  
The total wait time of timed other occurrences of the I/O event.
- `count_read`  
The number of read requests for the I/O event.
- `total_read`  
The number of bytes read for the I/O event.
- `avg_read`  
The average number of bytes per read for the I/O event.
- `count_write`  
The number of write requests for the I/O event.
- `total_written`  
The number of bytes written for the I/O event.
- `avg_written`  
The average number of bytes per write for the I/O event.

#### 27.4.3.15 The `latest_file_io` and `x$latest_file_io` Views

These views summarize file I/O activity, grouped by file and thread. By default, rows are sorted with most recent I/O first.

The `latest_file_io` and `x$latest_file_io` views have these columns:

- `thread`  
For foreground threads, the account associated with the thread (and port number for TCP/IP connections). For background threads, the thread name and thread ID
- `file`  
The file path name.

- `latency`

The wait time of the file I/O event.

- `operation`

The type of operation.

- `requested`

The number of data bytes requested for the file I/O event.

#### 27.4.3.16 The `memory_by_host_by_current_bytes` and `x$memory_by_host_by_current_bytes` Views

These views summarize memory use, grouped by host. By default, rows are sorted by descending amount of memory used.

The `memory_by_host_by_current_bytes` and `x$memory_by_host_by_current_bytes` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `current_count_used`

The current number of allocated memory blocks that have not been freed yet for the host.

- `current_allocated`

The current number of allocated bytes that have not been freed yet for the host.

- `current_avg_alloc`

The current number of allocated bytes per memory block for the host.

- `current_max_alloc`

The largest single current memory allocation in bytes for the host.

- `total_allocated`

The total memory allocation in bytes for the host.

#### 27.4.3.17 The `memory_by_thread_by_current_bytes` and `x$memory_by_thread_by_current_bytes` Views

These views summarize memory use, grouped by thread. By default, rows are sorted by descending amount of memory used.

The `memory_by_thread_by_current_bytes` and `x$memory_by_thread_by_current_bytes` views have these columns:

- `thread_id`

The thread ID.

- `user`

The thread user or thread name.

- `current_count_used`

The current number of allocated memory blocks that have not been freed yet for the thread.

- `current_allocated`

The current number of allocated bytes that have not been freed yet for the thread.

- `current_avg_alloc`

The current number of allocated bytes per memory block for the thread.

- `current_max_alloc`

The largest single current memory allocation in bytes for the thread.

- `total_allocated`

The total memory allocation in bytes for the thread.

#### **27.4.3.18 The `memory_by_user_by_current_bytes` and `x$memory_by_user_by_current_bytes` Views**

These views summarize memory use, grouped by user. By default, rows are sorted by descending amount of memory used.

The `memory_by_user_by_current_bytes` and `x$memory_by_user_by_current_bytes` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `current_count_used`

The current number of allocated memory blocks that have not been freed yet for the user.

- `current_allocated`

The current number of allocated bytes that have not been freed yet for the user.

- `current_avg_alloc`

The current number of allocated bytes per memory block for the user.

- `current_max_alloc`

The largest single current memory allocation in bytes for the user.

- `total_allocated`

The total memory allocation in bytes for the user.

#### 27.4.3.19 The `memory_global_by_current_bytes` and `x$memory_global_by_current_bytes` Views

These views summarize memory use, grouped by allocation type (that is, by event). By default, rows are sorted by descending amount of memory used.

The `memory_global_by_current_bytes` and `x$memory_global_by_current_bytes` views have these columns:

- `event_name`

The memory event name.

- `current_count`

The total number of occurrences of the event.

- `current_alloc`

The current number of allocated bytes that have not been freed yet for the event.

- `current_avg_alloc`

The current number of allocated bytes per memory block for the event.

- `high_count`

The high-water mark for number of memory blocks allocated for the event.

- `high_alloc`

The high-water mark for number of bytes allocated for the event.

- `high_avg_alloc`

The high-water mark for average number of bytes per memory block allocated for the event.

#### 27.4.3.20 The `memory_global_total` and `x$memory_global_total` Views

These views summarize total memory use within the server.

The `memory_global_total` and `x$memory_global_total` views have these columns:

- `total_allocated`

The total bytes of memory allocated within the server.

#### 27.4.3.21 The `metrics` View

This view summarizes MySQL server metrics to show variable names, values, types, and whether they are enabled. By default, rows are sorted by variable type and name.

The `metrics` view includes this information:

- Global status variables from the Performance Schema `global_status` table

- InnoDB metrics from the `INFORMATION_SCHEMA.INNODB_METRICS` table
- Current and total memory allocation, based on the Performance Schema memory instrumentation
- The current time (human readable and Unix timestamp formats)

There is some duplication of information between the `global_status` and `INNODB_METRICS` tables, which the `metrics` view eliminates.

The `metrics` view has these columns:

- `Variable_name`

The metric name. The metric type determines the source from which the name is taken:

- For global status variables: The `VARIABLE_NAME` column of the `global_status` table
- For InnoDB metrics: The `NAME` column of the `INNODB_METRICS` table
- For other metrics: A view-provided descriptive string

- `Variable_value`

The metric value. The metric type determines the source from which the value is taken:

- For global status variables: The `VARIABLE_VALUE` column of the `global_status` table
- For InnoDB metrics: The `COUNT` column of the `INNODB_METRICS` table
- For memory metrics: The relevant column from the Performance Schema `memory_summary_global_by_event_name` table
- For the current time: The value of `NOW(3)` or `UNIX_TIMESTAMP(NOW(3))`

- `Type`

The metric type:

- For global status variables: `Global Status`
- For InnoDB metrics: `InnoDB Metrics - %`, where `%` is replaced by the value of the `SUBSYSTEM` column of the `INNODB_METRICS` table
- For memory metrics: `Performance Schema`
- For the current time: `System Time`

- `Enabled`

Whether the metric is enabled:

- For global status variables: `YES`
- For InnoDB metrics: `YES` if the `STATUS` column of the `INNODB_METRICS` table is `enabled`, `NO` otherwise
- For memory metrics: `NO`, `YES`, or `PARTIAL` (currently, `PARTIAL` occurs only for memory metrics and indicates that not all `memory/%` instruments are enabled; Performance Schema memory instruments are always enabled)

- For the current time: [YES](#)

### 27.4.3.22 The processlist and x\$processlist Views

The MySQL process list indicates the operations currently being performed by the set of threads executing within the server. The [processlist](#) and [x\\$processlist](#) views summarize process information. They provide more complete information than the [SHOW PROCESSLIST](#) statement and the [INFORMATION\\_SCHEMA PROCESSLIST](#) table, and are also nonblocking. By default, rows are sorted by descending process time and descending wait time. For a comparison of process information sources, see [Sources of Process Information](#).

The column descriptions here are brief. For additional information, see the description of the Performance Schema [threads](#) table at [Section 26.12.19.7, “The threads Table”](#).

The [processlist](#) and [x\\$processlist](#) views have these columns:

- [thd\\_id](#)

The thread ID.

- [conn\\_id](#)

The connection ID.

- [user](#)

The thread user or thread name.

- [db](#)

The default database for the thread, or [NULL](#) if there is none.

- [command](#)

For foreground threads, the type of command the thread is executing on behalf of the client, or [Sleep](#) if the session is idle.

- [state](#)

An action, event, or state that indicates what the thread is doing.

- [time](#)

The time in seconds that the thread has been in its current state.

- [current\\_statement](#)

The statement the thread is executing, or [NULL](#) if it is not executing any statement.

- [statement\\_latency](#)

How long the statement has been executing.

- [progress](#)

The percentage of work completed for stages that support progress reporting. See [Section 27.3, “sys Schema Progress Reporting”](#).

- `lock_latency`  
The time spent waiting for locks by the current statement.
- `rows_examined`  
The number of rows read from storage engines by the current statement.
- `rows_sent`  
The number of rows returned by the current statement.
- `rows_affected`  
The number of rows affected by the current statement.
- `tmp_tables`  
The number of internal in-memory temporary tables created by the current statement.
- `tmp_disk_tables`  
The number of internal on-disk temporary tables created by the current statement.
- `full_scan`  
The number of full table scans performed by the current statement.
- `last_statement`  
The last statement executed by the thread, if there is no currently executing statement or wait.
- `last_statement_latency`  
How long the last statement executed.
- `current_memory`  
The number of bytes allocated by the thread.
- `last_wait`  
The name of the most recent wait event for the thread.
- `last_wait_latency`  
The wait time of the most recent wait event for the thread.
- `source`  
The source file and line number containing the instrumented code that produced the event.
- `trx_latency`  
The wait time of the current transaction for the thread.
- `trx_state`  
The state for the current transaction for the thread.

- `trx_autocommit`

Whether autocommit mode was enabled when the current transaction started.

- `pid`

The client process ID.

- `program_name`

The client program name.

### 27.4.3.23 The `ps_check_lost_instrumentation` View

This view returns information about lost Performance Schema instruments, to indicate whether the Performance Schema is unable to monitor all runtime data.

The `ps_check_lost_instrumentation` view has these columns:

- `variable_name`

The Performance Schema status variable name indicating which type of instrument was lost.

- `variable_value`

The number of instruments lost.

### 27.4.3.24 The `schema_auto_increment_columns` View

This view indicates which tables have `AUTO_INCREMENT` columns and provides information about those columns, such as the current and maximum column values and the usage ratio (ratio of used to possible values). By default, rows are sorted by descending usage ratio and maximum column value.

Tables in these schemas are excluded from view output: `mysql`, `sys`, `INFORMATION_SCHEMA`, `performance_schema`.

The `schema_auto_increment_columns` view has these columns:

- `table_schema`

The schema that contains the table.

- `table_name`

The table that contains the `AUTO_INCREMENT` column.

- `column_name`

The name of the `AUTO_INCREMENT` column.

- `data_type`

The data type of the column.

- `column_type`

The column type of the column, which is the data type plus possibly other information. For example, for a column with a `bigint(20) unsigned` column type, the data type is just `bigint`.

- `is_signed`  
Whether the column type is signed.
- `is_unsigned`  
Whether the column type is unsigned.
- `max_value`  
The maximum permitted value for the column.
- `auto_increment`  
The current `AUTO_INCREMENT` value for the column.
- `auto_increment_ratio`  
The ratio of used to permitted values for the column. This indicates how much of the sequence of values is “used up.”

#### 27.4.3.25 The `schema_index_statistics` and `x$schema_index_statistics` Views

These views provide index statistics. By default, rows are sorted by descending total index latency.

The `schema_index_statistics` and `x$schema_index_statistics` views have these columns:

- `table_schema`  
The schema that contains the table.
- `table_name`  
The table that contains the index.
- `index_name`  
The name of the index.
- `rows_selected`  
The total number of rows read using the index.
- `select_latency`  
The total wait time of timed reads using the index.
- `rows_inserted`  
The total number of rows inserted into the index.
- `insert_latency`  
The total wait time of timed inserts into the index.
- `rows_updated`  
The total number of rows updated in the index.
- `update_latency`

The total wait time of timed updates in the index.

- `rows_deleted`

The total number of rows deleted from the index.

- `delete_latency`

The total wait time of timed deletes from the index.

### 27.4.3.26 The `schema_object_overview` View

This view summarizes the types of objects within each schema. By default, rows are sorted by schema and object type.

#### Note

For MySQL instances with a large number of objects, this view might take a long time to execute.

The `schema_object_overview` view has these columns:

- `db`

The schema name.

- `object_type`

The object type: `BASE TABLE`, `INDEX (index_type)`, `EVENT`, `FUNCTION`, `PROCEDURE`, `TRIGGER`, `VIEW`.

- `count`

The number of objects in the schema of the given type.

### 27.4.3.27 The `schema_redundant_indexes` and `x$schema_flattened_keys` Views

The `schema_redundant_indexes` view displays indexes that duplicate other indexes or are made redundant by them. The `x$schema_flattened_keys` view is a helper view for `schema_redundant_indexes`.

In the following column descriptions, the dominant index is the one that makes the redundant index redundant.

The `schema_redundant_indexes` view has these columns:

- `table_schema`

The schema that contains the table.

- `table_name`

The table that contains the index.

- `redundant_index_name`

The name of the redundant index.

- `redundant_index_columns`  
The names of the columns in the redundant index.
- `redundant_index_non_unique`  
The number of nonunique columns in the redundant index.
- `dominant_index_name`  
The name of the dominant index.
- `dominant_index_columns`  
The names of the columns in the dominant index.
- `dominant_index_non_unique`  
The number of nonunique columns in the dominant index.
- `subpart_exists`  
Whether the index indexes only part of a column.
- `sql_drop_index`  
The statement to execute to drop the redundant index.

The `x$schema_flattened_keys` view has these columns:

- `table_schema`  
The schema that contains the table.
- `table_name`  
The table that contains the index.
- `index_name`  
An index name.
- `non_unique`  
The number of nonunique columns in the index.
- `subpart_exists`  
Whether the index indexes only part of a column.
- `index_columns`  
The name of the columns in the index.

#### 27.4.3.28 The `schema_table_lock_waits` and `x$schema_table_lock_waits` Views

These views display which sessions are blocked waiting on metadata locks, and what is blocking them.

The column descriptions here are brief. For additional information, see the description of the Performance Schema `metadata_locks` table at [Section 26.12.13.3, “The metadata\\_locks Table”](#).

The `schema_table_lock_waits` and `x$schema_table_lock_waits` views have these columns:

- `object_schema`

The schema containing the object to be locked.

- `object_name`

The name of the instrumented object.

- `waiting_thread_id`

The thread ID of the thread that is waiting for the lock.

- `waiting_pid`

The processlist ID of the thread that is waiting for the lock.

- `waiting_account`

The account associated with the session that is waiting for the lock.

- `waiting_lock_type`

The type of the waiting lock.

- `waiting_lock_duration`

How long the waiting lock has been waiting.

- `waiting_query`

The statement that is waiting for the lock.

- `waiting_query_secs`

How long the statement has been waiting, in seconds.

- `waiting_query_rows_affected`

The number of rows affected by the statement.

- `waiting_query_rows_examined`

The number of rows read from storage engines by the statement.

- `blocking_thread_id`

The thread ID of the thread that is blocking the waiting lock.

- `blocking_pid`

The processlist ID of the thread that is blocking the waiting lock.

- `blocking_account`

The account associated with the thread that is blocking the waiting lock.

- `blocking_lock_type`

The type of lock that is blocking the waiting lock.

- `blocking_lock_duration`

How long the blocking lock has been held.

- `sql_kill_blocking_query`

The `KILL` statement to execute to kill the blocking statement.

- `sql_kill_blocking_connection`

The `KILL` statement to execute to kill the session running the blocking statement.

### 27.4.3.29 The `schema_table_statistics` and `x$schema_table_statistics` Views

These views summarize table statistics. By default, rows are sorted by descending total wait time (tables with most contention first).

These views use a helper view, `x$ps_schema_table_statistics_io`.

The `schema_table_statistics` and `x$schema_table_statistics` views have these columns:

- `table_schema`

The schema that contains the table.

- `table_name`

The table name.

- `total_latency`

The total wait time of timed I/O events for the table.

- `rows_fetched`

The total number of rows read from the table.

- `fetch_latency`

The total wait time of timed read I/O events for the table.

- `rows_inserted`

The total number of rows inserted into the table.

- `insert_latency`

The total wait time of timed insert I/O events for the table.

- `rows_updated`

The total number of rows updated in the table.

- `update_latency`

The total wait time of timed update I/O events for the table.

- `rows_deleted`

The total number of rows deleted from the table.

- `delete_latency`

The total wait time of timed delete I/O events for the table.

- `io_read_requests`

The total number of read requests for the table.

- `io_read`

The total number of bytes read from the table.

- `io_read_latency`

The total wait time of reads from the table.

- `io_write_requests`

The total number of write requests for the table.

- `io_write`

The total number of bytes written to the table.

- `io_write_latency`

The total wait time of writes to the table.

- `io_misc_requests`

The total number of miscellaneous I/O requests for the table.

- `io_misc_latency`

The total wait time of miscellaneous I/O requests for the table.

### 27.4.3.30 The `schema_table_statistics_with_buffer` and `x$schema_table_statistics_with_buffer` Views

These views summarize table statistics, including InnoDB buffer pool statistics. By default, rows are sorted by descending total wait time (tables with most contention first).

These views use a helper view, `x$ps_schema_table_statistics_io`.

The `schema_table_statistics_with_buffer` and `x$schema_table_statistics_with_buffer` views have these columns:

- `table_schema`

The schema that contains the table.

- `table_name`

The table name.

- `rows_fetched`  
The total number of rows read from the table.
- `fetch_latency`  
The total wait time of timed read I/O events for the table.
- `rows_inserted`  
The total number of rows inserted into the table.
- `insert_latency`  
The total wait time of timed insert I/O events for the table.
- `rows_updated`  
The total number of rows updated in the table.
- `update_latency`  
The total wait time of timed update I/O events for the table.
- `rows_deleted`  
The total number of rows deleted from the table.
- `delete_latency`  
The total wait time of timed delete I/O events for the table.
- `io_read_requests`  
The total number of read requests for the table.
- `io_read`  
The total number of bytes read from the table.
- `io_read_latency`  
The total wait time of reads from the table.
- `io_write_requests`  
The total number of write requests for the table.
- `io_write`  
The total number of bytes written to the table.
- `io_write_latency`  
The total wait time of writes to the table.
- `io_misc_requests`  
The total number of miscellaneous I/O requests for the table.

- `io_misc_latency`

The total wait time of miscellaneous I/O requests for the table.

- `innodb_buffer_allocated`

The total number of InnoDB buffer bytes allocated for the table.

- `innodb_buffer_data`

The total number of InnoDB data bytes allocated for the table.

- `innodb_buffer_free`

The total number of InnoDB nondata bytes allocated for the table (`innodb_buffer_allocated - innodb_buffer_data`).

- `innodb_buffer_pages`

The total number of InnoDB pages allocated for the table.

- `innodb_buffer_pages_hashed`

The total number of InnoDB hashed pages allocated for the table.

- `innodb_buffer_pages_old`

The total number of InnoDB old pages allocated for the table.

- `innodb_buffer_rows_cached`

The total number of InnoDB cached rows for the table.

### 27.4.3.31 The `schema_tables_with_full_table_scans` and `x$schema_tables_with_full_table_scans` Views

These views display which tables are being accessed with full table scans. By default, rows are sorted by descending rows scanned.

The `schema_tables_with_full_table_scans` and `x$schema_tables_with_full_table_scans` views have these columns:

- `object_schema`

The schema name.

- `object_name`

The table name.

- `rows_full_scanned`

The total number of rows scanned by full scans of the table.

- `latency`

The total wait time of full scans of the table.

### 27.4.3.32 The `schema_unused_indexes` View

These views display indexes for which there are no events, which indicates that they are not being used. By default, rows are sorted by schema and table.

This view is most useful when the server has been up and processing long enough that its workload is representative. Otherwise, presence of an index in this view may not be meaningful.

The `schema_unused_indexes` view has these columns:

- `object_schema`

The schema name.

- `object_name`

The table name.

- `index_name`

The unused index name.

### 27.4.3.33 The session and x\$session Views

These views are similar to `processlist` and `x$processlist`, but they filter out background processes to display only user sessions. For descriptions of the columns, see [Section 27.4.3.22, “The processlist and x\\$processlist Views”](#).

### 27.4.3.34 The session\_ssl\_status View

For each connection, this view displays the SSL version, cipher, and count of reused SSL sessions.

The `session_ssl_status` view has these columns:

- `thread_id`

The thread ID for the connection.

- `ssl_version`

The version of SSL used for the connection.

- `ssl_cipher`

The SSL cipher used for the connection.

- `ssl_sessions_reused`

The number of reused SSL sessions for the connection.

### 27.4.3.35 The statement\_analysis and x\$statement\_analysis Views

These views list normalized statements with aggregated statistics. The content mimics the MySQL Enterprise Monitor Query Analysis view. By default, rows are sorted by descending total latency.

The `statement_analysis` and `x$statement_analysis` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `full_scan`

The total number of full table scans performed by occurrences of the statement.

- `exec_count`

The total number of times the statement has executed.

- `err_count`

The total number of errors produced by occurrences of the statement.

- `warn_count`

The total number of warnings produced by occurrences of the statement.

- `total_latency`

The total wait time of timed occurrences of the statement.

- `max_latency`

The maximum single wait time of timed occurrences of the statement.

- `avg_latency`

The average wait time per timed occurrence of the statement.

- `lock_latency`

The total time waiting for locks by timed occurrences of the statement.

- `rows_sent`

The total number of rows returned by occurrences of the statement.

- `rows_sent_avg`

The average number of rows returned per occurrence of the statement.

- `rows_examined`

The total number of rows read from storage engines by occurrences of the statement.

- `rows_examined_avg`

The average number of rows read from storage engines per occurrence of the statement.

- `rows_affected`

The total number of rows affected by occurrences of the statement.

- `rows_affected_avg`

The average number of rows affected per occurrence of the statement.

- `tmp_tables`

The total number of internal in-memory temporary tables created by occurrences of the statement.

- `tmp_disk_tables`

The total number of internal on-disk temporary tables created by occurrences of the statement.

- `rows_sorted`

The total number of rows sorted by occurrences of the statement.

- `sort_merge_passes`

The total number of sort merge passes by occurrences of the statement.

- `digest`

The statement digest.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

#### **27.4.3.36 The `statements_with_errors_or_warnings` and `x$statements_with_errors_or_warnings` Views**

These views display normalized statements that have produced errors or warnings. By default, rows are sorted by descending error and warning counts.

The `statements_with_errors_or_warnings` and `x$statements_with_errors_or_warnings` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `exec_count`

The total number of times the statement has executed.

- `errors`

The total number of errors produced by occurrences of the statement.

- `error_pct`

The percentage of statement occurrences that produced errors.

- `warnings`

The total number of warnings produced by occurrences of the statement.

- `warning_pct`

The percentage of statement occurrences that produced warnings.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

### 27.4.3.37 The `statements_with_full_table_scans` and `x$statements_with_full_table_scans` Views

These views display normalized statements that have done full table scans. By default, rows are sorted by descending percentage of time a full scan was done and descending total latency.

The `statements_with_full_table_scans` and `x$statements_with_full_table_scans` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `exec_count`

The total number of times the statement has executed.

- `total_latency`

The total wait time of timed statement events for the statement.

- `no_index_used_count`

The total number of times no index was used to scan the table.

- `no_good_index_used_count`

The total number of times no good index was used to scan the table.

- `no_index_used_pct`

The percentage of the time no index was used to scan the table.

- `rows_sent`

The total number of rows returned from the table.

- `rows_examined`

The total number of rows read from the storage engine for the table.

- `rows_sent_avg`

The average number of rows returned from the table.

- `rows_examined_avg`

The average number of rows read from the storage engine for the table.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

#### **27.4.3.38 The statements\_with\_runtimes\_in\_95th\_percentile and x\$statements\_with\_runtimes\_in\_95th\_percentile Views**

These views list statements with runtimes in the 95th percentile. By default, rows are sorted by descending average latency.

Both views use two helper views, `x$ps_digest_avg_latency_distribution` and `x$ps_digest_95th_percentile_by_avg_us`.

The `statements_with_runtimes_in_95th_percentile` and `x$statements_with_runtimes_in_95th_percentile` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `full_scan`

The total number of full table scans performed by occurrences of the statement.

- `exec_count`

The total number of times the statement has executed.

- `err_count`

The total number of errors produced by occurrences of the statement.

- `warn_count`

The total number of warnings produced by occurrences of the statement.

- `total_latency`

The total wait time of timed occurrences of the statement.

- `max_latency`

The maximum single wait time of timed occurrences of the statement.

- `avg_latency`

The average wait time per timed occurrence of the statement.

- `rows_sent`

The total number of rows returned by occurrences of the statement.

- `rows_sent_avg`

The average number of rows returned per occurrence of the statement.

- `rows_examined`

The total number of rows read from storage engines by occurrences of the statement.

- `rows_examined_avg`

The average number of rows read from storage engines per occurrence of the statement.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

### 27.4.3.39 The `statements_with_sorting` and `x$statements_with_sorting` Views

These views list normalized statements that have performed sorts. By default, rows are sorted by descending total latency.

The `statements_with_sorting` and `x$statements_with_sorting` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `exec_count`

The total number of times the statement has executed.

- `total_latency`

The total wait time of timed occurrences of the statement.

- `sort_merge_passes`

The total number of sort merge passes by occurrences of the statement.

- `avg_sort_merges`

The average number of sort merge passes per occurrence of the statement.

- `sorts_using_scans`

The total number of sorts using table scans by occurrences of the statement.

- `sort_using_range`

The total number of sorts using range accesses by occurrences of the statement.

- `rows_sorted`

The total number of rows sorted by occurrences of the statement.

- `avg_rows_sorted`

The average number of rows sorted per occurrence of the statement.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

#### 27.4.3.40 The `statements_with_temp_tables` and `x$statements_with_temp_tables` Views

These views list normalized statements that have used temporary tables. By default, rows are sorted by descending number of on-disk temporary tables used and descending number of in-memory temporary tables used.

The `statements_with_temp_tables` and `x$statements_with_temp_tables` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `exec_count`

The total number of times the statement has executed.

- `total_latency`

The total wait time of timed occurrences of the statement.

- `memory_tmp_tables`

The total number of internal in-memory temporary tables created by occurrences of the statement.

- `disk_tmp_tables`

The total number of internal on-disk temporary tables created by occurrences of the statement.

- `avg_tmp_tables_per_query`

The average number of internal temporary tables created per occurrence of the statement.

- `tmp_tables_to_disk_pct`

The percentage of internal in-memory temporary tables that were converted to on-disk tables.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

#### 27.4.3.41 The `user_summary` and `x$user_summary` Views

These views summarize statement activity, file I/O, and connections, grouped by user. By default, rows are sorted by descending total latency.

The `user_summary` and `x$user_summary` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statements`

The total number of statements for the user.

- `statement_latency`

The total wait time of timed statements for the user.

- `statement_avg_latency`

The average wait time per timed statement for the user.

- `table_scans`

The total number of table scans for the user.

- `file_ios`

The total number of file I/O events for the user.

- `file_io_latency`

The total wait time of timed file I/O events for the user.

- `current_connections`

The current number of connections for the user.

- `total_connections`

The total number of connections for the user.

- `unique_hosts`

The number of distinct hosts from which connections for the user have originated.

- `current_memory`

The current amount of allocated memory for the user.

- `total_memory_allocated`

The total amount of allocated memory for the user.

#### 27.4.3.42 The `user_summary_by_file_io` and `x$user_summary_by_file_io` Views

These views summarize file I/O, grouped by user. By default, rows are sorted by descending total file I/O latency.

The `user_summary_by_file_io` and `x$user_summary_by_file_io` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `ios`

The total number of file I/O events for the user.

- `io_latency`

The total wait time of timed file I/O events for the user.

#### 27.4.3.43 The `user_summary_by_file_io_type` and `x$user_summary_by_file_io_type` Views

These views summarize file I/O, grouped by user and event type. By default, rows are sorted by user and descending total latency.

The `user_summary_by_file_io_type` and `x$user_summary_by_file_io_type` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

The file I/O event name.

- `total`

The total number of occurrences of the file I/O event for the user.

- `latency`

The total wait time of timed occurrences of the file I/O event for the user.

- `max_latency`

The maximum single wait time of timed occurrences of the file I/O event for the user.

#### 27.4.3.44 The `user_summary_by_stages` and `x$user_summary_by_stages` Views

These views summarize stages, grouped by user. By default, rows are sorted by user and descending total stage latency.

The `user_summary_by_stages` and `x$user_summary_by_stages` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

The stage event name.

- `total`

The total number of occurrences of the stage event for the user.

- `total_latency`

The total wait time of timed occurrences of the stage event for the user.

- `avg_latency`

The average wait time per timed occurrence of the stage event for the user.

#### 27.4.3.45 The `user_summary_by_statement_latency` and `x$user_summary_by_statement_latency` Views

These views summarize overall statement statistics, grouped by user. By default, rows are sorted by descending total latency.

The `user_summary_by_statement_latency` and `x$user_summary_by_statement_latency` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `total`

The total number of statements for the user.

- `total_latency`

The total wait time of timed statements for the user.

- `max_latency`

The maximum single wait time of timed statements for the user.

- `lock_latency`

The total time waiting for locks by timed statements for the user.

- `rows_sent`

The total number of rows returned by statements for the user.

- `rows_examined`

The total number of rows read from storage engines by statements for the user.

- `rows_affected`

The total number of rows affected by statements for the user.

- `full_scans`

The total number of full table scans by statements for the user.

#### 27.4.3.46 The `user_summary_by_statement_type` and `xsuser_summary_by_statement_type` Views

These views summarize information about statements executed, grouped by user and statement type. By default, rows are sorted by user and descending total latency.

The `user_summary_by_statement_type` and `xsuser_summary_by_statement_type` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statement`

The final component of the statement event name.

- `total`

The total number of occurrences of the statement event for the user.

- `total_latency`

The total wait time of timed occurrences of the statement event for the user.

- `max_latency`

The maximum single wait time of timed occurrences of the statement event for the user.

- `lock_latency`

The total time waiting for locks by timed occurrences of the statement event for the user.

- `rows_sent`

The total number of rows returned by occurrences of the statement event for the user.

- `rows_examined`

The total number of rows read from storage engines by occurrences of the statement event for the user.

- `rows_affected`

The total number of rows affected by occurrences of the statement event for the user.

- `full_scans`

The total number of full table scans by occurrences of the statement event for the user.

#### 27.4.3.47 The version View

This view provides the current `sys` schema and MySQL server versions.

##### Note

As of MySQL 8.0.18, this view is deprecated and will be removed in a future MySQL version. Affected applications should be adjusted to use an alternative instead. For example, use the `VERSION()` function to retrieve the MySQL server version.

The `version` view has these columns:

- `sys_version`

The `sys` schema version.

- `mysql_version`

The MySQL server version.

#### 27.4.3.48 The `wait_classes_global_by_avg_latency` and `x$wait_classes_global_by_avg_latency` Views

These views summarize wait class average latencies, grouped by event class. By default, rows are sorted by descending average latency. Idle events are ignored.

An event class is determined by stripping from the event name everything after the first three components. For example, the class for `wait/io/file/sql/slow_log` is `wait/io/file`.

The `wait_classes_global_by_avg_latency` and `x$wait_classes_global_by_avg_latency` views have these columns:

- `event_class`

The event class.

- `total`

The total number of occurrences of events in the class.

- `total_latency`

The total wait time of timed occurrences of events in the class.

- `min_latency`

The minimum single wait time of timed occurrences of events in the class.

- `avg_latency`

The average wait time per timed occurrence of events in the class.

- `max_latency`

The maximum single wait time of timed occurrences of events in the class.

#### 27.4.3.49 The `wait_classes_global_by_latency` and `x$wait_classes_global_by_latency` Views

These views summarize wait class total latencies, grouped by event class. By default, rows are sorted by descending total latency. Idle events are ignored.

An event class is determined by stripping from the event name everything after the first three components. For example, the class for `wait/io/file/sql/slow_log` is `wait/io/file`.

The `wait_classes_global_by_latency` and `x$wait_classes_global_by_latency` views have these columns:

- `event_class`

The event class.

- `total`

The total number of occurrences of events in the class.

- `total_latency`

The total wait time of timed occurrences of events in the class.

- `min_latency`

The minimum single wait time of timed occurrences of events in the class.

- `avg_latency`

The average wait time per timed occurrence of events in the class.

- `max_latency`

The maximum single wait time of timed occurrences of events in the class.

### 27.4.3.50 The `waits_by_host_by_latency` and `x$waits_by_host_by_latency` Views

These views summarize wait events, grouped by host and event. By default, rows are sorted by host and descending total latency. Idle events are ignored.

The `waits_by_host_by_latency` and `x$waits_by_host_by_latency` views have these columns:

- `host`

The host from which the connection originated.

- `event`

The event name.

- `total`

The total number of occurrences of the event for the host.

- `total_latency`

The total wait time of timed occurrences of the event for the host.

- `avg_latency`

The average wait time per timed occurrence of the event for the host.

- `max_latency`

The maximum single wait time of timed occurrences of the event for the host.

### 27.4.3.51 The `waits_by_user_by_latency` and `x$waits_by_user_by_latency` Views

These views summarize wait events, grouped by user and event. By default, rows are sorted by user and descending total latency. Idle events are ignored.

The `waits_by_user_by_latency` and `x$waits_by_user_by_latency` views have these columns:

- `user`

The user associated with the connection.

- `event`

The event name.

- `total`

The total number of occurrences of the event for the user.

- `total_latency`

The total wait time of timed occurrences of the event for the user.

- `avg_latency`

The average wait time per timed occurrence of the event for the user.

- `max_latency`

The maximum single wait time of timed occurrences of the event for the user.

### 27.4.3.52 The `waits_global_by_latency` and `x$waits_global_by_latency` Views

These views summarize wait events, grouped by event. By default, rows are sorted by descending total latency. Idle events are ignored.

The `waits_global_by_latency` and `x$waits_global_by_latency` views have these columns:

- `events`

The event name.

- `total`

The total number of occurrences of the event.

- `total_latency`

The total wait time of timed occurrences of the event.

- `avg_latency`

The average wait time per timed occurrence of the event.

- `max_latency`

The maximum single wait time of timed occurrences of the event.

## 27.4.4 sys Schema Stored Procedures

The following sections describe `sys` schema stored procedures.

### 27.4.4.1 The `create_synonym_db()` Procedure

Given a schema name, this procedure creates a synonym schema containing views that refer to all the tables and views in the original schema. This can be used, for example, to create a shorter name by which to refer to a schema with a long name (such as `info` rather than `INFORMATION_SCHEMA`).

#### Parameters

- `in_db_name VARCHAR(64)`: The name of the schema for which to create the synonym.
- `in_synonym VARCHAR(64)`: The name to use for the synonym schema. This schema must not already exist.

#### Example

```
mysql> SHOW DATABASES;
+-----+
| Database |
+-----+
| information_schema |
| mysql |
| performance_schema |
| sys |
| world |
```

```

+-----+
mysql> CALL sys.create_synonym_db('INFORMATION_SCHEMA', 'info');
+-----+
| summary |
+-----+
| Created 63 views in the info database |
+-----+
mysql> SHOW DATABASES;
+-----+
| Database |
+-----+
| information_schema |
| info |
| mysql |
| performance_schema |
| sys |
| world |
+-----+
mysql> SHOW FULL TABLES FROM info;
+-----+ +-----+
| Tables_in_info | Table_type |
+-----+ +-----+
| character_sets | VIEW |
| collation_character_set_applicability | VIEW |
| collations | VIEW |
| column_privileges | VIEW |
| columns | VIEW |
...

```

#### 27.4.4.2 The `diagnostics()` Procedure

Creates a report of the current server status for diagnostic purposes.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 5.1.9.1, “System Variable Privileges”](#).

Data collected for `diagnostics()` includes this information:

- Information from the `metrics` view (see [Section 27.4.3.21, “The metrics View”](#))
- Information from other relevant `sys` schema views, such as the one that determines queries in the 95th percentile
- Information from the `ndbinfo` schema, if the MySQL server is part of NDB Cluster
- Replication status (both source and replica)

Some of the `sys` schema views are calculated as initial (optional), overall, and delta values:

- The initial view is the content of the view at the start of the `diagnostics()` procedure. This output is the same as the start values used for the delta view. The initial view is included if the `diagnostics.include_raw` configuration option is `ON`.
- The overall view is the content of the view at the end of the `diagnostics()` procedure. This output is the same as the end values used for the delta view. The overall view is always included.
- The delta view is the difference from the beginning to the end of procedure execution. The minimum and maximum values are the minimum and maximum values from the end view, respectively. They do not necessarily reflect the minimum and maximum values in the monitored period. Except for the `metrics` view, the delta is calculated only between the first and last outputs.

## Parameters

- `in_max_runtime INT UNSIGNED`: The maximum data collection time in seconds. Use `NULL` to collect data for the default of 60 seconds. Otherwise, use a value greater than 0.
- `in_interval INT UNSIGNED`: The sleep time between data collections in seconds. Use `NULL` to sleep for the default of 30 seconds. Otherwise, use a value greater than 0.
- `in_auto_config ENUM('current', 'medium', 'full')`: The Performance Schema configuration to use. Permitted values are:
  - `current`: Use the current instrument and consumer settings.
  - `medium`: Enable some instruments and consumers.
  - `full`: Enable all instruments and consumers.

### Note

The more instruments and consumers enabled, the more impact on MySQL server performance. Be careful with the `medium` setting and especially the `full` setting, which has a large performance impact.

Use of the `medium` or `full` setting requires the `SUPER` privilege.

If a setting other than `current` is chosen, the current settings are restored at the end of the procedure.

## Configuration Options

`diagnostics()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 27.4.2.1, “The sys\\_config Table”](#)):

- `debug, @sys.debug`

If this option is `ON`, produce debugging output. The default is `OFF`.

- `diagnostics.allow_i_s_tables, @sys.diagnostics.allow_i_s_tables`

If this option is `ON`, the `diagnostics()` procedure is permitted to perform table scans on the `INFORMATION_SCHEMA.TABLES` table. This can be expensive if there are many tables. The default is `OFF`.

- `diagnostics.include_raw, @sys.diagnostics.include_raw`

If this option is `ON`, the `diagnostics()` procedure output includes the raw output from querying the `metrics` view. The default is `OFF`.

- `statement_truncate_len, @sys.statement_truncate_len`

The maximum length of statements returned by the `format_statement()` function. Longer statements are truncated to this length. The default is 64.

## Example

Create a diagnostics report that starts an iteration every 30 seconds and runs for at most 120 seconds using the current Performance Schema settings:

```
mysql> CALL sys.diagnostics(120, 30, 'current');
```

To capture the output from the `diagnostics()` procedure in a file as it runs, use the `mysql` client `tee filename` and `notee` commands (see [Section 4.5.1.2, “mysql Client Commands”](#)):

```
mysql> tee diag.out;
mysql> CALL sys.diagnostics(120, 30, 'current');
mysql> notee;
```

### 27.4.4.3 The `execute_prepared_stmt()` Procedure

Given an SQL statement as a string, executes it as a prepared statement. The prepared statement is deallocated after execution, so it is not subject to reuse. Thus, this procedure is useful primarily for executing dynamic statements on a one-time basis.

This procedure uses `sys_execute_prepared_stmt` as the prepared statement name. If that statement name exists when the procedure is called, its previous content is destroyed.

#### Parameters

- `in_query` LONGTEXT CHARACTER SET utf8: The statement string to execute.

#### Configuration Options

`execute_prepared_stmt()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 27.4.2.1, “The sys\\_config Table”](#)):

- `debug`, `@sys.debug`

If this option is `ON`, produce debugging output. The default is `OFF`.

#### Example

```
mysql> CALL sys.execute_prepared_stmt('SELECT COUNT(*) FROM mysql.user');
+-----+
| COUNT(*) |
+-----+
| 15 |
+-----+
```

### 27.4.4.4 The `ps_setup_disable_background_threads()` Procedure

Disables Performance Schema instrumentation for all background threads. Produces a result set indicating how many background threads were disabled. Already disabled threads do not count.

#### Parameters

None.

#### Example

```
mysql> CALL sys.ps_setup_disable_background_threads();
+-----+
| summary |
+-----+
| Disabled 24 background threads |
+-----+
```

### 27.4.4.5 The `ps_setup_disable_consumer()` Procedure

Disables Performance Schema consumers with names that contain the argument. Produces a result set indicating how many consumers were disabled. Already disabled consumers do not count.

## Parameters

- `consumer VARCHAR(128)`: The value used to match consumer names, which are identified by using `%consumer%` as an operand for a `LIKE` pattern match.

A value of `' '` matches all consumers.

## Example

Disable all statement consumers:

```
mysql> CALL sys.ps_setup_disable_consumer('statement');
+-----+
| summary |
+-----+
| Disabled 4 consumers |
+-----+
```

### 27.4.4.6 The `ps_setup_disable_instrument()` Procedure

Disables Performance Schema instruments with names that contain the argument. Produces a result set indicating how many instruments were disabled. Already disabled instruments do not count.

## Parameters

- `in_pattern VARCHAR(128)`: The value used to match instrument names, which are identified by using `%in_pattern%` as an operand for a `LIKE` pattern match.

A value of `' '` matches all instruments.

## Example

Disable a specific instrument:

```
mysql> CALL sys.ps_setup_disable_instrument('wait/lock/metadata/sql/mdl');
+-----+
| summary |
+-----+
| Disabled 1 instrument |
+-----+
```

Disable all mutex instruments:

```
mysql> CALL sys.ps_setup_disable_instrument('mutex');
+-----+
| summary |
+-----+
| Disabled 177 instruments |
+-----+
```

### 27.4.4.7 The `ps_setup_disable_thread()` Procedure

Given a connection ID, disables Performance Schema instrumentation for the thread. Produces a result set indicating how many threads were disabled. Already disabled threads do not count.

## Parameters

- `in_connection_id BIGINT`: The connection ID. This is a value of the type given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

## Example

Disable a specific connection by its connection ID:

```
mysql> CALL sys.ps_setup_disable_thread(225);
+-----+
| summary |
+-----+
| Disabled 1 thread |
+-----+
```

Disable the current connection:

```
mysql> CALL sys.ps_setup_disable_thread(CONNECTION_ID());
+-----+
| summary |
+-----+
| Disabled 1 thread |
+-----+
```

### 27.4.4.8 The ps\_setup\_enable\_background\_threads() Procedure

Enables Performance Schema instrumentation for all background threads. Produces a result set indicating how many background threads were enabled. Already enabled threads do not count.

#### Parameters

None.

## Example

```
mysql> CALL sys.ps_setup_enable_background_threads();
+-----+
| summary |
+-----+
| Enabled 24 background threads |
+-----+
```

### 27.4.4.9 The ps\_setup\_enable\_consumer() Procedure

Enables Performance Schema consumers with names that contain the argument. Produces a result set indicating how many consumers were enabled. Already enabled consumers do not count.

#### Parameters

- `consumer VARCHAR(128)`: The value used to match consumer names, which are identified by using `%consumer%` as an operand for a `LIKE` pattern match.

A value of `' '` matches all consumers.

## Example

Enable all statement consumers:

```
mysql> CALL sys.ps_setup_enable_consumer('statement');
+-----+
| summary |
+-----+
| Enabled 4 consumers |
+-----+
```

```
+-----+
```

#### 27.4.4.10 The `ps_setup_enable_instrument()` Procedure

Enables Performance Schema instruments with names that contain the argument. Produces a result set indicating how many instruments were enabled. Already enabled instruments do not count.

##### Parameters

- `in_pattern VARCHAR(128)`: The value used to match instrument names, which are identified by using `%in_pattern%` as an operand for a `LIKE` pattern match.

A value of `' '` matches all instruments.

##### Example

Enable a specific instrument:

```
mysql> CALL sys.ps_setup_enable_instrument('wait/lock/metadata/sql/mdl');
+-----+
| summary |
+-----+
| Enabled 1 instrument |
+-----+
```

Enable all mutex instruments:

```
mysql> CALL sys.ps_setup_enable_instrument('mutex');
+-----+
| summary |
+-----+
| Enabled 177 instruments |
+-----+
```

#### 27.4.4.11 The `ps_setup_enable_thread()` Procedure

Given a connection ID, enables Performance Schema instrumentation for the thread. Produces a result set indicating how many threads were enabled. Already enabled threads do not count.

##### Parameters

- `in_connection_id BIGINT`: The connection ID. This is a value of the type given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

##### Example

Enable a specific connection by its connection ID:

```
mysql> CALL sys.ps_setup_enable_thread(225);
+-----+
| summary |
+-----+
| Enabled 1 thread |
+-----+
```

Enable the current connection:

```
mysql> CALL sys.ps_setup_enable_thread(CONNECTION_ID());
```

```

+-----+
| summary |
+-----+
| Enabled 1 thread |
+-----+

```

#### 27.4.4.12 The `ps_setup_reload_saved()` Procedure

Reloads a Performance Schema configuration saved earlier within the same session using `ps_setup_save()`. For more information, see the description of `ps_setup_save()`.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 5.1.9.1, “System Variable Privileges”](#).

##### Parameters

None.

#### 27.4.4.13 The `ps_setup_reset_to_default()` Procedure

Resets the Performance Schema configuration to its default settings.

##### Parameters

- `in_verbose` **BOOLEAN**: Whether to display information about each setup stage during procedure execution. This includes the SQL statements executed.

##### Example

```

mysql> CALL sys.ps_setup_reset_to_default(TRUE)\G
***** 1. row *****
status: Resetting: setup_actors
DELETE
FROM performance_schema.setup_actors
WHERE NOT (HOST = '%' AND USER = '%' AND ROLE = '%')

***** 1. row *****
status: Resetting: setup_actors
INSERT IGNORE INTO performance_schema.setup_actors
VALUES ('%', '%', '%')
...

```

#### 27.4.4.14 The `ps_setup_save()` Procedure

Saves the current Performance Schema configuration. This enables you to alter the configuration temporarily for debugging or other purposes, then restore it to the previous state by invoking the `ps_setup_reload_saved()` procedure.

To prevent other simultaneous calls to save the configuration, `ps_setup_save()` acquires an advisory lock named `sys.ps_setup_save` by calling the `GET_LOCK()` function. `ps_setup_save()` takes a timeout parameter to indicate how many seconds to wait if the lock already exists (which indicates that some other session has a saved configuration outstanding). If the timeout expires without obtaining the lock, `ps_setup_save()` fails.

It is intended you call `ps_setup_reload_saved()` later within the *same* session as `ps_setup_save()` because the configuration is saved in **TEMPORARY** tables. `ps_setup_save()` drops the temporary tables

and releases the lock. If you end your session without invoking `ps_setup_save()`, the tables and lock disappear automatically.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 5.1.9.1, “System Variable Privileges”](#).

## Parameters

- `in_timeout INT`: How many seconds to wait to obtain the `sys.ps_setup_save` lock. A negative timeout value means infinite timeout.

## Example

```
mysql> CALL sys.ps_setup_save(10);

... make Performance Schema configuration changes ...

mysql> CALL sys.ps_setup_reload_saved();
```

### 27.4.4.15 The `ps_setup_show_disabled()` Procedure

Displays all currently disabled Performance Schema configuration.

## Parameters

- `in_show_instruments BOOLEAN`: Whether to display disabled instruments. This might be a long list.
- `in_show_threads BOOLEAN`: Whether to display disabled threads.

## Example

```
mysql> CALL sys.ps_setup_show_disabled(TRUE, TRUE);
+-----+
| performance_schema_enabled |
+-----+
| 1 |
+-----+

+-----+
| enabled_users |
+-----+
| '%'@'%' |
+-----+

+-----+-----+-----+-----+
| object_type | objects | enabled | timed |
+-----+-----+-----+-----+
| EVENT | mysql.% | NO | NO |
| EVENT | performance_schema.% | NO | NO |
| EVENT | information_schema.% | NO | NO |
| FUNCTION | mysql.% | NO | NO |
| FUNCTION | performance_schema.% | NO | NO |
| FUNCTION | information_schema.% | NO | NO |
| PROCEDURE | mysql.% | NO | NO |
| PROCEDURE | performance_schema.% | NO | NO |
| PROCEDURE | information_schema.% | NO | NO |
| TABLE | mysql.% | NO | NO |
| TABLE | performance_schema.% | NO | NO |
| TABLE | information_schema.% | NO | NO |
| TRIGGER | mysql.% | NO | NO |
| TRIGGER | performance_schema.% | NO | NO |
| TRIGGER | information_schema.% | NO | NO |
```

```
+-----+-----+-----+-----+
...

```

#### 27.4.4.16 The `ps_setup_show_disabled_consumers()` Procedure

Displays all currently disabled Performance Schema consumers.

##### Parameters

None.

##### Example

```
mysql> CALL sys.ps_setup_show_disabled_consumers();
+-----+-----+
| disabled_consumers |
+-----+-----+
| events_stages_current |
| events_stages_history |
| events_stages_history_long |
| events_statements_history |
| events_statements_history_long |
| events_transactions_history |
| events_transactions_history_long |
| events_waits_current |
| events_waits_history |
| events_waits_history_long |
+-----+-----+
```

#### 27.4.4.17 The `ps_setup_show_disabled_instruments()` Procedure

Displays all currently disabled Performance Schema instruments. This might be a long list.

##### Parameters

None.

##### Example

```
mysql> CALL sys.ps_setup_show_disabled_instruments()\G
***** 1. row *****
disabled_instruments: wait/synch/mutex/sql/TC_LOG_MMAP::LOCK_tc
timed: NO
***** 2. row *****
disabled_instruments: wait/synch/mutex/sql/THD::LOCK_query_plan
timed: NO
***** 3. row *****
disabled_instruments: wait/synch/mutex/sql/MYSQL_BIN_LOG::LOCK_commit
timed: NO
...

```

#### 27.4.4.18 The `ps_setup_show_enabled()` Procedure

Displays all currently enabled Performance Schema configuration.

##### Parameters

- `in_show_instruments` `BOOLEAN`: Whether to display enabled instruments. This might be a long list.
- `in_show_threads` `BOOLEAN`: Whether to display enabled threads.

**Example**

```
mysql> CALL sys.ps_setup_show_enabled(FALSE, FALSE);
```

performance_schema_enabled
1

1 row in set (0.01 sec)

```

+-----+
| enabled_users |
+-----+
| '%@'%' |
+-----+
1 row in set (0.01 sec)

```

object_type	objects	enabled	timed
EVENT	%.%	YES	YES
FUNCTION	%.%	YES	YES
PROCEDURE	%.%	YES	YES
TABLE	%.%	YES	YES
TRIGGER	%.%	YES	YES

5 rows in set (0.02 sec)

```

+-----+
| enabled_consumers |
+-----+
| events_statements_current |
| events_statements_history |
| events_transactions_current |
| events_transactions_history |
| global_instrumentation |
| statements_digest |
| thread_instrumentation |
+-----+

```

**27.4.4.19 The ps\_setup\_show\_enabled\_consumers() Procedure**

Displays all currently enabled Performance Schema consumers.

**Parameters**

None.

**Example**

```
mysql> CALL sys.ps_setup_show_enabled_consumers();
```

enabled_consumers
events_statements_current
events_statements_history
events_transactions_current
events_transactions_history
global_instrumentation
statements_digest
thread_instrumentation

**27.4.4.20 The ps\_setup\_show\_enabled\_instruments() Procedure**

Displays all currently enabled Performance Schema instruments. This might be a long list.

## Parameters

None.

## Example

```
mysql> CALL sys.ps_setup_show_enabled_instruments()\G
***** 1. row *****
enabled_instruments: wait/io/file/sql/map
 timed: YES
***** 2. row *****
enabled_instruments: wait/io/file/sql/binlog
 timed: YES
***** 3. row *****
enabled_instruments: wait/io/file/sql/binlog_cache
 timed: YES
...
```

### 27.4.4.21 The `ps_statement_avg_latency_histogram()` Procedure

Displays a textual histogram graph of the average latency values across all normalized statements tracked within the Performance Schema `events_statements_summary_by_digest` table.

This procedure can be used to display a very high-level picture of the latency distribution of statements running within this MySQL instance.

## Parameters

None.

## Example

The histogram output in statement units. For example, `* = 2 units` in the histogram legend means that each `*` character represents 2 statements.

```
mysql> CALL sys.ps_statement_avg_latency_histogram()\G
***** 1. row *****
Performance Schema Statement Digest Average Latency Histogram:

. = 1 unit
* = 2 units
= 3 units

(0 - 66ms) 88 | #####
(66 - 133ms) 14 |
(133 - 199ms) 4 |
(199 - 265ms) 5 | **
(265 - 332ms) 1 | .
(332 - 398ms) 0 |
(398 - 464ms) 1 | .
(464 - 531ms) 0 |
(531 - 597ms) 0 |
(597 - 663ms) 0 |
(663 - 730ms) 0 |
(730 - 796ms) 0 |
(796 - 863ms) 0 |
(863 - 929ms) 0 |
(929 - 995ms) 0 |
(995 - 1062ms) 0 |

Total Statements: 114; Buckets: 16; Bucket Size: 66 ms;
```

### 27.4.4.22 The `ps_trace_statement_digest()` Procedure

Traces all Performance Schema instrumentation for a specific statement digest.

If you find a statement of interest within the Performance Schema `events_statements_summary_by_digest` table, specify its `DIGEST` column MD5 value to this procedure and indicate the polling duration and interval. The result is a report of all statistics tracked within Performance Schema for that digest for the interval.

The procedure also attempts to execute `EXPLAIN` for the longest running example of the digest during the interval. This attempt might fail because the Performance Schema truncates long `SQL_TEXT` values. Consequently, `EXPLAIN` will fail due to parse errors.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 5.1.9.1, “System Variable Privileges”](#).

#### Parameters

- `in_digest` `VARCHAR(32)`: The statement digest identifier to analyze.
- `in_runtime` `INT`: How long to run the analysis in seconds.
- `in_interval` `DECIMAL(2,2)`: The analysis interval in seconds (which can be fractional) at which to try to take snapshots.
- `in_start_fresh` `BOOLEAN`: Whether to truncate the Performance Schema `events_statements_history_long` and `events_stages_history_long` tables before starting.
- `in_auto_enable` `BOOLEAN`: Whether to automatically enable required consumers.

#### Example

```
mysql> CALL sys.ps_trace_statement_digest('891ec6860f98ba46d89dd20b0c03652c', 10, 0.1, TRUE, TRUE);

#### 27.4.4.23 The `ps_trace_thread()` Procedure

Dumps all Performance Schema data for an instrumented thread to a `.dot` formatted graph file (for the DOT graph description language). Each result set returned from the procedure should be used for a complete graph.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 5.1.9.1, “System Variable Privileges”](#).

#### Parameters

- `in_thread_id` `INT`: The thread to trace.
- `in_outfile` `VARCHAR(255)`: The name to use for the `.dot` output file.
- `in_max_runtime` `DECIMAL(20,2)`: The maximum number of seconds (which can be fractional) to collect data. Use `NULL` to collect data for the default of 60 seconds.
- `in_interval` `DECIMAL(20,2)`: The number of seconds (which can be fractional) to sleep between data collections. Use `NULL` to sleep for the default of 1 second.
- `in_start_fresh` `BOOLEAN`: Whether to reset all Performance Schema data before tracing.

- `in_auto_setup` `BOOLEAN`: Whether to disable all other threads and enable all instruments and consumers. This also resets the settings at the end of the run.
- `in_debug` `BOOLEAN`: Whether to include `file:lineno` information in the graph.

### Example

```
mysql> CALL sys.ps_trace_thread(25, CONCAT('/tmp/stack-', REPLACE(NOW(), ' ', '-'), '.dot'), NULL, NULL, T
+-----+
| summary |
+-----+
| Disabled 1 thread |

+-----+
| summary |
+-----+
| Enabled 1 thread |
+-----+
1 row in set (60.32 sec)
```

#### 27.4.4.24 The `ps_truncate_all_tables()` Procedure

Truncates all Performance Schema summary tables, resetting all aggregated instrumentation as a snapshot. Produces a result set indicating how many tables were truncated.

#### Parameters

- `in_verbose` `BOOLEAN`: Whether to display each `TRUNCATE TABLE` statement before executing it.

### Example

```
mysql> CALL sys.ps_truncate_all_tables(FALSE);
+-----+
| summary |
+-----+
```

```
+-----+
| Truncated 49 tables |
+-----+
```

### 27.4.4.25 The `statement_performance_analyzer()` Procedure

Creates a report of the statements running on the server. The views are calculated based on the overall and/or delta activity.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 5.1.9.1, “System Variable Privileges”](#).

#### Parameters

- `in_action` `ENUM('snapshot', 'overall', 'delta', 'create_tmp', 'create_table', 'save', 'cleanup')`: The action to take. These values are permitted:
  - `snapshot`: Store a snapshot. The default is to make a snapshot of the current content of the Performance Schema `events_statements_summary_by_digest` table. By setting `in_table`, this can be overwritten to copy the content of the specified table. The snapshot is stored in the `sys` schema `tmp_digests` temporary table.
  - `overall`: Generate an analysis based on the content of the table specified by `in_table`. For the overall analysis, `in_table` can be `NOW()` to use a fresh snapshot. This overwrites an existing snapshot. Use `NULL` for `in_table` to use the existing snapshot. If `in_table` is `NULL` and no snapshot exists, a new snapshot is created. The `in_views` parameter and the `statement_performance_analyzer.limit` configuration option affect the operation of this procedure.
  - `delta`: Generate a delta analysis. The delta is calculated between the reference table specified by `in_table` and the snapshot, which must exist. This action uses the `sys` schema `tmp_digests_delta` temporary table. The `in_views` parameter and the `statement_performance_analyzer.limit` configuration option affect the operation of this procedure.
  - `create_table`: Create a regular table suitable for storing the snapshot for later use (for example, for calculating deltas).
  - `create_tmp`: Create a temporary table suitable for storing the snapshot for later use (for example, for calculating deltas).
  - `save`: Save the snapshot in the table specified by `in_table`. The table must exist and have the correct structure. If no snapshot exists, a new snapshot is created.
  - `cleanup`: Remove the temporary tables used for the snapshot and delta.
- `in_table` `VARCHAR(129)`: The table parameter used for some of the actions specified by the `in_action` parameter. Use the format `db_name.tbl_name` or `tbl_name` without using any backtick (```) identifier-quoting characters. Periods (`.`) are not supported in database and table names.

The meaning of the `in_table` value for each `in_action` value is detailed in the individual `in_action` value descriptions.

- `in_views` `SET ('with_runtimes_in_95th_percentile', 'analysis', 'with_errors_or_warnings', 'with_full_table_scans', 'with_sorting', 'with_temp_tables', 'custom')`: Which views to include. This parameter is a `SET` value, so it can

contain multiple view names, separated by commas. The default is to include all views except `custom`. The following values are permitted:

- `with_runtimes_in_95th_percentile`: Use the `statements_with_runtimes_in_95th_percentile` view.
- `analysis`: Use the `statement_analysis` view.
- `with_errors_or_warnings`: Use the `statements_with_errors_or_warnings` view.
- `with_full_table_scans`: Use the `statements_with_full_table_scans` view.
- `with_sorting`: Use the `statements_with_sorting` view.
- `with_temp_tables`: Use the `statements_with_temp_tables` view.
- `custom`: Use a custom view. This view must be specified using the `statement_performance_analyzer.view` configuration option to name a query or an existing view.

## Configuration Options

`statement_performance_analyzer()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 27.4.2.1, “The sys\\_config Table”](#)):

- `debug, @sys.debug`

If this option is `ON`, produce debugging output. The default is `OFF`.

- `statement_performance_analyzer.limit, @sys.statement_performance_analyzer.limit`

The maximum number of rows to return for views that have no built-in limit. The default is 100.

- `statement_performance_analyzer.view, @sys.statement_performance_analyzer.view`

The custom query or view to be used. If the option value contains a space, it is interpreted as a query. Otherwise, it must be the name of an existing view that queries the Performance Schema `events_statements_summary_by_digest` table. There cannot be any `LIMIT` clause in the query or view definition if the `statement_performance_analyzer.limit` configuration option is greater than 0. If specifying a view, use the same format as for the `in_table` parameter. The default is `NULL` (no custom view defined).

## Example

To create a report with the queries in the 95th percentile since the last truncation of `events_statements_summary_by_digest` and with a one-minute delta period:

1. Create a temporary table to store the initial snapshot.
2. Create the initial snapshot.
3. Save the initial snapshot in the temporary table.
4. Wait one minute.
5. Create a new snapshot.
6. Perform analysis based on the new snapshot.

## 7. Perform analysis based on the delta between the initial and new snapshots.

```
mysql> CALL sys.statement_performance_analyzer('create_tmp', 'mydb.tmp_digests_ini', NULL);
Query OK, 0 rows affected (0.08 sec)

mysql> CALL sys.statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.02 sec)

mysql> CALL sys.statement_performance_analyzer('save', 'mydb.tmp_digests_ini', NULL);
Query OK, 0 rows affected (0.00 sec)

mysql> DO SLEEP(60);
Query OK, 0 rows affected (1 min 0.00 sec)

mysql> CALL sys.statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.02 sec)

mysql> CALL sys.statement_performance_analyzer('overall', NULL, 'with_runtimes_in_95th_percentile');
+-----+
| Next Output |
+-----+
| Queries with Runtime in 95th Percentile |
+-----+
1 row in set (0.05 sec)

...

mysql> CALL sys.statement_performance_analyzer('delta', 'mydb.tmp_digests_ini', 'with_runtimes_in_95th_percentile');
+-----+
| Next Output |
+-----+
| Queries with Runtime in 95th Percentile |
+-----+
1 row in set (0.03 sec)

...
```

Create an overall report of the 95th percentile queries and the top 10 queries with full table scans:

```
mysql> CALL sys.statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.01 sec)

mysql> SET @sys.statement_performance_analyzer.limit = 10;
Query OK, 0 rows affected (0.00 sec)

mysql> CALL sys.statement_performance_analyzer('overall', NULL, 'with_runtimes_in_95th_percentile,with_full_table_scans');
+-----+
| Next Output |
+-----+
| Queries with Runtime in 95th Percentile |
+-----+
1 row in set (0.01 sec)

...

+-----+
| Next Output |
+-----+
| Top 10 Queries with Full Table Scan |
+-----+
1 row in set (0.09 sec)

...
```

Use a custom view showing the top 10 queries sorted by total execution time, refreshing the view every minute using the `watch` command in Linux:

```

mysql> CREATE OR REPLACE VIEW mydb.my_statements AS
 SELECT sys.format_statement(DIGEST_TEXT) AS query,
 SCHEMA_NAME AS db,
 COUNT_STAR AS exec_count,
 sys.format_time(SUM_TIMER_WAIT) AS total_latency,
 sys.format_time(AVG_TIMER_WAIT) AS avg_latency,
 ROUND(IFNULL(SUM_ROWS_SENT / NULLIF(COUNT_STAR, 0), 0)) AS rows_sent_avg,
 ROUND(IFNULL(SUM_ROWS_EXAMINED / NULLIF(COUNT_STAR, 0), 0)) AS rows_examined_avg,
 ROUND(IFNULL(SUM_ROWS_AFFECTED / NULLIF(COUNT_STAR, 0), 0)) AS rows_affected_avg,
 DIGEST AS digest
 FROM performance_schema.events_statements_summary_by_digest
 ORDER BY SUM_TIMER_WAIT DESC;
Query OK, 0 rows affected (0.10 sec)

mysql> CALL sys.statement_performance_analyzer('create_table', 'mydb.digests_prev', NULL);
Query OK, 0 rows affected (0.10 sec)

shell> watch -n 60 "mysql sys --table -e \"
> SET @sys.statement_performance_analyzer.view = 'mydb.my_statements';
> SET @sys.statement_performance_analyzer.limit = 10;
> CALL statement_performance_analyzer('snapshot', NULL, NULL);
> CALL statement_performance_analyzer('delta', 'mydb.digests_prev', 'custom');
> CALL statement_performance_analyzer('save', 'mydb.digests_prev', NULL);
> \""

Every 60.0s: mysql sys --table -e " ... Mon Dec 22 10:58:51 2014

+-----+
| Next Output |
+-----+
| Top 10 Queries Using Custom View |
+-----+
+-----+-----+-----+-----+-----+-----+-----+
| query | db | exec_count | total_latency | avg_latency | rows_sent_avg | rows_examined_avg |
+-----+-----+-----+-----+-----+-----+-----+
| ...

```

#### 27.4.4.26 The table\_exists() Procedure

Tests whether a given table exists as a regular table, a [TEMPORARY](#) table, or a view. The procedure returns the table type in an [OUT](#) parameter. If both a temporary and a permanent table exist with the given name, [TEMPORARY](#) is returned.

##### Parameters

- `in_db VARCHAR(64)`: The name of the database in which to check for table existence.
- `in_table VARCHAR(64)`: The name of the table to check the existence of.
- `out_exists ENUM('', 'BASE TABLE', 'VIEW', 'TEMPORARY')`: The return value. This is an [OUT](#) parameter, so it must be a variable into which the table type can be stored. When the procedure returns, the variable has one of the following values to indicate whether the table exists:
  - `''`: The table name does not exist as a base table, [TEMPORARY](#) table, or view.
  - `BASE TABLE`: The table name exists as a base (permanent) table.
  - `VIEW`: The table name exists as a view.
  - `TEMPORARY`: The table name exists as a [TEMPORARY](#) table.

##### Example

```
mysql> CREATE DATABASE db1;
```

```

Query OK, 1 row affected (0.01 sec)

mysql> USE db1;
Database changed
mysql> CREATE TABLE t1 (id INT PRIMARY KEY);
Query OK, 0 rows affected (0.03 sec)

mysql> CREATE TABLE t2 (id INT PRIMARY KEY);
Query OK, 0 rows affected (0.20 sec)

mysql> CREATE view v_t1 AS SELECT * FROM t1;
Query OK, 0 rows affected (0.02 sec)

mysql> CREATE TEMPORARY TABLE t1 (id INT PRIMARY KEY);
Query OK, 0 rows affected (0.00 sec)

mysql> CALL sys.table_exists('db1', 't1', @exists); SELECT @exists;
Query OK, 0 rows affected (0.01 sec)

+-----+
| @exists |
+-----+
| TEMPORARY |
+-----+
1 row in set (0.00 sec)

mysql> CALL sys.table_exists('db1', 't2', @exists); SELECT @exists;
Query OK, 0 rows affected (0.02 sec)

+-----+
| @exists |
+-----+
| BASE TABLE |
+-----+
1 row in set (0.00 sec)

mysql> CALL sys.table_exists('db1', 'v_t1', @exists); SELECT @exists;
Query OK, 0 rows affected (0.02 sec)

+-----+
| @exists |
+-----+
| VIEW |
+-----+
1 row in set (0.00 sec)

mysql> CALL sys.table_exists('db1', 't3', @exists); SELECT @exists;
Query OK, 0 rows affected (0.00 sec)

+-----+
| @exists |
+-----+
| |
+-----+
1 row in set (0.00 sec)

```

## 27.4.5 sys Schema Stored Functions

The following sections describe `sys` schema stored functions.

### 27.4.5.1 The `extract_schema_from_file_name()` Function

Given a file path name, returns the path component that represents the schema name. This function assumes that the file name lies within the schema directory. For this reason, it will not work with partitions or tables defined using their own `DATA_DIRECTORY` table option.

This function is useful when extracting file I/O information from the Performance Schema that includes file path names. It provides a convenient way to display schema names, which can be more easily understood than full path names, and can be used in joins against object schema names.

### Parameters

- `path VARCHAR(512)`: The full path to a data file from which to extract the schema name.

### Return Value

A `VARCHAR(64)` value.

### Example

```
mysql> SELECT sys.extract_schema_from_file_name('/usr/local/mysql/data/world/City.ibd');
+-----+
| sys.extract_schema_from_file_name('/usr/local/mysql/data/world/City.ibd') |
+-----+
| world |
+-----+
```

#### 27.4.5.2 The `extract_table_from_file_name()` Function

Given a file path name, returns the path component that represents the table name.

This function is useful when extracting file I/O information from the Performance Schema that includes file path names. It provides a convenient way to display table names, which can be more easily understood than full path names, and can be used in joins against object table names.

### Parameters

- `path VARCHAR(512)`: The full path to a data file from which to extract the table name.

### Return Value

A `VARCHAR(64)` value.

### Example

```
mysql> SELECT sys.extract_table_from_file_name('/usr/local/mysql/data/world/City.ibd');
+-----+
| sys.extract_table_from_file_name('/usr/local/mysql/data/world/City.ibd') |
+-----+
| City |
+-----+
```

#### 27.4.5.3 The `format_bytes()` Function

#### Note

As of MySQL 8.0.16, `format_bytes()` is deprecated and will be removed in a future MySQL version. Applications that use it should be migrated to use the built-in `FORMAT_BYTES()` function instead. See [Section 12.22, “Performance Schema Functions”](#)

Given a byte count, converts it to human-readable format and returns a string consisting of a value and a units indicator. Depending on the size of the value, the units part is `bytes`, `KiB` (kibibytes), `MiB` (mebibytes), `GiB` (gibibytes), `TiB` (tebibytes), or `PiB` (pebibytes).

## Parameters

- `bytes TEXT`: The byte count to format.

## Return Value

A `TEXT` value.

## Example

```
mysql> SELECT sys.format_bytes(512), sys.format_bytes(18446644073709551615);
+-----+-----+
| sys.format_bytes(512) | sys.format_bytes(18446644073709551615) |
+-----+-----+
| 512 bytes | 16383.91 PiB |
+-----+-----+
```

### 27.4.5.4 The format\_path() Function

Given a path name, returns the modified path name after replacing subpaths that match the values of the following system variables, in order:

```
datadir
tmpdir
slave_load_tmpdir
innodb_data_home_dir
innodb_log_group_home_dir
innodb_undo_directory
basedir
```

A value that matches the value of system variable `sysvar` is replaced with the string `@@GLOBAL.sysvar`.

## Parameters

- `path VARCHAR(512)`: The path name to format.

## Return Value

A `VARCHAR(512) CHARACTER SET utf8` value.

## Example

```
mysql> SELECT sys.format_path('/usr/local/mysql/data/world/City.ibd');
+-----+
| sys.format_path('/usr/local/mysql/data/world/City.ibd') |
+-----+
| /usr/local/mysql/data/world/City.ibd |
+-----+
```

### 27.4.5.5 The format\_statement() Function

Given a string (normally representing an SQL statement), reduces it to the length given by the `statement_truncate_len` configuration option, and returns the result. No truncation occurs if the string is shorter than `statement_truncate_len`. Otherwise, the middle part of the string is replaced by an ellipsis (...).

This function is useful for formatting possibly lengthy statements retrieved from Performance Schema tables to a known fixed maximum length.

## Parameters

- `statement LONGTEXT`: The statement to format.

## Configuration Options

`format_statement()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 27.4.2.1](#), “The `sys_config` Table”):

- `statement_truncate_len, @sys.statement_truncate_len`

The maximum length of statements returned by the `format_statement()` function. Longer statements are truncated to this length. The default is 64.

## Return Value

A `LONGTEXT` value.

## Example

By default, `format_statement()` truncates statements to be no more than 64 characters. Setting `@sys.statement_truncate_len` changes the truncation length for the current session:

```
mysql> SET @stmt = 'SELECT variable, value, set_time, set_by FROM sys_config';
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
| SELECT variable, value, set_time, set_by FROM sys_config |
+-----+
mysql> SET @sys.statement_truncate_len = 32;
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
| SELECT variabl ... ROM sys_config |
+-----+
```

### 27.4.5.6 The `format_time()` Function

#### Note

As of MySQL 8.0.16, `format_time()` is deprecated and will be removed in a future MySQL version. Applications that use it should be migrated to use the built-in `FORMAT_PICO_TIME()` function instead. See [Section 12.22](#), “Performance Schema Functions”

Given a Performance Schema latency or wait time in picoseconds, converts it to human-readable format and returns a string consisting of a value and a units indicator. Depending on the size of the value, the units part is `ps` (picoseconds), `ns` (nanoseconds), `us` (microseconds), `ms` (milliseconds), `s` (seconds), `m` (minutes), `h` (hours), `d` (days), or `w` (weeks).

## Parameters

- `picoseconds TEXT`: The picoseconds value to format.

## Return Value

A `TEXT` value.

## Example

```
mysql> SELECT sys.format_time(3501), sys.format_time(188732396662000);
```

```

+-----+-----+
| sys.format_time(3501) | sys.format_time(188732396662000) |
+-----+-----+
| 3.50 ns | 3.15 m |
+-----+-----+

```

### 27.4.5.7 The list\_add() Function

Adds a value to a comma-separated list of values and returns the result.

This function and `list_drop()` can be useful for manipulating the value of system variables such as `sql_mode` and `optimizer_switch` that take a comma-separated list of values.

#### Parameters

- `in_list TEXT`: The list to be modified.
- `in_add_value TEXT`: The value to add to the list.

#### Return Value

A `TEXT` value.

#### Example

```

mysql> SELECT @@sql_mode;
+-----+
| @@sql_mode |
+-----+
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES |
+-----+
mysql> SET @@sql_mode = sys.list_add(@@sql_mode, 'NO_ENGINE_SUBSTITUTION');
mysql> SELECT @@sql_mode;
+-----+
| @@sql_mode |
+-----+
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ENGINE_SUBSTITUTION |
+-----+
mysql> SET @@sql_mode = sys.list_drop(@@sql_mode, 'ONLY_FULL_GROUP_BY');
mysql> SELECT @@sql_mode;
+-----+
| @@sql_mode |
+-----+
| STRICT_TRANS_TABLES,NO_ENGINE_SUBSTITUTION |
+-----+

```

### 27.4.5.8 The list\_drop() Function

Removes a value from a comma-separated list of values and returns the result. For more information, see the description of `list_add()`

#### Parameters

- `in_list TEXT`: The list to be modified.
- `in_drop_value TEXT`: The value to drop from the list.

#### Return Value

A `TEXT` value.

### 27.4.5.9 The `ps_is_account_enabled()` Function

Returns `YES` or `NO` to indicate whether Performance Schema instrumentation for a given account is enabled.

#### Parameters

- `in_host VARCHAR(60)`: The host name of the account to check.
- `in_user VARCHAR(32)`: The user name of the account to check.

#### Return Value

An `ENUM('YES', 'NO')` value.

#### Example

```
mysql> SELECT sys.ps_is_account_enabled('localhost', 'root');
+-----+
| sys.ps_is_account_enabled('localhost', 'root') |
+-----+
| YES |
+-----+
```

### 27.4.5.10 The `ps_is_consumer_enabled()` Function

Returns `YES` or `NO` to indicate whether a given Performance Schema consumer is enabled, or `NULL` if the argument is `NULL`. If the argument is not a valid consumer name, an error occurs. (Prior to MySQL 8.0.18, the function returns `NULL` if the argument is not a valid consumer name.)

This function accounts for the consumer hierarchy, so a consumer is not considered enabled unless all consumers on which depends are also enabled. For information about the consumer hierarchy, see [Section 26.4.7, “Pre-Filtering by Consumer”](#).

#### Parameters

- `in_consumer VARCHAR(64)`: The name of the consumer to check.

#### Return Value

An `ENUM('YES', 'NO')` value.

#### Example

```
mysql> SELECT sys.ps_is_consumer_enabled('thread_instrumentation');
+-----+
| sys.ps_is_consumer_enabled('thread_instrumentation') |
+-----+
| YES |
+-----+
```

### 27.4.5.11 The `ps_is_instrument_default_enabled()` Function

Returns `YES` or `NO` to indicate whether a given Performance Schema instrument is enabled by default.

#### Parameters

- `in_instrument VARCHAR(128)`: The name of the instrument to check.

## Return Value

An `ENUM('YES', 'NO')` value.

## Example

```
mysql> SELECT sys.ps_is_instrument_default_enabled('memory/innodb/row_log_buf');
+-----+
| sys.ps_is_instrument_default_enabled('memory/innodb/row_log_buf') |
+-----+
| NO |
+-----+
mysql> SELECT sys.ps_is_instrument_default_enabled('statement/sql/alter_user');
+-----+
| sys.ps_is_instrument_default_enabled('statement/sql/alter_user') |
+-----+
| YES |
+-----+
```

### 27.4.5.12 The `ps_is_instrument_default_timed()` Function

Returns `YES` or `NO` to indicate whether a given Performance Schema instrument is timed by default.

## Parameters

- `in_instrument VARCHAR(128)`: The name of the instrument to check.

## Return Value

An `ENUM('YES', 'NO')` value.

## Example

```
mysql> SELECT sys.ps_is_instrument_default_timed('memory/innodb/row_log_buf');
+-----+
| sys.ps_is_instrument_default_timed('memory/innodb/row_log_buf') |
+-----+
| NO |
+-----+
mysql> SELECT sys.ps_is_instrument_default_timed('statement/sql/alter_user');
+-----+
| sys.ps_is_instrument_default_timed('statement/sql/alter_user') |
+-----+
| YES |
+-----+
```

### 27.4.5.13 The `ps_is_thread_instrumented()` Function

Returns `YES` or `NO` to indicate whether Performance Schema instrumentation for a given connection ID is enabled, `UNKNOWN` if the ID is unknown, or `NULL` if the ID is `NULL`.

## Parameters

- `in_connection_id BIGINT UNSIGNED`: The connection ID. This is a value of the type given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

## Return Value

An `ENUM('YES', 'NO', 'UNKNOWN')` value.

## Example

```
mysql> SELECT sys.ps_is_thread_instrumented(43);
+-----+
| sys.ps_is_thread_instrumented(43) |
+-----+
| UNKNOWN |
+-----+
mysql> SELECT sys.ps_is_thread_instrumented(CONNECTION_ID());
+-----+
| sys.ps_is_thread_instrumented(CONNECTION_ID()) |
+-----+
| YES |
+-----+
```

### 27.4.5.14 The `ps_thread_account()` Function

Given a Performance Schema thread ID, returns the `user_name@host_name` account associated with the thread.

#### Parameters

- `in_thread_id` **BIGINT UNSIGNED**: The thread ID for which to return the account. The value should match the `THREAD_ID` column from some Performance Schema `threads` table row.

#### Return Value

A **TEXT** value.

## Example

```
mysql> SELECT sys.ps_thread_account(sys.ps_thread_id(CONNECTION_ID()));
+-----+
| sys.ps_thread_account(sys.ps_thread_id(CONNECTION_ID())) |
+-----+
| root@localhost |
+-----+
```

### 27.4.5.15 The `ps_thread_id()` Function

#### Note

As of MySQL 8.0.16, `ps_thread_id()` is deprecated and will be removed in a future MySQL version. Applications that use it should be migrated to use the built-in `PS_THREAD_ID()` and `PS_CURRENT_THREAD_ID()` functions instead. See [Section 12.22, “Performance Schema Functions”](#)

Returns the Performance Schema thread ID assigned to a given connection ID, or the thread ID for the current connection if the connection ID is `NULL`.

#### Parameters

- `in_connection_id` **BIGINT UNSIGNED**: The ID of the connection for which to return the thread ID. This is a value of the type given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

#### Return Value

A **BIGINT UNSIGNED** value.

## Example

```
mysql> SELECT sys.ps_thread_id(260);
+-----+
| sys.ps_thread_id(260) |
+-----+
| 285 |
+-----+
```

### 27.4.5.16 The ps\_thread\_stack() Function

Returns a JSON formatted stack of all statements, stages, and events within the Performance Schema for a given thread ID.

#### Parameters

- `in_thread_id` **BIGINT**: The ID of the thread to trace. The value should match the `THREAD_ID` column from some Performance Schema `threads` table row.
- `in_verbose` **BOOLEAN**: Whether to include `file:lineno` information in the events.

#### Return Value

A `LONGTEXT CHARACTER SET latin1` value.

## Example

```
mysql> SELECT sys.ps_thread_stack(37, FALSE) AS thread_stack\G
***** 1. row *****
thread_stack: {"rankdir": "LR", "nodesep": "0.10",
"stack_created": "2014-02-19 13:39:03", "mysql_version": "8.0.2-dmr-debug-log",
"mysql_user": "root@localhost", "events": [{"nesting_event_id": "0",
"event_id": "10", "timer_wait": 256.35, "event_info": "sql/select",
"wait_info": "select @@version_comment limit 1\nerrors: 0\nwarnings: 0\nlock time:
...

```

### 27.4.5.17 The ps\_thread\_trx\_info() Function

Returns a JSON object containing information about a given thread. The information includes the current transaction, and the statements it has already executed, derived from the Performance Schema `events_transactions_current` and `events_statements_history` tables. (The consumers for those tables must be enabled to obtain full data in the JSON object.)

If the output exceeds the truncation length (65535 by default), a JSON error object is returned, such as:

```
{ "error": "Trx info truncated: Row 6 was cut by GROUP_CONCAT()" }
```

Similar error objects are returned for other warnings and exceptions raised during function execution.

#### Parameters

- `in_thread_id` **BIGINT UNSIGNED**: The thread ID for which to return transaction information. The value should match the `THREAD_ID` column from some Performance Schema `threads` table row.

#### Configuration Options

`ps_thread_trx_info()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 27.4.2.1, “The sys\\_config Table”](#)):

- `ps_thread_trx_info.max_length`, `@sys.ps_thread_trx_info.max_length`

The maximum length of the output. The default is 65535.

## Return Value

A `LONGTEXT` value.

## Example

```
mysql> SELECT sys.ps_thread_trx_info(48)\G
***** 1. row *****
sys.ps_thread_trx_info(48): [
 {
 "time": "790.70 us",
 "state": "COMMITTED",
 "mode": "READ WRITE",
 "autocommitted": "NO",
 "gtid": "AUTOMATIC",
 "isolation": "REPEATABLE READ",
 "statements_executed": [
 {
 "sql_text": "INSERT INTO info VALUES (1, \'foo\')",
 "time": "471.02 us",
 "schema": "trx",
 "rows_examined": 0,
 "rows_affected": 1,
 "rows_sent": 0,
 "tmp_tables": 0,
 "tmp_disk_tables": 0,
 "sort_rows": 0,
 "sort_merge_passes": 0
 },
 {
 "sql_text": "COMMIT",
 "time": "254.42 us",
 "schema": "trx",
 "rows_examined": 0,
 "rows_affected": 0,
 "rows_sent": 0,
 "tmp_tables": 0,
 "tmp_disk_tables": 0,
 "sort_rows": 0,
 "sort_merge_passes": 0
 }
]
 },
 {
 "time": "426.20 us",
 "state": "COMMITTED",
 "mode": "READ WRITE",
 "autocommitted": "NO",
 "gtid": "AUTOMATIC",
 "isolation": "REPEATABLE READ",
 "statements_executed": [
 {
 "sql_text": "INSERT INTO info VALUES (2, \'bar\')",
 "time": "107.33 us",
 "schema": "trx",
 "rows_examined": 0,
 "rows_affected": 1,
 "rows_sent": 0,
 "tmp_tables": 0,
 "tmp_disk_tables": 0,
 "sort_rows": 0,
 "sort_merge_passes": 0
 }
]
 }
]
```

```

 {
 "sql_text": "COMMIT",
 "time": "213.23 us",
 "schema": "trx",
 "rows_examined": 0,
 "rows_affected": 0,
 "rows_sent": 0,
 "tmp_tables": 0,
 "tmp_disk_tables": 0,
 "sort_rows": 0,
 "sort_merge_passes": 0
 }
]
}
]

```

### 27.4.5.18 The `quote_identifier()` Function

Given a string argument, this function produces a quoted identifier suitable for inclusion in SQL statements. This is useful when a value to be used as an identifier is a reserved word or contains backtick (``) characters.

#### Parameters

`in_identifier TEXT`: The identifier to quote.

#### Return Value

A `TEXT` value.

#### Example

```

mysql> SELECT sys.quote_identifier('plain');
+-----+
| sys.quote_identifier('plain') |
+-----+
| `plain` |
+-----+
mysql> SELECT sys.quote_identifier('trick`ier');
+-----+
| sys.quote_identifier('trick`ier') |
+-----+
| `trick``ier` |
+-----+
mysql> SELECT sys.quote_identifier('integer');
+-----+
| sys.quote_identifier('integer') |
+-----+
| `integer` |
+-----+

```

### 27.4.5.19 The `sys_get_config()` Function

Given a configuration option name, returns the option value from the `sys_config` table, or the provided default value (which may be `NULL`) if the option does not exist in the table.

If `sys_get_config()` returns the default value and that value is `NULL`, it is expected that the caller is able to handle `NULL` for the given configuration option.

By convention, routines that call `sys_get_config()` first check whether the corresponding user-defined variable exists and is non-`NULL`. If so, the routine uses the variable value without reading the `sys_config` table. If the variable does not exist or is `NULL`, the routine reads the option value from the table and sets

the user-defined variable to that value. For more information about the relationship between configuration options and their corresponding user-defined variables, see [Section 27.4.2.1, “The sys\\_config Table”](#).

If you want to check whether the configuration option has already been set and, if not, use the return value of `sys_get_config()`, you can use `IFNULL(...)` (see example later). However, this should not be done inside a loop (for example, for each row in a result set) because for repeated calls where the assignment is needed only in the first iteration, using `IFNULL(...)` is expected to be significantly slower than using an `IF (...) THEN ... END IF;` block (see example later).

## Parameters

- `in_variable_name VARCHAR(128)`: The name of the configuration option for which to return the value.
- `in_default_value VARCHAR(128)`: The default value to return if the configuration option is not found in the `sys_config` table.

## Return Value

A `VARCHAR(128)` value.

## Example

Get a configuration value from the `sys_config` table, falling back to 128 as the default if the option is not present in the table:

```
mysql> SELECT sys.sys_get_config('statement_truncate_len', 128) AS Value;
+-----+
| Value |
+-----+
| 64 |
+-----+
```

One-liner example: Check whether the option is already set; if not, assign the `IFNULL(...)` result (using the value from the `sys_config` table):

```
mysql> SET @sys.statement_truncate_len =
 IFNULL(@sys.statement_truncate_len,
 sys.sys_get_config('statement_truncate_len', 64));
```

`IF (...) THEN ... END IF;` block example: Check whether the option is already set; if not, assign the value from the `sys_config` table:

```
IF (@sys.statement_truncate_len IS NULL) THEN
 SET @sys.statement_truncate_len = sys.sys_get_config('statement_truncate_len', 64);
END IF;
```

### 27.4.5.20 The version\_major() Function

This function returns the major version of the MySQL server.

## Parameters

None.

## Return Value

A `TINYINT UNSIGNED` value.

## Example

```
mysql> SELECT VERSION(), sys.version_major();
+-----+-----+
| VERSION() | sys.version_major() |
+-----+-----+
| 8.0.13-debug | 8 |
+-----+-----+
```

### 27.4.5.21 The version\_minor() Function

This function returns the minor version of the MySQL server.

#### Parameters

None.

#### Return Value

A `TINYINT UNSIGNED` value.

## Example

```
mysql> SELECT VERSION(), sys.version_minor();
+-----+-----+
| VERSION() | sys.version_minor() |
+-----+-----+
| 8.0.13-debug | 0 |
+-----+-----+
```

### 27.4.5.22 The version\_patch() Function

This function returns the patch release version of the MySQL server.

#### Parameters

None.

#### Return Value

A `TINYINT UNSIGNED` value.

## Example

```
mysql> SELECT VERSION(), sys.version_patch();
+-----+-----+
| VERSION() | sys.version_patch() |
+-----+-----+
| 8.0.13-debug | 13 |
+-----+-----+
```

---

28.10 MySQL Python API .....	4963
28.11 MySQL Ruby APIs .....	4963
28.11.1 The MySQL/Ruby API .....	4964
28.11.2 The Ruby/MySQL API .....	4964
28.12 MySQL Tcl API .....	4964
28.13 MySQL Eiffel Wrapper .....	4964

MySQL Connectors provide connectivity to the MySQL server for client programs. APIs provide low-level access to MySQL resources using either the classic MySQL protocol or X Protocol. Both Connectors and the APIs enable you to connect and execute MySQL statements from another language or environment, including ODBC, Java (JDBC), C++, Python, Node.js, PHP, Perl, Ruby, and C.

### MySQL Connectors

Oracle develops a number of connectors:

- [Connector/C++](#) enables C++ applications to connect to MySQL.
- [Connector/J](#) provides driver support for connecting to MySQL from Java applications using the standard Java Database Connectivity (JDBC) API.
- [Connector/NET](#) enables developers to create .NET applications that connect to MySQL. Connector/NET implements a fully functional ADO.NET interface and provides support for use with ADO.NET aware tools. Applications that use Connector/NET can be written in any supported .NET language.

[MySQL for Visual Studio](#) works with Connector/NET and Microsoft Visual Studio 2012, 2013, 2015, and 2017. MySQL for Visual Studio provides access to MySQL objects and data from Visual Studio. As a Visual Studio package, it integrates directly into Server Explorer providing the ability to create new connections and work with MySQL database objects.

- [Connector/ODBC](#) provides driver support for connecting to MySQL using the Open Database Connectivity (ODBC) API. Support is available for ODBC connectivity from Windows, Unix, and macOS platforms.
- [Connector/Python](#) provides driver support for connecting to MySQL from Python applications using an API that is compliant with the [Python DB API version 2.0](#). No additional Python modules or MySQL client libraries are required.
- [Connector/Node.js](#) provides an asynchronous API for connecting to MySQL from Node.js applications using X Protocol. Connector/Node.js supports managing database sessions and schemas, working with MySQL Document Store collections and using raw SQL statements.

## The MySQL C API

For direct access to using MySQL natively within a C application, the [C API](#) provides low-level access to the MySQL client/server protocol through the `libmysqlclient` client library. This is the primary method used to connect to an instance of the MySQL server, and is used both by MySQL command-line clients and many of the MySQL Connectors and third-party APIs detailed here.

`libmysqlclient` is included in MySQL distributions.

See also [MySQL C API Implementations](#).

To access MySQL from a C application, or to build an interface to MySQL for a language not supported by the Connectors or APIs in this chapter, the [C API](#) is where to start. A number of programmer's utilities are available to help with the process; see [Section 4.7, "Program Development Utilities"](#).

## Third-Party MySQL APIs

The remaining APIs described in this chapter provide an interface to MySQL from specific application languages. These third-party solutions are not developed or supported by Oracle. Basic information on their usage and abilities is provided here for reference purposes only.

All the third-party language APIs are developed using one of two methods, using `libmysqlclient` or by implementing a *native driver*. The two solutions offer different benefits:

- Using `libmysqlclient` offers complete compatibility with MySQL because it uses the same libraries as the MySQL client applications. However, the feature set is limited to the implementation and interfaces exposed through `libmysqlclient` and the performance may be lower as data is copied between the native language, and the MySQL API components.
- *Native drivers* are an implementation of the MySQL network protocol entirely within the host language or environment. Native drivers are fast, as there is less copying of data between components, and they can offer advanced functionality not available through the standard MySQL API. Native drivers are also easier for end users to build and deploy because no copy of the MySQL client libraries is needed to build the native driver components.

[Table 28.1, "MySQL APIs and Interfaces"](#) lists many of the libraries and interfaces available for MySQL.

**Table 28.1 MySQL APIs and Interfaces**

Environment	API	Type	Notes
Ada	GNU Ada MySQL Bindings	<code>libmysqlclient</code>	See <a href="#">MySQL Bindings for GNU Ada</a>

## 28.1 MySQL Connector/C++

The MySQL Connector/C++ manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/C++ 8.0 Developer Guide](#)
- Release notes: [MySQL Connector/C++ Release Notes](#)

## 28.2 MySQL Connector/J

The MySQL Connector/J manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/J Developer Guide](#)
- Release notes: [MySQL Connector/J Release Notes](#)

## 28.3 MySQL Connector/NET

The MySQL Connector/NET manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/NET Developer Guide](#)
- Release notes: [MySQL Connector/NET Release Notes](#)

## 28.4 MySQL Connector/ODBC

The MySQL Connector/ODBC manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/ODBC Developer Guide](#)
- Release notes: [MySQL Connector/ODBC Release Notes](#)

## 28.5 MySQL Connector/Python

The MySQL Connector/Python manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/Python Developer Guide](#)
- Release notes: [MySQL Connector/Python Release Notes](#)

## 28.6 MySQL Connector/Node.js

The MySQL Connector/Node.js manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Release notes: [MySQL Connector/Node.js Release Notes](#)

## 28.7 MySQL C API

The MySQL C API Developer Guide is published in standalone form, not as part of the MySQL Reference Manual. See [MySQL 8.0 C API Developer Guide](#).

## 28.8 MySQL PHP API

The MySQL PHP API manual is now published in standalone form, not as part of the MySQL Reference Manual. See [MySQL and PHP](#).

## 28.9 MySQL Perl API

The Perl [DBI](#) module provides a generic interface for database access. You can write a DBI script that works with many different database engines without change. To use DBI with MySQL, install the following:

1. The [DBI](#) module.
2. The [DBD::mysql](#) module. This is the DataBase Driver (DBD) module for Perl.
3. Optionally, the DBD module for any other type of database server you want to access.

Perl DBI is the recommended Perl interface. It replaces an older interface called [mysqlperl](#), which should be considered obsolete.

These sections contain information about using Perl with MySQL and writing MySQL applications in Perl:

- For installation instructions for Perl DBI support, see [Section 2.13, “Perl Installation Notes”](#).
- For an example of reading options from option files, see [Section 5.8.4, “Using Client Programs in a Multiple-Server Environment”](#).
- For secure coding tips, see [Section 6.1.1, “Security Guidelines”](#).
- For debugging tips, see [Section 5.9.1.4, “Debugging mysqld under gdb”](#).
- For some Perl-specific environment variables, see [Section 4.9, “Environment Variables”](#).
- For considerations for running on macOS, see [Section 2.4, “Installing MySQL on macOS”](#).
- For ways to quote string literals, see [Section 9.1.1, “String Literals”](#).

DBI information is available at the command line, online, or in printed form:

- Once you have the [DBI](#) and [DBD::mysql](#) modules installed, you can get information about them at the command line with the [perldoc](#) command:

```
shell> perldoc DBI
shell> perldoc DBI::FAQ
shell> perldoc DBD::mysql
```

You can also use [pod2man](#), [pod2html](#), and so on to translate this information into other formats.

- For online information about Perl DBI, visit the DBI website, <http://dbi.perl.org/>. That site hosts a general DBI mailing list.
- For printed information, the official DBI book is *Programming the Perl DBI* (Alligator Descartes and Tim Bunce, O'Reilly & Associates, 2000). Information about the book is available at the DBI website, <http://dbi.perl.org/>.

## 28.10 MySQL Python API

[MySQLdb](#) is a third-party driver that provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at <http://sourceforge.net/projects/mysql-python/>.

The new MySQL Connector/Python component provides an interface to the same Python API, and is built into the MySQL Server and supported by Oracle. See [MySQL Connector/Python Developer Guide](#) for details on the Connector, as well as coding guidelines for Python applications and sample Python code.

## 28.11 MySQL Ruby APIs

Two APIs are available for Ruby programmers developing MySQL applications:

- The MySQL/Ruby API is based on the `libmysqlclient` API library. For information on installing and using the MySQL/Ruby API, see [Section 28.11.1, “The MySQL/Ruby API”](#).
- The Ruby/MySQL API is written to use the native MySQL network protocol (a native driver). For information on installing and using the Ruby/MySQL API, see [Section 28.11.2, “The Ruby/MySQL API”](#).

For background and syntax information about the Ruby language, see [Ruby Programming Language](#).

### 28.11.1 The MySQL/Ruby API

The MySQL/Ruby module provides access to MySQL databases using Ruby through `libmysqlclient`.

For information on installing the module, and the functions exposed, see [MySQL/Ruby](#).

### 28.11.2 The Ruby/MySQL API

The Ruby/MySQL module provides access to MySQL databases using Ruby through a native driver interface using the MySQL network protocol.

For information on installing the module, and the functions exposed, see [Ruby/MySQL](#).

## 28.12 MySQL Tcl API

`MySQLtcl` is a simple API for accessing a MySQL database server from the [Tcl programming language](#). It can be found at <http://www.xdoby.de/mysqltcl/>.

## 28.13 MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the [Eiffel programming language](#), written by Michael Ravits. It can be found at <http://efsa.sourceforge.net/archive/ravits/mysql.htm>.

## Chapter 29 MySQL Enterprise Edition

### Table of Contents

29.1 MySQL Enterprise Monitor Overview .....	4965
29.2 MySQL Enterprise Backup Overview .....	4966
29.3 MySQL Enterprise Security Overview .....	4967
29.4 MySQL Enterprise Encryption Overview .....	4967
29.5 MySQL Enterprise Audit Overview .....	4967
29.6 MySQL Enterprise Firewall Overview .....	4968
29.7 MySQL Enterprise Thread Pool Overview .....	4968
29.8 MySQL Enterprise Data Masking and De-Identification Overview .....	4968

MySQL Enterprise Edition is a commercial product. Like MySQL Community Edition, MySQL Enterprise Edition includes MySQL Server, a fully integrated transaction-safe, ACID-compliant database with full commit, rollback, crash-recovery, and row-level locking capabilities. In addition, MySQL Enterprise Edition includes the following components designed to provide monitoring and online backup, as well as improved security and scalability:

The following sections briefly discuss each of these components and indicate where to find more detailed information. To learn more about commercial products, see <https://www.mysql.com/products/>.

- [MySQL Enterprise Monitor](#)
- [MySQL Enterprise Backup](#)
- [MySQL Enterprise Security](#)
- [MySQL Enterprise Encryption](#)
- [MySQL Enterprise Audit](#)
- [MySQL Enterprise Firewall](#)
- [MySQL Enterprise Thread Pool](#)
- [MySQL Enterprise Data Masking and De-Identification](#)

### 29.1 MySQL Enterprise Monitor Overview

MySQL Enterprise Monitor is an enterprise monitoring system for MySQL that keeps an eye on your MySQL servers, notifies you of potential issues and problems, and advises you how to fix the issues. MySQL Enterprise Monitor can monitor all kinds of configurations, from a single MySQL server that is important to your business, all the way up to a huge farm of MySQL servers powering a busy website.

The following discussion briefly summarizes the basic components that make up the MySQL Enterprise Monitor product. For more information, see the MySQL Enterprise Monitor manual, available at <https://dev.mysql.com/doc/mysql-monitor/en/>.

MySQL Enterprise Monitor components can be installed in various configurations depending on your database and network topology, to give you the best combination of reliable and responsive monitoring data, with minimal overhead on the database server machines. A typical MySQL Enterprise Monitor installation consists of:

- One or more MySQL servers to monitor. MySQL Enterprise Monitor can monitor both Community and Enterprise MySQL server releases.
- A MySQL Enterprise Monitor Agent for each monitored host.
- A single MySQL Enterprise Service Manager, which collates information from the agents and provides the user interface to the collected data.

MySQL Enterprise Monitor is designed to monitor one or more MySQL servers. The monitoring information is collected by using an agent, *MySQL Enterprise Monitor Agent*. The agent communicates with the hosts and MySQL servers that it monitors, collecting variables, status and health information, and sending this information to the MySQL Enterprise Service Manager.

The information collected by the agent about each MySQL server and host you are monitoring is sent to the *MySQL Enterprise Service Manager*. This server collates all of the information from the agents. As it collates the information sent by the agents, the MySQL Enterprise Service Manager continually tests the collected data, comparing the status of the server to reasonable values. When thresholds are reached, the server can trigger an event (including an alarm and notification) to highlight a potential issue, such as low memory, high CPU usage, or more complex conditions such as insufficient buffer sizes and status information. We call each test, with its associated threshold value, a *rule*.

These rules, and the alarms and notifications, are each known as a *MySQL Enterprise Advisors*. Advisors form a critical part of the MySQL Enterprise Service Manager, as they provide warning information and troubleshooting advice about potential problems.

The MySQL Enterprise Service Manager includes a web server, and you interact with it through any web browser. This interface, the MySQL Enterprise Monitor User Interface, displays all of the information collected by the agents, and lets you view all of your servers and their current status as a group or individually. You control and configure all aspects of the service using the MySQL Enterprise Monitor User Interface.

The information supplied by the MySQL Enterprise Monitor Agent processes also includes statistical and query information, which you can view in the form of graphs. For example, you can view aspects such as server load, query numbers, or index usage information as a graph over time. The graph lets you pinpoint problems or potential issues on your server, and can help diagnose the impact from database or external problems (such as external system or network failure) by examining the data from a specific time interval.

The MySQL Enterprise Monitor Agent can also be configured to collect detailed information about the queries executed on your server, including the row counts and performance times for executing each query. You can correlate the detailed query data with the graphical information to identify which queries were executing when you experienced a particularly high load, index or other issue. The query data is supported by a system called Query Analyzer, and the data can be presented in different ways depending on your needs.

## 29.2 MySQL Enterprise Backup Overview

MySQL Enterprise Backup performs hot backup operations for MySQL databases. The product is architected for efficient and reliable backups of tables created by the InnoDB storage engine. For completeness, it can also back up tables from MyISAM and other storage engines.

The following discussion briefly summarizes MySQL Enterprise Backup. For more information, see the MySQL Enterprise Backup manual, available at <https://dev.mysql.com/doc/mysql-enterprise-backup/en/>.

Hot backups are performed while the database is running and applications are reading and writing to it. This type of backup does not block normal database operations, and it captures even changes that occur while the backup is happening. For these reasons, hot backups are desirable when your database

“grows up” -- when the data is large enough that the backup takes significant time, and when your data is important enough to your business that you must capture every last change, without taking your application, website, or web service offline.

MySQL Enterprise Backup does a hot backup of all tables that use the InnoDB storage engine. For tables using MyISAM or other non-InnoDB storage engines, it does a “warm” backup, where the database continues to run, but those tables cannot be modified while being backed up. For efficient backup operations, you can designate InnoDB as the default storage engine for new tables, or convert existing tables to use the InnoDB storage engine.

## 29.3 MySQL Enterprise Security Overview

MySQL Enterprise Edition provides plugins that implement security features using external services:

- MySQL Enterprise Edition includes an authentication plugin that enables MySQL Server to use PAM (Pluggable Authentication Modules) to authenticate MySQL users. PAM enables a system to use a standard interface to access various kinds of authentication methods, such as Unix passwords or an LDAP directory. For more information, see [Section 6.4.1.5, “PAM Pluggable Authentication”](#).
- MySQL Enterprise Edition includes an authentication plugin that performs external authentication on Windows, enabling MySQL Server to use native Windows services to authenticate client connections. Users who have logged in to Windows can connect from MySQL client programs to the server based on the information in their environment without specifying an additional password. For more information, see [Section 6.4.1.6, “Windows Pluggable Authentication”](#).
- MySQL Enterprise Edition includes a set of encryption functions based on the OpenSSL library that expose OpenSSL capabilities at the SQL level. These functions enable masking existing data using several methods such as obfuscation (removing identifying characteristics), generation of formatted random data, and data replacement or substitution. For more information, see [Section 29.4, “MySQL Enterprise Encryption Overview”](#).
- MySQL Enterprise Edition 5.7 and higher includes a keyring plugin that uses Oracle Key Vault as a back end for keyring storage. For more information, see [Section 6.4.4, “The MySQL Keyring”](#).

For other related Enterprise security features, see [Section 29.4, “MySQL Enterprise Encryption Overview”](#).

## 29.4 MySQL Enterprise Encryption Overview

MySQL Enterprise Edition includes a set of encryption functions based on the OpenSSL library that expose OpenSSL capabilities at the SQL level. These functions enable Enterprise applications to perform the following operations:

- Implement added data protection using public-key asymmetric cryptography
- Create public and private keys and digital signatures
- Perform asymmetric encryption and decryption
- Use cryptographic hashing for digital signing and data verification and validation

For more information, see [Section 6.6, “MySQL Enterprise Encryption”](#).

For other related Enterprise security features, see [Section 29.3, “MySQL Enterprise Security Overview”](#).

## 29.5 MySQL Enterprise Audit Overview

MySQL Enterprise Edition includes MySQL Enterprise Audit, implemented using a server plugin. MySQL Enterprise Audit uses the open MySQL Audit API to enable standard, policy-based monitoring and logging of connection and query activity executed on specific MySQL servers. Designed to meet the Oracle audit specification, MySQL Enterprise Audit provides an out of box, easy to use auditing and compliance solution for applications that are governed by both internal and external regulatory guidelines.

When installed, the audit plugin enables MySQL Server to produce a log file containing an audit record of server activity. The log contents include when clients connect and disconnect, and what actions they perform while connected, such as which databases and tables they access.

For more information, see [Section 6.4.5, “MySQL Enterprise Audit”](#).

## 29.6 MySQL Enterprise Firewall Overview

MySQL Enterprise Edition includes MySQL Enterprise Firewall, an application-level firewall that enables database administrators to permit or deny SQL statement execution based on matching against whitelists of accepted statement patterns. This helps harden MySQL Server against attacks such as SQL injection or attempts to exploit applications by using them outside of their legitimate query workload characteristics.

Each MySQL account registered with the firewall has its own statement whitelist, enabling protection to be tailored per account. For a given account, the firewall can operate in recording or protecting mode, for training in the accepted statement patterns or protection against unacceptable statements.

For more information, see [Section 6.4.7, “MySQL Enterprise Firewall”](#).

## 29.7 MySQL Enterprise Thread Pool Overview

MySQL Enterprise Edition includes MySQL Enterprise Thread Pool, implemented using a server plugin. The default thread-handling model in MySQL Server executes statements using one thread per client connection. As more clients connect to the server and execute statements, overall performance degrades. In MySQL Enterprise Edition, a thread pool plugin provides an alternative thread-handling model designed to reduce overhead and improve performance. The plugin implements a thread pool that increases server performance by efficiently managing statement execution threads for large numbers of client connections.

For more information, see [Section 5.6.3, “MySQL Enterprise Thread Pool”](#).

## 29.8 MySQL Enterprise Data Masking and De-Identification Overview

MySQL Enterprise Edition 5.7 and higher includes MySQL Enterprise Data Masking and De-Identification, implemented as a plugin library containing a plugin and a set of user-defined functions. Data masking hides sensitive information by replacing real values with substitutes. MySQL Enterprise Data Masking and De-Identification functions enable masking existing data using several methods such as obfuscation (removing identifying characteristics), generation of formatted random data, and data replacement or substitution.

For more information, see [Section 6.5, “MySQL Enterprise Data Masking and De-Identification”](#).

---

## Chapter 30 MySQL Workbench

MySQL Workbench provides a graphical tool for working with MySQL servers and databases. MySQL Workbench fully supports MySQL versions 5.5 and higher.

The following discussion briefly describes MySQL Workbench capabilities. For more information, see the MySQL Workbench manual, available at <https://dev.mysql.com/doc/workbench/en/>.

MySQL Workbench provides five main areas of functionality:

- **SQL Development:** Enables you to create and manage connections to database servers. As well as enabling you to configure connection parameters, MySQL Workbench provides the capability to execute SQL queries on the database connections using the built-in SQL Editor. This functionality replaces that previously provided by the Query Browser standalone application.
- **Data Modeling:** Enables you to create models of your database schema graphically, reverse and forward engineer between a schema and a live database, and edit all aspects of your database using the comprehensive Table Editor. The Table Editor provides easy-to-use facilities for editing Tables, Columns, Indexes, Triggers, Partitioning, Options, Inserts and Privileges, Routines and Views.
- **Server Administration:** Enables you to create and administer server instances.
- **Data Migration:** Allows you to migrate from Microsoft SQL Server, Sybase ASE, SQLite, SQL Anywhere, PostgreSQL, and other RDBMS tables, objects and data to MySQL. Migration also supports migrating from earlier versions of MySQL to the latest releases.
- **MySQL Enterprise Support:** Support for Enterprise products such as MySQL Enterprise Backup and MySQL Audit.

MySQL Workbench is available in two editions, the Community Edition and the Commercial Edition. The Community Edition is available free of charge. The Commercial Edition provides additional Enterprise features, such as database documentation generation, at low cost.

---

# Chapter 31 MySQL on the OCI Marketplace

## Table of Contents

31.1 Prerequisites to Deploying MySQL EE on Oracle Cloud Infrastructure .....	4971
31.2 Deploying MySQL EE on Oracle Cloud Infrastructure .....	4971
31.3 Configuring Network Access .....	4973
31.4 Connecting .....	4973
31.5 Maintenance .....	4974

This chapter describes how to deploy MySQL Enterprise Edition as an Oracle Cloud Infrastructure (OCI) Marketplace Application. This is a BYOL product.

### Note

For more information on OCI marketplace, see [Overview of Marketplace](#).

The MySQL Enterprise Edition Marketplace Application is an OCI compute instance, running Oracle Linux 7.7, with MySQL EE 8.0. The MySQL EE installation on the deployed image is similar to the RPM installation, as described in [Section 2.5.4, “Installing MySQL on Linux Using RPM Packages from Oracle”](#).

For more information on MySQL Enterprise Edition, see [Chapter 29, MySQL Enterprise Edition](#).

For more information on MySQL advanced configuration, see [Secure Deployment Guide](#).

For more information on Oracle Linux 7, see [Oracle Linux Documentation](#)

This product is user-managed, meaning you are responsible for upgrades and maintenance.

## 31.1 Prerequisites to Deploying MySQL EE on Oracle Cloud Infrastructure

The following assumptions are made:

- You are familiar with OCI terminology. If you are new to OCI, see [Getting Started](#).
- You have access to a properly configured Virtual Cloud Network (VCN) and subnet. For more information, see [Virtual Networking](#).
- You have the permissions required to deploy OCI Marketplace applications in a compartment of your tenancy. For more information, see [How Policies Work](#).

## 31.2 Deploying MySQL EE on Oracle Cloud Infrastructure

To deploy MySQL EE on Oracle Cloud Infrastructure, do the following:

1. Open the OCI Marketplace and select **MySQL**.

The **MySQL** listing is displayed.

2. Click **Launch Instance** to begin the application launch process.

The **Create Compute Instance** dialog is displayed.

See [To create a Linux instance](#) for information on how to complete the fields.

By default, the MySQL server listens on port 3306 and is configured with a single user, root.

**Important**

When the deployment is complete, the MySQL server is started, and you must connect to the compute instance, and retrieve the default root password which was written to the MySQL log file.

See [Connecting with SSH](#) for more information.

The following MySQL software is installed:

- MySQL Server EE
- MySQL Enterprise Backup
- MySQL Shell
- MySQL Router

## MySQL Configuration

For security, the following are enabled:

- SELinux: for more information, see [Configuring and Using SELinux](#)
- `firewalld`: for more information, see [Current Status and Settings of firewalld](#)

The following MySQL plugins are enabled:

- `thread_pool`
- `validate_password`

On startup, the following occurs:

- MySQL Server reads `/etc/my.cnf` and all files named `*.cnf` in `/etc/my.cnf.d/`.
- `/etc/my.cnf.d/perf-tuning.cnf` is created by `/usr/bin/mkcnf` based on the selected OCI shape.

**Note**

To disable this mechanism, remove `/etc/systemd/system/mysqld.service.d/perf-tuning.conf`.

Performance tuning is configured for the following shapes:

- VM.Standard2.1
- VM.Standard2.2
- VM.Standard2.4
- VM.Standard2.8

- VM.Standard2.16
- VM.Standard2.24
- VM.Standard.E2.1
- VM.Standard.E2.2
- VM.Standard.E2.4
- VM.Standard.E2.8
- BM.Standard2.52

For all other shapes, the tuning for VM.Standard2.1 is used.

## 31.3 Configuring Network Access

For information on OCI Security Rules, see [Security Rules](#).

### Important

You must enable ingress on ports 22 (SSH) and 3306 (MySQL), and optionally 33060, if you intend to use MySQL X Protocol.

## 31.4 Connecting

This section describes the various connection methods for connecting to the deployed MySQL server on the OCI Compute Instance.

### Connecting with SSH

This section gives some detail on connecting from a UNIX-like platform to the OCI Compute. For more information on connecting with SSH, see [Accessing an Oracle Linux Instance Using SSH](#) and [Connecting to Your Instance](#).

To connect to the Oracle Linux running on the Compute Instance with SSH, run the following command:

```
ssh opc@computeIP
```

where `opc` is the compute user and `computeIP` is the IP address of your Compute Instance.

To find the temporary root password created for the root user, run the following command:

```
sudo grep 'temporary password' /var/log/mysqld.log
```

To change your default password, log in to the server using the generated, temporary password, using the following command: `mysql -uroot -p`. Then run the following:

```
ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass4!';
```

### Connecting with MySQL Client

### Note

To connect from your local MySQL client, you must first create on the MySQL server a user which allows remote login.

To connect to the MySQL Server from your local MySQL client, run the following command from your shell session:

```
mysql -uroot -p -hcomputeIP
```

where `computeIP` is the IP address of your Compute Instance.

## Connecting with MySQL Shell

To connect to the MySQL Server from your local MySQL Shell, run the following command to start your shell session:

```
mysqlsh \connect root@computeIP
```

where `computeIP` is the IP address of your Compute Instance.

For more information on MySQL Shell connections, see [MySQL Shell Connections](#).

## Connecting with Workbench

To connect to the MySQL Server from MySQL Workbench, see [Connections in MySQL Workbench](#).

## 31.5 Maintenance

This product is user-managed, meaning you are responsible for upgrades and maintenance.

### Upgrading MySQL

The existing installation is RPM-based, to upgrade the MySQL server, see [Section 2.11.6, “Upgrading MySQL Binary or Package-based Installations on Unix/Linux”](#).

You can use `scp` to copy the required RPM to the OCI Compute Instance, or copy it from OCI Object Storage, if you have configured access to it. File Storage is also an option. For more information, see [File Storage and NFS](#).

### Backup and Restore

MySQL Enterprise Backup is the preferred backup and restore solution. For more information, see [Backing Up to Cloud Storage](#).

For information on MySQL Enterprise Backup, see [Getting Started with MySQL Enterprise Backup](#).

For information on the default MySQL backup and restore, see [Chapter 7, Backup and Recovery](#).

---

# Appendix A MySQL 8.0 Frequently Asked Questions

## Table of Contents

A.1 MySQL 8.0 FAQ: General .....	4975
A.2 MySQL 8.0 FAQ: Storage Engines .....	4976
A.3 MySQL 8.0 FAQ: Server SQL Mode .....	4977
A.4 MySQL 8.0 FAQ: Stored Procedures and Functions .....	4978

A.11 MySQL 8.0 FAQ: MySQL Chinese, Japanese, and Korean Character Sets .....	5001
A.12 MySQL 8.0 FAQ: Connectors & APIs .....	5012
A.13 MySQL 8.0 FAQ: C API, libmysql .....	5012
A.14 MySQL 8.0 FAQ: Replication .....	5013
A.15 MySQL 8.0 FAQ: MySQL Enterprise Thread Pool .....	5017
A.16 MySQL 8.0 FAQ: InnoDB Change Buffer .....	5018
A.17 MySQL 8.0 FAQ: InnoDB Data-at-Rest Encryption .....	5020
A.18 MySQL 8.0 FAQ: Virtualization Support .....	5022

## A.1 MySQL 8.0 FAQ: General

A.1.1 Which version of MySQL is production-ready (GA)? .....	4975
A.1.2 Why did MySQL version numbering skip versions 6 and 7 and go straight to 8.0? .....	4976
A.1.3 Can MySQL 8.0 do subqueries? .....	4976
A.1.4 Can MySQL 8.0 perform multiple-table inserts, updates, and deletes? .....	4976
A.1.5 Does MySQL 8.0 have Sequences? .....	4976
A.1.6 Does MySQL 8.0 have a <a href="#">NOW()</a> function with fractions of seconds? .....	4976
A.1.7 Does MySQL 8.0 work with multi-core processors? .....	4976
A.1.8 Why do I see multiple processes for <a href="#">mysqld</a> ? .....	4976
A.1.9 Can MySQL 8.0 perform ACID transactions? .....	4976

### A.1.1. Which version of MySQL is production-ready (GA)?

MySQL 8.0, 5.7, and MySQL 5.6 are supported for production use.

MySQL 8.0 achieved General Availability (GA) status with MySQL 8.0.11, which was released for production use on 19 April 2018.

MySQL 5.7 achieved General Availability (GA) status with MySQL 5.7.9, which was released for production use on 21 October 2015.

MySQL 5.6 achieved General Availability (GA) status with MySQL 5.6.10, which was released for production use on 5 February 2013.

MySQL 5.5 achieved General Availability (GA) status with MySQL 5.5.8, which was released for production use on 3 December 2010. The MySQL 5.5 series is no longer current, but still supported in production.

MySQL 5.1 achieved General Availability (GA) status with MySQL 5.1.30, which was released for production use on 14 November 2008. Active development for MySQL 5.1 has ended.

MySQL 5.0 achieved General Availability (GA) status with MySQL 5.0.15, which was released for production use on 19 October 2005. Active development for MySQL 5.0 has ended.

**A.1.2.** Why did MySQL version numbering skip versions 6 and 7 and go straight to 8.0?

Due to the many new and important features we were introducing in this MySQL version, we decided to start a fresh new series. As the series numbers 6 and 7 had actually been used before by MySQL, we went to 8.0.

**A.1.3.** Can MySQL 8.0 do subqueries?

Yes. See [Section 13.2.11, “Subqueries”](#).

**A.1.4.** Can MySQL 8.0 perform multiple-table inserts, updates, and deletes?

Yes. For the syntax required to perform multiple-table updates, see [Section 13.2.13, “UPDATE Statement”](#); for that required to perform multiple-table deletes, see [Section 13.2.2, “DELETE Statement”](#).

A multiple-table insert can be accomplished using a trigger whose `FOR EACH ROW` clause contains multiple `INSERT` statements within a `BEGIN ... END` block. See [Section 24.3, “Using Triggers”](#).

**A.1.5.** Does MySQL 8.0 have Sequences?

No. However, MySQL has an `AUTO_INCREMENT` system, which in MySQL 8.0 can also handle inserts in a multi-source replication setup. With the `auto_increment_increment` and `auto_increment_offset` system variables, you can set each server to generate auto-increment values that don't conflict with other servers. The `auto_increment_increment` value should be greater than the number of servers, and each server should have a unique offset.

**A.1.6.** Does MySQL 8.0 have a `NOW()` function with fractions of seconds?

Yes, see [Section 11.2.6, “Fractional Seconds in Time Values”](#).

**A.1.7.** Does MySQL 8.0 work with multi-core processors?

Yes. MySQL is fully multithreaded, and will make use of multiple CPUs, provided that the operating system supports them.

**A.1.8.** Why do I see multiple processes for `mysqld`?

When using LinuxThreads, you should see a minimum of three `mysqld` processes running. These are in fact threads. There is one thread for the LinuxThreads manager, one thread to handle connections, and one thread to handle alarms and signals.

**A.1.9.** Can MySQL 8.0 perform ACID transactions?

Yes. All current MySQL versions support transactions. The `InnoDB` storage engine offers full ACID transactions with row-level locking, multi-versioning, nonlocking repeatable reads, and all four SQL standard isolation levels.

The `NDB` storage engine supports the `READ COMMITTED` transaction isolation level only.

## A.2 MySQL 8.0 FAQ: Storage Engines

A.2.1 Where can I obtain complete documentation for MySQL storage engines? .....	4977
A.2.2 Are there any new storage engines in MySQL 8.0? .....	4977
A.2.3 Have any storage engines been removed in MySQL 8.0? .....	4977

A.2.4 Can I prevent the use of a particular storage engine? .....	4977
A.2.5 Is there an advantage to using the <a href="#">InnoDB</a> storage engine exclusively, as opposed to a combination of <a href="#">InnoDB</a> and non- <a href="#">InnoDB</a> storage engines? .....	4977
A.2.6 What are the unique benefits of the <a href="#">ARCHIVE</a> storage engine? .....	4977

**A.2.1.** Where can I obtain complete documentation for MySQL storage engines?

See [Chapter 16, Alternative Storage Engines](#). That chapter contains information about all MySQL storage engines except for the [InnoDB](#) storage engine and the [NDB](#) storage engine (used for MySQL Cluster). [InnoDB](#) is covered in [Chapter 15, The InnoDB Storage Engine](#). [NDB](#) is covered in [Chapter 22, MySQL NDB Cluster 8.0](#).

**A.2.2.** Are there any new storage engines in MySQL 8.0?

No. [InnoDB](#) is the default storage engine for new tables. See [Section 15.1, “Introduction to InnoDB”](#) for details.

**A.2.3.** Have any storage engines been removed in MySQL 8.0?

The [PARTITION](#) storage engine plugin which provided partitioning support is replaced by a native partitioning handler. As part of this change, the server can no longer be built using `-DWITH_PARTITION_STORAGE_ENGINE`. `partition` is also no longer displayed in the output of `SHOW PLUGINS`, or shown in the `INFORMATION_SCHEMA.PLUGINS` table.

In order to support partitioning of a given table, the storage engine used for the table must now provide its own (“native”) partitioning handler. [InnoDB](#) is the only storage engine supported in MySQL 8.0 that includes a native partitioning handler. An attempt to create partitioned tables in MySQL 8.0 using any other storage engine fails. (The [NDB](#) storage engine used by MySQL Cluster also provides its own partitioning handler, but is currently not supported by MySQL 8.0.)

**A.2.4.** Can I prevent the use of a particular storage engine?

Yes. The `disabled_storage_engines` configuration option defines which storage engines cannot be used to create tables or tablespaces. By default, `disabled_storage_engines` is empty (no engines disabled), but it can be set to a comma-separated list of one or more engines.

**A.2.5.** Is there an advantage to using the [InnoDB](#) storage engine exclusively, as opposed to a combination of [InnoDB](#) and non-[InnoDB](#) storage engines?

Yes. Using [InnoDB](#) tables exclusively can simplify backup and recovery operations. MySQL Enterprise Backup does a [hot backup](#) of all tables that use the [InnoDB](#) storage engine. For tables using [MyISAM](#) or other non-[InnoDB](#) storage engines, it does a “warm” backup, where the database continues to run, but those tables cannot be modified while being backed up. See [Section 29.2, “MySQL Enterprise Backup Overview”](#).

**A.2.6.** What are the unique benefits of the [ARCHIVE](#) storage engine?

The [ARCHIVE](#) storage engine stores large amounts of data without indexes; it has a small footprint, and performs selects using table scans. See [Section 16.5, “The ARCHIVE Storage Engine”](#), for details.

## A.3 MySQL 8.0 FAQ: Server SQL Mode

A.3.1 What are server SQL modes? .....	4978
A.3.2 How many server SQL modes are there? .....	4978
A.3.3 How do you determine the server SQL mode? .....	4978
A.3.4 Is the mode dependent on the database or connection? .....	4978
A.3.5 Can the rules for strict mode be extended? .....	4978

A.3.6 Does strict mode impact performance? .....	4978
A.3.7 What is the default server SQL mode when MySQL 8.0 is installed? .....	4978

#### A.3.1. What are server SQL modes?

Server SQL modes define what SQL syntax MySQL should support and what kind of data validation checks it should perform. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers. The MySQL Server apply these modes individually to different clients. For more information, see [Section 5.1.11, “Server SQL Modes”](#).

#### A.3.2. How many server SQL modes are there?

Each mode can be independently switched on and off. See [Section 5.1.11, “Server SQL Modes”](#), for a complete list of available modes.

#### A.3.3. How do you determine the server SQL mode?

You can set the default SQL mode (for `mysqld` startup) with the `--sql-mode` option. Using the statement `SET [GLOBAL|SESSION] sql_mode='modes'`, you can change the settings from within a connection, either locally to the connection, or to take effect globally. You can retrieve the current mode by issuing a `SELECT @@sql_mode` statement.

#### A.3.4. Is the mode dependent on the database or connection?

A mode is not linked to a particular database. Modes can be set locally to the session (connection), or globally for the server. you can change these settings using `SET [GLOBAL|SESSION] sql_mode='modes'`.

#### A.3.5. Can the rules for strict mode be extended?

When we refer to *strict mode*, we mean a mode where at least one of the modes `TRADITIONAL`, `STRICT_TRANS_TABLES`, or `STRICT_ALL_TABLES` is enabled. Options can be combined, so you can add restrictions to a mode. See [Section 5.1.11, “Server SQL Modes”](#), for more information.

#### A.3.6. Does strict mode impact performance?

The intensive validation of input data that some settings requires more time than if the validation is not done. While the performance impact is not that great, if you do not require such validation (perhaps your application already handles all of this), then MySQL gives you the option of leaving strict mode disabled. However, if you do require it, strict mode can provide such validation.

#### A.3.7. What is the default server SQL mode when MySQL 8.0 is installed?

The default SQL mode in MySQL 8.0 includes these modes: `ONLY_FULL_GROUP_BY`, `STRICT_TRANS_TABLES`, `NO_ZERO_IN_DATE`, `NO_ZERO_DATE`, `ERROR_FOR_DIVISION_BY_ZERO`, and `NO_ENGINE_SUBSTITUTION`.

For information about all available modes and default MySQL behavior, see [Section 5.1.11, “Server SQL Modes”](#).

## A.4 MySQL 8.0 FAQ: Stored Procedures and Functions

A.4.1 Does MySQL 8.0 support stored procedures and functions? .....	4979
A.4.2 Where can I find documentation for MySQL stored procedures and stored functions? .....	4979
A.4.3 Is there a discussion forum for MySQL stored procedures? .....	4979
A.4.4 Where can I find the ANSI SQL 2003 specification for stored procedures? .....	4979
A.4.5 How do you manage stored routines? .....	4979
A.4.6 Is there a way to view all stored procedures and stored functions in a given database? .....	4979
A.4.7 Where are stored procedures stored? .....	4980

A.4.8 Is it possible to group stored procedures or stored functions into packages? .....	4980
A.4.9 Can a stored procedure call another stored procedure? .....	4980
A.4.10 Can a stored procedure call a trigger? .....	4980
A.4.11 Can a stored procedure access tables? .....	4980
A.4.12 Do stored procedures have a statement for raising application errors? .....	4980
A.4.13 Do stored procedures provide exception handling? .....	4980
A.4.14 Can MySQL 8.0 stored routines return result sets? .....	4980
A.4.15 Is <code>WITH RECOMPILE</code> supported for stored procedures? .....	4980
A.4.16 Is there a MySQL equivalent to using <code>mod_plsql</code> as a gateway on Apache to talk directly to a stored procedure in the database? .....	4981
A.4.17 Can I pass an array as input to a stored procedure? .....	4981
A.4.18 Can I pass a cursor as an <code>IN</code> parameter to a stored procedure? .....	4981
A.4.19 Can I return a cursor as an <code>OUT</code> parameter from a stored procedure? .....	4981
A.4.20 Can I print out a variable's value within a stored routine for debugging purposes? .....	4981
A.4.21 Can I commit or roll back transactions inside a stored procedure? .....	4981
A.4.22 Do MySQL 8.0 stored procedures and functions work with replication? .....	4981
A.4.23 Are stored procedures and functions created on a replication source server replicated to a replica? .....	4981
A.4.24 How are actions that take place inside stored procedures and functions replicated? .....	4981
A.4.25 Are there special security requirements for using stored procedures and functions together with replication? .....	4981
A.4.26 What limitations exist for replicating stored procedure and function actions? .....	4982
A.4.27 Do the preceding limitations affect the ability of MySQL to do point-in-time recovery? .....	4982
A.4.28 What is being done to correct the aforementioned limitations? .....	4982

**A.4.1. Does MySQL 8.0 support stored procedures and functions?**

Yes. MySQL 8.0 supports two types of stored routines, stored procedures and stored functions.

**A.4.2. Where can I find documentation for MySQL stored procedures and stored functions?**

See [Section 24.2, “Using Stored Routines”](#).

**A.4.3. Is there a discussion forum for MySQL stored procedures?**

Yes. See <https://forums.mysql.com/list.php?98>.

**A.4.4. Where can I find the ANSI SQL 2003 specification for stored procedures?**

Unfortunately, the official specifications are not freely available (ANSI makes them available for purchase). However, there are books, such as *SQL-99 Complete, Really* by Peter Gultzan and Trudy Pelzer, that provide a comprehensive overview of the standard, including coverage of stored procedures.

**A.4.5. How do you manage stored routines?**

It is always good practice to use a clear naming scheme for your stored routines. You can manage stored procedures with `CREATE [FUNCTION|PROCEDURE]`, `ALTER [FUNCTION|PROCEDURE]`, `DROP [FUNCTION|PROCEDURE]`, and `SHOW CREATE [FUNCTION|PROCEDURE]`. You can obtain information about existing stored procedures using the `ROUTINES` table in the `INFORMATION_SCHEMA` database (see [Section 25.30, “The INFORMATION\\_SCHEMA ROUTINES Table”](#)).

**A.4.6. Is there a way to view all stored procedures and stored functions in a given database?**

Yes. For a database named `dbname`, use this query on the `INFORMATION_SCHEMA.ROUTINES` table:

```
SELECT ROUTINE_TYPE, ROUTINE_NAME
FROM INFORMATION_SCHEMA.ROUTINES
WHERE ROUTINE_SCHEMA='dbname' ;
```

For more information, see [Section 25.30, “The INFORMATION\\_SCHEMA ROUTINES Table”](#).

The body of a stored routine can be viewed using `SHOW CREATE FUNCTION` (for a stored function) or `SHOW CREATE PROCEDURE` (for a stored procedure). See [Section 13.7.7.9, “SHOW CREATE PROCEDURE Statement”](#), for more information.

**A.4.7. Where are stored procedures stored?**

Stored procedures are stored in the `mysql.routines` and `mysql.parameters` tables, which are part of the data dictionary. You cannot access these tables directly. Instead, query the `INFORMATION_SCHEMA.ROUTINES` and `PARAMETERS` tables. See [Section 25.30, “The INFORMATION\\_SCHEMA ROUTINES Table”](#), and [Section 25.20, “The INFORMATION\\_SCHEMA PARAMETERS Table”](#).

You can also use `SHOW CREATE FUNCTION` to obtain information about stored functions, and `SHOW CREATE PROCEDURE` to obtain information about stored procedures. See [Section 13.7.7.9, “SHOW CREATE PROCEDURE Statement”](#).

**A.4.8. Is it possible to group stored procedures or stored functions into packages?**

No. This is not supported in MySQL 8.0.

**A.4.9. Can a stored procedure call another stored procedure?**

Yes.

**A.4.10 Can a stored procedure call a trigger?**

A stored procedure can execute an SQL statement, such as an `UPDATE`, that causes a trigger to activate.

**A.4.11 Can a stored procedure access tables?**

Yes. A stored procedure can access one or more tables as required.

**A.4.12 Do stored procedures have a statement for raising application errors?**

Yes. MySQL 8.0 implements the SQL standard `SIGNAL` and `RESIGNAL` statements. See [Section 13.6.7, “Condition Handling”](#).

**A.4.13 Do stored procedures provide exception handling?**

MySQL implements `HANDLER` definitions according to the SQL standard. See [Section 13.6.7.2, “DECLARE ... HANDLER Statement”](#), for details.

**A.4.14 Can MySQL 8.0 stored routines return result sets?**

*Stored procedures* can, but stored functions cannot. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You need to use the MySQL 4.1 (or higher) client/server protocol for this to work. This means that, for example, in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

**A.4.15 Is `WITH RECOMPILE` supported for stored procedures?**

Not in MySQL 8.0.

**A.4.16** Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?

There is no equivalent in MySQL 8.0.

**A.4.17** Can I pass an array as input to a stored procedure?

Not in MySQL 8.0.

**A.4.18** Can I pass a cursor as an `IN` parameter to a stored procedure?

In MySQL 8.0, cursors are available inside stored procedures only.

**A.4.19** Can I return a cursor as an `OUT` parameter from a stored procedure?

In MySQL 8.0, cursors are available inside stored procedures only. However, if you do not open a cursor on a `SELECT`, the result will be sent directly to the client. You can also `SELECT INTO` variables. See [Section 13.2.10, “SELECT Statement”](#).

**A.4.20** Can I print out a variable's value within a stored routine for debugging purposes?

Yes, you can do this in a *stored procedure*, but not in a stored function. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You will need to use the MySQL 4.1 (or above) client/server protocol for this to work. This means that, for example, in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

**A.4.21** Can I commit or roll back transactions inside a stored procedure?

Yes. However, you cannot perform transactional operations within a stored function.

**A.4.22** Do MySQL 8.0 stored procedures and functions work with replication?

Yes, standard actions carried out in stored procedures and functions are replicated from a replication source server to a replica. There are a few limitations that are described in detail in [Section 24.7, “Stored Program Binary Logging”](#).

**A.4.23** Are stored procedures and functions created on a replication source server replicated to a replica?

Yes, creation of stored procedures and functions carried out through normal DDL statements on a replication source server are replicated to a replica, so the objects will exist on both servers. `ALTER` and `DROP` statements for stored procedures and functions are also replicated.

**A.4.24** How are actions that take place inside stored procedures and functions replicated?

MySQL records each DML event that occurs in a stored procedure and replicates those individual actions to a replica. The actual calls made to execute stored procedures are not replicated.

Stored functions that change data are logged as function invocations, not as the DML events that occur inside each function.

**A.4.25** Are there special security requirements for using stored procedures and functions together with replication?

Yes. Because a replica has authority to execute any statement read from a source's binary log, special security constraints exist for using stored functions with replication. If replication or binary logging in general (for the purpose of point-in-time recovery) is active, then MySQL DBAs have two security options open to them:

1. Any user wishing to create stored functions must be granted the `SUPER` privilege.

2. Alternatively, a DBA can set the `log_bin_trust_function_creators` system variable to 1, which enables anyone with the standard `CREATE ROUTINE` privilege to create stored functions.

#### A.4.26 What limitations exist for replicating stored procedure and function actions?

Nondeterministic (random) or time-based actions embedded in stored procedures may not replicate properly. By their very nature, randomly produced results are not predictable and cannot be exactly reproduced, and therefore, random actions replicated to a replica will not mirror those performed on a source. Declaring stored functions to be `DETERMINISTIC` or setting the `log_bin_trust_function_creators` system variable to 0 will not allow random-valued operations to be invoked.

In addition, time-based actions cannot be reproduced on a replica because the timing of such actions in a stored procedure is not reproducible through the binary log used for replication. It records only DML events and does not factor in timing constraints.

Finally, nontransactional tables for which errors occur during large DML actions (such as bulk inserts) may experience replication issues in that a source may be partially updated from DML activity, but no updates are done to the replica because of the errors that occurred. A workaround is for a function's DML actions to be carried out with the `IGNORE` keyword so that updates on the source that cause errors are ignored and updates that do not cause errors are replicated to the replica.

#### A.4.27 Do the preceding limitations affect the ability of MySQL to do point-in-time recovery?

The same limitations that affect replication do affect point-in-time recovery.

#### A.4.28 What is being done to correct the aforementioned limitations?

You can choose either statement-based replication or row-based replication. The original replication implementation is based on statement-based binary logging. Row-based binary logging resolves the limitations mentioned earlier.

*Mixed* replication is also available (by starting the server with `--binlog-format=mixed`). This hybrid form of replication “knows” whether statement-level replication can safely be used, or row-level replication is required.

For additional information, see [Section 17.2.1, “Replication Formats”](#).

## A.5 MySQL 8.0 FAQ: Triggers

A.5.1 Where can I find the documentation for MySQL 8.0 triggers? .....	4983
A.5.2 Is there a discussion forum for MySQL Triggers? .....	4983
A.5.3 Does MySQL 8.0 have statement-level or row-level triggers? .....	4983
A.5.4 Are there any default triggers? .....	4983
A.5.5 How are triggers managed in MySQL? .....	4983
A.5.6 Is there a way to view all triggers in a given database? .....	4983
A.5.7 Where are triggers stored? .....	4983
A.5.8 Can a trigger call a stored procedure? .....	4983
A.5.9 Can triggers access tables? .....	4983
A.5.10 Can a table have multiple triggers with the same trigger event and action time? .....	4983
A.5.11 Can triggers call an external application through a UDF? .....	4984
A.5.12 Is it possible for a trigger to update tables on a remote server? .....	4984
A.5.13 Do triggers work with replication? .....	4984
A.5.14 How are actions carried out through triggers on a source replicated to a replica? .....	4984

**A.5.1.** Where can I find the documentation for MySQL 8.0 triggers?

See [Section 24.3, “Using Triggers”](#).

**A.5.2.** Is there a discussion forum for MySQL Triggers?

Yes. It is available at <https://forums.mysql.com/list.php?99>.

**A.5.3.** Does MySQL 8.0 have statement-level or row-level triggers?

In MySQL 8.0, all triggers are `FOR EACH ROW`; that is, the trigger is activated for each row that is inserted, updated, or deleted. MySQL 8.0 does not support triggers using `FOR EACH STATEMENT`.

**A.5.4.** Are there any default triggers?

Not explicitly. MySQL does have specific special behavior for some `TIMESTAMP` columns, as well as for columns which are defined using `AUTO_INCREMENT`.

**A.5.5.** How are triggers managed in MySQL?

In MySQL 8.0, triggers can be created using the `CREATE TRIGGER` statement, and dropped using `DROP TRIGGER`. See [Section 13.1.22, “CREATE TRIGGER Statement”](#), and [Section 13.1.34, “DROP TRIGGER Statement”](#), for more about these statements.

Information about triggers can be obtained by querying the `INFORMATION_SCHEMA.TRIGGERS` table. See [Section 25.45, “The INFORMATION\\_SCHEMA TRIGGERS Table”](#).

**A.5.6.** Is there a way to view all triggers in a given database?

Yes. You can obtain a listing of all triggers defined on database `dbname` using a query on the `INFORMATION_SCHEMA.TRIGGERS` table such as the one shown here:

```
SELECT TRIGGER_NAME, EVENT_MANIPULATION, EVENT_OBJECT_TABLE, ACTION_STATEMENT
FROM INFORMATION_SCHEMA.TRIGGERS
WHERE TRIGGER_SCHEMA= 'dbname' ;
```

For more information about this table, see [Section 25.45, “The INFORMATION\\_SCHEMA TRIGGERS Table”](#).

You can also use the `SHOW TRIGGERS` statement, which is specific to MySQL. See [Section 13.7.7.40, “SHOW TRIGGERS Statement”](#).

**A.5.7.** Where are triggers stored?

Triggers are stored in the `mysql.triggers` system table, which is part of the data dictionary.

**A.5.8.** Can a trigger call a stored procedure?

Yes.

**A.5.9.** Can triggers access tables?

A trigger can access both old and new data in its own table. A trigger can also affect other tables, but it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.

**A.5.10** Can a table have multiple triggers with the same trigger event and action time?

In MySQL 8.0, it is possible to define multiple triggers for a given table that have the same trigger event and action time. For example, you can have two `BEFORE UPDATE` triggers for a table. By

default, triggers that have the same trigger event and action time activate in the order they were created. To affect trigger order, specify a clause after `FOR EACH ROW` that indicates `FOLLOWS` or `PRECEDES` and the name of an existing trigger that also has the same trigger event and action time. With `FOLLOWS`, the new trigger activates after the existing trigger. With `PRECEDES`, the new trigger activates before the existing trigger.

**A.5.11** Can triggers call an external application through a UDF?

Yes. For example, a trigger could invoke the `sys_exec()` UDF.

**A.5.12** Is it possible for a trigger to update tables on a remote server?

Yes. A table on a remote server could be updated using the `FEDERATED` storage engine. (See [Section 16.8, “The FEDERATED Storage Engine”](#)).

**A.5.13** Do triggers work with replication?

Yes. However, the way in which they work depends whether you are using MySQL's “classic” statement-based or row-based replication format.

When using statement-based replication, triggers on the replica are executed by statements that are executed on the source (and replicated to the replica).

When using row-based replication, triggers are not executed on the replica due to statements that were run on the source and then replicated to the replica. Instead, when using row-based replication, the changes caused by executing the trigger on the source are applied on the replica.

For more information, see [Section 17.5.1.35, “Replication and Triggers”](#).

**A.5.14** How are actions carried out through triggers on a source replicated to a replica?

Again, this depends on whether you are using statement-based or row-based replication.

**Statement-based replication.** First, the triggers that exist on a source must be re-created on the replica server. Once this is done, the replication flow works as any other standard DML statement that participates in replication. For example, consider a table `EMP` that has an `AFTER` insert trigger, which exists on a replication source server. The same `EMP` table and `AFTER` insert trigger exist on the replica server as well. The replication flow would be:

1. An `INSERT` statement is made to `EMP`.
2. The `AFTER` trigger on `EMP` activates.
3. The `INSERT` statement is written to the binary log.
4. The replica picks up the `INSERT` statement to `EMP` and executes it.
5. The `AFTER` trigger on `EMP` that exists on the replica activates.

**Row-based replication.** When you use row-based replication, the changes caused by executing the trigger on the source are applied on the replica. However, the triggers themselves are not actually executed on the replica under row-based replication. This is because, if both the source and the replica applied the changes from the source and, in addition, the trigger causing these changes were applied on the replica, the changes would in effect be applied twice on the replica, leading to different data on the source and the replica.

In most cases, the outcome is the same for both row-based and statement-based replication. However, if you use different triggers on the source and replica, you cannot use row-based

replication. (This is because the row-based format replicates the changes made by triggers executing on the source to the replicas, rather than the statements that caused the triggers to execute, and the corresponding triggers on the replica are not executed.) Instead, any statements causing such triggers to be executed must be replicated using statement-based replication.

For more information, see [Section 17.5.1.35, “Replication and Triggers”](#).

## A.6 MySQL 8.0 FAQ: Views

A.6.1 Where can I find documentation covering MySQL Views? .....	4985
A.6.2 Is there a discussion forum for MySQL Views? .....	4985
A.6.3 What happens to a view if an underlying table is dropped or renamed? .....	4985
A.6.4 Does MySQL 8.0 have table snapshots? .....	4985
A.6.5 Does MySQL 8.0 have materialized views? .....	4985
A.6.6 Can you insert into views that are based on joins? .....	4985

### A.6.1. Where can I find documentation covering MySQL Views?

See [Section 24.5, “Using Views”](#).

### A.6.2. Is there a discussion forum for MySQL Views?

Yes. See <https://forums.mysql.com/list.php?100>

### A.6.3. What happens to a view if an underlying table is dropped or renamed?

After a view has been created, it is possible to drop or alter a table or view to which the definition refers. To check a view definition for problems of this kind, use the [CHECK TABLE](#) statement. (See [Section 13.7.3.2, “CHECK TABLE Statement”](#).)

### A.6.4. Does MySQL 8.0 have table snapshots?

No.

### A.6.5. Does MySQL 8.0 have materialized views?

No.

### A.6.6. Can you insert into views that are based on joins?

It is possible, provided that your [INSERT](#) statement has a column list that makes it clear there is only one table involved.

You *cannot* insert into multiple tables with a single insert on a view.

## A.7 MySQL 8.0 FAQ: INFORMATION\_SCHEMA

A.7.1 Where can I find documentation for the MySQL <a href="#">INFORMATION_SCHEMA</a> database? .....	4985
A.7.2 Is there a discussion forum for <a href="#">INFORMATION_SCHEMA</a> ? .....	4986
A.7.3 Where can I find the ANSI SQL 2003 specification for <a href="#">INFORMATION_SCHEMA</a> ? .....	4986
A.7.4 What is the difference between the Oracle Data Dictionary and MySQL <a href="#">INFORMATION_SCHEMA</a> ? .....	4986
A.7.5 Can I add to or otherwise modify the tables found in the <a href="#">INFORMATION_SCHEMA</a> database? ....	4986

### A.7.1. Where can I find documentation for the MySQL [INFORMATION\\_SCHEMA](#) database?

See [Chapter 25, \*INFORMATION\\_SCHEMA\* Tables](#)

**A.7.2.** Is there a discussion forum for [INFORMATION\\_SCHEMA](#)?

See <https://forums.mysql.com/list.php?101>.

**A.7.3.** Where can I find the ANSI SQL 2003 specification for [INFORMATION\\_SCHEMA](#)?

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available, such as *SQL-99 Complete, Really* by Peter Gultzan and Trudy Pelzer, that provide a comprehensive overview of the standard, including [INFORMATION\\_SCHEMA](#).

**A.7.4.** What is the difference between the Oracle Data Dictionary and MySQL [INFORMATION\\_SCHEMA](#)?

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names. The MySQL implementation is more similar to those found in DB2 and SQL Server, which also support [INFORMATION\\_SCHEMA](#) as defined in the SQL standard.

**A.7.5.** Can I add to or otherwise modify the tables found in the [INFORMATION\\_SCHEMA](#) database?

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, *we cannot support bugs or other issues which result from modifying [INFORMATION\\_SCHEMA](#) tables or data.*

## A.8 MySQL 8.0 FAQ: Migration

A.8.1 Where can I find information on how to migrate from MySQL 5.7 to MySQL 8.0? ..... 4986

A.8.2 How has storage engine (table type) support changed in MySQL 8.0 from previous versions? ... 4986

**A.8.1.** Where can I find information on how to migrate from MySQL 5.7 to MySQL 8.0?

For detailed upgrade information, see [Section 2.11, “Upgrading MySQL”](#). Do not skip a major version when upgrading, but rather complete the process in steps, upgrading from one major version to the next in each step. This may seem more complicated, but it will you save time and trouble. If you encounter problems during the upgrade, their origin will be easier to identify, either by you or, if you have a MySQL Enterprise subscription, by MySQL support.

**A.8.2.** How has storage engine (table type) support changed in MySQL 8.0 from previous versions?

Storage engine support has changed as follows:

- Support for [ISAM](#) tables was removed in MySQL 5.0 and you should now use the [MyISAM](#) storage engine in place of [ISAM](#). To convert a table [tblname](#) from [ISAM](#) to [MyISAM](#), simply issue a statement such as this one:

```
ALTER TABLE tblname ENGINE=MYISAM;
```

- Internal [RAID](#) for [MyISAM](#) tables was also removed in MySQL 5.0. This was formerly used to allow large tables in file systems that did not support file sizes greater than 2GB. All modern file systems allow for larger tables; in addition, there are now other solutions such as [MERGE](#) tables and views.
- The [VARCHAR](#) column type now retains trailing spaces in all storage engines.
- [MEMORY](#) tables (formerly known as [HEAP](#) tables) can also contain [VARCHAR](#) columns.

## A.9 MySQL 8.0 FAQ: Security

A.9.1 Where can I find documentation that addresses security issues for MySQL? ..... 4987

A.9.2 What is the default authentication plugin in MySQL 8.0? .....	4987
A.9.3 Does MySQL 8.0 have native support for SSL? .....	4987
A.9.4 Is SSL support built into MySQL binaries, or must I recompile the binary myself to enable it? ....	4987
A.9.5 Does MySQL 8.0 have built-in authentication against LDAP directories? .....	4988
A.9.6 Does MySQL 8.0 include support for Roles Based Access Control (RBAC)? .....	4988

**A.9.1.** Where can I find documentation that addresses security issues for MySQL?

The best place to start is [Chapter 6, Security](#).

Other portions of the MySQL Documentation which you may find useful with regard to specific security concerns include the following:

- [Section 6.1.1, “Security Guidelines”](#).
- [Section 6.1.3, “Making MySQL Secure Against Attackers”](#).
- [Section B.3.3.2, “How to Reset the Root Password”](#).
- [Section 6.1.5, “How to Run MySQL as a Normal User”](#).
- [UDF Security Precautions](#).
- [Section 6.1.4, “Security-Related mysqld Options and Variables”](#).
- [Section 6.1.6, “Security Considerations for LOAD DATA LOCAL”](#).
- [Section 2.10, “Postinstallation Setup and Testing”](#).
- [Section 6.3, “Using Encrypted Connections”](#).

**A.9.2.** What is the default authentication plugin in MySQL 8.0?

The default authentication plugin in MySQL 8.0 is `caching_sha2_password`. For information about this plugin, see [Section 6.4.1.2, “Caching SHA-2 Pluggable Authentication”](#).

The `caching_sha2_password` plugin provides more secure password encryption than the `mysql_native_password` plugin (the default plugin in previous MySQL series). For information about the implications of this change of default plugin for server operation and compatibility of the server with clients and connectors, see [caching\\_sha2\\_password as the Preferred Authentication Plugin](#).

For general information about pluggable authentication and other available authentication plugins, see [Section 6.2.17, “Pluggable Authentication”](#), and [Section 6.4.1, “Authentication Plugins”](#).

**A.9.3.** Does MySQL 8.0 have native support for SSL?

Most 8.0 binaries have support for SSL connections between the client and server. See [Section 6.3, “Using Encrypted Connections”](#).

You can also tunnel a connection using SSH, if (for example) the client application does not support SSL connections. For an example, see [Section 6.3.4, “Connecting to MySQL Remotely from Windows with SSH”](#).

**A.9.4.** Is SSL support built into MySQL binaries, or must I recompile the binary myself to enable it?

Most 8.0 binaries have SSL enabled for client/server connections that are secured, authenticated, or both. See [Section 6.3, “Using Encrypted Connections”](#).

**A.9.5.** Does MySQL 8.0 have built-in authentication against LDAP directories?

The Enterprise edition includes a [PAM Authentication Plugin](#) that supports authentication against an LDAP directory.

**A.9.6.** Does MySQL 8.0 include support for Roles Based Access Control (RBAC)?

Not at this time.

## A.10 MySQL 8.0 FAQ: NDB Cluster

In the following section, we answer questions that are frequently asked about MySQL NDB Cluster and the [NDB](#) storage engine.

A.10.1 Which versions of the MySQL software support NDB Cluster? Do I have to compile from source? .....	4989
A.10.2 What do “NDB” and “NDBCLUSTER” mean? .....	4990
A.10.3 What is the difference between using NDB Cluster versus using MySQL Replication? .....	4990
A.10.4 Do I need any special networking to run NDB Cluster? How do computers in a cluster communicate? .....	4990
A.10.5 How many computers do I need to run an NDB Cluster, and why? .....	4990
A.10.6 What do the different computers do in an NDB Cluster? .....	4990
A.10.7 When I run the <a href="#">SHOW</a> command in the NDB Cluster management client, I see a line of output that looks like this: .....	4991
A.10.8 With which operating systems can I use NDB Cluster? .....	4992

#### **A.10.1** Which versions of the MySQL software support NDB Cluster? Do I have to compile from source?

NDB Cluster is not supported in standard MySQL Server 8.0 releases. Instead, MySQL NDB Cluster is provided as a separate product. Available NDB Cluster release series include the following:

- **NDB Cluster 7.2.** This series is no longer supported for new deployments or maintained. Users of NDB Cluster 7.2 should upgrade to a newer release series as soon as possible. We recommend that new deployments use the latest NDB Cluster 8.0 release.
- **NDB Cluster 7.3.** This series is a previous General Availability (GA) version of NDB Cluster, still available for production use, although we recommend that new deployments use the latest NDB Cluster 8.0 release. The most recent NDB Cluster 7.3 release can be obtained from <https://dev.mysql.com/downloads/cluster/>.
- **NDB Cluster 7.4.** This series is a previous General Availability (GA) version of NDB Cluster, still available for production use, although we recommend that new deployments use the latest NDB Cluster 8.0 release. The most recent NDB Cluster 7.4 release can be obtained from <https://dev.mysql.com/downloads/cluster/>.
- **NDB Cluster 7.5.** This series is a previous General Availability (GA) version of NDB Cluster, still available for production use, although we recommend that new deployments use the latest NDB Cluster 7.6 release. The latest NDB Cluster 7.5 releases can be obtained from <https://dev.mysql.com/downloads/cluster/>.
- **NDB Cluster 7.6.** This series is a previous General Availability (GA) version of NDB Cluster, still available for production use, although we recommend that new deployments use the latest NDB Cluster 8.0 release. The latest NDB Cluster 7.6 releases can be obtained from <https://dev.mysql.com/downloads/cluster/>.
- **NDB Cluster 8.0.** This series is the most recent General Availability (GA) version of NDB Cluster, based on version 8.0 of the [NDB](#) storage engine and MySQL Server 8.0. NDB Cluster 8.0 is available for production use; new deployments intended for production should use the latest GA release in this series, which is currently NDB Cluster 8.0.22. You can obtain the most recent NDB Cluster 8.0 release from <https://dev.mysql.com/downloads/cluster/>. For information about new features and other important changes in this series, see [Section 22.1.4, “What is New in NDB Cluster”](#).

You can obtain and compile NDB Cluster from source (see [Section 22.2.1.4, “Building NDB Cluster from Source on Linux”](#), and [Section 22.2.2.2, “Compiling and Installing NDB Cluster from Source on Windows”](#)), but for all but the most specialized cases, we recommend using one of the following installers provided by Oracle that is appropriate to your operating platform and circumstances:

- The web-based [NDB Cluster Auto-Installer](#) (works on all platforms supported by [NDB](#))
- Linux [binary release](#) (`tar.gz` file)
- Linux [RPM package](#)

- Linux [.deb file](#)
- Windows [binary “no-install” release](#)
- Windows [MSI Installer](#)

Installation packages may also be available from your platform's package management system.

You can determine whether your MySQL Server has [NDB](#) support using one of the statements [SHOW VARIABLES LIKE 'have\\_%'](#), [SHOW ENGINES](#), or [SHOW PLUGINS](#).

#### A.10.2 What do “NDB” and “NDBCLUSTER” mean?

“NDB” stands for “**N**etwork **D**atabase”. [NDB](#) and [NDBCLUSTER](#) are both names for the storage engine that enables clustering support with MySQL. [NDB](#) is preferred, but either name is correct.

#### A.10.3 What is the difference between using NDB Cluster versus using MySQL Replication?

In traditional MySQL replication, a source MySQL server updates one or more replicas. Transactions are committed sequentially, and a slow transaction can cause the replica to lag behind the source. This means that if the source fails, it is possible that the replica might not have recorded the last few transactions. If a transaction-safe engine such as [InnoDB](#) is being used, a transaction will either be complete on the replica or not applied at all, but replication does not guarantee that all data on the source and the replica will be consistent at all times. In NDB Cluster, all data nodes are kept in synchrony, and a transaction committed by any one data node is committed for all data nodes. In the event of a data node failure, all remaining data nodes remain in a consistent state.

In short, whereas standard MySQL replication is *asynchronous*, NDB Cluster is *synchronous*.

Asynchronous replication is also available in NDB Cluster. *NDB Cluster Replication* (also sometimes known as “geo-replication”) includes the capability to replicate both between two NDB Clusters, and from an NDB Cluster to a non-Cluster MySQL server. See [Section 22.6, “NDB Cluster Replication”](#).

#### A.10.4 Do I need any special networking to run NDB Cluster? How do computers in a cluster communicate?

NDB Cluster is intended to be used in a high-bandwidth environment, with computers connecting using TCP/IP. Its performance depends directly upon the connection speed between the cluster's computers. The minimum connectivity requirements for NDB Cluster include a typical 100-megabit Ethernet network or the equivalent. We recommend you use gigabit Ethernet whenever available.

#### A.10.5 How many computers do I need to run an NDB Cluster, and why?

A minimum of three computers is required to run a viable cluster. However, the minimum *recommended* number of computers in an NDB Cluster is four: one each to run the management and SQL nodes, and two computers to serve as data nodes. The purpose of the two data nodes is to provide redundancy; the management node must run on a separate machine to guarantee continued arbitration services in the event that one of the data nodes fails.

To provide increased throughput and high availability, you should use multiple SQL nodes (MySQL Servers connected to the cluster). It is also possible (although not strictly necessary) to run multiple management servers.

#### A.10.6 What do the different computers do in an NDB Cluster?

An NDB Cluster has both a physical and logical organization, with computers being the physical elements. The logical or functional elements of a cluster are referred to as *nodes*, and a computer

housing a cluster node is sometimes referred to as a *cluster host*. There are three types of nodes, each corresponding to a specific role within the cluster. These are:

- **Management node.** This node provides management services for the cluster as a whole, including startup, shutdown, backups, and configuration data for the other nodes. The management node server is implemented as the application `ndb_mgmd`; the management client used to control NDB Cluster is `ndb_mgm`. See [Section 22.4.4, “ndb\\_mgmd — The NDB Cluster Management Server Daemon”](#), and [Section 22.4.5, “ndb\\_mgm — The NDB Cluster Management Client”](#), for information about these programs.
- **Data node.** This type of node stores and replicates data. Data node functionality is handled by instances of the NDB data node process `ndbd`. For more information, see [Section 22.4.1, “ndbd — The NDB Cluster Data Node Daemon”](#).
- **SQL node.** This is simply an instance of MySQL Server (`mysqld`) that is built with support for the `NDBCLUSTER` storage engine and started with the `--ndb-cluster` option to enable the engine and the `--ndb-connectstring` option to enable it to connect to an NDB Cluster management server. For more about these options, see [MySQL Server Options for NDB Cluster](#).

#### Note

An *API node* is any application that makes direct use of Cluster data nodes for data storage and retrieval. An SQL node can thus be considered a type of API node that uses a MySQL Server to provide an SQL interface to the Cluster. You can write such applications (that do not depend on a MySQL Server) using the NDB API, which supplies a direct, object-oriented transaction and scanning interface to NDB Cluster data; see [NDB Cluster API Overview: The NDB API](#), for more information.

**A.10.7** When I run the `SHOW` command in the NDB Cluster management client, I see a line of output that looks like this:

```
id=2 @10.100.10.32 (Version: 8.0.22-ndb-8.0.22 Nodegroup: 0, *)
```

What does the `*` mean? How is this node different from the others?

The simplest answer is, “It’s not something you can control, and it’s nothing that you need to worry about in any case, unless you’re a software engineer writing or analyzing the NDB Cluster source code”.

If you don’t find that answer satisfactory, here’s a longer and more technical version:

A number of mechanisms in NDB Cluster require distributed coordination among the data nodes. These distributed algorithms and protocols include global checkpointing, DDL (schema) changes, and node restart handling. To make this coordination simpler, the data nodes “elect” one of their number to act as leader. There is no user-facing mechanism for influencing this selection, which is completely automatic; the fact that it *is* automatic is a key part of NDB Cluster’s internal architecture.

When a node acts as the “leader” for any of these mechanisms, it is usually the point of coordination for the activity, and the other nodes act as “followers”, carrying out their parts of the activity as directed by the leader. If the node acting as leader fails, then the remaining nodes elect a new leader. Tasks in progress that were being coordinated by the old leader may either fail or be continued by the new leader, depending on the actual mechanism involved.

It is possible for some of these different mechanisms and protocols to have different leader nodes, but in general the same leader is chosen for all of them. The node indicated as the leader in the

output of `SHOW` in the management client is known internally as the `DICT` manager (see [The DBDICT Block](#), in the *NDB Cluster API Developer Guide*, for more information), responsible for coordinating DDL and metadata activity.

NDB Cluster is designed in such a way that the choice of leader has no discernible effect outside the cluster itself. For example, the current leader does not have significantly higher CPU or resource usage than the other data nodes, and failure of the leader should not have a significantly different impact on the cluster than the failure of any other data node.

#### A.10.8 With which operating systems can I use NDB Cluster?

NDB Cluster is supported on most Unix-like operating systems. NDB Cluster is also supported in production settings on Microsoft Windows operating systems.

For more detailed information concerning the level of support which is offered for NDB Cluster on various operating system versions, operating system distributions, and hardware platforms, please refer to <https://www.mysql.com/support/supportedplatforms/cluster.html>.

#### A.10.9 What are the hardware requirements for running NDB Cluster?

NDB Cluster should run on any platform for which `NDB`-enabled binaries are available. For data nodes and API nodes, faster CPUs and more memory are likely to improve performance, and 64-bit CPUs are likely to be more effective than 32-bit processors. There must be sufficient memory on machines used for data nodes to hold each node's share of the database (see *How much RAM do I Need?* for more information). For a computer which is used only for running the NDB Cluster management server, the requirements are minimal; a common desktop PC (or the equivalent) is generally sufficient for this task. Nodes can communicate through the standard TCP/IP network and hardware. They can also use the high-speed SCI protocol; however, special networking hardware and software are required to use SCI (see [Section 22.3.4, "Using High-Speed Interconnects with NDB Cluster"](#)).

#### A.10.10 How much RAM do I need to use NDB Cluster? Is it possible to use disk memory at all?

NDB Cluster was originally implemented as in-memory only, but all versions currently available also provide the ability to store NDB Cluster on disk. See [Section 22.5.10, "NDB Cluster Disk Data Tables"](#), for more information.

For in-memory `NDB` tables, you can use the following formula for obtaining a rough estimate of how much RAM is needed for each data node in the cluster:

```
(SizeofDatabase × NumberOfReplicas × 1.1) / NumberOfDataNodes
```

To calculate the memory requirements more exactly requires determining, for each table in the cluster database, the storage space required per row (see [Section 11.7, "Data Type Storage Requirements"](#), for details), and multiplying this by the number of rows. You must also remember to account for any column indexes as follows:

- Each primary key or hash index created for an `NDBCLUSTER` table requires 21–25 bytes per record. These indexes use `IndexMemory`.
- Each ordered index requires 10 bytes storage per record, using `DataMemory`.

- Creating a primary key or unique index also creates an ordered index, unless this index is created with `USING HASH`. In other words:
  - A primary key or unique index on a Cluster table normally takes up 31 to 35 bytes per record.
  - However, if the primary key or unique index is created with `USING HASH`, then it requires only 21 to 25 bytes per record.

Creating NDB Cluster tables with `USING HASH` for all primary keys and unique indexes will generally cause table updates to run more quickly—in some cases by as much as 20 to 30 percent faster than updates on tables where `USING HASH` was not used in creating primary and unique keys. This is due to the fact that less memory is required (because no ordered indexes are created), and that less CPU must be utilized (because fewer indexes must be read and possibly updated). However, it also means that queries that could otherwise use range scans must be satisfied by other means, which can result in slower selects.

When calculating Cluster memory requirements, you may find useful the `ndb_size.pl` utility which is available in recent MySQL 8.0 releases. This Perl script connects to a current (non-Cluster) MySQL database and creates a report on how much space that database would require if it used the `NDBCLUSTER` storage engine. For more information, see [Section 22.4.28, “ndb\\_size.pl — NDBCLUSTER Size Requirement Estimator”](#).

It is especially important to keep in mind that *every NDB Cluster table must have a primary key*. The `NDB` storage engine creates a primary key automatically if none is defined; this primary key is created without `USING HASH`.

You can determine how much memory is being used for storage of NDB Cluster data and indexes at any given time using the `REPORT MEMORYUSAGE` command in the `ndb_mgm` client; see [Section 22.5.1, “Commands in the NDB Cluster Management Client”](#), for more information. In addition, warnings are written to the cluster log when 80% of available `DataMemory` or (prior to NDB 7.6) `IndexMemory` is in use, and again when usage reaches 90%, 99%, and 100%.

#### **A.10.1** What file systems can I use with NDB Cluster? What about network file systems or network shares?

Generally, any file system that is native to the host operating system should work well with NDB Cluster. If you find that a given file system works particularly well (or not so especially well) with NDB Cluster, we invite you to discuss your findings in the [NDB Cluster Forums](#).

For Windows, we recommend that you use `NTFS` file systems for NDB Cluster, just as we do for standard MySQL. We do not test NDB Cluster with `FAT` or `VFAT` file systems. Because of this, we do not recommend their use with MySQL or NDB Cluster.

NDB Cluster is implemented as a shared-nothing solution; the idea behind this is that the failure of a single piece of hardware should not cause the failure of multiple cluster nodes, or possibly even the failure of the cluster as a whole. For this reason, the use of network shares or network file systems is not supported for NDB Cluster. This also applies to shared storage devices such as SANs.

#### **A.10.12** Can I run NDB Cluster nodes inside virtual machines (such as those created by VMWare, VirtualBox, Parallels, or Xen)?

NDB Cluster is supported for use in virtual machines. We currently support and test using [Oracle VM](#).

Some NDB Cluster users have successfully deployed NDB Cluster using other virtualization products; in such cases, Oracle can provide NDB Cluster support, but issues specific to the virtual environment must be referred to that product's vendor.

**A.10.13** I am trying to populate an NDB Cluster database. The loading process terminates prematurely and I get an error message like this one:

```
ERROR 1114: The table 'my_cluster_table' is full
```

Why is this happening?

The cause is very likely to be that your setup does not provide sufficient RAM for all table data and all indexes, *including the primary key required by the NDB storage engine and automatically created in the event that the table definition does not include the definition of a primary key.*

It is also worth noting that all data nodes should have the same amount of RAM, since no data node in a cluster can use more memory than the least amount available to any individual data node. For example, if there are four computers hosting Cluster data nodes, and three of these have 3GB of RAM available to store Cluster data while the remaining data node has only 1GB RAM, then each data node can devote at most 1GB to NDB Cluster data and indexes.

In some cases it is possible to get `Table is full` errors in MySQL client applications even when `ndb_mgm -e "ALL REPORT MEMORYUSAGE"` shows significant free `DataMemory`. You can force NDB to create extra partitions for NDB Cluster tables and thus have more memory available for hash indexes by using the `MAX_ROWS` option for `CREATE TABLE`. In general, setting `MAX_ROWS` to twice the number of rows that you expect to store in the table should be sufficient.

For similar reasons, you can also sometimes encounter problems with data node restarts on nodes that are heavily loaded with data. The `MinFreePct` parameter can help with this issue by reserving a portion (5% by default) of `DataMemory` and (prior to NDB 7.6) `IndexMemory` for use in restarts. This reserved memory is not available for storing NDB tables or data.

**A.10.14** NDB Cluster uses TCP/IP. Does this mean that I can run it over the Internet, with one or more nodes in remote locations?

It is very unlikely that a cluster would perform reliably under such conditions, as NDB Cluster was designed and implemented with the assumption that it would be run under conditions guaranteeing dedicated high-speed connectivity such as that found in a LAN setting using 100 Mbps or gigabit Ethernet—preferably the latter. We neither test nor warrant its performance using anything slower than this.

Also, it is extremely important to keep in mind that communications between the nodes in an NDB Cluster are not secure; they are neither encrypted nor safeguarded by any other protective mechanism. The most secure configuration for a cluster is in a private network behind a firewall, with no direct access to any Cluster data or management nodes from outside. (For SQL nodes, you should take the same precautions as you would with any other instance of the MySQL server.) For more information, see [Section 22.5.17, “NDB Cluster Security Issues”](#).

**A.10.15** Do I have to learn a new programming or query language to use NDB Cluster?

No. Although some specialized commands are used to manage and configure the cluster itself, only standard (MySQL) statements are required for the following operations:

- Creating, altering, and dropping tables
- Inserting, updating, and deleting table data
- Creating, changing, and dropping primary and unique indexes

Some specialized configuration parameters and files are required to set up an NDB Cluster—see [Section 22.3.3, “NDB Cluster Configuration Files”](#), for information about these.

A few simple commands are used in the NDB Cluster management client (`ndb_mgm`) for tasks such as starting and stopping cluster nodes. See [Section 22.5.1, “Commands in the NDB Cluster Management Client”](#).

**A.10.16** What programming languages and APIs are supported by NDB Cluster?

NDB Cluster supports the same programming APIs and languages as the standard MySQL Server, including ODBC, .Net, the MySQL C API, and numerous drivers for popular scripting languages such as PHP, Perl, and Python. NDB Cluster applications written using these APIs behave similarly to other MySQL applications; they transmit SQL statements to a MySQL Server (in the case of NDB Cluster, an SQL node), and receive responses containing rows of data. For more information about these APIs, see [Chapter 28, Connectors and APIs](#).

NDB Cluster also supports application programming using the NDB API, which provides a low-level C++ interface to NDB Cluster data without needing to go through a MySQL Server. See [The NDB API](#). In addition, many `NDBCLUSTER` management functions are exposed by the C-language MGM API; see [The MGM API](#), for more information.

NDB Cluster also supports Java application programming using ClusterJ, which supports a domain object model of data using sessions and transactions. See [Java and NDB Cluster](#), for more information.

In addition, NDB Cluster provides support for `memcached`, allowing developers to access data stored in NDB Cluster using the `memcached` interface; for more information, see [ndbmemcache—Memcache API for NDB Cluster \(DEPRECATED\)](#).

NDB Cluster also includes adapters supporting NoSQL applications written against `Node.js`, with NDB Cluster as the data store. See [MySQL NoSQL Connector for JavaScript](#), for more information.

**A.10.17** Does NDB Cluster include any management tools?

NDB Cluster includes a command line client for performing basic management functions. See [Section 22.4.5, “ndb\\_mgm — The NDB Cluster Management Client”](#), and [Section 22.5.1, “Commands in the NDB Cluster Management Client”](#).

NDB Cluster 7.6 and earlier are also supported by MySQL Cluster Manager, a separate product providing an advanced command line interface that can automate many NDB Cluster management tasks such as rolling restarts and configuration changes. Beginning with version 1.4.8, MySQL Cluster Manager also provides experimental support for NDB Cluster 8.0. For more information about MySQL Cluster Manager, see [MySQL™ Cluster Manager 1.4.8 User Manual](#).

NDB Cluster also provides a graphical, browser-based Auto-Installer for setting up and deploying NDB Cluster, as part of the NDB Cluster software distribution. For more information, see [The NDB Cluster Auto-Installer \(NDB 7.5\) \(DEPRECATED\)](#).

**A.10.18** How do I find out what an error or warning message means when using NDB Cluster?

There are two ways in which this can be done:

- From within the `mysql` client, use `SHOW ERRORS` or `SHOW WARNINGS` immediately upon being notified of the error or warning condition.
- From a system shell prompt, use `perror --ndb error_code`.

**A.10.19** Is NDB Cluster transaction-safe? What isolation levels are supported?

Yes. For tables created with the [NDB](#) storage engine, transactions are supported. Currently, NDB Cluster supports only the [READ COMMITTED](#) transaction isolation level.

**A.10.20** What storage engines are supported by NDB Cluster?

NDB Cluster requires the [NDB](#) storage engine. That is, in order for a table to be shared between nodes in an NDB Cluster, the table must be created using [ENGINE=NDB](#) (or the equivalent option [ENGINE=NDBCLUSTER](#)).

It is possible to create tables using other storage engines (such as [InnoDB](#) or [MyISAM](#)) on a MySQL server being used with NDB Cluster, but since these tables do not use [NDB](#), they do not participate in clustering; each such table is strictly local to the individual MySQL server instance on which it is created.

NDB Cluster is quite different from [InnoDB](#) clustering with regard to architecture, requirements, and implementation; despite any similarity in their names, the two are not compatible. For more information about [InnoDB](#) clustering, see [Chapter 21, Using MySQL AdminAPI](#). See also [Section 22.1.6, “MySQL Server Using InnoDB Compared with NDB Cluster”](#), for information about the differences between the [NDB](#) and [InnoDB](#) storage engines.

**A.10.21** In the event of a catastrophic failure—for example, the whole city loses power *and* my UPS fails—would I lose all my data?

All committed transactions are logged. Therefore, although it is possible that some data could be lost in the event of a catastrophe, this should be quite limited. Data loss can be further reduced by minimizing the number of operations per transaction. (It is not a good idea to perform large numbers of operations per transaction in any case.)

**A.10.22** Is it possible to use [FULLTEXT](#) indexes with NDB Cluster?

[FULLTEXT](#) indexing is currently supported only by the [InnoDB](#) and [MyISAM](#) storage engines. See [Section 12.10, “Full-Text Search Functions”](#), for more information.

**A.10.23** Can I run multiple nodes on a single computer?

It is possible but not always advisable. One of the chief reasons to run a cluster is to provide redundancy. To obtain the full benefits of this redundancy, each node should reside on a separate machine. If you place multiple nodes on a single machine and that machine fails, you lose all of those nodes. For this reason, if you do run multiple data nodes on a single machine, it is *extremely* important that they be set up in such a way that the failure of this machine does not cause the loss of all the data nodes in a given node group.

Given that NDB Cluster can be run on commodity hardware loaded with a low-cost (or even no-cost) operating system, the expense of an extra machine or two is well worth it to safeguard mission-critical data. It also worth noting that the requirements for a cluster host running a management node are minimal. This task can be accomplished with a 300 MHz Pentium or equivalent CPU and sufficient RAM for the operating system, plus a small amount of overhead for the [ndb\\_mgmd](#) and [ndb\\_mgm](#) processes.

It is acceptable to run multiple cluster data nodes on a single host that has multiple CPUs, cores, or both. The NDB Cluster distribution also provides a multithreaded version of the data node binary intended for use on such systems. For more information, see [Section 22.4.3, “ndbmtdd — The NDB Cluster Data Node Daemon \(Multi-Threaded\)”](#).

It is also possible in some cases to run data nodes and SQL nodes concurrently on the same machine; how well such an arrangement performs is dependent on a number of factors such as number of cores and CPUs as well as the amount of disk and memory available to the data node

and SQL node processes, and you must take these factors into account when planning such a configuration.

**A.10.24** Can I add data nodes to an NDB Cluster without restarting it?

It is possible to add new data nodes to a running NDB Cluster without taking the cluster offline. For more information, see [Section 22.5.7, “Adding NDB Cluster Data Nodes Online”](#).

For other types of NDB Cluster nodes, a rolling restart is all that is required (see [Section 22.5.5, “Performing a Rolling Restart of an NDB Cluster”](#)).

**A.10.25** Are there any limitations that I should be aware of when using NDB Cluster?

Limitations on [NDB](#) tables in MySQL NDB Cluster include the following:

- Temporary tables are not supported; a `CREATE TEMPORARY TABLE` statement using `ENGINE=NDB` or `ENGINE=NDBCLUSTER` fails with an error.
- The only types of user-defined partitioning supported for `NDBCLUSTER` tables are `KEY` and `LINEAR KEY`. Trying to create an `NDB` table using any other partitioning type fails with an error.
- `FULLTEXT` indexes are not supported.
- Index prefixes are not supported. Only complete columns may be indexed.
- Spatial indexes are not supported (although spatial columns can be used). See [Section 11.4, “Spatial Data Types”](#).
- Support for partial transactions and partial rollbacks is comparable to that of other transactional storage engines such as `InnoDB` that can roll back individual statements.
- The maximum number of attributes allowed per table is 512. Attribute names cannot be any longer than 31 characters. For each table, the maximum combined length of the table and database names is 122 characters.
- Prior to NDB 8.0, the maximum size for a table row is 14 kilobytes, not counting `BLOB` values. In NDB 8.0, this maximum is increased to 30000 bytes. See [Section 22.1.7.5, “Limits Associated with Database Objects in NDB Cluster”](#), for more information.

There is no set limit for the number of rows per `NDB` table. Limits on table size depend on a number of factors, in particular on the amount of RAM available to each data node.

For a complete listing of limitations in NDB Cluster, see [Section 22.1.7, “Known Limitations of NDB Cluster”](#). See also [Section 22.1.7.11, “Previous NDB Cluster Issues Resolved in NDB Cluster 8.0”](#).

**A.10.26** Does NDB Cluster support foreign keys?

NDB Cluster provides support for foreign key constraints which is comparable to that found in the `InnoDB` storage engine; see [Section 1.7.3.2, “FOREIGN KEY Constraints”](#), for more detailed information, as well as [Section 13.1.20.5, “FOREIGN KEY Constraints”](#). Applications requiring foreign key support should use NDB Cluster 7.3, 7.4, 7.5, or later.

**A.10.27** How do I import an existing MySQL database into an NDB Cluster?

You can import databases into NDB Cluster much as you would with any other version of MySQL. Other than the limitations mentioned elsewhere in this FAQ, the only other special requirement is that any tables to be included in the cluster must use the `NDB` storage engine. This means that the tables must be created with `ENGINE=NDB` or `ENGINE=NDBCLUSTER`.

It is also possible to convert existing tables that use other storage engines to `NDBCLUSTER` using one or more `ALTER TABLE` statement. However, the definition of the table must be compatible with the `NDBCLUSTER` storage engine prior to making the conversion. In MySQL 8.0, an additional workaround is also required; see [Section 22.1.7, “Known Limitations of NDB Cluster”](#), for details.

#### A.10.28 How do NDB Cluster nodes communicate with one another?

Cluster nodes can communicate through any of three different transport mechanisms: TCP/IP, SHM (shared memory), and SCI (Scalable Coherent Interface). Where available, SHM is used by default between nodes residing on the same cluster host; however, this is considered experimental. SCI is a high-speed (1 gigabit per second and higher), high-availability protocol used in building scalable multi-processor systems; it requires special hardware and drivers. See [Section 22.3.4, “Using High-Speed Interconnects with NDB Cluster”](#), for more about using SCI as a transport mechanism for NDB Cluster.

#### A.10.29 What is an *arbiter*?

If one or more data nodes in a cluster fail, it is possible that not all cluster data nodes will be able to “see” one another. In fact, it is possible that two sets of data nodes might become isolated from one another in a network partitioning, also known as a “split-brain” scenario. This type of situation is undesirable because each set of data nodes tries to behave as though it is the entire cluster. An arbiter is required to decide between the competing sets of data nodes.

When all data nodes in at least one node group are alive, network partitioning is not an issue, because no single subset of the cluster can form a functional cluster on its own. The real problem arises when no single node group has all its nodes alive, in which case network partitioning (the “split-brain” scenario) becomes possible. Then an arbiter is required. All cluster nodes recognize the same node as the arbiter, which is normally the management server; however, it is possible to configure any of the MySQL Servers in the cluster to act as the arbiter instead. The arbiter accepts the first set of cluster nodes to contact it, and tells the remaining set to shut down. Arbiter selection is controlled by the `ArbitrationRank` configuration parameter for MySQL Server and management server nodes. You can also use the `ArbitrationRank` configuration parameter to control the arbiter selection process. For more information about these parameters, see [Section 22.3.3.5, “Defining an NDB Cluster Management Server”](#).

The role of arbiter does not in and of itself impose any heavy demands upon the host so designated, and thus the arbiter host does not need to be particularly fast or to have extra memory especially for this purpose.

#### A.10.30 What data types are supported by NDB Cluster?

NDB Cluster supports all of the usual MySQL data types, including those associated with MySQL's spatial extensions; however, the `NDB` storage engine does not support spatial indexes. (Spatial indexes are supported only by `MyISAM`; see [Section 11.4, “Spatial Data Types”](#), for more information.) In addition, there are some differences with regard to indexes when used with `NDB` tables.

#### Note

NDB Cluster Disk Data tables (that is, tables created with `TABLESPACE ... STORAGE DISK ENGINE=NDB` or `TABLESPACE ... STORAGE DISK ENGINE=NDBCLUSTER`) have only fixed-width rows. This means that (for example) each Disk Data table record containing a `VARCHAR(255)` column requires space for 255 characters (as required for the character set and

collation being used for the table), regardless of the actual number of characters stored therein.

See [Section 22.1.7, “Known Limitations of NDB Cluster”](#), for more information about these issues.

### A.10.31 How do I start and stop NDB Cluster?

It is necessary to start each node in the cluster separately, in the following order:

1. Start the management node, using the `ndb_mgmd` command.

You must include the `-f` or `--config-file` option to tell the management node where its configuration file can be found.

2. Start each data node with the `ndbd` command.

Each data node must be started with the `-c` or `--ndb-connectstring` option so that the data node knows how to connect to the management server.

3. Start each MySQL Server (SQL node) using your preferred startup script, such as `mysqld_safe`.

Each MySQL Server must be started with the `--ndbcluster` and `--ndb-connectstring` options. These options cause `mysqld` to enable `NDBCLUSTER` storage engine support and how to connect to the management server.

Each of these commands must be run from a system shell on the machine housing the affected node. (You do not have to be physically present at the machine—a remote login shell can be used for this purpose.) You can verify that the cluster is running by starting the NDB management client `ndb_mgm` on the machine housing the management node and issuing the `SHOW` or `ALL STATUS` command.

To shut down a running cluster, issue the command `SHUTDOWN` in the management client. Alternatively, you may enter the following command in a system shell:

```
shell> ndb_mgm -e "SHUTDOWN"
```

(The quotation marks in this example are optional, since there are no spaces in the command string following the `-e` option; in addition, the `SHUTDOWN` command, like other management client commands, is not case-sensitive.)

Either of these commands causes the `ndb_mgm`, `ndb_mgm`, and any `ndbd` processes to terminate gracefully. MySQL servers running as SQL nodes can be stopped using `mysqladmin shutdown`.

For more information, see [Section 22.5.1, “Commands in the NDB Cluster Management Client”](#), and [Section 22.2.6, “Safe Shutdown and Restart of NDB Cluster”](#).

MySQL Cluster Manager and the NDB Cluster Auto-Installer provide additional ways to handle starting and stopping of NDB Cluster nodes. See [MySQL™ Cluster Manager 1.4.8 User Manual](#), and [Section 22.2.8, “The NDB Cluster Auto-Installer \(DEPRECATED\)”](#), for more information about these tools.

### A.10.32 What happens to NDB Cluster data when the NDB Cluster is shut down?

The data that was held in memory by the cluster's data nodes is written to disk, and is reloaded into memory the next time that the cluster is started.

### A.10.33 Is it a good idea to have more than one management node for an NDB Cluster?

It can be helpful as a fail-safe. Only one management node controls the cluster at any given time, but it is possible to configure one management node as primary, and one or more additional management nodes to take over in the event that the primary management node fails.

See [Section 22.3.3, “NDB Cluster Configuration Files”](#), for information on how to configure NDB Cluster management nodes.

**A.10.34** Can I mix different kinds of hardware and operating systems in one NDB Cluster?

Yes, as long as all machines and operating systems have the same “endianness” (all big-endian or all little-endian).

It is also possible to use software from different NDB Cluster releases on different nodes. However, we support such use only as part of a rolling upgrade procedure (see [Section 22.5.5, “Performing a Rolling Restart of an NDB Cluster”](#)).

**A.10.35** Can I run two data nodes on a single host? Two SQL nodes?

Yes, it is possible to do this. In the case of multiple data nodes, it is advisable (but not required) for each node to use a different data directory. If you want to run multiple SQL nodes on one machine, each instance of `mysqld` must use a different TCP/IP port.

Running data nodes and SQL nodes together on the same host is possible, but you should be aware that the `ndbd` or `ndbmt` processes may compete for memory with `mysqld`.

**A.10.36** Can I use host names with NDB Cluster?

Yes, it is possible to use DNS and DHCP for cluster hosts. However, if your application requires “five nines” availability, you should use fixed (numeric) IP addresses, since making communication between Cluster hosts dependent on services such as DNS and DHCP introduces additional potential points of failure.

**A.10.37** Does NDB Cluster support IPv6?

IPv6 is supported for connections between SQL nodes (MySQL servers), but connections between all other types of NDB Cluster nodes must use IPv4.

In practical terms, this means that you can use IPv6 for replication between NDB Clusters, but connections between nodes in the same NDB Cluster must use IPv4. For more information, see [Section 22.6.3, “Known Issues in NDB Cluster Replication”](#).

**A.10.38** How do I handle MySQL users in an NDB Cluster having multiple MySQL servers?

MySQL user accounts and privileges are normally not automatically propagated between different MySQL servers accessing the same NDB Cluster. MySQL NDB Cluster provides support for shared and synchronized users and privileges using the `NDB_STORED_USER` privilege; see [Section 22.5.12, “Distributed MySQL Privileges with NDB\\_STORED\\_USER”](#), for more information. You should be aware that this implementation is new to NDB 8.0 and is not compatible with the shared privileges mechanism employed in earlier versions of NDB Cluster, which is no longer supported in NDB 8.0.

**A.10.39** How do I continue to send queries in the event that one of the SQL nodes fails?

MySQL NDB Cluster does not provide any sort of automatic failover between SQL nodes. Your application must be prepared to handle the loss of SQL nodes and to fail over between them.

**A.10.40** How do I back up and restore an NDB Cluster?

You can use the NDB Cluster native backup and restore functionality in the NDB management client and the `ndb_restore` program. See [Section 22.5.8, “Online Backup of NDB Cluster”](#), and [Section 22.4.23, “ndb\\_restore — Restore an NDB Cluster Backup”](#).

You can also use the traditional functionality provided for this purpose in `mysqldump` and the MySQL server. See [Section 4.5.4, “mysqldump — A Database Backup Program”](#), for more information.

#### A.10.4 What is an “angel process”?

This process monitors and, if necessary, attempts to restart the data node process. If you check the list of active processes on your system after starting `ndbd`, you can see that there are actually 2 processes running by that name, as shown here (we omit the output from `ndb_mgmd` and `ndbd` for brevity):

```
shell> ./ndb_mgmd

shell> ps aux | grep ndb
me 23002 0.0 0.0 122948 3104 ? Ssl 14:14 0:00 ./ndb_mgmd
me 23025 0.0 0.0 5284 820 pts/2 S+ 14:14 0:00 grep ndb

shell> ./ndbd -c 127.0.0.1 --initial

shell> ps aux | grep ndb
me 23002 0.0 0.0 123080 3356 ? Ssl 14:14 0:00 ./ndb_mgmd
me 23096 0.0 0.0 35876 2036 ? Ss 14:14 0:00 ./ndbmttd -c 127.0.0.1 --initial
me 23097 1.0 2.4 524116 91096 ? Sl 14:14 0:00 ./ndbmttd -c 127.0.0.1 --initial
me 23168 0.0 0.0 5284 812 pts/2 R+ 14:15 0:00 grep ndb
```

The `ndbd` process showing 0.0 for both memory and CPU usage is the angel process (although it actually does use a very small amount of each). This process merely checks to see if the main `ndbd` or `ndbmttd` process (the primary data node process which actually handles the data) is running. If permitted to do so (for example, if the `StopOnError` configuration parameter is set to `false`), the angel process tries to restart the primary data node process.

## A.11 MySQL 8.0 FAQ: MySQL Chinese, Japanese, and Korean Character Sets

This set of Frequently Asked Questions derives from the experience of MySQL's Support and Development groups in handling many inquiries about CJK (Chinese-Japanese-Korean) issues.

- A.11.1 What CJK character sets are available in MySQL? ..... 5002
- A.11.2 I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters? ..... 5003
- A.11.3 What problems should I be aware of when working with the Big5 Chinese character set? ..... 5005
- A.11.4 Why do Japanese character set conversions fail? ..... 5005
- A.11.5 What should I do if I want to convert SJIS 81CA to cp932? ..... 5006
- A.11.6 How does MySQL represent the Yen (¥) sign? ..... 5006
- A.11.7 Of what issues should I be aware when working with Korean character sets in MySQL? ..... 5006
- A.11.8 Why do I get `Incorrect string value` error messages? ..... 5006
- A.11.9 Why does my GUI front end or browser display CJK characters incorrectly in my application using Access, PHP, or another API? ..... 5007
- A.11.10 I've upgraded to MySQL 8.0. How can I revert to behavior like that in MySQL 4.0 with regard to character sets? ..... 5008
- A.11.11 Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail? ..... 5009
- A.11.12 How do I know whether character *x* is available in all character sets? ..... 5010
- A.11.13 Why do CJK strings sort incorrectly in Unicode? (I) ..... 5011

A.11.14 Why do CJK strings sort incorrectly in Unicode? (II) .....	5011
A.11.15 Why are my supplementary characters rejected by MySQL? .....	5011
A.11.16 Should “CJK” be “CJKV”? .....	5011
A.11.17 Does MySQL permit CJK characters to be used in database and table names? .....	5012
A.11.18 Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean? ...	5012
A.11.19 Where can I get help with CJK and related issues in MySQL? .....	5012

#### A.11.1 What CJK character sets are available in MySQL?

The list of CJK character sets may vary depending on your MySQL version. For example, the `gb18030` character set is not supported prior to MySQL 5.7.4. However, since the name of the applicable language appears in the `DESCRIPTION` column for every entry in the `INFORMATION_SCHEMA.CHARACTER_SETS` table, you can obtain a current list of all the non-Unicode CJK character sets using this query:

```
mysql> SELECT CHARACTER_SET_NAME, DESCRIPTION
FROM INFORMATION_SCHEMA.CHARACTER_SETS
WHERE DESCRIPTION LIKE '%Chin%'
OR DESCRIPTION LIKE '%Japanese%'
OR DESCRIPTION LIKE '%Korean%'
ORDER BY CHARACTER_SET_NAME;
```

CHARACTER_SET_NAME	DESCRIPTION
big5	Big5 Traditional Chinese
cp932	SJIS for Windows Japanese
eucjpms	UJIS for Windows Japanese
euckr	EUC-KR Korean
gb18030	China National Standard GB18030
gb2312	GB2312 Simplified Chinese
gbk	GBK Simplified Chinese
sjis	Shift-JIS Japanese
ujis	EUC-JP Japanese

(For more information, see [Section 25.4, “The INFORMATION\\_SCHEMA CHARACTER\\_SETS Table”](#).)

MySQL supports three variants of the *GB* (*Guojia Biaozhun*, or *National Standard*, or *Simplified Chinese*) character sets which are official in the People's Republic of China: `gb2312`, `gbk`, and (as of MySQL 5.7.4) `gb18030`.

Sometimes people try to insert `gbk` characters into `gb2312`, and it works most of the time because `gbk` is a superset of `gb2312`. But eventually they try to insert a rarer Chinese character and it does not work. (For an example, see [Bug #16072](#)).

Here, we try to clarify exactly what characters are legitimate in `gb2312` or `gbk`, with reference to the official documents. Please check these references before reporting `gb2312` or `gbk` bugs:

- The MySQL `gbk` character set is in reality “Microsoft code page 936”. This differs from the official `gbk` for characters `A1A4` (middle dot), `A1AA` (em dash), `A6E0–A6F5`, and `A8BB–A8C0`.
- For a listing of `gbk`/Unicode mappings, see <http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP936.TXT>.

It is also possible to store CJK characters in Unicode character sets, although the available collations may not sort characters quite as you expect:

- The `utf8` and `ucs2` character sets support the characters from Unicode Basic Multilingual Plane (BMP). These characters have code point values between `U+0000` and `U+FFFF`.
- The `utf8mb4`, `utf16`, `utf16le`, and `utf32` character sets support BMP characters, as well as supplementary characters that lie outside the BMP. Supplementary characters have code point values between `U+10000` and `U+10FFFF`.

The collation used for a Unicode character set determines the ability to sort (that is, distinguish) characters in the set:

- Collations based on Unicode Collation Algorithm (UCA) 4.0.0 distinguish only BMP characters.
- Collations based on UCA 5.2.0 or 9.0.0 distinguish BMP and supplementary characters.
- Non-UCA collations may not distinguish all Unicode characters. For example, the `utf8mb4` default collation is `utf8mb4_general_ci`, which distinguishes only BMP characters.

Moreover, distinguishing characters is not the same as ordering them per the conventions of a given CJK language. Currently, MySQL has only one CJK-specific UCA collation, `gb18030_unicode_520_ci` (which requires use of the non-Unicode `gb18030` character set).

For information about Unicode collations and their differentiating properties, including collation properties for supplementary characters, see [Section 10.10.1, “Unicode Character Sets”](#).

#### **A.11.2I** have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?

This problem is usually due to a setting in MySQL that does not match the settings for the application program or the operating system. Here are some common steps for correcting these types of issues:

- *Be certain of what MySQL version you are using.*

Use the statement `SELECT VERSION();` to determine this.

- *Make sure that the database is actually using the desired character set.*

People often think that the client character set is always the same as either the server character set or the character set used for display purposes. However, both of these are false assumptions. You can make sure by checking the result of `SHOW CREATE TABLE tablename` or, better yet, by using this statement:

```
SELECT character_set_name, collation_name
FROM information_schema.columns
WHERE table_schema = your_database_name
AND table_name = your_table_name
AND column_name = your_column_name;
```

- *Determine the hexadecimal value of the character or characters that are not being displayed correctly.*

You can obtain this information for a column `column_name` in the table `table_name` using the following query:

```
SELECT HEX(column_name)
```

```
FROM table_name;
```

`3F` is the encoding for the `?` character; this means that `?` is the character actually stored in the column. This most often happens because of a problem converting a particular character from your client character set to the target character set.

- *Make sure that a round trip is possible. When you select `literal` (or `_introducer hexadecimal-value`), do you obtain `literal` as a result?*

For example, the Japanese Katakana character *Pe* (ペ) exists in all CJK character sets, and has the code point value (hexadecimal coding) `0x30da`. To test a round trip for this character, use this query:

```
SELECT 'ペ' AS `ペ`; /* or SELECT _ucs2 0x30da; */
```

If the result is not also ペ, the round trip failed.

For bug reports regarding such failures, we might ask you to follow up with `SELECT HEX('ペ');`. Then we can determine whether the client encoding is correct.

- *Make sure that the problem is not with the browser or other application, rather than with MySQL.*

Use the `mysql` client program to accomplish this task. If `mysql` displays characters correctly but your application does not, your problem is probably due to system settings.

To determine your settings, use the `SHOW VARIABLES` statement, whose output should resemble what is shown here:

```
mysql> SHOW VARIABLES LIKE 'char%';
```

Variable_name	Value
character_set_client	utf8
character_set_connection	utf8
character_set_database	latin1
character_set_filesystem	binary
character_set_results	utf8
character_set_server	latin1
character_set_system	utf8
character_sets_dir	/usr/local/mysql/share/mysqlCharsets/

These are typical character-set settings for an international-oriented client (notice the use of `utf8` Unicode) connected to a server in the West (`latin1` is a West Europe character set).

Although Unicode (usually the `utf8` variant on Unix, and the `ucs2` variant on Windows) is preferable to Latin, it is often not what your operating system utilities support best. Many Windows users find that a Microsoft character set, such as `cp932` for Japanese Windows, is suitable.

If you cannot control the server settings, and you have no idea what setting your underlying computer uses, try changing to a common character set for the country that you're in (`euckr` = Korea; `gb18030`, `gb2312` or `gbk` = People's Republic of China; `big5` = Taiwan; `sjis`, `ujis`, `cp932`, or `eucjpms` = Japan; `ucs2` or `utf8` = anywhere). Usually it is necessary to change only

the client and connection and results settings. The `SET NAMES` statement changes all three at once. For example:

```
SET NAMES 'big5';
```

Once the setting is correct, you can make it permanent by editing `my.cnf` or `my.ini`. For example you might add lines looking like these:

```
[mysqld]
character-set-server=big5
[client]
default-character-set=big5
```

It is also possible that there are issues with the API configuration setting being used in your application; see *Why does my GUI front end or browser not display CJK characters correctly...?* for more information.

#### A.11.3 What problems should I be aware of when working with the Big5 Chinese character set?

MySQL supports the Big5 character set which is common in Hong Kong and Taiwan (Republic of China). The MySQL `big5` character set is in reality Microsoft code page 950, which is very similar to the original `big5` character set.

A feature request for adding `HKSCS` extensions has been filed. People who need this extension may find the suggested patch for Bug #13577 to be of interest.

#### A.11.4 Why do Japanese character set conversions fail?

MySQL supports the `sjis`, `ujis`, `cp932`, and `eucjpms` character sets, as well as Unicode. A common need is to convert between character sets. For example, there might be a Unix server (typically with `sjis` or `ujis`) and a Windows client (typically with `cp932`).

In the following conversion table, the `ucs2` column represents the source, and the `sjis`, `cp932`, `ujis`, and `eucjpms` columns represent the destinations; that is, the last 4 columns provide the hexadecimal result when we use `CONVERT(ucs2)` or we assign a `ucs2` column containing the value to an `sjis`, `cp932`, `ujis`, or `eucjpms` column.

Character Name	ucs2	sjis	cp932	ujis	eucjpms
BROKEN BAR	00A6	3F	3F	8FA2C3	3F
FULLWIDTH BROKEN BAR	FFE4	3F	FA55	3F	8FA2
YEN SIGN	00A5	3F	3F	20	3F
FULLWIDTH YEN SIGN	FFE5	818F	818F	A1EF	3F
TILDE	007E	7E	7E	7E	7E
OVERLINE	203E	3F	3F	20	3F
HORIZONTAL BAR	2015	815C	815C	A1BD	A1BD
EM DASH	2014	3F	3F	3F	3F
REVERSE SOLIDUS	005C	815F	5C	5C	5C
FULLWIDTH ""	FF3C	3F	815F	3F	A1C0
WAVE DASH	301C	8160	3F	A1C1	3F
FULLWIDTH TILDE	FF5E	3F	8160	3F	A1C1
DOUBLE VERTICAL LINE	2016	8161	3F	A1C2	3F

Character Name	ucs2	sjis	cp932	ujis	eucjpms
PARALLEL TO	2225	3F	8161	3F	A1C2
MINUS SIGN	2212	817C	3F	A1DD	3F
FULLWIDTH HYPHEN-MINUS	FF0D	3F	817C	3F	A1DD
CENT SIGN	00A2	8191	3F	A1F1	3F
FULLWIDTH CENT SIGN	FFE0	3F	8191	3F	A1F1
POUND SIGN	00A3	8192	3F	A1F2	3F
FULLWIDTH POUND SIGN	FFE1	3F	8192	3F	A1F2
NOT SIGN	00AC	81CA	3F	A2CC	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA	3F	A2CC

Now consider the following portion of the table.

	ucs2	sjis	cp932
NOT SIGN	00AC	81CA	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA

This means that MySQL converts the `NOT SIGN` (Unicode `U+00AC`) to `sjis` code point `0x81CA` and to `cp932` code point `3F`. (`3F` is the question mark (“?”). This is what is always used when the conversion cannot be performed.)

#### A.11.5 What should I do if I want to convert SJIS `81CA` to `cp932`?

Our answer is: “?”. There are disadvantages to this, and many people would prefer a “loose” conversion, so that `81CA` (`NOT SIGN`) in `sjis` becomes `81CA` (`FULLWIDTH NOT SIGN`) in `cp932`.

#### A.11.6 How does MySQL represent the Yen (¥) sign?

A problem arises because some versions of Japanese character sets (both `sjis` and `euc`) treat `5C` as a *reverse solidus* (`\`, also known as a backslash), whereas others treat it as a yen sign (¥).

MySQL follows only one version of the JIS (Japanese Industrial Standards) standard description. In MySQL, `5C` is *always the reverse solidus* (`\`).

#### A.11.7 Of what issues should I be aware when working with Korean character sets in MySQL?

In theory, while there have been several versions of the `euckr` (*Extended Unix Code Korea*) character set, only one problem has been noted. We use the “ASCII” variant of EUC-KR, in which the code point `0x5C` is REVERSE SOLIDUS, that is `\`, instead of the “KS-Roman” variant of EUC-KR, in which the code point `0x5C` is `WON SIGN` (₩). This means that you cannot convert Unicode `U+20A9` to `euckr`:

```
mysql> SELECT
 CONVERT('₩' USING euckr) AS euckr,
 HEX(CONVERT('₩' USING euckr)) AS hexeuckr;
+-----+-----+
| euckr | hexeuckr |
+-----+-----+
| ? | 3F |
+-----+-----+
```

#### A.11.8 Why do I get `Incorrect string value` error messages?

To see the problem, create a table with one Unicode ([ucs2](#)) column and one Chinese ([gb2312](#)) column.

```
mysql> CREATE TABLE ch
 (ucs2 CHAR(3) CHARACTER SET ucs2,
 gb2312 CHAR(3) CHARACTER SET gb2312);
```

In nonstrict SQL mode, try to place the rare character ㄸ in both columns.

```
mysql> SET sql_mode = '';
mysql> INSERT INTO ch VALUES ('AㄸB','AㄸB');
Query OK, 1 row affected, 1 warning (0.00 sec)
```

The `INSERT` produces a warning. Use the following statement to see what it is:

```
mysql> SHOW WARNINGS\G
***** 1. row *****
Level: Warning
Code: 1366
Message: Incorrect string value: '\xE6\xB1\x8CB' for column 'gb2312' at row 1
```

So it is a warning about the [gb2312](#) column only.

```
mysql> SELECT ucs2,HEX(ucs2),gb2312,HEX(gb2312) FROM ch;
+-----+-----+-----+-----+
| ucs2 | HEX(ucs2) | gb2312 | HEX(gb2312) |
+-----+-----+-----+-----+
| AㄸB | 00416C4C0042 | A?B | 413F42 |
+-----+-----+-----+-----+
```

Several things need explanation here:

1. The ㄸ character is not in the [gb2312](#) character set, as described earlier.
2. If you are using an old version of MySQL, you may see a different message.
3. A warning occurs rather than an error because MySQL is not set to use strict SQL mode. In nonstrict mode, MySQL tries to do what it can, to get the best fit, rather than give up. With strict SQL mode, the `Incorrect string value` message occurs as an error rather than a warning, and the `INSERT` fails.

#### A.11.9 Why does my GUI front end or browser display CJK characters incorrectly in my application using Access, PHP, or another API?

Obtain a direct connection to the server using the `mysql` client, and try the same query there. If `mysql` responds correctly, the trouble may be that your application interface requires initialization. Use `mysql` to tell you what character set or sets it uses with the statement `SHOW VARIABLES LIKE 'char%'`. If you are using Access, you are most likely connecting with Connector/ODBC. In this case, you should check [Configuring Connector/ODBC](#). If, for example, you use `big5`, you would enter `SET NAMES 'big5'`. (In this case, no `;` character is required.) If you are using ASP, you might need to add `SET NAMES` in the code. Here is an example that has worked in the past:

```
<%
Session.CodePage=0
Dim strConnection
Dim Conn
strConnection="driver={MySQL ODBC 3.51 Driver};server=server;uid=username;" \
 & "pwd=password;database=database;stmt=SET NAMES 'big5';"
Set Conn = Server.CreateObject("ADODB.Connection")
Conn.Open strConnection
%>
```

In much the same way, if you are using any character set other than `latin1` with Connector/NET, you must specify the character set in the connection string. See [Connector/NET Connections](#), for more information.

If you are using PHP, try this:

```
<?php
$link = new mysqli($host, $usr, $pwd, $db);

if(mysqli_connect_errno())
{
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$link->query("SET NAMES 'utf8'");
?>
```

In this case, we used `SET NAMES` to change `character_set_client`, `character_set_connection`, and `character_set_results`.

Another issue often encountered in PHP applications has to do with assumptions made by the browser. Sometimes adding or changing a `<meta>` tag suffices to correct the problem: for example, to insure that the user agent interprets page content as `UTF-8`, include `<meta http-equiv="Content-Type" content="text/html; charset=utf-8">` in the `<head>` section of the HTML page.

If you are using Connector/J, see [Using Character Sets and Unicode](#).

#### **A.11.10** I've upgraded to MySQL 8.0. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?

In MySQL Version 4.0, there was a single “global” character set for both server and client, and the decision as to which character to use was made by the server administrator. This changed starting with MySQL Version 4.1. What happens now is a “handshake”, as described in [Section 10.4](#), “[Connection Character Sets and Collations](#)”:

When a client connects, it sends to the server the name of the character set that it wants to use. The server uses the name to set the `character_set_client`, `character_set_results`, and `character_set_connection` system variables. In effect, the server performs a `SET NAMES` operation using the character set name.

The effect of this is that you cannot control the client character set by starting `mysqld` with `--character-set-server=utf8`. However, some Asian customers prefer the MySQL 4.0 behavior. To make it possible to retain this behavior, we added a `mysqld` switch, `--character-set-client-handshake`, which can be turned off with `--skip-character-set-client-handshake`. If you start `mysqld` with `--skip-character-set-client-handshake`, then, when a client connects, it sends to the server the name of the character set that it wants to use. However, *the server ignores this request from the client*.

By way of example, suppose that your favorite server character set is `latin1`. Suppose further that the client uses `utf8` because this is what the client's operating system supports. Start the server with `latin1` as its default character set:

```
mysqld --character-set-server=latin1
```

And then start the client with the default character set `utf8`:

```
mysql --default-character-set=utf8
```

The resulting settings can be seen by viewing the output of `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'char%';
```

Variable_name	Value
character_set_client	utf8
character_set_connection	utf8
character_set_database	latin1
character_set_filesystem	binary
character_set_results	utf8
character_set_server	latin1
character_set_system	utf8
character_sets_dir	/usr/local/mysql/share/mysqlCharsets/

Now stop the client, and stop the server using `mysqladmin`. Then start the server again, but this time tell it to skip the handshake like so:

```
mysqld --character-set-server=utf8 --skip-character-set-client-handshake
```

Start the client with `utf8` once again as the default character set, then display the resulting settings:

```
mysql> SHOW VARIABLES LIKE 'char%';
```

Variable_name	Value
character_set_client	latin1
character_set_connection	latin1
character_set_database	latin1
character_set_filesystem	binary
character_set_results	latin1
character_set_server	latin1
character_set_system	utf8
character_sets_dir	/usr/local/mysql/share/mysqlCharsets/

As you can see by comparing the differing results from `SHOW VARIABLES`, the server ignores the client's initial settings if the `--skip-character-set-client-handshake` option is used.

#### A.11.1 Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?

For `LIKE` searches, there is a very simple problem with binary string column types such as `BINARY` and `BLOB`: we must know where characters end. With multibyte character sets, different characters might have different octet lengths. For example, in `utf8`, `A` requires one byte but `ㄅ` requires three bytes, as shown here:

OCTET_LENGTH(utf8 'A')	OCTET_LENGTH(utf8 'ㄅ')
1	3

If we do not know where the first character in a string ends, we do not know where the second character begins, in which case even very simple searches such as `LIKE '_A%'` fail. The solution is to use a nonbinary string column type defined to have the proper CJK character set. For example:

`mycol TEXT CHARACTER SET sjis`. Alternatively, convert to a CJK character set before comparing.

This is one reason why MySQL cannot permit encodings of nonexistent characters. If it is not strict about rejecting bad input, it has no way of knowing where characters end.

For `FULLTEXT` searches, we must know where words begin and end. With Western languages, this is rarely a problem because most (if not all) of these use an easy-to-identify word boundary: the space character. However, this is not usually the case with Asian writing. We could use arbitrary halfway measures, like assuming that all Han characters represent words, or (for Japanese) depending on changes from Katakana to Hiragana due to grammatical endings. However, the only sure solution requires a comprehensive word list, which means that we would have to include a dictionary in the server for each Asian language supported. This is simply not feasible.

#### A.11.12 How do I know whether character `x` is available in all character sets?

The majority of simplified Chinese and basic nonhalfwidth Japanese Kana characters appear in all CJK character sets. The following stored procedure accepts a `UCS-2` Unicode character, converts it to other character sets, and displays the results in hexadecimal.

```
DELIMITER //

CREATE PROCEDURE p_convert(ucs2_char CHAR(1) CHARACTER SET ucs2)
BEGIN

CREATE TABLE tj
 (ucs2 CHAR(1) character set ucs2,
 utf8 CHAR(1) character set utf8,
 big5 CHAR(1) character set big5,
 cp932 CHAR(1) character set cp932,
 eucjpms CHAR(1) character set eucjpms,
 euckr CHAR(1) character set euckr,
 gb2312 CHAR(1) character set gb2312,
 gbk CHAR(1) character set gbk,
 sjis CHAR(1) character set sjis,
 ujis CHAR(1) character set ujis);

INSERT INTO tj (ucs2) VALUES (ucs2_char);

UPDATE tj SET utf8=ucs2,
 big5=ucs2,
 cp932=ucs2,
 eucjpms=ucs2,
 euckr=ucs2,
 gb2312=ucs2,
 gbk=ucs2,
 sjis=ucs2,
 ujis=ucs2;

/* If there are conversion problems, UPDATE produces warnings. */

SELECT hex(ucs2) AS ucs2,
 hex(utf8) AS utf8,
 hex(big5) AS big5,
 hex(cp932) AS cp932,
 hex(eucjpms) AS eucjpms,
 hex(euckr) AS euckr,
 hex(gb2312) AS gb2312,
 hex(gbk) AS gbk,
 hex(sjis) AS sjis,
 hex(ujis) AS ujis
FROM tj;

DROP TABLE tj;
```

```
END//
```

```
DELIMITER ;
```

The input can be any single `ucs2` character, or it can be the code value (hexadecimal representation) of that character. For example, from Unicode's list of `ucs2` encodings and names (<http://www.unicode.org/Public/UNIDATA/UnicodeData.txt>), we know that the Katakana character *Pe* appears in all CJK character sets, and that its code value is `x'30DA'`. If we use this value as the argument to `p_convert()`, the result is as shown here:

```
mysql> CALL p_convert(X'30DA');
```

ucs2	utf8	big5	cp932	eucjpms	euckr	gb2312	gbk	sjis	ujis
30DA	E3839A	C772	8379	A5DA	ABDA	A5DA	A5DA	8379	A5DA

Since none of the column values is `3F` (that is, the question mark character, `?`), we know that every conversion worked.

#### A.11.13 Why do CJK strings sort incorrectly in Unicode? (I)

CJK sorting problems that occurred in older MySQL versions can be solved as of MySQL 8.0 by using the `utf8mb4` character set and the `utf8mb4_ja_0900_as_cs` collation.

#### A.11.14 Why do CJK strings sort incorrectly in Unicode? (II)

CJK sorting problems that occurred in older MySQL versions can be solved as of MySQL 8.0 by using the `utf8mb4` character set and the `utf8mb4_ja_0900_as_cs` collation.

#### A.11.15 Why are my supplementary characters rejected by MySQL?

Supplementary characters lie outside the Unicode *Basic Multilingual Plane / Plane 0*. BMP characters have code point values between `U+0000` and `U+FFFF`. Supplementary characters have code point values between `U+10000` and `U+10FFFF`.

To store supplementary characters, you must use a character set that permits them:

- The `utf8` and `ucs2` character sets support BMP characters only.

The `utf8` character set permits only UTF-8 characters that take up to three bytes. This has led to reports such as that found in Bug #12600, which we rejected as “not a bug”. With `utf8`, MySQL must truncate an input string when it encounters bytes that it does not understand. Otherwise, it is unknown how long the bad multibyte character is.

One possible workaround is to use `ucs2` instead of `utf8`, in which case the “bad” characters are changed to question marks. However, no truncation takes place. You can also change the data type to `BLOB` or `BINARY`, which perform no validity checking.

- The `utf8mb4`, `utf16`, `utf16le`, and `utf32` character sets support BMP characters, as well as supplementary characters outside the BMP.

#### A.11.16 Should “CJK” be “CJKV”?

No. The term “CJKV” (*Chinese Japanese Korean Vietnamese*) refers to Vietnamese character sets which contain Han (originally Chinese) characters. MySQL supports the modern Vietnamese script with Western characters, but does not support the old Vietnamese script using Han characters.

As of MySQL 5.6, there are Vietnamese collations for Unicode character sets, as described in [Section 10.10.1, “Unicode Character Sets”](#).

**A.11.17** Does MySQL permit CJK characters to be used in database and table names?

Yes.

**A.11.18** Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?

The Japanese translation of the MySQL 5.6 manual can be downloaded from <https://dev.mysql.com/doc/>.

**A.11.19** Where can I get help with CJK and related issues in MySQL?

The following resources are available:

- A listing of MySQL user groups can be found at <https://wikis.oracle.com/display/mysql/List+of+MySQL+User+Groups>.
- View feature requests relating to character set issues at <http://tinyurl.com/y6xcuf>.
- Visit the MySQL [Character Sets, Collation, Unicode Forum](#). <http://forums.mysql.com/> also provides foreign-language forums.

## A.12 MySQL 8.0 FAQ: Connectors & APIs

For common questions, issues, and answers relating to the MySQL Connectors and other APIs, see the following areas of the Manual:

- [C API Common Issues](#)
- [Common Problems with MySQL and PHP](#)
- [Connector/ODBC Notes and Tips](#)
- [Connector/NET Programming](#)
- [MySQL Connector/J 8.0 Developer Guide](#)

## A.13 MySQL 8.0 FAQ: C API, libmysql

Frequently asked questions about MySQL C API and libmysql.

A.13.1 What is “MySQL Native C API”? What are typical benefits and use cases? .....	5012
A.13.2 Which version of libmysql should I use? .....	5012
A.13.3 What if I want to use the “NoSQL” X DevAPI? .....	5013
A.13.4 How to I download libmysql? .....	5013
A.13.5 Where is the documentation? .....	5013
A.13.6 How do I report bugs? .....	5013
A.13.7 Is it possible to compile the library myself? .....	5013

**A.13.1** What is “MySQL Native C API”? What are typical benefits and use cases?

libmysql is a C-based API that you can use in C applications to connect with the MySQL database server. It is also itself used as the foundation for drivers for standard database APIs like ODBC, Perl's DBI, and Python's DB API.

**A.13.2** Which version of libmysql should I use?

For MySQL 8.0, 5.7, 5.6, and 5.5, we recommend libmysql 8.0.

#### A.13.3 What if I want to use the “NoSQL” X DevAPI?

For C-language and X DevApi Document Store for MySQL 8.0, we recommend MySQL Connector/C++. Connector/C++ 8.0 has compatible C headers. (This is not applicable to MySQL 5.7 or before.)

#### A.13.4 How do I download libmysql?

- Linux: The Client Utilities Package is available from the [MySQL Community Server](#) download page.
- Repos: The Client Utilities Package is available from the [Yum](#), [APT](#), [SuSE repositories](#).
- Windows: The Client Utilities Package is available from [Windows Installer](#).

#### A.13.5 Where is the documentation?

See [MySQL 8.0 C API Developer Guide](#).

#### A.13.6 How do I report bugs?

Please report any bugs or inconsistencies you observe to our [Bugs Database](#). Select the C API Client as shown.

#### A.13.7 Is it possible to compile the library myself?

Yes, you can download the libmysqlclient source code and compile it on your own. Here's an example:

```
$ git clone --depth 1 https://github.com/mysql/mysql-server
$ cd mysql-server
$ mkdir build
$ cd build
$ cmake .. -GNinja -DDOWNLOAD_BOOST=1 \
 -DWITH_BOOST=/tmp -DCMAKE_BUILD_TYPE=Release -DWITHOUT_SERVER=ON \
 -DWITH_SSL=system
$ ninja libmysqlclient.a
$ ls -la archive_output_directory/libmysqlclient.a
-rw-rw-r-- 1 kg kg 8,5M wrz 5 04:57 archive_output_directory/libmysqlclient.a
```

#### Note

This example uses <https://ninja-build.org/> as a build system instead of make.

## A.14 MySQL 8.0 FAQ: Replication

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication.

A.14.1 Must the replica be connected to the source all the time? .....	5014
A.14.2 Must I enable networking on my source and replica to enable replication? .....	5014
A.14.3 How do I know how late a replica is compared to the source? In other words, how do I know the date of the last statement replicated by the replica? .....	5014
A.14.4 How do I force the source to block updates until the replica catches up? .....	5014
A.14.5 What issues should I be aware of when setting up two-way replication? .....	5015
A.14.6 How can I use replication to improve performance of my system? .....	5015
A.14.7 What should I do to prepare client code in my own applications to use performance-enhancing replication? .....	5015

A.14.8 When and how much can MySQL replication improve the performance of my system? .....	5015
A.14.9 How can I use replication to provide redundancy or high availability? .....	5016
A.14.10 How do I tell whether a replication source server is using statement-based or row-based binary logging format? .....	5017
A.14.11 How do I tell a replica to use row-based replication? .....	5017
A.14.12 How do I prevent <a href="#">GRANT</a> and <a href="#">REVOKE</a> statements from replicating to replica machines? .....	5017
A.14.13 Does replication work on mixed operating systems (for example, the source runs on Linux while replicas run on OS X and Windows)? .....	5017
A.14.14 Does replication work on mixed hardware architectures (for example, the source runs on a 64-bit machine while replicas run on 32-bit machines)? .....	5017

**A.14.1** Must the replica be connected to the source all the time?

No, it does not. The replica can go down or stay disconnected for hours or even days, and then reconnect and catch up on updates. For example, you can set up a source/replica relationship over a dial-up link where the link is up only sporadically and for short periods of time. The implication of this is that, at any given time, the replica is not guaranteed to be in synchrony with the source unless you take some special measures.

To ensure that catchup can occur for a replica that has been disconnected, you must not remove binary log files from the source that contain information that has not yet been replicated to the replicas. Asynchronous replication can work only if the replica is able to continue reading the binary log from the point where it last read events.

**A.14.2** Must I enable networking on my source and replica to enable replication?

Yes, networking must be enabled on the source and replica. If networking is not enabled, the replica cannot connect to the source and transfer the binary log. Verify that the [skip\\_networking](#) system variable has not been enabled in the configuration file for either server.

**A.14.3** How do I know how late a replica is compared to the source? In other words, how do I know the date of the last statement replicated by the replica?

Check the [Seconds\\_Behind\\_Master](#) column in the output from [SHOW SLAVE STATUS](#). See [Section 17.1.7.1, “Checking Replication Status”](#).

When the replication SQL thread executes an event read from the source, it modifies its own time to the event timestamp. (This is why [TIMESTAMP](#) is well replicated.) In the [Time](#) column in the output of [SHOW PROCESSLIST](#), the number of seconds displayed for the replication SQL thread is the number of seconds between the timestamp of the last replicated event and the real time of the replica machine. You can use this to determine the date of the last replicated event. Note that if your replica has been disconnected from the source for one hour, and then reconnects, you may immediately see large [Time](#) values such as 3600 for the replication SQL thread in [SHOW PROCESSLIST](#). This is because the replica is executing statements that are one hour old. See [Section 17.2.3, “Replication Threads”](#).

**A.14.4** How do I force the source to block updates until the replica catches up?

Use the following procedure:

1. On the source, execute these statements:

```
mysql> FLUSH TABLES WITH READ LOCK;
mysql> SHOW MASTER STATUS;
```

Record the replication coordinates (the current binary log file name and position) from the output of the [SHOW](#) statement.

2. On the replica, issue the following statement, where the arguments to the `MASTER_POS_WAIT()` function are the replication coordinate values obtained in the previous step:

```
mysql> SELECT MASTER_POS_WAIT('log_name', log_pos);
```

The `SELECT` statement blocks until the replica reaches the specified log file and position. At that point, the replica is in synchrony with the source and the statement returns.

3. On the source, issue the following statement to enable the source to begin processing updates again:

```
mysql> UNLOCK TABLES;
```

#### A.14.5 What issues should I be aware of when setting up two-way replication?

MySQL replication currently does not support any locking protocol between source and replica to guarantee the atomicity of a distributed (cross-server) update. In other words, it is possible for client A to make an update to co-source 1, and in the meantime, before it propagates to co-source 2, client B could make an update to co-source 2 that makes the update of client A work differently than it did on co-source 1. Thus, when the update of client A makes it to co-source 2, it produces tables that are different from what you have on co-source 1, even after all the updates from co-source 2 have also propagated. This means that you should not chain two servers together in a two-way replication relationship unless you are sure that your updates can safely happen in any order, or unless you take care of mis-ordered updates somehow in the client code.

You should also realize that two-way replication actually does not improve performance very much (if at all) as far as updates are concerned. Each server must do the same number of updates, just as you would have a single server do. The only difference is that there is a little less lock contention because the updates originating on another server are serialized in one replication thread. Even this benefit might be offset by network delays.

#### A.14.6 How can I use replication to improve performance of my system?

Set up one server as the source and direct all writes to it. Then configure as many replicas as you have the budget and rackspace for, and distribute the reads among the source and the replicas. You can also start the replicas with the `--skip-innodb` option, enable the `low_priority_updates` system variable, and set the `delay_key_write` system variable to `ALL` to get speed improvements on the replica end. In this case, the replica uses nontransactional `MyISAM` tables instead of `InnoDB` tables to get more speed by eliminating transactional overhead.

#### A.14.7 What should I do to prepare client code in my own applications to use performance-enhancing replication?

See the guide to using replication as a scale-out solution, [Section 17.4.5, “Using Replication for Scale-Out”](#).

#### A.14.8 When and how much can MySQL replication improve the performance of my system?

MySQL replication is most beneficial for a system that processes frequent reads and infrequent writes. In theory, by using a single-source/multiple-replica setup, you can scale the system by adding more replicas until you either run out of network bandwidth, or your update load grows to the point that the source cannot handle it.

To determine how many replicas you can use before the added benefits begin to level out, and how much you can improve performance of your site, you must know your query patterns, and determine empirically by benchmarking the relationship between the throughput for reads and writes on a

typical source and a typical replica. The example here shows a rather simplified calculation of what you can get with replication for a hypothetical system. Let `reads` and `writes` denote the number of reads and writes per second, respectively.

Let's say that system load consists of 10% writes and 90% reads, and we have determined by benchmarking that `reads` is  $1200 - 2 * \text{writes}$ . In other words, the system can do 1,200 reads per second with no writes, the average write is twice as slow as the average read, and the relationship is linear. Suppose that the source and each replica have the same capacity, and that we have one source and  $N$  replicas. Then we have for each server (source or replica):

$$\text{reads} = 1200 - 2 * \text{writes}$$

$$\text{reads} = 9 * \text{writes} / (N + 1) \text{ (reads are split, but writes replicated to all replicas)}$$

$$9 * \text{writes} / (N + 1) + 2 * \text{writes} = 1200$$

$$\text{writes} = 1200 / (2 + 9/(N + 1))$$

The last equation indicates the maximum number of writes for  $N$  replicas, given a maximum possible read rate of 1,200 per second and a ratio of nine reads per write.

This analysis yields the following conclusions:

- If  $N = 0$  (which means we have no replication), our system can handle about  $1200/11 = 109$  writes per second.
- If  $N = 1$ , we get up to 184 writes per second.
- If  $N = 8$ , we get up to 400 writes per second.
- If  $N = 17$ , we get up to 480 writes per second.
- Eventually, as  $N$  approaches infinity (and our budget negative infinity), we can get very close to 600 writes per second, increasing system throughput about 5.5 times. However, with only eight servers, we increase it nearly four times.

These computations assume infinite network bandwidth and neglect several other factors that could be significant on your system. In many cases, you may not be able to perform a computation similar to the one just shown that accurately predicts what will happen on your system if you add  $N$  replicas. However, answering the following questions should help you decide whether and by how much replication will improve the performance of your system:

- What is the read/write ratio on your system?
- How much more write load can one server handle if you reduce the reads?
- For how many replicas do you have bandwidth available on your network?

#### **A.14.9**How can I use replication to provide redundancy or high availability?

How you implement redundancy is entirely dependent on your application and circumstances. High-availability solutions (with automatic failover) require active monitoring and either custom scripts or third party tools to provide the failover support from the original MySQL server to the replica.

To handle the process manually, you should be able to switch from a failed source to a pre-configured replica by altering your application to talk to the new server or by adjusting the DNS for the MySQL server from the failed server to the new server.

For more information and some example solutions, see [Section 17.4.8, “Switching Sources During Failover”](#).

**A.14.10** How do I tell whether a replication source server is using statement-based or row-based binary logging format?

Check the value of the `binlog_format` system variable:

```
mysql> SHOW VARIABLES LIKE 'binlog_format';
```

The value shown will be one of `STATEMENT`, `ROW`, or `MIXED`. For `MIXED` mode, statement-based logging is used by default but replication switches automatically to row-based logging under certain conditions, such as unsafe statements. For information about when this may occur, see [Section 5.4.4.3, “Mixed Binary Logging Format”](#).

**A.14.11** How do I tell a replica to use row-based replication?

Replicas automatically know which format to use.

**A.14.12** How do I prevent `GRANT` and `REVOKE` statements from replicating to replica machines?

Start the server with the `--replicate-wild-ignore-table=mysql.%` option to ignore replication for tables in the `mysql` database.

**A.14.13** Does replication work on mixed operating systems (for example, the source runs on Linux while replicas run on OS X and Windows)?

Yes.

**A.14.14** Does replication work on mixed hardware architectures (for example, the source runs on a 64-bit machine while replicas run on 32-bit machines)?

Yes.

## A.15 MySQL 8.0 FAQ: MySQL Enterprise Thread Pool

A.15.1 What is the Thread Pool and what problem does it solve? .....	5017
A.15.2 How does the Thread Pool limit and manage concurrent sessions and transactions for optimal performance and throughput? .....	5018
A.15.3 How is the Thread Pool different from the client side Connection Pool? .....	5018
A.15.4 When should I use the Thread Pool? .....	5018
A.15.5 Are there recommended Thread Pool configurations? .....	5018

**A.15.1** What is the Thread Pool and what problem does it solve?

The MySQL Thread Pool is a MySQL server plugin that extends the default connection-handling capabilities of the MySQL server to limit the number of concurrently executing statements/queries and transactions to ensure that each has sufficient CPU and memory resources to fulfill its task. For MySQL 8.0, the Thread Pool plugin is included in MySQL Enterprise Edition, a commercial product.

The default thread-handling model in MySQL Server executes statements using one thread per client connection. As more clients connect to the server and execute statements, overall performance degrades. The Thread Pool plugin provides an alternative thread-handling model designed to reduce overhead and improve performance. The Thread Pool plugin increases server performance by efficiently managing statement execution threads for large numbers of client connections, especially on modern multi-CPU/Core systems.

For more information, see [Section 5.6.3, “MySQL Enterprise Thread Pool”](#).

**A.15.2**How does the Thread Pool limit and manage concurrent sessions and transactions for optimal performance and throughput?

The Thread Pool uses a “divide and conquer” approach to limiting and balancing concurrency. Unlike the default connection handling of the MySQL Server, the Thread Pool separates connections and threads, so there is no fixed relationship between connections and the threads that execute statements received from those connections. The Thread Pool then manages client connections within configurable thread groups, where they are prioritized and queued based on the nature of the work they were submitted to accomplish.

For more information, see [Section 5.6.3.3, “Thread Pool Operation”](#).

**A.15.3**How is the Thread Pool different from the client side Connection Pool?

The MySQL Connection Pool operates on the client side to ensure that a MySQL client does not constantly connect to and disconnect from the MySQL server. It is designed to cache idle connections in the MySQL client for use by other users as they are needed. This minimizes the overhead and expense of establishing and tearing down connections as queries are submitted to the MySQL server. The MySQL Connection Pool has no visibility as to the query handling capabilities or load of the back-end MySQL server. By contrast, the Thread Pool operates on the MySQL server side and is designed to manage the execution of inbound concurrent connections and queries as they are received from the client connections accessing the back-end MySQL database. Because of the separation of duties, the MySQL Connection Pool and Thread Pool are orthogonal and can be used independent of each other.

MySQL Connection Pooling via the MySQL Connectors is covered in [Chapter 28, \*Connectors and APIs\*](#).

**A.15.4**When should I use the Thread Pool?

There are a few rules of thumb to consider for optimal Thread Pool use cases:

The MySQL `Threads_running` variable keeps track of the number of concurrent statements currently executing in the MySQL Server. If this variable consistently exceeds a region where the server won't operate optimally (usually going beyond 40 for InnoDB workloads), the Thread Pool will be beneficial, especially in extreme parallel overload situations.

If you are using the `innodb_thread_concurrency` to limit the number of concurrently executing statements, you will find the Thread Pool solves the same problem, only better, by assigning connections to thread groups, then queuing executions based on transactional content, user defined designations, and so forth.

Lastly, if your workload comprises mainly short queries, the Thread Pool will be beneficial.

To learn more, see [Section 5.6.3.4, “Thread Pool Tuning”](#).

**A.15.5**Are there recommended Thread Pool configurations?

The Thread Pool has a number of user case driven configuration parameters that affect its performance. To learn about these and tips on tuning, see [Section 5.6.3.4, “Thread Pool Tuning”](#).

## A.16 MySQL 8.0 FAQ: InnoDB Change Buffer

A.16.1 What types of operations modify secondary indexes and result in change buffering? ..... 5019

A.16.2 What is the benefit of the <a href="#">InnoDB</a> change buffer? .....	5019
A.16.3 Does the change buffer support other types of indexes? .....	5019
A.16.4 How much space does <a href="#">InnoDB</a> use for the change buffer? .....	5019
A.16.5 How do I determine the current size of the change buffer? .....	5019
A.16.6 When does change buffer merging occur? .....	5020
A.16.7 When is the change buffer flushed? .....	5020
A.16.8 When should the change buffer be used? .....	5020
A.16.9 When should the change buffer not be used? .....	5020
A.16.10 Where can I find additional information about the change buffer? .....	5020

#### A.16.1 What types of operations modify secondary indexes and result in change buffering?

[INSERT](#), [UPDATE](#), and [DELETE](#) operations can modify secondary indexes. If an affected index page is not in the buffer pool, the changes can be buffered in the change buffer.

#### A.16.2 What is the benefit of the [InnoDB](#) change buffer?

Buffering secondary index changes when secondary index pages are not in the buffer pool avoids expensive random access I/O operations that would be required to immediately read in affected index pages from disk. Buffered changes can be applied later, in batches, as pages are read into the buffer pool by other read operations.

#### A.16.3 Does the change buffer support other types of indexes?

No. The change buffer only supports secondary indexes. Clustered indexes, full-text indexes, and spatial indexes are not supported. Full-text indexes have their own caching mechanism.

#### A.16.4 How much space does [InnoDB](#) use for the change buffer?

Prior to the introduction of the [innodb\\_change\\_buffer\\_max\\_size](#) configuration option in MySQL 5.6, the maximum size of the on-disk change buffer in the system tablespace was 1/3 of the [InnoDB](#) buffer pool size.

In MySQL 5.6 and later, the [innodb\\_change\\_buffer\\_max\\_size](#) configuration option defines the maximum size of the change buffer as a percentage of the total buffer pool size. By default, [innodb\\_change\\_buffer\\_max\\_size](#) is set to 25. The maximum setting is 50.

[InnoDB](#) does not buffer an operation if it would cause the on-disk change buffer to exceed the defined limit.

Change buffer pages are not required to persist in the buffer pool and may be evicted by LRU operations.

#### A.16.5 How do I determine the current size of the change buffer?

The current size of the change buffer is reported by [SHOW ENGINE INNODB STATUS \G](#), under the [INSERT BUFFER AND ADAPTIVE HASH INDEX](#) heading. For example:

```

INSERT BUFFER AND ADAPTIVE HASH INDEX

Ibuf: size 1, free list len 0, seg size 2, 0 merges
```

Relevant data points include:

- [size](#): The number of pages used within the change buffer. Change buffer size is equal to [seg size](#) - (1 + [free list len](#)). The 1 + value represents the change buffer header page.
- [seg size](#): The size of the change buffer, in pages.

For information about monitoring change buffer status, see [Section 15.5.2, “Change Buffer”](#).

**A.16.6**When does change buffer merging occur?

- When a page is read into the buffer pool, buffered changes are merged upon completion of the read, before the page is made available.
- Change buffer merging is performed as a background task. The `innodb_io_capacity` parameter sets an upper limit on the I/O activity performed by InnoDB background tasks such as merging data from the change buffer.
- A change buffer merge is performed during crash recovery. Changes are applied from the change buffer (in the system tablespace) to leaf pages of secondary indexes as index pages are read into the buffer pool.
- The change buffer is fully durable and will survive a system crash. Upon restart, change buffer merge operations resume as part of normal operations.
- A full merge of the change buffer can be forced as part of a slow server shutdown using `--innodb-fast-shutdown=0`.

**A.16.7**When is the change buffer flushed?

Updated pages are flushed by the same flushing mechanism that flushes the other pages that occupy the buffer pool.

**A.16.8**When should the change buffer be used?

The change buffer is a feature designed to reduce random I/O to secondary indexes as indexes grow larger and no longer fit in the InnoDB buffer pool. Generally, the change buffer should be used when the entire data set does not fit into the buffer pool, when there is substantial DML activity that modifies secondary index pages, or when there are lots of secondary indexes that are regularly changed by DML activity.

**A.16.9**When should the change buffer not be used?

You might consider disabling the change buffer if the entire data set fits within the InnoDB buffer pool, if you have relatively few secondary indexes, or if you are using solid-state storage, where random reads are about as fast as sequential reads. Before making configuration changes, it is recommended that you run tests using a representative workload to determine if disabling the change buffer provides any benefit.

**A.16.10**Where can I find additional information about the change buffer?

See [Section 15.5.2, “Change Buffer”](#).

## A.17 MySQL 8.0 FAQ: InnoDB Data-at-Rest Encryption

A.17.1 Is data decrypted for users who are authorized to see it? .....	5021
A.17.2 What is the overhead associated with InnoDB data-at-rest encryption? .....	5021
A.17.3 What are the encryption algorithms used with InnoDB data-at-rest encryption? .....	5021
A.17.4 Is it possible to use 3rd party encryption algorithms in place of the one provided by the InnoDB data-at-rest encryption feature? .....	5021
A.17.5 Can indexed columns be encrypted? .....	5021
A.17.6 What data types and data lengths does InnoDB data-at-rest encryption support? .....	5021
A.17.7 Does data remain encrypted on the network? .....	5021

A.17.8 Does database memory contain cleartext or encrypted data? .....	5021
A.17.9 How do I know which data to encrypt? .....	5021
A.17.10 How is <a href="#">InnoDB</a> data-at-rest encryption different from encryption functions MySQL already provides? .....	5022
A.17.11 Does the transportable tablespaces feature work with <a href="#">InnoDB</a> data-at-rest encryption? .....	5022
A.17.12 Does compression work with <a href="#">InnoDB</a> data-at-rest encryption? .....	5022
A.17.13 Can I use <a href="#">mysqldump</a> or <a href="#">mysqldump</a> with encrypted tables? .....	5022
A.17.14 How do I change (rotate, re-key) the master encryption key? .....	5022
A.17.15 How do I migrate data from a cleartext <a href="#">InnoDB</a> tablespace to an encrypted <a href="#">InnoDB</a> tablespace? .....	5022

**A.17.1**Is data decrypted for users who are authorized to see it?

Yes. [InnoDB](#) data-at-rest encryption is designed to transparently apply encryption within the database without impacting existing applications. Returning data in encrypted format would break most existing applications. [InnoDB](#) data-at-rest encryption provides the benefit of encryption without the overhead associated with traditional database encryption solutions, which would typically require expensive and substantial changes to applications, database triggers, and views.

**A.17.2**What is the overhead associated with [InnoDB](#) data-at-rest encryption?

There is no additional storage overhead. According to internal benchmarks, performance overhead amounts to a single digit percentage difference.

**A.17.3**What are the encryption algorithms used with [InnoDB](#) data-at-rest encryption?

[InnoDB](#) data-at-rest encryption supports the Advanced Encryption Standard (AES256) block-based encryption algorithm. It uses Electronic Codebook (ECB) block encryption mode for tablespace key encryption and Cipher Block Chaining (CBC) block encryption mode for data encryption.

**A.17.4**Is it possible to use 3rd party encryption algorithms in place of the one provided by the [InnoDB](#) data-at-rest encryption feature?

No, it is not possible to use other encryption algorithms. The provided encryption algorithm is broadly accepted.

**A.17.5**Can indexed columns be encrypted?

[InnoDB](#) data-at-rest encryption supports all indexes transparently.

**A.17.6**What data types and data lengths does [InnoDB](#) data-at-rest encryption support?

[InnoDB](#) data-at-rest encryption supports all supported data types. There is no data length limitation.

**A.17.7**Does data remain encrypted on the network?

Data encrypted by the [InnoDB](#) data-at-rest feature is decrypted when it is read from the tablespace file. Thus, if the data is on the network, it is in cleartext form. However, data on the network can be encrypted using MySQL network encryption, which encrypts data traveling to and from a database using SSL/TLS.

**A.17.8**Does database memory contain cleartext or encrypted data?

With [InnoDB](#) data-at-rest encryption, in-memory data is decrypted, which provides complete transparency.

**A.17.9**How do I know which data to encrypt?

Compliance with the PCI-DSS standard requires that credit card numbers (Primary Account Number, or 'PAN') be stored in encrypted form. Breach Notification Laws (for example, CA SB 1386, CA AB 1950, and similar laws in 43+ more US states) require encryption of first name, last name, driver license number, and other PII data. In early 2008, CA AB 1298 added medical and health insurance information to PII data. Additionally, industry specific privacy and security standards may require encryption of certain assets. For example, assets such as pharmaceutical research results, oil field exploration results, financial contracts, or personal data of law enforcement informants may require encryption. In the health care industry, the privacy of patient data, health records and X-ray images is of the highest importance.

**A.17.10** How is [InnoDB](#) data-at-rest encryption different from encryption functions MySQL already provides?

There are symmetric and asymmetric encryption APIs in MySQL that can be used to manually encrypt data within the database. However, the application must manage encryption keys and perform required encryption and decryption operations by calling API functions. [InnoDB](#) data-at-rest encryption requires no application changes, is transparent to end users, and provides automated, built-in key management.

**A.17.11** Does the transportable tablespaces feature work with [InnoDB](#) data-at-rest encryption?

Yes. It is supported for encrypted file-per-table tablespaces. For more information, see [Exporting Encrypted Tablespaces](#).

**A.17.12** Does compression work with [InnoDB](#) data-at-rest encryption?

Customers using [InnoDB](#) data-at-rest encryption receive the full benefit of compression because compression is applied before data blocks are encrypted.

**A.17.13** Can I use [mysqlpump](#) or [mysqldump](#) with encrypted tables?

Yes. Because these utilities create logical backups, the data dumped from encrypted tables is not encrypted.

**A.17.14** How do I change (rotate, re-key) the master encryption key?

[InnoDB](#) data-at-rest encryption uses a two tier key mechanism. When data-at-rest encryption is used, individual tablespace keys are stored in the header of the underlying tablespace data file. Tablespace keys are encrypted using the master encryption key. The master encryption key is generated when tablespace encryption is enabled, and is stored outside the database. The master encryption key is rotated using the [ALTER INSTANCE ROTATE INNODB MASTER KEY](#) statement, which generates a new master encryption key, stores the key, and rotates the key into use.

**A.17.15** How do I migrate data from a cleartext [InnoDB](#) tablespace to an encrypted [InnoDB](#) tablespace?

Transferring data from one tablespace to another is not required. To encrypt data in an [InnoDB](#) file-per-table tablespace, run [ALTER TABLE tbl\\_name ENCRYPTION = 'Y'](#). To encrypt a general tablespace or the [mysql](#) tablespace, run [ALTER TABLESPACE tablespace\\_name ENCRYPTION = 'Y'](#). Encryption support for general tablespaces was introduced in MySQL 8.0.13. Encryption support for the [mysql](#) system tablespace is available as of MySQL 8.0.16.

## A.18 MySQL 8.0 FAQ: Virtualization Support

**A.18.1** Is MySQL supported on virtualized environments such as Oracle VM, VMWare, Docker, Microsoft Hyper-V, or others? ..... 5022

**A.18.1** Is MySQL supported on virtualized environments such as Oracle VM, VMWare, Docker, Microsoft Hyper-V, or others?

MySQL is supported on virtualized environments, but is certified only for [Oracle VM](#). Contact Oracle Support for more information.

Be aware of potential problems when using virtualization software. The usual ones are related to performance, performance degradations, slowness, or unpredictability of disk, I/O, network, and memory.

---

## Appendix B Error Messages and Common Problems

### Table of Contents

B.1 Error Message Sources and Elements .....	5025
B.2 Error Information Interfaces .....	5027
B.3 Problems and Common Errors .....	5029
B.3.1 How to Determine What Is Causing a Problem .....	5029
B.3.2 Common Errors When Using MySQL Programs .....	5031
B.3.3 Administration-Related Issues .....	5042
B.3.4 Query-Related Issues .....	5050
B.3.5 Optimizer-Related Issues .....	5057
B.3.6 Table Definition-Related Issues .....	5058
B.3.7 Known Issues in MySQL .....	5059

This appendix describes the types of error information MySQL provides and how to obtain information about them. The final section is for troubleshooting. It describes common problems and errors that may occur and potential resolutions.

### Additional Resources

Other error-related documentation includes:

- Information about configuring where and how the server writes the error log: [Section 5.4.2, “The Error Log”](#)
- Information about the character set used for error messages: [Section 10.6, “Error Message Character Set”](#)
- Information about the language used for error messages: [Section 10.12, “Setting the Error Message Language”](#)
- Information about errors related to [InnoDB](#): [Section 15.21.4, “InnoDB Error Handling”](#)
- Descriptions of the error messages that the MySQL server and client programs generate: [MySQL 8.0 Error Message Reference](#)

### B.1 Error Message Sources and Elements

This section discusses how error messages originate within MySQL and the elements they contain.

- [Error Message Sources](#)
- [Error Message Elements](#)
- [Error Code Ranges](#)

### Error Message Sources

Error messages can originate on the server side or the client side:

- On the server side, error messages may occur during the startup and shutdown processes, as a result of issues that occur during SQL statement execution, and so forth.
- The MySQL server writes some error messages to its error log. These indicate issues of interest to database administrators or that require DBA action.

- The server sends other error messages to client programs. These indicate issues pertaining only to a particular client. The MySQL client library takes errors received from the server and makes them available to the host client program.
- Client-side error messages are generated from within the MySQL client library, usually involving problems communicating with the server.

Example server-side error messages written to the error log:

- This message produced during the startup process provides a status or progress indicator:

```
2018-10-28T13:01:32.735983Z 0 [Note] [MY-010303] [Server] Skipping
generation of SSL certificates as options related to SSL are specified.
```

- This message indicates an issue that requires DBA action:

```
2018-10-02T03:20:39.410387Z 768 [ERROR] [MY-010045] [Server] Event Scheduler:
[evtuser@localhost][myschema.e_daily] Unknown database 'mydb'
```

Example server-side error message sent to client programs, as displayed by the `mysql` client:

```
mysql> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Example client-side error message originating from within the client library, as displayed by the `mysql` client:

```
shell> mysql -h no-such-host
ERROR 2005 (HY000): Unknown MySQL server host 'no-such-host' (0)
```

Whether an error originates from within the client library or is received from the server, a MySQL client program may respond in varying ways. As just illustrated, the client may display the error message so the user can take corrective measures. The client may instead internally attempt to resolve or retry a failed operation, or take other action.

## Error Message Elements

When an error occurs, error information includes several elements: an error code, SQLSTATE value, and message string. These elements have the following characteristics:

- Error code: This value is numeric. It is MySQL-specific and is not portable to other database systems.

Each error number has a corresponding symbolic value. Examples:

- The symbol for server error number `1146` is `ER_NO_SUCH_TABLE`.
- The symbol for client error number `2005` is `CR_UNKNOWN_HOST`.

The set of error codes used in error messages is partitioned into distinct ranges; see [Error Code Ranges](#).

Error codes are stable across General Availability (GA) releases of a given MySQL series. Before a series reaches GA status, new codes may still be under development and are subject to change.

- SQLSTATE value: This value is a five-character string (for example, `'42S02'`). SQLSTATE values are taken from ANSI SQL and ODBC and are more standardized than the numeric error codes. The first two characters of an SQLSTATE value indicate the error class:

- Class = '00' indicates success.
- Class = '01' indicates a warning.
- Class = '02' indicates “not found.” This is relevant within the context of cursors and is used to control what happens when a cursor reaches the end of a data set. This condition also occurs for `SELECT ... INTO var_list` statements that retrieve no rows.
- Class > '02' indicates an exception.

For server-side errors, not all MySQL error numbers have corresponding SQLSTATE values. In these cases, 'HY000' (general error) is used.

For client-side errors, the SQLSTATE value is always 'HY000' (general error), so it is not meaningful for distinguishing one client error from another.

- Message string: This string provides a textual description of the error.

## Error Code Ranges

The set of error codes used in error messages is partitioned into distinct ranges, each with its own purpose:

- 1 to 999: Global error codes. This error code range is called “global” because it is a shared range that is used by the server as well as by clients.

When an error in this range originates on the server side, the server writes it to the error log, padding the error code with leading zeros to six digits and adding a prefix of `MY-`.

When an error in this range originates on the client side, the client library makes it available to the client program with no zero-padding or prefix.

- 1,000 to 1,999: Server error codes reserved for messages sent to clients.
- 2,000 to 2,999: Client error codes reserved for use by the client library.
- 3,000 to 4,999: Server error codes reserved for messages sent to clients.
- 5,000 to 5,999: Error codes reserved for use by X Plugin for messages sent to clients.
- 10,000 to 49,999: Server error codes reserved for messages to be written to the error log (not sent to clients).

When an error in this range occurs, the server writes it to the error log, padding the error code with leading zeros to six digits and adding a prefix of `MY-`.

- 50,000 to 51,999: Error codes reserved for use by third parties.

The server handles error messages written to the error log differently from error messages sent to clients:

- When the server writes a message to the error log, it pads the error code with leading zeros to six digits and adds a prefix of `MY-` (examples: `MY-000022`, `MY-010048`).
- When the server sends a message to a client program, it adds no zero-padding or prefix to the error code (examples: `1036`, `3013`).

## B.2 Error Information Interfaces

Error messages can originate on the server side or the client side, and each error message includes an error code, SQLSTATE value, and message string, as described in [Section B.1, “Error Message Sources and Elements”](#). For lists of server-side, client-side, and global (shared between server and clients) errors, see [MySQL 8.0 Error Message Reference](#).

For error checking from within programs, use error code numbers or symbols, not error message strings. Message strings do not change often, but it is possible. Also, if the database administrator changes the language setting, that affects the language of message strings; see [Section 10.12, “Setting the Error Message Language”](#).

Error information in MySQL is available in the server error log, at the SQL level, from within client programs, and at the command line.

- [Error Log](#)
- [SQL Error Message Interface](#)
- [Client Error Message Interface](#)
- [Command-Line Error Message Interface](#)

## Error Log

On the server side, some messages are intended for the error log. For information about configuring where and how the server writes the log, see [Section 5.4.2, “The Error Log”](#).

Other server error messages are intended to be sent to client programs and are available as described in [Client Error Message Interface](#).

The range within which a particular error code lies determines whether the server writes an error message to the error log or sends it to clients. For information about these ranges, see [Error Code Ranges](#).

## SQL Error Message Interface

At the SQL level, there are several sources of error information in MySQL:

- SQL statement warning and error information is available through the `SHOW WARNINGS` and `SHOW ERRORS` statements. The `warning_count` system variable indicates the number of errors, warnings, and notes (with notes excluded if the `sql_notes` system variable is disabled). The `error_count` system variable indicates the number of errors. Its value excludes warnings and notes.
- The `GET DIAGNOSTICS` statement may be used to inspect the diagnostic information in the diagnostics area. See [Section 13.6.7.3, “GET DIAGNOSTICS Statement”](#).
- `SHOW SLAVE STATUS` statement output includes information about replication errors occurring on replica servers.
- `SHOW ENGINE INNODB STATUS` statement output includes information about the most recent foreign key error if a `CREATE TABLE` statement for an `InnoDB` table fails.

## Client Error Message Interface

Client programs receive errors from two sources:

- Errors that originate on the client side from within the MySQL client library.
- Errors that originate on the server side and are sent to the client by the server. These are received within the client library, which makes them available to the host client program.

The range within which a particular error code lies determines whether it originated from within the client library or was received by the client from the server. For information about these ranges, see [Error Code Ranges](#).

Regardless of whether an error originates from within the client library or is received from the server, a MySQL client program obtains the error code, SQLSTATE value, message string, and other related information by calling C API functions in the client library:

- `mysql_errno()` returns the MySQL error code.
- `mysql_sqlstate()` returns the SQLSTATE value.
- `mysql_error()` returns the message string.
- `mysql_stmt_errno()`, `mysql_stmt_sqlstate()`, and `mysql_stmt_error()` are the corresponding error functions for prepared statements.
- `mysql_warning_count()` returns the number of errors, warnings, and notes for the most recent statement.

For descriptions of the client library error functions, see [MySQL 8.0 C API Developer Guide](#).

A MySQL client program may respond to an error in varying ways. The client may display the error message so the user can take corrective measures, internally attempt to resolve or retry a failed operation, or take other action. For example, (using the `mysql` client), a failure to connect to the server might result in this message:

```
shell> mysql -h no-such-host
ERROR 2005 (HY000): Unknown MySQL server host 'no-such-host' (0)
```

## Command-Line Error Message Interface

The `pererror` program provides information from the command line about error numbers. See [Section 4.8.2, “pererror — Display MySQL Error Message Information”](#).

```
shell> pererror 1231
MySQL error code MY-001231 (ER_WRONG_VALUE_FOR_VAR): Variable '%-.64s'
can't be set to the value of '%-.200s'
```

For MySQL NDB Cluster errors, use `ndb_pererror`. See [Section 22.4.16, “ndb\\_pererror — Obtain NDB Error Message Information”](#).

```
shell> ndb_pererror 323
NDB error code 323: Invalid nodegroup id, nodegroup already existing:
Permanent error: Application error
```

## B.3 Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

### B.3.1 How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:

- The keyboard does not work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light does not change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
- The mouse pointer does not move.
- The machine does not answer to a remote machine's pings.
- Other programs that are not related to MySQL do not behave correctly.
- Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as `glibc`) are up to date.

It is always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.
- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See [Section 5.4, "MySQL Server Logs"](#).
- If you do not think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it does not want to die, there is probably a bug in the operating system.

If you have examined all other possibilities and concluded that the MySQL server or a MySQL client is causing the problem, it is time to create a bug report, see [Section 1.6, "How to Report Bugs or Problems"](#). In the bug report, try to give a complete description of how the system is behaving and what you think is happening. Also state why you think that MySQL is causing the problem. Take into consideration all the situations described in this chapter. State any problems exactly how they appear when you examine your system. Use the "copy and paste" method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only "the system does not work." This provides us with no information about what could be the problem.

If a program fails, it is always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?

- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in [Section 1.6, “How to Report Bugs or Problems”](#).

## B.3.2 Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

### B.3.2.1 Access denied

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server permits client programs to use when connecting. See [Section 6.2, “Access Control and Account Management”](#), and [Section 6.2.21, “Troubleshooting Problems Connecting to MySQL”](#).

### B.3.2.2 Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the file system (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you do not specify a host name or if you specify the special host name `localhost`.

If the MySQL server is running on Windows, you can connect using TCP/IP. If the server is started with the `named_pipe` system variable enabled, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you do not give a host name when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that does not work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the host name.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket file name or TCP/IP port number when trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See [Section 2.10.2, “Starting the Server”](#).

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket file name might be different in your setup. `host_ip` represents the IP address of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=SOCKET --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotation marks with the `hostname` command; these cause the output of `hostname` (that is, the current host name) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the host name of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with the `skip_networking` system variable enabled, it will not accept TCP/IP connections at all. If the server was started with the `bind_address` system variable set to `127.0.0.1`, it will listen for TCP/IP connections only locally on the loopback interface and will not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or Windows Firewall may need to be configured not to block the MySQL port.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running on the local host. Check your operating system's process list to ensure the `mysqld` process is present.
- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: [Connection to MySQL Server Failing on Windows](#).
- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See [Section B.3.3.6, "How to Protect or Change the MySQL Unix Socket File"](#).
- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket path name for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

```
shell> netstat -ln | grep mysql
```

See [Section B.3.3.6, "How to Protect or Change the MySQL Unix Socket File"](#).

- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill`) before you can restart the MySQL server. See [Section B.3.3.3, "What to Do If MySQL Keeps Crashing"](#).
- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket file name in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.
- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)
- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, see [Section 6.7](#), “SELinux”.

## Connection to MySQL Server Failing on Windows

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows does not allow for enough ephemeral (short-lived) ports to serve those connections.

The purpose of `TIME_WAIT` is to keep a connection accepting packets even after the connection has been closed. This is because Internet routing can cause a packet to take a slow route to its destination and it may arrive after both sides have agreed to close. If the port is in use for a new connection, that packet from the old connection could break the protocol or compromise personal information from the original connection. The `TIME_WAIT` delay prevents this by ensuring that the port cannot be reused until after some time has been permitted for those delayed packets to arrive.

It is safe to reduce `TIME_WAIT` greatly on LAN connections because there is little chance of packets arriving at very long delays, as they could through the Internet with its comparatively large distances and latencies.

Windows permits ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a `TIME_WAIT` status for 120 seconds. The port will not be available again until this time expires. The default range of port numbers depends on the version of Windows, with a more limited number of ports in older versions:

- Windows through Server 2003: Ports in range 1025–5000
- Windows Vista, Server 2008, and newer: Ports in range 49152–65535

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

### Important

The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore it if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: <http://support.microsoft.com/kb/256986/EN-US/>.

1. Start Registry Editor ([Regedt32.exe](#)).

2. Locate the following key in the registry:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
```

3. On the **Edit** menu, click **Add Value**, and then add the following registry value:

```
Value Name: MaxUserPort
Data Type: REG_DWORD
Value: 65534
```

This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the **Edit** menu, click **Add Value**, and then add the following registry value:

```
Value Name: TcpTimedWaitDelay
Data Type: REG_DWORD
Value: 30
```

This sets the number of seconds to hold a TCP port connection in **TIME\_WAIT** state before closing. The valid range is between 30 and 300 decimal, although you may wish to check with Microsoft for the latest permitted values. The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

### B.3.2.3 Lost connection to MySQL server

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes “during query,” this is probably the case you are experiencing.

Sometimes the “during query” form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing `net_read_timeout` from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your `connect_timeout` value is set to only a few seconds, you may be able to resolve the problem by increasing it to ten seconds, perhaps more if you have a very long distance or slow connection. You can determine whether you are experiencing this more uncommon cause by using `SHOW GLOBAL STATUS LIKE 'Aborted_connects'`. It will increase by one for each initial connection attempt that the server aborts. You may see “reading authorization packet” as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with **BLOB** values that are larger than `max_allowed_packet`, which can cause this error with some clients. Sometime you may see an `ER_NET_PACKET_TOO_LARGE` error, and that confirms that you need to increase `max_allowed_packet`.

### B.3.2.4 Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

### B.3.2.5 Host 'host\_name' is blocked

If the following error occurs, it means that `mysqld` has received many connection requests from the given host that were interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.
Unblock with 'mysqladmin flush-hosts'
```

The value of the `max_connect_errors` system variable determines how many successive interrupted connection requests are permitted. After `max_connect_errors` failed requests without a successful connection, `mysqld` assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you flush the host cache by executing a `FLUSH HOSTS` statement, a `TRUNCATE TABLE` statement that truncates the Performance Schema `host_cache` table, or a `mysqladmin flush-hosts` command.

To adjust the permitted number of successive connection errors, set `max_connect_errors` at server startup. For example, put these lines in the server `my.cnf` file:

```
[mysqld]
max_connect_errors=10000
```

The value can also be set at runtime:

```
SET GLOBAL max_connect_errors=10000;
```

If you get the `Host 'host_name' is blocked` error message for a given host, you should first verify that there is nothing wrong with TCP/IP connections from that host. If you are having network problems, it does no good to increase the value of `max_connect_errors`.

For more information about how the host cache works, see [Section 5.1.12.3, “DNS Lookups and the Host Cache”](#).

### B.3.2.6 Too many connections

If clients encounter `Too many connections` errors when attempting to connect to the `mysqld` server, all available connections are in use by other clients.

The permitted number of connections is controlled by the `max_connections` system variable. The default value is 151 to improve performance when MySQL is used with the Apache Web server. To support more connections, set `max_connections` to a larger value.

`mysqld` actually permits `max_connections` + 1 client connections. The extra connection is reserved for use by accounts that have the `CONNECTION_ADMIN` privilege (or the deprecated `SUPER` privilege). By granting the privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See [Section 13.7.7.29, “SHOW PROCESSLIST Statement”](#).

The server also permits administrative connections on a dedicated interface. For more information about how the server handles client connections, see [Section 5.1.12.1, “Connection Interfaces”](#).

### B.3.2.7 Out of memory

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

### B.3.2.8 MySQL server has gone away

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent).

Error Code	Description
<code>CR_SERVER_GONE_ERROR</code>	The client couldn't send a question to the server.
<code>CR_SERVER_LOST</code>	The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See [Section 5.1.8, “Server System Variables”](#).

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).

- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` expired) before the command was issued.

The problem on Windows is that in some cases MySQL does not get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

The solution to this is to either do a `mysql_ping()` on the connection if there has been a long time since the last query (this is what Connector/ODBC does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` variable, which has a default value of 64MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in [Section B.3.2.9, "Packet Too Large"](#).

An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.

- It is also possible to see this error if host name lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working—from MySQL's point of view the problem is indistinguishable from any other network timeout.

You may also see the `MySQL server has gone away` error if MySQL is started with the `skip_networking` system variable enabled.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See [Section B.3.3.3, "What to Do If MySQL Keeps Crashing"](#).

You can obtain more information about lost connections by starting `mysqld` with the `log_error_verbosity` system variable set to 3. This logs some of the disconnection messages in the `hostname.err` file. See [Section 5.4.2, "The Error Log"](#).

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See [Section B.3.3.3, "What to Do If MySQL Keeps Crashing"](#).
- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See [Section 5.9, "Debugging MySQL"](#).

- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the general query log enabled to determine whether the problem query appears in the log? (See [Section 5.4.3, “The General Query Log”](#).)

See also [Section B.3.2.10, “Communication Errors and Aborted Connections”](#), and [Section 1.6, “How to Report Bugs or Problems”](#).

### B.3.2.9 Packet Too Large

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a source replication server to a replica.

The largest possible packet that can be transmitted to or from a MySQL 8.0 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues an `ER_NET_PACKET_TOO_LARGE` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 64MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 128MB, start the server like this:

```
shell> mysqld --max_allowed_packet=128M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 128MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=128M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

### B.3.2.10 Communication Errors and Aborted Connections

If connection problems occur such as communication errors or aborted connections, use these sources of information to diagnose problems:

- The error log. See [Section 5.4.2, “The Error Log”](#).

- The general query log. See [Section 5.4.3, “The General Query Log”](#).
- The `Aborted_xxx` and `Connection_errors_xxx` status variables. See [Section 5.1.10, “Server Status Variables”](#).
- The host cache, which is accessible using the Performance Schema `host_cache` table. See [Section 5.1.12.3, “DNS Lookups and the Host Cache”](#), and [Section 26.12.19.2, “The host\\_cache Table”](#).

If the `log_error_verbosity` system variable is set to 3, you might find messages like this in your error log:

```
[Note] Aborted connection 854 to db: 'employees' user: 'josh'
```

If a client is unable even to connect, the server increments the `Aborted_connects` status variable. Unsuccessful connection attempts can occur for the following reasons:

- A client attempts to access a database but has no privileges for it.
- A client uses an incorrect password.
- A connection packet does not contain the right information.
- It takes more than `connect_timeout` seconds to obtain a connect packet. See [Section 5.1.8, “Server System Variables”](#).

If these kinds of things happen, it might indicate that someone is trying to break into your server! If the general query log is enabled, messages for these types of problems are logged to it.

If a client successfully connects but later disconnects improperly or is terminated, the server increments the `Aborted_clients` status variable, and logs an `Aborted connection` message to the error log. The cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See [Section 5.1.8, “Server System Variables”](#).
- The client program ended abruptly in the middle of a data transfer.

Other reasons for problems with aborted connections or aborted clients:

- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See [Section B.3.2.9, “Packet Too Large”](#).
- Use of Ethernet protocol with Linux, both half and full duplex. Some Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file using FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. Switch the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and test the results to determine the best setting.
- A problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.

See also [Section B.3.2.8, “MySQL server has gone away”](#).

### B.3.2.11 The table is full

If a table-full error occurs, it may be that the disk is full or that the table has reached its maximum size. The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. See [Section 8.4.6, “Limits on Table Size”](#).

### B.3.2.12 Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '...\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See [Section 4.2.2.2, “Using Option Files”](#).

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `perror`. One reason the server cannot write to a table is that the file system is full:

```
shell> perror 28
OS error code 28: No space left on device
```

If you get an error of the following type during startup, it indicates that the file system or directory used for storing data files is write protected. Provided that the write error is to a test file, the error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

### B.3.2.13 Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

### B.3.2.14 Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

```
Found wrong password for user 'some_user'@'some_host'; ignoring user
```

As a result, the account is simply ignored by the permission system. To fix this problem, assign a new, valid password to the account.

### B.3.2.15 Table 'tbl\_name' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a file system that has case-sensitive file names.
- Even for file systems that are not case-sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See [Section 13.7.7, “SHOW Statements”](#).

### B.3.2.16 Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multibyte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `CMake` with the `-DDEFAULT_CHARSET=charset_name` option. See [Section 2.9.7, “MySQL Source-Configuration Options”](#).

All standard MySQL binaries are compiled with support for all multibyte character sets.

- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

In this case, you need to use one of the following methods to solve the problem:

- Recompile the client with support for the character set. See [Section 2.9.7, “MySQL Source-Configuration Options”](#).
- Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
- Copy the character definition files to the path where the client expects them to be.

### B.3.2.17 File Not Found and Similar Errors

If you get `ERROR 'file_name' not found (errno: 23)`, `Can't open file: file_name (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you have not allocated enough file descriptors for the MySQL server. You can use the `pererror` utility to get a description of what the error number means:

```
shell> pererror 23
OS error code 23: File table overflow
shell> pererror 24
OS error code 24: Too many open files
shell> pererror 11
OS error code 11: Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` system variable (the default value is 64). This may not entirely prevent running out of file descriptors because in some circumstances the server may attempt to extend the cache size temporarily, as described in [Section 8.4.3.1, “How MySQL Opens and Closes Tables”](#). Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or set the `open_files_limit` system variable. See [Section 5.1.8, “Server System Variables”](#). The easiest way to set these values is to add an option to your option file. See [Section 4.2.2.2, “Using Option Files”](#). If you have an old version of `mysqld` that does not support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the `#` character to uncomment this line, and change the number 256 to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

#### Note

If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

### B.3.2.18 Table-Corruption Issues

If you have started `mysqld` with the `myisam_recover_options` system variable set, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file `'Warning: Checking table ...'` which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further.

When the server detects `MyISAM` table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: `Got an error from thread_id=1, mi_dynrec.c:368`. This is useful information to include in bug reports.

See also [Section 5.1.7, “Server Command Options”](#), and [Section 5.9.1.7, “Making a Test Case If You Experience Table Corruption”](#).

## B.3.3 Administration-Related Issues

### B.3.3.1 Problems with File Permissions

If you have problems with file permissions, the `UMASK` or `UMASK_DIR` environment variable might be set incorrectly when `mysqld` starts. For example, `mysqld` might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/file_name' (Errcode: 13)
```

The default `UMASK` and `UMASK_DIR` values are 0640 and 0750, respectively. `mysqld` assumes that the value for `UMASK` or `UMASK_DIR` is in octal if it starts with a zero. For example, setting `UMASK=0600` is equivalent to `UMASK=384` because 0600 octal is 384 decimal.

Assuming that you start `mysqld` using `mysqld_safe`, change the default `UMASK` value as follows:

```
UMASK=384 # = 600 in octal
export UMASK
mysqld_safe &
```

#### Note

An exception applies for the error log file if you start `mysqld` using `mysqld_safe`, which does not respect `UMASK`: `mysqld_safe` may create the error log file if it does not exist prior to starting `mysqld`, and `mysqld_safe` uses a umask set to a strict value of `0137`. If this is unsuitable, create the error file manually with the desired access mode prior to executing `mysqld_safe`.

By default, `mysqld` creates database directories with an access permission value of `0750`. To modify this behavior, set the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, to give group access to all new directories, start `mysqld_safe` as follows:

```
UMASK_DIR=504 # = 770 in octal
export UMASK_DIR
mysqld_safe &
```

For additional details, see [Section 4.9, “Environment Variables”](#).

### B.3.3.2 How to Reset the Root Password

If you have never assigned a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, this is insecure. For instructions on assigning a password, see [Section 2.10.4, “Securing the Initial MySQL Account”](#).

If you know the `root` password and want to change it, see [Section 13.7.1.1, “ALTER USER Statement”](#), and [Section 13.7.1.10, “SET PASSWORD Statement”](#).

If you assigned a `root` password previously but have forgotten it, you can assign a new password. The following sections provide instructions for Windows and Unix and Unix-like systems, as well as generic instructions that apply to any system.

#### Resetting the Root Password: Windows Systems

On Windows, use the following procedure to reset the password for the MySQL `'root'@'localhost'` account. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

1. Log on to your system as Administrator.
2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager: From the **Start** menu, select **Control Panel**, then **Administrative Tools**, then **Services**. Find the MySQL service in the list and stop it.

If your server is not running as a service, you may need to use the Task Manager to force it to stop.

3. Create a text file containing the password-assignment statement on a single line. Replace the password with the password that you want to use.

```
ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

4. Save the file. This example assumes that you name the file `C:\mysql-init.txt`.
5. Open a console window to get to the command prompt: From the **Start** menu, select **Run**, then enter `cmd` as the command to be run.
6. Start the MySQL server with the `init_file` system variable set to name the file (notice that the backslash in the option value is doubled):

```
C:\> cd "C:\Program Files\MySQL\MySQL Server 8.0\bin"
C:\> mysqld --init-file=C:\mysql-init.txt
```

If you installed MySQL to a different location, adjust the `cd` command accordingly.

The server executes the contents of the file named by the `init_file` system variable at startup, changing the `'root'@'localhost'` account password.

To have server output to appear in the console window rather than in a log file, add the `--console` option to the `mysqld` command.

If you installed MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option. For example:

```
C:\> mysqld
 --defaults-file="C:\\ProgramData\\MySQL\\MySQL Server 8.0\\my.ini"
 --init-file=C:\\mysql-init.txt
```

The appropriate `--defaults-file` setting can be found using the Services Manager: From the **Start** menu, select **Control Panel**, then **Administrative Tools**, then **Services**. Find the MySQL service in the list, right-click it, and choose the `Properties` option. The `Path to executable` field contains the `--defaults-file` setting.

7. After the server has started successfully, delete `C:\mysql-init.txt`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the MySQL server and restart it normally. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

## Resetting the Root Password: Unix and Unix-Like Systems

On Unix, use the following procedure to reset the password for the MySQL `'root'@'localhost'` account. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

The instructions assume that you will start the MySQL server from the Unix login account that you normally use for running it. For example, if you run the server using the `mysql` login account, you should log in as `mysql` before using the instructions. Alternatively, you can log in as `root`, but in this case you *must* start `mysqld` with the `--user=mysql` option. If you start the server as `root` without using `--user=mysql`, the server may create `root`-owned files in the data directory, such as log files, and these may cause permission-related problems for future server startups. If that happens, you will need to either change the ownership of the files to `mysql` or remove them.

1. Log on to your system as the Unix user that the MySQL server runs as (for example, `mysql`).
2. Stop the MySQL server if it is running. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, host name, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the file name has an extension of `.pid` and begins with either `mysqld` or your system's host name.

Stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process. Use the actual path name of the `.pid` file in the following command:

```
shell> kill `cat /mysql-data-directory/host_name.pid`
```

Use backticks (not forward quotation marks) with the `cat` command. These cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file containing the password-assignment statement on a single line. Replace the password with the password that you want to use.

```
ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

4. Save the file. This example assumes that you name the file `/home/me/mysql-init`. The file contains the password, so do not save it where it can be read by other users. If you are not logged in as `mysql` (the user the server runs as), make sure that the file has permissions that permit `mysql` to read it.
5. Start the MySQL server with the `init_file` system variable set to name the file:

```
shell> mysqld --init-file=/home/me/mysql-init &
```

The server executes the contents of the file named by the `init_file` system variable at startup, changing the `'root'@'localhost'` account password.

Other options may be necessary as well, depending on how you normally start your server. For example, `--defaults-file` may be needed before the `init_file` argument.

6. After the server has started successfully, delete `/home/me/mysql-init`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally.

## Resetting the Root Password: Generic Instructions

The preceding sections provide password-resetting instructions specifically for Windows and Unix and Unix-like systems. Alternatively, on any platform, you can reset the password using the `mysql` client (but this approach is less secure):

1. Stop the MySQL server if necessary, then restart it with the `--skip-grant-tables` option. This enables anyone to connect without a password and with all privileges, and disables account-management statements such as `ALTER USER` and `SET PASSWORD`. Because this is insecure, if the server is started with the `--skip-grant-tables` option, it also disables remote connections by enabling `skip_networking`.
2. Connect to the MySQL server using the `mysql` client; no password is necessary because the server was started with `--skip-grant-tables`:

```
shell> mysql
```

3. In the `mysql` client, tell the server to reload the grant tables so that account-management statements work:

```
mysql> FLUSH PRIVILEGES;
```

Then change the `'root'@'localhost'` account password. Replace the password with the password that you want to use. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

```
mysql> ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally (without the `--skip-grant-tables` option and without enabling the `skip_networking` system variable).

### B.3.3.3 What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This does not mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See [Section 5.4.2, “The Error Log”](#).

On some systems, you can find in the error log a stack trace of where `mysqld` died. Note that the variable values written in the error log may not always be 100% correct.

Many unexpected server exits are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with the `delay_key_write` system variable enabled, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that does not support good file system locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it is at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others result in an unexpected exit for you. Try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all MyISAM tables, and restart `mysqld`. This ensures that you are running from a clean state. See [Chapter 5, MySQL Server Administration](#).
- Start `mysqld` with the general query log enabled (see [Section 5.4.3, “The General Query Log”](#)). Then try to determine from the information written to the log whether some specific query kills the server. About

95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See [Section 5.4.3, “The General Query Log”](#). If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have isolated the bug and should submit a bug report for it. See [Section 1.6, “How to Report Bugs or Problems”](#).

- Try to make a test case that we can use to repeat the problem. See [Section 5.9, “Debugging MySQL”](#).
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- Configuring MySQL for debugging makes it much easier to gather information about possible errors if something goes wrong. Reconfigure MySQL with the `-DWITH_DEBUG=1` option to `CMake` and then recompile. See [Section 5.9, “Debugging MySQL”](#).
- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- If `mysqld` appears to be running but not responding, try `mysqladmin -u root processlist`. Sometimes `mysqld` is not hung even though it seems unresponsive. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while running other queries.
- Try the following:
  1. Start `mysqld` from `gdb` (or another debugger). See [Section 5.9, “Debugging MySQL”](#).
  2. Run your test scripts.
  3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

```
backtrace
info local
up
info local
up
info local
```

With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where `N` is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to exit or misbehave.
- Send a normal bug report. See [Section 1.6, “How to Report Bugs or Problems”](#). Be even more detailed than usual. Because MySQL works for many people, the crash might result from something that exists only on your computer (for example, an error that is related to your particular system libraries).
- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

The current dynamic row code has been in use for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Consider the possibility of hardware faults when diagnosing problems. Defective hardware can be the cause of data corruption. Pay particular attention to your memory and disk subsystems when troubleshooting hardware.

### B.3.3.4 How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- Alternatively, to abort the thread, use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition enables the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for `ALTER TABLE`, the old table is left unchanged.

### B.3.3.5 Where MySQL Stores Temporary Files

On Unix, MySQL uses the value of the `TMPDIR` environment variable as the path name of the directory in which to store temporary files. If `TMPDIR` is not set, MySQL uses the system default, which is usually `/tmp`, `/var/tmp`, or `/usr/tmp`.

On Windows, MySQL checks in order the values of the `TMPDIR`, `TEMP`, and `TMP` environment variables. For the first one found to be set, MySQL uses it and does not check those remaining. If none of `TMPDIR`, `TEMP`, or `TMP` are set, MySQL uses the Windows system default, which is usually `C:\windows\temp\`.

If the file system containing your temporary file directory is too small, you can use the `mysqld --tmpdir` option to specify a directory in a file system where you have enough space.

The `--tmpdir` option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (:) on Unix and semicolon characters (;) on Windows.

**Note**

To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replica, you can set the `slave_load_tmpdir` system variable to specify a separate directory for holding temporary files when replicating `LOAD DATA` statements. This directory should be in a disk-based file system (not a memory-based file system) so that the temporary files used to replicate `LOAD DATA` can survive machine restarts. The directory also should not be one that is cleared by the operating system during the system startup process. However, replication can now continue after a restart if the temporary files have been removed.

MySQL arranges that temporary files are removed if `mysqld` is terminated. On platforms that support it (such as Unix), this is done by unlinking the file after opening it. The disadvantage of this is that the name does not appear in directory listings and you do not see a big temporary file that fills up the file system in which the temporary file directory is located. (In such cases, `ls -l` may be helpful in identifying large files associated with `mysqld`.)

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some statements, MySQL creates temporary SQL tables that are not hidden and have names that begin with `#sql`.

Some `SELECT` queries create temporary SQL tables to hold intermediate results.

DDL operations that rebuild the table and are not performed online using the `ALGORITHM=INPLACE` technique create a temporary copy of the original table in the same directory as the original table.

Online DDL operations may use temporary log files for recording concurrent DML, temporary sort files when creating an index, and temporary intermediate tables files when rebuilding the table. For more information, see [Section 15.12.3, “Online DDL Space Requirements”](#).

InnoDB user-created temporary tables and on-disk internal temporary tables are created in a temporary tablespace file named `ibtmp1` in the MySQL data directory. For more information, see [Section 15.6.3.5, “Temporary Tablespaces”](#).

See also [Section 15.15.7, “InnoDB INFORMATION\\_SCHEMA Temporary Table Info Table”](#).

The optional `EXTENDED` modifier causes `SHOW TABLES` to list hidden tables created by failed `ALTER TABLE` statements. See [Section 13.7.7.39, “SHOW TABLES Statement”](#).

### B.3.3.6 How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the `sticky` bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

```
[mysqld]
socket=/path/to/socket

[client]
socket=/path/to/socket
```

See [Section 4.2.2.2, “Using Option Files”](#).

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.
- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.
- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `MYSQL_UNIX_ADDR` option when you run `CMake`. See [Section 2.9.7, “MySQL Source-Configuration Options”](#).

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

### B.3.3.7 Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs (for example, in `mysqld_safe` or `mysql.server`). See [Section 4.9, “Environment Variables”](#).

You can set the time zone for the server with the `--timezone=timezone_name` option to `mysqld_safe`. You can also set it by setting the `TZ` environment variable before you start `mysqld`.

The permissible values for `--timezone` or `TZ` are system dependent. Consult your operating system documentation to see what values are acceptable.

## B.3.4 Query-Related Issues

### B.3.4.1 Case Sensitivity in String Searches

For nonbinary strings (`CHAR`, `VARCHAR`, `TEXT`), string searches use the collation of the comparison operands. For binary strings (`BINARY`, `VARBINARY`, `BLOB`), comparisons use the numeric values of the bytes in the operands; this means that for alphabetic characters, comparisons will be case-sensitive.

A comparison between a nonbinary string and binary string is treated as a comparison of binary strings.

Simple comparison operations ( $\geq$ ,  $>$ ,  $=$ ,  $<$ ,  $\leq$ , sorting, and grouping) are based on each character's "sort value." Characters with the same sort value are treated as the same character. For example, if `e` and `é` have the same sort value in a given collation, they compare as equal.

The default character set and collation are `utf8mb4` and `utf8mb4_0900_ai_ci`, so nonbinary string comparisons are case-insensitive by default. This means that if you search with `col_name LIKE 'a%'`, you get all column values that start with `A` or `a`. To make this search case-sensitive, make sure that one of the operands has a case-sensitive or binary collation. For example, if you are comparing a column and a string that both have the `utf8mb4` character set, you can use the `COLLATE` operator to cause either operand to have the `utf8mb4_0900_as_cs` or `utf8mb4_bin` collation:

```
col_name COLLATE utf8mb4_0900_as_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE utf8mb4_0900_as_cs
col_name COLLATE utf8mb4_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE utf8mb4_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case-sensitive or binary collation. See [Section 13.1.20, "CREATE TABLE Statement"](#).

To cause a case-sensitive comparison of nonbinary strings to be case-insensitive, use `COLLATE` to name a case-insensitive collation. The strings in the following example normally are case-sensitive, but `COLLATE` changes the comparison to be case-insensitive:

```
mysql> SET NAMES 'utf8mb4';
mysql> SET @s1 = 'MySQL' COLLATE utf8mb4_bin,
 @s2 = 'mysql' COLLATE utf8mb4_bin;
mysql> SELECT @s1 = @s2;
+-----+
| @s1 = @s2 |
+-----+
| 0 |
+-----+
mysql> SELECT @s1 COLLATE utf8mb4_0900_ai_ci = @s2;
+-----+
| @s1 COLLATE utf8mb4_0900_ai_ci = @s2 |
+-----+
| 1 |
+-----+
```

A binary string is case-sensitive in comparisons. To compare the string as case-insensitive, convert it to a nonbinary string and use `COLLATE` to name a case-insensitive collation:

```
mysql> SET @s = BINARY 'MySQL';
mysql> SELECT @s = 'mysql';
+-----+
| @s = 'mysql' |
+-----+
| 0 |
+-----+
mysql> SELECT CONVERT(@s USING utf8mb4) COLLATE utf8mb4_0900_ai_ci = 'mysql';
+-----+
| CONVERT(@s USING utf8mb4) COLLATE utf8mb4_0900_ai_ci = 'mysql' |
+-----+
| 1 |
+-----+
```

To determine whether a value will compare as a nonbinary or binary string, use the `COLLATION()` function. This example shows that `VERSION()` returns a string that has a case-insensitive collation, so comparisons are case-insensitive:

```
mysql> SELECT COLLATION(VERSION());
+-----+
```

```
| COLLATION(VERSION()) |
+-----+
| utf8_general_ci |
+-----+
```

For binary strings, the collation value is `binary`, so comparisons will be case sensitive. One context in which you will see `binary` is for compression functions, which return binary strings as a general rule: string:

```
mysql> SELECT COLLATION(COMPRESS('x'));
+-----+
| COLLATION(COMPRESS('x')) |
+-----+
| binary |
+-----+
```

To check the sort value of a string, the `WEIGHT_STRING()` may be helpful. See [Section 12.8, “String Functions and Operators”](#).

### B.3.4.2 Problems Using DATE Columns

The format of a `DATE` value is `'YYYY-MM-DD'`. According to standard SQL, no other format is permitted. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
SELECT * FROM t1 WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in numeric context and vice versa. MySQL also permits a “relaxed” string format when updating and in a `WHERE` clause that compares a date to a `DATE`, `DATETIME`, or `TIMESTAMP` column. “Relaxed” format means that any punctuation character may be used as the separator between parts. For example, `'2004-08-15'` and `'2004#08#15'` are equivalent. MySQL can also convert a string containing no separators (such as `'20040815'`), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any comparison method other than those just listed, such as `IN` or `STRCMP()`.

For those exceptions, the comparison is done by converting the objects to strings and performing a string comparison.

To be on the safe side, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special “zero” date `'0000-00-00'` can be stored and retrieved as `'0000-00-00'`. When a `'0000-00-00'` date is used through Connector/ODBC, it is automatically converted to `NULL` because ODBC cannot handle that kind of date.

Because MySQL performs the conversions just described, the following statements work (assume that `idate` is a `DATE` column):

```
INSERT INTO t1 (idate) VALUES (19970505);
```

```

INSERT INTO t1 (idate) VALUES ('19970505');
INSERT INTO t1 (idate) VALUES ('97-05-05');
INSERT INTO t1 (idate) VALUES ('1997.05.05');
INSERT INTO t1 (idate) VALUES ('1997 05 05');
INSERT INTO t1 (idate) VALUES ('0000-00-00');

SELECT idate FROM t1 WHERE idate >= '1997-05-05';
SELECT idate FROM t1 WHERE idate >= 19970505;
SELECT MOD(idate,100) FROM t1 WHERE idate >= 19970505;
SELECT idate FROM t1 WHERE idate >= '19970505';

```

However, the following statement does not work:

```

SELECT idate FROM t1 WHERE STRCMP(idate,'20030505')=0;

```

`STRCMP()` is a string function, so it converts `idate` to a string in `'YYYY-MM-DD'` format and performs a string comparison. It does not convert `'20030505'` to the date `'2003-05-05'` and perform a date comparison.

If you enable the `ALLOW_INVALID_DATES` SQL mode, MySQL permits you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12. This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

MySQL permits you to store dates where the day or month and day are zero. This is convenient if you want to store a birthdate in a `DATE` column and you know only part of the date. To disallow zero month or day parts in dates, enable the `NO_ZERO_IN_DATE` mode.

MySQL permits you to store a “zero” value of `'0000-00-00'` as a “dummy date.” This is in some cases more convenient than using `NULL` values. If a date to be stored in a `DATE` column cannot be converted to any reasonable value, MySQL stores `'0000-00-00'`. To disallow `'0000-00-00'`, enable the `NO_ZERO_DATE` mode.

To have MySQL check all dates and accept only legal dates (unless overridden by `IGNORE`), set the `sql_mode` system variable to `"NO_ZERO_IN_DATE,NO_ZERO_DATE"`.

### B.3.4.3 Problems with NULL Values

The concept of the `NULL` value is a common source of confusion for newcomers to SQL, who often think that `NULL` is the same thing as an empty string `''`. This is not the case. For example, the following statements are completely different:

```

mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');

```

Both statements insert a value into the `phone` column, but the first inserts a `NULL` value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the person is known to have no phone, and thus no phone number.”

To help with `NULL` handling, you can use the `IS NULL` and `IS NOT NULL` operators and the `IFNULL()` function.

In SQL, the `NULL` value is never true in comparison to any other value, even `NULL`. An expression that contains `NULL` always produces a `NULL` value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return `NULL`:

```

mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);

```

To search for column values that are `NULL`, you cannot use an `expr = NULL` test. The following statement returns no rows, because `expr = NULL` is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for `NULL` values, you must use the `IS NULL` test. The following statements show how to find the `NULL` phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See [Section 3.3.4.6, “Working with NULL Values”](#), for additional information and examples.

You can add an index on a column that can have `NULL` values if you are using the `MyISAM`, `InnoDB`, or `MEMORY` storage engine. Otherwise, you must declare an indexed column `NOT NULL`, and you cannot insert `NULL` into the column.

When reading data with `LOAD DATA`, empty or missing columns are updated with `''`. To load a `NULL` value into a column, use `\N` in the data file. The literal word `NULL` may also be used under some circumstances. See [Section 13.2.7, “LOAD DATA Statement”](#).

When using `DISTINCT`, `GROUP BY`, or `ORDER BY`, all `NULL` values are regarded as equal.

When using `ORDER BY`, `NULL` values are presented first, or last if you specify `DESC` to sort in descending order.

Aggregate (group) functions such as `COUNT()`, `MIN()`, and `SUM()` ignore `NULL` values. The exception to this is `COUNT(*)`, which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-`NULL` values in the `age` column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles `NULL` values specially. If you insert `NULL` into a `TIMESTAMP` column, the current date and time is inserted. If you insert `NULL` into an integer or floating-point column that has the `AUTO_INCREMENT` attribute, the next number in the sequence is inserted.

### B.3.4.4 Problems with Column Aliases

An alias can be used in a query select list to give a column a different name. You can use the alias in `GROUP BY`, `ORDER BY`, or `HAVING` clauses to refer to the column:

```
SELECT SQRT(a*b) AS root FROM tbl_name
GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name
GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL disallows references to column aliases in a `WHERE` clause. This restriction is imposed because when the `WHERE` clause is evaluated, the column value may not yet have been determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name
WHERE cnt > 0 GROUP BY id;
```

The `WHERE` clause determines which rows should be included in the `GROUP BY` clause, but it refers to the alias of a column value that is not known until after the rows have been selected, and grouped by the `GROUP BY`.

In the select list of a query, a quoted column alias can be specified using identifier or string quoting characters:

```
SELECT 1 AS `one`, 2 AS 'two';
```

Elsewhere in the statement, quoted references to the alias must use identifier quoting or the reference is treated as a string literal. For example, this statement groups by the values in column `id`, referenced using the alias ``a``:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
GROUP BY `a`;
```

But this statement groups by the literal string `'a'` and will not work as expected:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
GROUP BY 'a';
```

### B.3.4.5 Rollback Failure for Nontransactional Tables

If you receive the following message when trying to perform a [ROLLBACK](#), it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These nontransactional tables are not affected by the [ROLLBACK](#) statement.

If you were not deliberately mixing transactional and nontransactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` does not support a storage engine, it instead creates the table as a [MyISAM](#) table, which is nontransactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';
SHOW CREATE TABLE tbl_name;
```

See [Section 13.7.7.38, “SHOW TABLE STATUS Statement”](#), and [Section 13.7.7.10, “SHOW CREATE TABLE Statement”](#).

To check which storage engines your `mysqld` server supports, use this statement:

```
SHOW ENGINES;
```

See [Section 13.7.7.16, “SHOW ENGINES Statement”](#) for full details.

### B.3.4.6 Deleting Rows from Related Tables

If the total length of the [DELETE](#) statement for `related_table` is more than the default value of the `max_allowed_packet` system variable, you should split it into smaller parts and execute multiple [DELETE](#) statements. You probably get the fastest [DELETE](#) by specifying only 100 to 1,000 `related_column` values per statement if the `related_column` is indexed. If the `related_column` isn't indexed, the speed is independent of the number of arguments in the [IN](#) clause.

### B.3.4.7 Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that returns no rows, you should use the following procedure to find out what is wrong:

1. Test the query with `EXPLAIN` to check whether you can find something that is obviously wrong. See [Section 13.8.2, “EXPLAIN Statement”](#).
2. Select only those columns that are used in the `WHERE` clause.
3. Remove one table at a time from the query until it returns some rows. If the tables are large, it is a good idea to use `LIMIT 10` with the query.
4. Issue a `SELECT` for the column that should have matched a row against the table that was last removed from the query.
5. If you are comparing `FLOAT` or `DOUBLE` columns with numbers that have decimals, you cannot use equality (=) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the `FLOAT` to a `DOUBLE` fixes this. See [Section B.3.4.8, “Problems with Floating-Point Values”](#).
6. If you still cannot figure out what is wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your `SELECT` statement at the end of the file.

Verify that the test file demonstrates the problem by executing these commands:

```
shell> mysqladmin create test2
shell> mysql test2 < query.sql
```

Attach the test file to a bug report, which you can file using the instructions in [Section 1.6, “How to Report Bugs or Problems”](#).

### B.3.4.8 Problems with Floating-Point Values

Floating-point numbers sometimes cause confusion because they are approximate and not stored as exact values. A floating-point value as written in an SQL statement may not be the same as the value represented internally. Attempts to treat floating-point values as exact in comparisons may lead to problems. They are also subject to platform or implementation dependencies. The `FLOAT` and `DOUBLE` data types are subject to these issues. For `DECIMAL` columns, MySQL performs operations with a precision of 65 decimal digits, which should solve most common inaccuracy problems.

The following example uses `DOUBLE` to demonstrate how calculations that are done using floating-point operations are subject to floating-point error.

```
mysql> CREATE TABLE t1 (i INT, d1 DOUBLE, d2 DOUBLE);
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
-> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
-> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
-> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
-> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
-> (6, 0.00, 0.00), (6, -51.40, 0.00);
```

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;
```

i	a	b
1	21.4	21.4
2	76.8	76.8
3	7.4	7.4
4	15.4	15.4
5	7.2	7.2

6	-51.4	0
---	-------	---

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

If columns `d1` and `d2` had been defined as `DECIMAL` rather than `DOUBLE`, the result of the `SELECT` query would have contained only one row—the last one shown above.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) > 0.0001;
+-----+-----+-----+
| i | a | b |
+-----+-----+-----+
| 6 | -51.4 | 0 |
+-----+-----+-----+
1 row in set (0.00 sec)
```

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) <= 0.0001;
+-----+-----+-----+
| i | a | b |
+-----+-----+-----+
| 1 | 21.4 | 21.4 |
| 2 | 76.8 | 76.8 |
| 3 | 7.4 | 7.4 |
| 4 | 15.4 | 15.4 |
| 5 | 7.2 | 7.2 |
+-----+-----+-----+
5 rows in set (0.03 sec)
```

Floating-point values are subject to platform or implementation dependencies. Suppose that you execute the following statements:

```
CREATE TABLE t1(c1 FLOAT(53,0), c2 FLOAT(53,0));
INSERT INTO t1 VALUES('1e+52', '-1e+52');
SELECT * FROM t1;
```

On some platforms, the `SELECT` statement returns `inf` and `-inf`. On others, it returns `0` and `-0`.

An implication of the preceding issues is that if you attempt to create a replica by dumping table contents with `mysqldump` on the source and reloading the dump file into the replica, tables containing floating-point columns might differ between the two hosts.

## B.3.5 Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL does not have enough information about the data at hand and has to make “educated” guesses about the data.

For the cases when MySQL does not do the "right" thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `EXPLAIN` to the front of your `SELECT` statement:

```
mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
```

`EXPLAIN` is discussed in more detail in [Section 13.8.2, “EXPLAIN Statement”](#).

- Use `ANALYZE TABLE tbl_name` to update the key distributions for the scanned table. See [Section 13.7.3.1, “ANALYZE TABLE Statement”](#).
- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

```
SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
WHERE t1.col_name=t2.col_name;
```

`USE INDEX` and `IGNORE INDEX` may also be useful. See [Section 8.9.4, “Index Hints”](#).

- Global and table-level `STRAIGHT_JOIN`. See [Section 13.2.10, “SELECT Statement”](#).
- You can tune global or thread-specific system variables. For example, start `mysqld` with the `--max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See [Section 5.1.8, “Server System Variables”](#).

## B.3.6 Table Definition-Related Issues

### B.3.6.1 Problems with ALTER TABLE

If you get a duplicate-key error when using `ALTER TABLE` to change the character set or collation of a character column, the cause is either that the new column collation maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table. `REPAIR TABLE` works for `MyISAM`, `ARCHIVE`, and `CSV` tables.

If you use `ALTER TABLE` on a transactional table or if you are using Windows, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

### B.3.6.2 TEMPORARY Table Problems

Temporary tables created with `CREATE TEMPORARY TABLE` have the following limitations:

- `TEMPORARY` tables are supported only by the `InnoDB`, `MEMORY`, `MyISAM`, and `MERGE` storage engines.
- Temporary tables are not supported for NDB Cluster.
- The `SHOW TABLES` statement does not list `TEMPORARY` tables.
- To rename `TEMPORARY` tables, `RENAME TABLE` does not work. Use `ALTER TABLE` instead:

```
ALTER TABLE old_name RENAME new_name;
```

- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
SELECT * FROM temp_table JOIN temp_table AS t2;
```

The statement produces this error:

```
ERROR 1137: Can't reopen table: 'temp_table'
```

You can work around this issue if your query permits use of a common table expression (CTE) rather than a [TEMPORARY](#) table. For example, this fails with the [Can't reopen table](#) error:

```
CREATE TEMPORARY TABLE t SELECT 1 AS col_a, 2 AS col_b;
SELECT * FROM t AS t1 JOIN t AS t2;
```

To avoid the error, use a [WITH](#) clause that defines a CTE, rather than the [TEMPORARY](#) table:

```
WITH cte AS (SELECT 1 AS col_a, 2 AS col_b)
SELECT * FROM cte AS t1 JOIN cte AS t2;
```

- The [Can't reopen table](#) error also occurs if you refer to a temporary table multiple times in a stored function under different aliases, even if the references occur in different statements within the function. It may occur for temporary tables created outside stored functions and referred to across multiple calling and callee functions.
- If a [TEMPORARY](#) is created with the same name as an existing non-[TEMPORARY](#) table, the non-[TEMPORARY](#) table is hidden until the [TEMPORARY](#) table is dropped, even if the tables use different storage engines.
- There are known issues in using temporary tables with replication. See [Section 17.5.1.30, “Replication and Temporary Tables”](#), for more information.

## B.3.7 Known Issues in MySQL

This section lists known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and debugging instructions in [Section 2.1, “General Installation Guidance”](#), and [Section 5.9, “Debugging MySQL”](#).

The following problems are known:

- Subquery optimization for [IN](#) is not as effective as for [=](#).
- Even if you use [lower\\_case\\_table\\_names=2](#) (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function [DATABASE\(\)](#) or within the various logs (on case-insensitive systems).
- Dropping a [FOREIGN KEY](#) constraint does not work in replication because the constraint may have another name on the replica.
- [REPLACE](#) (and [LOAD DATA](#) with the [REPLACE](#) option) does not trigger [ON DELETE CASCADE](#).
- [DISTINCT](#) with [ORDER BY](#) does not work inside [GROUP\\_CONCAT\(\)](#) if you do not use all and only those columns that are in the [DISTINCT](#) list.
- When inserting a big integer value (between  $2^{63}$  and  $2^{64}-1$ ) into a decimal or string column, it is inserted as a negative value because the number is evaluated in signed integer context.
- With statement-based binary logging, the source server writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases. However, it is possible for the data on the source and replica to become different if a query is designed in such a way that the data modification is nondeterministic (generally not a recommended practice, even outside of replication).

For example:

- `CREATE TABLE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
- `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
- `REPLACE ... SELECT`, `INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

**If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic order.**

For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the source and replica.

A query is optimized differently on the source and replica only if:

- The table is stored using a different storage engine on the source than on the replica. (It is possible to use different storage engines on the source and replica. For example, you can use `InnoDB` on the source, but `MyISAM` on the replica if the replica has less available disk space.)
- MySQL buffer sizes (`key_buffer_size`, and so on) are different on the source and replica.
- The source and replica run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using `mysqlbinlog|mysql`.

The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned nondeterministic queries to ensure that the rows are always stored or modified in the same order. Using row-based or mixed logging format also avoids the problem.

- Log file names are based on the server host name if you do not specify a file name with the startup option. To retain the same log file names if you change your host name to something else, you must explicitly use options such as `--log-bin=old_host_name-bin`. See [Section 5.1.7, “Server Command Options”](#). Alternatively, rename the old files to reflect your host name change. If these are binary logs, you must edit the binary log index file and fix the binary log file names there as well. (The same is true for the relay logs on a replica.)
- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA` statement. See [Section 4.6.8, “mysqlbinlog — Utility for Processing Binary Log Files”](#).
- `RENAME` does not work with `TEMPORARY` tables or tables used in a `MERGE` table.
- When using `SET CHARACTER SET`, you cannot use translated characters in database, table, and column names.
- Prior to MySQL 8.0.17, you cannot use `_` or `%` with `ESCAPE` in `LIKE ... ESCAPE`.
- The server uses only the first `max_sort_length` bytes when comparing data values. This means that values cannot reliably be used in `GROUP BY`, `ORDER BY`, or `DISTINCT` if they differ only after the first `max_sort_length` bytes. To work around this, increase the variable value. The default value of `max_sort_length` is 1024 and can be changed at server startup time or at runtime.

- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF()` and `ELT()` with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.
- You can have up to 255 `ENUM` and `SET` columns in one table.
- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.
- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by 2, not 1:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns do not participate in the `DISTINCT` comparison.

An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads
WHERE userid = 9 ORDER BY id DESC;
```

and

```
SELECT DISTINCT band_downloads.mp3id
FROM band_downloads,band_mp3
WHERE band_downloads.userid = 9
AND band_mp3.id = band_downloads.mp3id
ORDER BY band_downloads.id DESC;
```

In the second case, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

Note that this happens only for queries that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` does not check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

# MySQL Glossary

These terms are commonly used in information about the MySQL database server. This glossary originated as a reference for terminology about the InnoDB storage engine, and the majority of definitions are InnoDB-related.

## A

### .ARM file

Metadata for [ARCHIVE](#) tables. Contrast with **.ARZ file**. Files with this extension are always included in backups produced by the `mysqlbackup` command of the **MySQL Enterprise Backup** product.  
See Also [.ARZ file](#), [MySQL Enterprise Backup](#), [mysqlbackup command](#).

### .ARZ file

Data for ARCHIVE tables. Contrast with **.ARM file**. Files with this extension are always included in backups produced by the `mysqlbackup` command of the **MySQL Enterprise Backup** product.  
See Also [.ARM file](#), [MySQL Enterprise Backup](#), [mysqlbackup command](#).

## ACID

An acronym standing for atomicity, consistency, isolation, and durability. These properties are all desirable in a database system, and are all closely tied to the notion of a **transaction**. The transactional features of [InnoDB](#) adhere to the ACID principles.

Transactions are **atomic** units of work that can be **committed** or **rolled back**. When a transaction makes multiple changes to the database, either all the changes succeed when the transaction is committed, or all the changes are undone when the transaction is rolled back.

The database remains in a consistent state at all times — after each commit or rollback, and while transactions are in progress. If related data is being updated across multiple tables, queries see either all old values or all new values, not a mix of old and new values.

Transactions are protected (isolated) from each other while they are in progress; they cannot interfere with each other or see each other's uncommitted data. This isolation is achieved through the **locking** mechanism. Experienced users can adjust the **isolation level**, trading off less protection in favor of increased performance and **concurrency**, when they can be sure that the transactions really do not interfere with each other.

The results of transactions are durable: once a commit operation succeeds, the changes made by that transaction are safe from power failures, system crashes, race conditions, or other potential dangers that many non-database applications are vulnerable to. Durability typically involves writing to disk storage, with a certain amount of redundancy to protect against power failures or software crashes during write operations. (In [InnoDB](#), the **doublewrite buffer** assists with durability.)

See Also [atomic](#), [commit](#), [concurrency](#), [doublewrite buffer](#), [isolation level](#), [locking](#), [rollback](#), [transaction](#).

## adaptive flushing

An algorithm for **InnoDB** tables that smooths out the I/O overhead introduced by **checkpoints**. Instead of **flushing** all modified **pages** from the **buffer pool** to the **data files** at once, MySQL periodically flushes small sets of modified pages. The adaptive flushing algorithm extends this process by estimating the optimal rate to perform these periodic flushes, based on the rate of flushing and how fast **redo** information is generated.

See Also [buffer pool](#), [checkpoint](#), [data files](#), [flush](#), [InnoDB](#), [page](#), [redo log](#).

## adaptive hash index

An optimization for [InnoDB](#) tables that can speed up lookups using `=` and `IN` operators, by constructing a **hash index** in memory. MySQL monitors index searches for [InnoDB](#) tables, and if queries could benefit from a hash index, it builds one automatically for index **pages** that are frequently accessed. In a sense, the adaptive hash index configures MySQL at runtime to take advantage of ample main memory, coming closer to the architecture

---

of main-memory databases. This feature is controlled by the [innodb\\_adaptive\\_hash\\_index](#) configuration option. Because this feature benefits some workloads and not others, and the memory used for the hash index is reserved in the **buffer pool**, typically you should benchmark with this feature both enabled and disabled.

The hash index is always built based on an existing **B-tree** index on the table. MySQL can build a hash index on a prefix of any length of the key defined for the B-tree, depending on the pattern of searches against the index. A hash index can be partial; the whole B-tree index does not need to be cached in the buffer pool.

In MySQL 5.6 and higher, another way to take advantage of fast single-value lookups with [InnoDB](#) tables is to use the [InnoDB memcached](#) plugin. See [Section 15.20, “InnoDB memcached Plugin”](#) for details.  
See Also [B-tree](#), [buffer pool](#), [hash index](#), [memcached](#), [page](#), [secondary index](#).

## ADO.NET

An object-relational mapping (ORM) framework for applications built using .NET technologies such as **ASP.NET**. Such applications can interface with MySQL through the **Connector/NET** component.  
See Also [.NET](#), [ASP.net](#), [Connector/NET](#), [Mono](#), [Visual Studio](#).

## AIO

Acronym for **asynchronous I/O**. You might see this acronym in [InnoDB](#) messages or keywords.  
See Also [asynchronous I/O](#).

## ANSI

In **ODBC**, an alternative method of supporting character sets and other internationalization aspects. Contrast with **Unicode**. **Connector/ODBC** 3.51 is an ANSI driver, while Connector/ODBC 5.1 is a Unicode driver.  
See Also [Connector/ODBC](#), [ODBC](#), [Unicode](#).

## API

APIs provide low-level access to the MySQL protocol and MySQL resources from **client** programs. Contrast with the higher-level access provided by a **Connector**.  
See Also [C API](#), [client](#), [connector](#), [native C API](#), [Perl API](#), [PHP API](#), [Python API](#), [Ruby API](#).

## application programming interface (API)

A set of functions or procedures. An API provides a stable set of names and types for functions, procedures, parameters, and return values.

## apply

When a backup produced by the **MySQL Enterprise Backup** product does not include the most recent changes that occurred while the backup was underway, the process of updating the backup files to include those changes is known as the **apply** step. It is specified by the [apply-log](#) option of the [mysqlbackup](#) command.

Before the changes are applied, we refer to the files as a **raw backup**. After the changes are applied, we refer to the files as a **prepared backup**. The changes are recorded in the [ibbackup\\_logfile](#) file; once the apply step is finished, this file is no longer necessary.

See Also [hot backup](#), [ibbackup\\_logfile](#), [MySQL Enterprise Backup](#), [prepared backup](#), [raw backup](#).

## ASP.net

A framework for developing web-based applications using .NET technologies and languages. Such applications can interface with MySQL through the **Connector/NET** component.

Another technology for writing server-side web pages with MySQL is **PHP**.  
See Also [.NET](#), [ADO.NET](#), [Connector/NET](#), [Mono](#), [PHP](#), [Visual Studio](#).

## assembly

A library of compiled code in a .NET system, accessed through **Connector/NET**. Stored in the **GAC** to allow versioning without naming conflicts.

---

See Also [.NET](#), [GAC](#).

#### asynchronous I/O

A type of I/O operation that allows other processing to proceed before the I/O is completed. Also known as **nonblocking I/O** and abbreviated as **AIO**. [InnoDB](#) uses this type of I/O for certain operations that can run in parallel without affecting the reliability of the database, such as reading pages into the **buffer pool** that have not actually been requested, but might be needed soon.

Historically, [InnoDB](#) used asynchronous I/O on Windows systems only. Starting with the [InnoDB Plugin 1.1](#) and [MySQL 5.5](#), [InnoDB](#) uses asynchronous I/O on Linux systems. This change introduces a dependency on [libaio](#). Asynchronous I/O on Linux systems is configured using the `innodb_use_native_aio` option, which is enabled by default. On other Unix-like systems, [InnoDB](#) uses synchronous I/O only.

See Also [buffer pool](#), [nonblocking I/O](#).

#### atomic

In the SQL context, **transactions** are units of work that either succeed entirely (when **committed**) or have no effect at all (when **rolled back**). The indivisible ("atomic") property of transactions is the "A" in the acronym **ACID**. See Also [ACID](#), [commit](#), [rollback](#), [transaction](#).

#### atomic DDL

An atomic *DDL* statement is one that combines the *data dictionary* updates, *storage engine* operations, and *binary log* writes associated with a DDL operation into a single, atomic transaction. The transaction is either fully committed or rolled back, even if the server halts during the operation. Atomic DDL support was added in [MySQL 8.0](#). For more information, see [Section 13.1.1, "Atomic Data Definition Statement Support"](#).

See Also [binary log](#), [data dictionary](#), [DDL](#), [storage engine](#).

#### atomic instruction

Special instructions provided by the CPU, to ensure that critical low-level operations cannot be interrupted.

#### auto-increment

A property of a table column (specified by the `AUTO_INCREMENT` keyword) that automatically adds an ascending sequence of values in the column.

It saves work for the developer, not to have to produce new unique values when inserting new rows. It provides useful information for the query optimizer, because the column is known to be not null and with unique values. The values from such a column can be used as lookup keys in various contexts, and because they are auto-generated there is no reason to ever change them; for this reason, primary key columns are often specified as auto-incrementing.

Auto-increment columns can be problematic with statement-based replication, because replaying the statements on a replica might not produce the same set of column values as on the source, due to timing issues. When you have an auto-incrementing primary key, you can use statement-based replication only with the setting `innodb_autoinc_lock_mode=1`. If you have `innodb_autoinc_lock_mode=2`, which allows higher concurrency for insert operations, use **row-based replication** rather than **statement-based replication**. The setting `innodb_autoinc_lock_mode=0` should not be used except for compatibility purposes.

Consecutive lock mode (`innodb_autoinc_lock_mode=1`) is the default setting prior to [MySQL 8.0.3](#). As of [MySQL 8.0.3](#), interleaved lock mode (`innodb_autoinc_lock_mode=2`) is the default, which reflects the change from statement-based to row-based replication as the default replication type.

See Also [auto-increment locking](#), [innodb\\_autoinc\\_lock\\_mode](#), [primary key](#), [row-based replication](#), [statement-based replication](#).

#### auto-increment locking

The convenience of an **auto-increment** primary key involves some tradeoff with concurrency. In the simplest case, if one transaction is inserting values into the table, any other transactions must wait to do their own

---

inserts into that table, so that rows inserted by the first transaction receive consecutive primary key values. [InnoDB](#) includes optimizations and the [innodb\\_autoinc\\_lock\\_mode](#) option so that you can configure and optimal balance between predictable sequences of auto-increment values and maximum **concurrency** for insert operations.

See Also [auto-increment](#), [concurrency](#), [innodb\\_autoinc\\_lock\\_mode](#).

#### autocommit

A setting that causes a **commit** operation after each **SQL** statement. This mode is not recommended for working with [InnoDB](#) tables with **transactions** that span several statements. It can help performance for **read-only transactions** on [InnoDB](#) tables, where it minimizes overhead from **locking** and generation of **undo** data, especially in MySQL 5.6.4 and up. It is also appropriate for working with [MyISAM](#) tables, where transactions are not applicable.

See Also [commit](#), [locking](#), [read-only transaction](#), [SQL](#), [transaction](#), [undo](#).

#### availability

The ability to cope with, and if necessary recover from, failures on the host, including failures of MySQL, the operating system, or the hardware and maintenance activity that may otherwise cause downtime. Often paired with **scalability** as critical aspects of a large-scale deployment.

See Also [scalability](#).

## B

#### B-tree

A tree data structure that is popular for use in database indexes. The structure is kept sorted at all times, enabling fast lookup for exact matches (equals operator) and ranges (for example, greater than, less than, and [BETWEEN](#) operators). This type of index is available for most storage engines, such as [InnoDB](#) and [MyISAM](#).

Because B-tree nodes can have many children, a B-tree is not the same as a binary tree, which is limited to 2 children per node.

Contrast with **hash index**, which is only available in the [MEMORY](#) storage engine. The [MEMORY](#) storage engine can also use B-tree indexes, and you should choose B-tree indexes for [MEMORY](#) tables if some queries use range operators.

The use of the term B-tree is intended as a reference to the general class of index design. B-tree structures used by MySQL storage engines may be regarded as variants due to sophistications not present in a classic B-tree design. For related information, refer to the [InnoDB](#) Page Structure [Fil Header](#) section of the [MySQL Internals Manual](#).

See Also [hash index](#).

#### backticks

Identifiers within MySQL SQL statements must be quoted using the backtick character (```) if they contain special characters or reserved words. For example, to refer to a table named `FOO#BAR` or a column named `SELECT`, you would specify the identifiers as ``FOO#BAR`` and ``SELECT``. Since the backticks provide an extra level of safety, they are used extensively in program-generated SQL statements, where the identifier names might not be known in advance.

Many other database systems use double quotation marks (`"`) around such special names. For portability, you can enable [ANSI\\_QUOTES](#) mode in MySQL and use double quotation marks instead of backticks to qualify identifier names.

See Also [SQL](#).

#### backup

The process of copying some or all table data and metadata from a MySQL instance, for safekeeping. Can also refer to the set of copied files. This is a crucial task for DBAs. The reverse of this process is the **restore** operation.

---

With MySQL, **physical backups** are performed by the **MySQL Enterprise Backup** product, and **logical backups** are performed by the `mysqldump` command. These techniques have different characteristics in terms of size and representation of the backup data, and speed (especially speed of the restore operation).

Backups are further classified as **hot**, **warm**, or **cold** depending on how much they interfere with normal database operation. (Hot backups have the least interference, cold backups the most.)

See Also [cold backup](#), [hot backup](#), [logical backup](#), [MySQL Enterprise Backup](#), [mysqldump](#), [physical backup](#), [warm backup](#).

#### base column

A non-generated table column upon which a stored generated column or virtual generated column is based. In other words, a base column is a non-generated table column that is part of a generated column definition.

See Also [generated column](#), [stored generated column](#), [virtual generated column](#).

#### beta

An early stage in the life of a software product, when it is available only for evaluation, typically without a definite release number or a number less than 1. [InnoDB](#) does not use the beta designation, preferring an **early adopter** phase that can extend over several point releases, leading to a **GA** release.

See Also [early adopter](#), [GA](#).

#### binary log

A file containing a record of all statements or row changes that attempt to change table data. The contents of the binary log can be replayed to bring replicas up to date in a **replication** scenario, or to bring a database up to date after restoring table data from a backup. The binary logging feature can be turned on and off, although Oracle recommends always enabling it if you use replication or perform backups.

You can examine the contents of the binary log, or replay it during replication or recovery, by using the `mysqlbinlog` command. For full information about the binary log, see [Section 5.4.4, “The Binary Log”](#). For MySQL configuration options related to the binary log, see [Section 17.1.6.4, “Binary Logging Options and Variables”](#).

For the **MySQL Enterprise Backup** product, the file name of the binary log and the current position within the file are important details. To record this information for the source when taking a backup in a replication context, you can specify the `--slave-info` option.

Prior to MySQL 5.0, a similar capability was available, known as the update log. In MySQL 5.0 and higher, the binary log replaces the update log.

See Also [binlog](#), [MySQL Enterprise Backup](#), [replication](#).

#### binlog

An informal name for the **binary log** file. For example, you might see this abbreviation used in e-mail messages or forum discussions.

See Also [binary log](#).

#### blind query expansion

A special mode of **full-text search** enabled by the `WITH QUERY EXPANSION` clause. It performs the search twice, where the search phrase for the second search is the original search phrase concatenated with the few most highly relevant documents from the first search. This technique is mainly applicable for short search phrases, perhaps only a single word. It can uncover relevant matches where the precise search term does not occur in the document.

See Also [full-text search](#).

#### BLOB

An SQL data type ([TINYBLOB](#), [BLOB](#), [MEDIUMBLOB](#), and [LONGBLOB](#)) for objects containing any kind of binary data, of arbitrary size. Used for storing documents, images, sound files, and other kinds of information that cannot

---

easily be decomposed to rows and columns within a MySQL table. The techniques for handling BLOBs within a MySQL application vary with each **Connector** and **API**. MySQL [Connector/ODBC](#) defines **BLOB** values as [LONGVARBINARY](#). For large, free-form collections of character data, the industry term is **CLOB**, represented by the MySQL [TEXT](#) data types.

See Also [API](#), [CLOB](#), [connector](#), [Connector/ODBC](#).

#### bottleneck

A portion of a system that is constrained in size or capacity, that has the effect of limiting overall throughput. For example, a memory area might be smaller than necessary; access to a single required resource might prevent multiple CPU cores from running simultaneously; or waiting for disk I/O to complete might prevent the CPU from running at full capacity. Removing bottlenecks tends to improve **concurrency**. For example, the ability to have multiple [InnoDB buffer pool](#) instances reduces contention when multiple sessions read from and write to the buffer pool simultaneously.

See Also [buffer pool](#), [concurrency](#).

#### bounce

A **shutdown** operation immediately followed by a restart. Ideally with a relatively short **warmup** period so that performance and throughput quickly return to a high level.

See Also [shutdown](#).

#### buddy allocator

A mechanism for managing different-sized **pages** in the InnoDB **buffer pool**.

See Also [buffer pool](#), [page](#), [page size](#).

#### buffer

A memory or disk area used for temporary storage. Data is buffered in memory so that it can be written to disk efficiently, with a few large I/O operations rather than many small ones. Data is buffered on disk for greater reliability, so that it can be recovered even when a **crash** or other failure occurs at the worst possible time. The main types of buffers used by InnoDB are the **buffer pool**, the **doublewrite buffer**, and the **change buffer**.

See Also [buffer pool](#), [change buffer](#), [crash](#), [doublewrite buffer](#).

#### buffer pool

The memory area that holds cached [InnoDB](#) data for both tables and indexes. For efficiency of high-volume read operations, the buffer pool is divided into **pages** that can potentially hold multiple rows. For efficiency of cache management, the buffer pool is implemented as a linked list of pages; data that is rarely used is aged out of the cache, using a variation of the **LRU** algorithm. On systems with large memory, you can improve concurrency by dividing the buffer pool into multiple **buffer pool instances**.

Several [InnoDB](#) status variables, [INFORMATION\\_SCHEMA](#) tables, and [performance\\_schema](#) tables help to monitor the internal workings of the buffer pool. Starting in MySQL 5.6, you can avoid a lengthy warmup period after restarting the server, particularly for instances with large buffer pools, by saving the buffer pool state at server shutdown and restoring the buffer pool to the same state at server startup. See [Section 15.8.3.6, “Saving and Restoring the Buffer Pool State”](#).

See Also [buffer pool instance](#), [LRU](#), [page](#), [warm up](#).

#### buffer pool instance

Any of the multiple regions into which the **buffer pool** can be divided, controlled by the [innodb\\_buffer\\_pool\\_instances](#) configuration option. The total memory size specified by [innodb\\_buffer\\_pool\\_size](#) is divided among all buffer pool instances. Typically, having multiple buffer pool instances is appropriate for systems that allocate multiple gigabytes to the [InnoDB](#) buffer pool, with each instance being one gigabyte or larger. On systems loading or looking up large amounts of data in the buffer pool from many concurrent sessions, having multiple buffer pool instances reduces contention for exclusive access to data structures that manage the buffer pool.

See Also [buffer pool](#).

---

## built-in

The built-in [InnoDB](#) storage engine within MySQL is the original form of distribution for the storage engine. Contrast with the **InnoDB Plugin**. Starting with MySQL 5.5, the InnoDB Plugin is merged back into the MySQL code base as the built-in [InnoDB](#) storage engine (known as InnoDB 1.1).

This distinction is important mainly in MySQL 5.1, where a feature or bug fix might apply to the InnoDB Plugin but not the built-in [InnoDB](#), or vice versa.

See Also [InnoDB](#).

## business rules

The relationships and sequences of actions that form the basis of business software, used to run a commercial company. Sometimes these rules are dictated by law, other times by company policy. Careful planning ensures that the relationships encoded and enforced by the database, and the actions performed through application logic, accurately reflect the real policies of the company and can handle real-life situations.

For example, an employee leaving a company might trigger a sequence of actions from the human resources department. The human resources database might also need the flexibility to represent data about a person who has been hired, but not yet started work. Closing an account at an online service might result in data being removed from a database, or the data might be moved or flagged so that it could be recovered if the account is re-opened. A company might establish policies regarding salary maximums, minimums, and adjustments, in addition to basic sanity checks such as the salary not being a negative number. A retail database might not allow a purchase with the same serial number to be returned more than once, or might not allow credit card purchases above a certain value, while a database used to detect fraud might allow these kinds of things.

See Also [relational](#).

# C

## .cfg file

A metadata file used with the [InnoDB transportable tablespace](#) feature. It is produced by the command `FLUSH TABLES ... FOR EXPORT`, puts one or more tables in a consistent state that can be copied to another server. The `.cfg` file is copied along with the corresponding `.ibd` file, and used to adjust the internal values of the `.ibd` file, such as the **space ID**, during the `ALTER TABLE ... IMPORT TABLESPACE` step.

See Also [.ibd file](#), [space ID](#), [transportable tablespace](#).

## C

A programming language that combines portability with performance and access to low-level hardware features, making it a popular choice for writing operating systems, drivers, and other kinds of system software. Many complex applications, languages, and reusable modules feature pieces written in C, tied together with high-level components written in other languages. Its core syntax is familiar to **C++**, **Java**, and **C#** developers.

See Also [C API](#), [C++](#), [C#](#), [Java](#).

## C API

The **C API** code is distributed with MySQL. It is included in the **libmysqlclient** library and enables **C** programs to access a database.

See Also [API](#), [C](#), [libmysqlclient](#).

## C#

A programming language combining strong typing and object-oriented features, running within the Microsoft **.NET** framework or its open-source counterpart **Mono**. Often used for creating applications with the **ASP.net** framework. Its syntax is familiar to **C**, **C++** and **Java** developers.

See Also [.NET](#), [ASP.net](#), [C](#), [Connector/NET](#), [C++](#), [Java](#), [Mono](#).

## C++

A programming language with core syntax familiar to **C** developers. Provides access to low-level operations for performance, combined with higher-level data types, object-oriented features, and garbage collection. To write C++ applications for MySQL, you use the **Connector/C++** component.

---

See Also [C](#), [Connector/C++](#).

#### cache

The general term for any memory area that stores copies of data for frequent or high-speed retrieval. In [InnoDB](#), the primary kind of cache structure is the **buffer pool**.

See Also [buffer](#), [buffer pool](#).

#### cardinality

The number of different values in a table **column**. When queries refer to columns that have an associated **index**, the cardinality of each column influences which access method is most efficient. For example, for a column with a **unique constraint**, the number of different values is equal to the number of rows in the table. If a table has a million rows but only 10 different values for a particular column, each value occurs (on average) 100,000 times. A query such as `SELECT c1 FROM t1 WHERE c1 = 50;` thus might return 1 row or a huge number of rows, and the database server might process the query differently depending on the cardinality of `c1`.

If the values in a column have a very uneven distribution, the cardinality might not be a good way to determine the best query plan. For example, `SELECT c1 FROM t1 WHERE c1 = x;` might return 1 row when `x=50` and a million rows when `x=30`. In such a case, you might need to use **index hints** to pass along advice about which lookup method is more efficient for a particular query.

Cardinality can also apply to the number of distinct values present in multiple columns, as in a **composite index**. See Also [column](#), [composite index](#), [index](#), [index hint](#), [persistent statistics](#), [random dive](#), [selectivity](#), [unique constraint](#).

#### change buffer

A special data structure that records changes to **pages** in **secondary indexes**. These values could result from SQL [INSERT](#), [UPDATE](#), or [DELETE](#) statements (**DML**). The set of features involving the change buffer is known collectively as **change buffering**, consisting of **insert buffering**, **delete buffering**, and **purge buffering**.

Changes are only recorded in the change buffer when the relevant page from the secondary index is not in the **buffer pool**. When the relevant index page is brought into the buffer pool while associated changes are still in the change buffer, the changes for that page are applied in the buffer pool (**merged**) using the data from the change buffer. Periodically, the **purge** operation that runs during times when the system is mostly idle, or during a slow shutdown, writes the new index pages to disk. The purge operation can write the disk blocks for a series of index values more efficiently than if each value were written to disk immediately.

Physically, the change buffer is part of the **system tablespace**, so that the index changes remain buffered across database restarts. The changes are only applied (**merged**) when the pages are brought into the buffer pool due to some other read operation.

The kinds and amount of data stored in the change buffer are governed by the [innodb\\_change\\_buffering](#) and [innodb\\_change\\_buffer\\_max\\_size](#) configuration options. To see information about the current data in the change buffer, issue the `SHOW ENGINE INNODB STATUS` command.

Formerly known as the **insert buffer**.

See Also [buffer pool](#), [change buffering](#), [delete buffering](#), [DML](#), [insert buffer](#), [insert buffering](#), [merge](#), [page](#), [purge](#), [purge buffering](#), [secondary index](#), [system tablespace](#).

#### change buffering

The general term for the features involving the **change buffer**, consisting of **insert buffering**, **delete buffering**, and **purge buffering**. Index changes resulting from SQL statements, which could normally involve random I/O operations, are held back and performed periodically by a background **thread**. This sequence of operations can write the disk blocks for a series of index values more efficiently than if each value were written to disk immediately. Controlled by the [innodb\\_change\\_buffering](#) and [innodb\\_change\\_buffer\\_max\\_size](#) configuration options.

See Also [change buffer](#), [delete buffering](#), [insert buffering](#), [purge buffering](#).

---

## checkpoint

As changes are made to data pages that are cached in the **buffer pool**, those changes are written to the **data files** sometime later, a process known as **flushing**. The checkpoint is a record of the latest changes (represented by an **LSN** value) that have been successfully written to the data files.

See Also [buffer pool](#), [data files](#), [flush](#), [fuzzy checkpointing](#), [LSN](#).

## checksum

In **InnoDB**, a validation mechanism to detect corruption when a **page** in a **tablespace** is read from disk into the **InnoDB buffer pool**. This feature is controlled by the `innodb_checksums` configuration option in MySQL 5.5. `innodb_checksums` is deprecated in MySQL 5.6.3, replaced by `innodb_checksum_algorithm`.

The `innochecksum` command helps diagnose corruption problems by testing the checksum values for a specified **tablespace** file while the MySQL server is shut down.

MySQL also uses checksums for replication purposes. For details, see the configuration options `binlog_checksum`, `master_verify_checksum`, and `slave_sql_verify_checksum`.

See Also [buffer pool](#), [page](#), [tablespace](#).

## child table

In a **foreign key** relationship, a child table is one whose rows refer (or point) to rows in another table with an identical value for a specific column. This is the table that contains the `FOREIGN KEY ... REFERENCES` clause and optionally `ON UPDATE` and `ON DELETE` clauses. The corresponding row in the **parent table** must exist before the row can be created in the child table. The values in the child table can prevent delete or update operations on the parent table, or can cause automatic deletion or updates in the child table, based on the `ON CASCADE` option used when creating the foreign key.

See Also [foreign key](#), [parent table](#).

## clean page

A **page** in the **InnoDB buffer pool** where all changes made in memory have also been written (**flushed**) to the **data files**. The opposite of a **dirty page**.

See Also [buffer pool](#), [data files](#), [dirty page](#), [flush](#), [page](#).

## clean shutdown

A **shutdown** that completes without errors and applies all changes to **InnoDB** tables before finishing, as opposed to a **crash** or a **fast shutdown**. Synonym for **slow shutdown**.

See Also [crash](#), [fast shutdown](#), [shutdown](#), [slow shutdown](#).

## client

A program that runs outside the database server, communicating with the database by sending requests through a **Connector**, or an **API** made available through **client libraries**. It can run on the same physical machine as the database server, or on a remote machine connected over a network. It can be a special-purpose database application, or a general-purpose program like the `mysql` command-line processor.

See Also [API](#), [client libraries](#), [connector](#), [mysql](#), [server](#).

## client libraries

Files containing collections of functions for working with databases. By compiling your program with these libraries, or installing them on the same system as your application, you can run a database application (known as a **client**) on a machine that does not have the MySQL server installed; the application accesses the database over a network. With MySQL, you can use the `libmysqlclient` library from the MySQL server itself.

See Also [client](#), [libmysqlclient](#).

## client-side prepared statement

A type of **prepared statement** where the caching and reuse are managed locally, emulating the functionality of **server-side prepared statements**. Historically, used by some **Connector/J**, **Connector/ODBC**, and **Connector/PHP** developers to work around issues with server-side stored procedures. With modern MySQL server versions, server-side prepared statements are recommended for performance, scalability, and memory efficiency.

---

See Also [Connector/J](#), [Connector/ODBC](#), [Connector/PHP](#), [prepared statement](#).

## CLOB

An SQL data type ([TINYTEXT](#), [TEXT](#), [MEDIUMTEXT](#), or [LONGTEXT](#)) for objects containing any kind of character data, of arbitrary size. Used for storing text-based documents, with associated character set and collation order. The techniques for handling CLOBs within a MySQL application vary with each **Connector** and **API**. MySQL Connector/ODBC defines [TEXT](#) values as [LONGVARCHAR](#). For storing binary data, the equivalent is the **BLOB** type.

See Also [API](#), [BLOB](#), [connector](#), [Connector/ODBC](#).

## clustered index

The [InnoDB](#) term for a **primary key** index. [InnoDB](#) table storage is organized based on the values of the primary key columns, to speed up queries and sorts involving the primary key columns. For best performance, choose the primary key columns carefully based on the most performance-critical queries. Because modifying the columns of the clustered index is an expensive operation, choose primary columns that are rarely or never updated.

In the Oracle Database product, this type of table is known as an **index-organized table**.

See Also [index](#), [primary key](#), [secondary index](#).

## cold backup

A **backup** taken while the database is shut down. For busy applications and websites, this might not be practical, and you might prefer a **warm backup** or a **hot backup**.

See Also [backup](#), [hot backup](#), [warm backup](#).

## column

A data item within a **row**, whose storage and semantics are defined by a data type. Each **table** and **index** is largely defined by the set of columns it contains.

Each column has a **cardinality** value. A column can be the **primary key** for its table, or part of the primary key. A column can be subject to a **unique constraint**, a **NOT NULL constraint**, or both. Values in different columns, even across different tables, can be linked by a **foreign key** relationship.

In discussions of MySQL internal operations, sometimes **field** is used as a synonym.

See Also [cardinality](#), [foreign key](#), [index](#), [NOT NULL constraint](#), [primary key](#), [row](#), [table](#), [unique constraint](#).

## column index

An **index** on a single column.

See Also [composite index](#), [index](#).

## column prefix

When an **index** is created with a length specification, such as `CREATE INDEX idx ON t1 (c1(N))`, only the first N characters of the column value are stored in the index. Keeping the index prefix small makes the index compact, and the memory and disk I/O savings help performance. (Although making the index prefix too small can hinder query optimization by making rows with different values appear to the query optimizer to be duplicates.)

For columns containing binary values or long text strings, where sorting is not a major consideration and storing the entire value in the index would waste space, the index automatically uses the first N (typically 768) characters of the value to do lookups and sorts.

See Also [index](#).

## command interceptor

Synonym for **statement interceptor**. One aspect of the **interceptor** design pattern available for both **Connector/NET** and **Connector/J**. What Connector/NET calls a command, Connector/J refers to as a statement. Contrast with **exception interceptor**.

---

See Also [Connector/J](#), [Connector/NET](#), [exception interceptor](#), [interceptor](#), [statement interceptor](#).

#### commit

A **SQL** statement that ends a **transaction**, making permanent any changes made by the transaction. It is the opposite of **rollback**, which undoes any changes made in the transaction.

[InnoDB](#) uses an **optimistic** mechanism for commits, so that changes can be written to the data files before the commit actually occurs. This technique makes the commit itself faster, with the tradeoff that more work is required in case of a rollback.

By default, MySQL uses the **autocommit** setting, which automatically issues a commit following each SQL statement.

See Also [autocommit](#), [optimistic](#), [rollback](#), [SQL](#), [transaction](#).

#### compact row format

A **row format** for InnoDB tables. It was the default row format from MySQL 5.0.3 to MySQL 5.7.8. In MySQL 8.0, the default row format is defined by the [innodb\\_default\\_row\\_format](#) configuration option, which has a default setting of **DYNAMIC**. The **COMPACT** row format provides a more compact representation for nulls and variable-length columns than the **REDUNDANT** row format.

For additional information about [InnoDB COMPACT](#) row format, see [Section 15.10, “InnoDB Row Formats”](#).

See Also [dynamic row format](#), [file format](#), [redundant row format](#), [row format](#).

#### composite index

An **index** that includes multiple columns.

See Also [index](#).

#### compressed backup

The compression feature of the **MySQL Enterprise Backup** product makes a compressed copy of each tablespace, changing the extension from [.ibd](#) to [.ibz](#). Compressing backup data allows you to keep more backups on hand, and reduces the time to transfer backups to a different server. The data is uncompressed during the restore operation. When a compressed backup operation processes a table that is already compressed, it skips the compression step for that table, because compressing again would result in little or no space savings.

A set of files produced by the **MySQL Enterprise Backup** product, where each **tablespace** is compressed. The compressed files are renamed with a [.ibz](#) file extension.

Applying **compression** at the start of the backup process helps to avoid storage overhead during the compression process, and to avoid network overhead when transferring the backup files to another server. The process of **applying** the **binary log** takes longer, and requires uncompressing the backup files.

See Also [apply](#), [binary log](#), [compression](#), [hot backup](#), [MySQL Enterprise Backup](#), [tablespace](#).

#### compressed row format

A **row format** that enables data and index **compression** for [InnoDB](#) tables. Large fields are stored away from the page that holds the rest of the row data, as in **dynamic row format**. Both index pages and the large fields are compressed, yielding memory and disk savings. Depending on the structure of the data, the decrease in memory and disk usage might or might not outweigh the performance overhead of uncompressing the data as it is used. See [Section 15.9, “InnoDB Table and Page Compression”](#) for usage details.

For additional information about [InnoDB COMPRESSED](#) row format, see [DYNAMIC Row Format](#).

See Also [compression](#), [dynamic row format](#), [row format](#).

#### compressed table

A table for which the data is stored in compressed form. For [InnoDB](#), it is a table created with [ROW\\_FORMAT=COMPRESSED](#). See [Section 15.9, “InnoDB Table and Page Compression”](#) for more information.

---

See Also [compressed row format](#), [compression](#).

#### compression

A feature with wide-ranging benefits from using less disk space, performing less I/O, and using less memory for caching.

[InnoDB](#) supports both table-level and page-level compression. [InnoDB](#) page compression is also referred to as **transparent page compression**. For more information about [InnoDB](#) compression, see [Section 15.9, “InnoDB Table and Page Compression”](#).

Another type of compression is the **compressed backup** feature of the **MySQL Enterprise Backup** product. See Also [buffer pool](#), [compressed backup](#), [compressed row format](#), [DML](#), [transparent page compression](#).

#### compression failure

Not actually an error, rather an expensive operation that can occur when using **compression** in combination with **DML** operations. It occurs when: updates to a compressed **page** overflow the area on the page reserved for recording modifications; the page is compressed again, with all changes applied to the table data; the re-compressed data does not fit on the original page, requiring MySQL to split the data into two new pages and compress each one separately. To check the frequency of this condition, query the [INFORMATION\\_SCHEMA.INNODB\\_CMP](#) table and check how much the value of the [COMPRESS\\_OPS](#) column exceeds the value of the [COMPRESS\\_OPS\\_OK](#) column. Ideally, compression failures do not occur often; when they do, you can adjust the [innodb\\_compression\\_level](#), [innodb\\_compression\\_failure\\_threshold\\_pct](#), and [innodb\\_compression\\_pad\\_pct\\_max](#) configuration options.

See Also [compression](#), [DML](#), [page](#).

#### concatenated index

See [composite index](#).

#### concurrency

The ability of multiple operations (in database terminology, **transactions**) to run simultaneously, without interfering with each other. Concurrency is also involved with performance, because ideally the protection for multiple simultaneous transactions works with a minimum of performance overhead, using efficient mechanisms for **locking**.

See Also [ACID](#), [locking](#), [transaction](#).

#### configuration file

The file that holds the **option** values used by MySQL at startup. Traditionally, on Linux and Unix this file is named [my.cnf](#), and on Windows it is named [my.ini](#). You can set a number of options related to [InnoDB](#) under the [\[mysqld\]](#) section of the file.

See [Section 4.2.2.2, “Using Option Files”](#) for information about where MySQL searches for configuration files.

When you use the **MySQL Enterprise Backup** product, you typically use two configuration files: one that specifies where the data comes from and how it is structured (which could be the original configuration file for your server), and a stripped-down one containing only a small set of options that specify where the backup data goes and how it is structured. The configuration files used with the **MySQL Enterprise Backup** product must contain certain options that are typically left out of regular configuration files, so you might need to add options to your existing configuration file for use with **MySQL Enterprise Backup**.

See Also [my.cnf](#), [MySQL Enterprise Backup](#), [option](#), [option file](#).

#### connection

The communication channel between an application and a MySQL server. The performance and scalability of a database applications is influenced by on how quickly a database connection can be established, how many can be made simultaneously, and how long they persist. The parameters such as **host**, **port**, and so on are represented as a **connection string** in **Connector/NET**, and as a **DSN** in **Connector/ODBC**. High-traffic systems make use of an optimization known as the **connection pool**.

---

See Also [connection pool](#), [connection string](#), [Connector/NET](#), [Connector/ODBC](#), [DSN](#), [host](#), [port](#).

#### connection pool

A cache area that allows database **connections** to be reused within the same application or across different applications, rather than setting up and tearing down a new connection for every database operation. This technique is common with **J2EE** application servers. **Java** applications using **Connector/J** can use the connection pool features of **Tomcat** and other application servers. The reuse is transparent to applications; the application still opens and closes the connection as usual.

See Also [connection](#), [Connector/J](#), [J2EE](#), [Tomcat](#).

#### connection string

A representation of the parameters for a database **connection**, encoded as a string literal so that it can be used in program code. The parts of the string represent connection parameters such as **host** and **port**. A connection string contains several key-value pairs, separated by semicolons. Each key-value pair is joined with an equal sign. Frequently used with **Connector/NET** applications; see [Creating a Connector/NET Connection String](#) for details.

See Also [connection](#), [Connector/NET](#), [host](#), [port](#).

#### connector

MySQL Connectors provide connectivity to the MySQL server for **client** programs. Several programming languages and frameworks each have their own associated Connector. Contrast with the lower-level access provided by an **API**.

See Also [API](#), [client](#), [Connector/C++](#), [Connector/J](#), [Connector/NET](#), [Connector/ODBC](#).

#### Connector/C++

Connector/C++ 8.0 can be used to access MySQL servers that implement a [document store](#), or in a traditional way using SQL queries. It enables development of C++ applications using X DevAPI, or plain C applications using X DevAPI for C. It also enables development of C++ applications that use the legacy JDBC-based API from Connector/C++ 1.1. For more information, see [MySQL Connector/C++ 8.0 Developer Guide](#).

See Also [client](#), [connector](#), [JDBC](#).

#### Connector/J

A **JDBC** driver that provides connectivity for **client** applications developed in the **Java** programming language. MySQL Connector/J is a JDBC Type 4 driver: a pure-Java implementation of the MySQL protocol that does not rely on the MySQL **client libraries**. For full details, see [MySQL Connector/J 8.0 Developer Guide](#).

See Also [client](#), [client libraries](#), [connector](#), [Java](#), [JDBC](#).

#### Connector/NET

A MySQL **connector** for developers writing applications using languages, technologies, and frameworks such as **C#**, **.NET**, **Mono**, **Visual Studio**, **ASP.net**, and **ADO.net**.

See Also [ADO.NET](#), [ASP.net](#), [connector](#), [C#](#), [Mono](#), [Visual Studio](#).

#### Connector/ODBC

The family of MySQL ODBC drivers that provide access to a MySQL database using the industry standard Open Database Connectivity (**ODBC**) API. Formerly called MyODBC drivers. For full details, see [MySQL Connector/ODBC Developer Guide](#).

See Also [connector](#), [ODBC](#).

#### Connector/PHP

A version of the [mysql](#) and [mysql\\_i](#) **APIs** for **PHP** optimized for the Windows operating system.

See Also [connector](#), [PHP](#), [PHP API](#).

#### consistent read

A read operation that uses **snapshot** information to present query results based on a point in time, regardless of changes performed by other transactions running at the same time. If queried data has been changed by another

---

transaction, the original data is reconstructed based on the contents of the **undo log**. This technique avoids some of the **locking** issues that can reduce **concurrency** by forcing transactions to wait for other transactions to finish.

With **REPEATABLE READ isolation level**, the snapshot is based on the time when the first read operation is performed. With **READ COMMITTED** isolation level, the snapshot is reset to the time of each consistent read operation.

Consistent read is the default mode in which **InnoDB** processes **SELECT** statements in **READ COMMITTED** and **REPEATABLE READ** isolation levels. Because a consistent read does not set any locks on the tables it accesses, other sessions are free to modify those tables while a consistent read is being performed on the table.

For technical details about the applicable isolation levels, see [Section 15.7.2.3, “Consistent Nonlocking Reads”](#). See Also [concurrency](#), [isolation level](#), [locking](#), [READ COMMITTED](#), [REPEATABLE READ](#), [snapshot](#), [transaction](#), [undo log](#).

#### constraint

An automatic test that can block database changes to prevent data from becoming inconsistent. (In computer science terms, a kind of assertion related to an invariant condition.) Constraints are a crucial component of the **ACID** philosophy, to maintain data consistency. Constraints supported by MySQL include **FOREIGN KEY constraints** and **unique constraints**.

See Also [ACID](#), [foreign key](#), [unique constraint](#).

#### counter

A value that is incremented by a particular kind of **InnoDB** operation. Useful for measuring how busy a server is, troubleshooting the sources of performance issues, and testing whether changes (for example, to configuration settings or indexes used by queries) have the desired low-level effects. Different kinds of counters are available through **Performance Schema** tables and **INFORMATION\_SCHEMA** tables, particularly **INFORMATION\_SCHEMA.INNODB\_METRICS**.

See Also [INFORMATION\\_SCHEMA](#), [metrics counter](#), [Performance Schema](#).

#### covering index

An **index** that includes all the columns retrieved by a query. Instead of using the index values as pointers to find the full table rows, the query returns values from the index structure, saving disk I/O. **InnoDB** can apply this optimization technique to more indexes than MyISAM can, because **InnoDB secondary indexes** also include the **primary key** columns. **InnoDB** cannot apply this technique for queries against tables modified by a transaction, until that transaction ends.

Any **column index** or **composite index** could act as a covering index, given the right query. Design your indexes and queries to take advantage of this optimization technique wherever possible.

See Also [column index](#), [composite index](#), [index](#), [primary key](#), [secondary index](#).

#### CPU-bound

A type of **workload** where the primary **bottleneck** is CPU operations in memory. Typically involves read-intensive operations where the results can all be cached in the **buffer pool**.

See Also [bottleneck](#), [buffer pool](#), [workload](#).

#### crash

MySQL uses the term “crash” to refer generally to any unexpected **shutdown** operation where the server cannot do its normal cleanup. For example, a crash could happen due to a hardware fault on the database server machine or storage device; a power failure; a potential data mismatch that causes the MySQL server to halt; a **fast shutdown** initiated by the DBA; or many other reasons. The robust, automatic **crash recovery** for **InnoDB** tables ensures that data is made consistent when the server is restarted, without any extra work for the DBA.

See Also [crash recovery](#), [fast shutdown](#), [InnoDB](#), [shutdown](#).

#### crash recovery

The cleanup activities that occur when MySQL is started again after a **crash**. For **InnoDB** tables, changes from incomplete transactions are replayed using data from the **redo log**. Changes that were **committed** before the

---

crash, but not yet written into the **data files**, are reconstructed from the **doublewrite buffer**. When the database is shut down normally, this type of activity is performed during shutdown by the **purge** operation.

During normal operation, committed data can be stored in the **change buffer** for a period of time before being written to the data files. There is always a tradeoff between keeping the data files up-to-date, which introduces performance overhead during normal operation, and buffering the data, which can make shutdown and crash recovery take longer.

See Also [change buffer](#), [commit](#), [crash](#), [data files](#), [doublewrite buffer](#), [InnoDB](#), [purge](#), [redo log](#).

## CRUD

Acronym for “create, read, update, delete”, a common sequence of operations in database applications. Often denotes a class of applications with relatively simple database usage (basic **DDL**, **DML** and **query** statements in **SQL**) that can be implemented quickly in any language.

See Also [DDL](#), [DML](#), [query](#), [SQL](#).

## cursor

An internal MySQL data structure that represents the result set of an SQL statement. Often used with **prepared statements** and **dynamic SQL**. It works like an iterator in other high-level languages, producing each value from the result set as requested.

Although SQL usually handles the processing of cursors for you, you might delve into the inner workings when dealing with performance-critical code.

See Also [dynamic SQL](#), [prepared statement](#), [query](#).

# D

## data definition language

See [DDL](#).

## data dictionary

Metadata that keeps track of database objects such as **tables**, **indexes**, and table **columns**. For the MySQL data dictionary, introduced in MySQL 8.0, metadata is physically located in [InnoDB file-per-table](#) tablespace files in the [mysql](#) database directory. For the [InnoDB](#) data dictionary, metadata is physically located in the [InnoDB system tablespace](#).

Because the **MySQL Enterprise Backup** product always backs up the [InnoDB](#) system tablespace, all backups include the contents of the [InnoDB](#) data dictionary.

See Also [column](#), [file-per-table](#), [.frm file](#), [index](#), [MySQL Enterprise Backup](#), [system tablespace](#), [table](#).

## data directory

The directory under which each MySQL **instance** keeps the **data files** for [InnoDB](#) and the directories representing individual databases. Controlled by the [datadir](#) configuration option.

See Also [data files](#), [instance](#).

## data files

The files that physically contain **table** and **index** data.

The [InnoDB system tablespace](#), which holds the [InnoDB data dictionary](#) and is capable of holding data for multiple [InnoDB](#) tables, is represented by one or more [.ibdata](#) data files.

File-per-table tablespaces, which hold data for a single [InnoDB](#) table, are represented by a [.ibd](#) data file.

General tablespaces (introduced in MySQL 5.7.6), which can hold data for multiple [InnoDB](#) tables, are also represented by a [.ibd](#) data file.

See Also [data dictionary](#), [file-per-table](#), [general tablespace](#), [.ibd file](#), [ibdata file](#), [index](#), [system tablespace](#), [table](#), [tablespace](#).

---

data manipulation language

See [DML](#).

data warehouse

A database system or application that primarily runs large **queries**. The read-only or read-mostly data might be organized in **denormalized** form for query efficiency. Can benefit from the optimizations for **read-only transactions** in MySQL 5.6 and higher. Contrast with **OLTP**.

See Also [denormalized](#), [OLTP](#), [query](#), [read-only transaction](#).

database

Within the MySQL **data directory**, each database is represented by a separate directory. The InnoDB **system tablespace**, which can hold table data from multiple databases within a MySQL **instance**, is kept in **data files** that reside outside of individual database directories. When **file-per-table** mode is enabled, the **.ibd files** representing individual InnoDB tables are stored inside the database directories unless created elsewhere using the [DATA DIRECTORY](#) clause. General tablespaces, introduced in MySQL 5.7.6, also hold table data in **.ibd files**. Unlike file-per-table **.ibd files**, general tablespace **.ibd files** can hold table data from multiple databases within a MySQL **instance**, and can be assigned to directories relative to or independent of the MySQL data directory.

For long-time MySQL users, a database is a familiar notion. Users coming from an Oracle Database background will find that the MySQL meaning of a database is closer to what Oracle Database calls a **schema**.

See Also [data files](#), [file-per-table](#), [.ibd file](#), [instance](#), [schema](#), [system tablespace](#).

DCL

Data control language, a set of **SQL** statements for managing privileges. In MySQL, consists of the [GRANT](#) and [REVOKE](#) statements. Contrast with **DDL** and **DML**.

See Also [DDL](#), [DML](#), [SQL](#).

DDEX provider

A feature that lets you use the data design tools within **Visual Studio** to manipulate the schema and objects within a MySQL database. For MySQL applications using **Connector/NET**, the MySQL Visual Studio Plugin acts as a DDEX provider with MySQL 5.0 and later.

See Also [Visual Studio](#).

DDL

Data definition language, a set of **SQL** statements for manipulating the database itself rather than individual table rows. Includes all forms of the [CREATE](#), [ALTER](#), and [DROP](#) statements. Also includes the [TRUNCATE](#) statement, because it works differently than a [DELETE FROM table\\_name](#) statement, even though the ultimate effect is similar.

DDL statements automatically **commit** the current **transaction**; they cannot be **rolled back**.

The [InnoDB online DDL](#) feature enhances performance for [CREATE INDEX](#), [DROP INDEX](#), and many types of [ALTER TABLE](#) operations. See [Section 15.12, “InnoDB and Online DDL”](#) for more information. Also, the [InnoDB file-per-table](#) setting can affect the behavior of [DROP TABLE](#) and [TRUNCATE TABLE](#) operations.

Contrast with **DML** and **DCL**.

See Also [commit](#), [DCL](#), [DML](#), [file-per-table](#), [rollback](#), [SQL](#), [transaction](#).

deadlock

A situation where different **transactions** are unable to proceed, because each holds a **lock** that the other needs. Because both transactions are waiting for a resource to become available, neither will ever release the locks it holds.

A deadlock can occur when the transactions lock rows in multiple tables (through statements such as [UPDATE](#) or [SELECT ... FOR UPDATE](#)), but in the opposite order. A deadlock can also occur when such statements

---

lock ranges of index records and **gaps**, with each transaction acquiring some locks but not others due to a timing issue.

For background information on how deadlocks are automatically detected and handled, see [Section 15.7.5.2, “Deadlock Detection”](#). For tips on avoiding and recovering from deadlock conditions, see [Section 15.7.5.3, “How to Minimize and Handle Deadlocks”](#).

See Also [gap](#), [lock](#), [transaction](#).

#### deadlock detection

A mechanism that automatically detects when a **deadlock** occurs, and automatically **rolls back** one of the **transactions** involved (the **victim**). Deadlock detection can be disabled using the `innodb_deadlock_detect` configuration option.

See Also [deadlock](#), [rollback](#), [transaction](#), [victim](#).

#### delete

When **InnoDB** processes a **DELETE** statement, the rows are immediately marked for deletion and no longer are returned by queries. The storage is reclaimed sometime later, during the periodic garbage collection known as the **purge** operation. For removing large quantities of data, related operations with their own performance characteristics are **TRUNCATE** and **DROP**.

See Also [drop](#), [purge](#), [truncate](#).

#### delete buffering

The technique of storing changes to secondary index pages, resulting from **DELETE** operations, in the **change buffer** rather than writing the changes immediately, so that the physical writes can be performed to minimize random I/O. (Because delete operations are a two-step process, this operation buffers the write that normally marks an index record for deletion.) It is one of the types of **change buffering**; the others are **insert buffering** and **purge buffering**.

See Also [change buffer](#), [change buffering](#), [insert buffer](#), [insert buffering](#), [purge buffering](#).

#### denormalized

A data storage strategy that duplicates data across different tables, rather than linking the tables with **foreign keys** and **join** queries. Typically used in **data warehouse** applications, where the data is not updated after loading. In such applications, query performance is more important than making it simple to maintain consistent data during updates. Contrast with **normalized**.

See Also [data warehouse](#), [foreign key](#), [join](#), [normalized](#).

#### descending index

A type of **index** where index storage is optimized to process `ORDER BY column DESC` clauses.

See Also [index](#).

#### dictionary object cache

The dictionary object cache stores previously accessed **data dictionary** objects in memory to enable object reuse and minimize disk I/O. An **LRU**-based eviction strategy is used to evict least recently used objects from memory. The cache is comprised of several partitions that store different object types.

For more information, see [Section 14.4, “Dictionary Object Cache”](#).

See Also [data dictionary](#), [LRU](#).

#### dirty page

A **page** in the **InnoDB buffer pool** that has been updated in memory, where the changes are not yet written (**flushed**) to the **data files**. The opposite of a **clean page**.

See Also [buffer pool](#), [clean page](#), [data files](#), [flush](#), [page](#).

#### dirty read

An operation that retrieves unreliable data, data that was updated by another transaction but not yet **committed**. It is only possible with the **isolation level** known as **read uncommitted**.

---

This kind of operation does not adhere to the **ACID** principle of database design. It is considered very risky, because the data could be **rolled back**, or updated further before being committed; then, the transaction doing the dirty read would be using data that was never confirmed as accurate.

Its opposite is **consistent read**, where [InnoDB](#) ensures that a transaction does not read information updated by another transaction, even if the other transaction commits in the meantime.

See Also [ACID](#), [commit](#), [consistent read](#), [isolation level](#), [READ UNCOMMITTED](#), [rollback](#).

#### disk-based

A kind of database that primarily organizes data on disk storage (hard drives or equivalent). Data is brought back and forth between disk and memory to be operated upon. It is the opposite of an **in-memory database**. Although [InnoDB](#) is disk-based, it also contains features such as the **buffer pool**, multiple buffer pool instances, and the **adaptive hash index** that allow certain kinds of workloads to work primarily from memory.

See Also [adaptive hash index](#), [buffer pool](#), [in-memory database](#).

#### disk-bound

A type of **workload** where the primary **bottleneck** is disk I/O. (Also known as **I/O-bound**.) Typically involves frequent writes to disk, or random reads of more data than can fit into the **buffer pool**.

See Also [bottleneck](#), [buffer pool](#), [workload](#).

#### DML

Data manipulation language, a set of **SQL** statements for performing [INSERT](#), [UPDATE](#), and [DELETE](#) operations. The [SELECT](#) statement is sometimes considered as a DML statement, because the [SELECT ... FOR UPDATE](#) form is subject to the same considerations for **locking** as [INSERT](#), [UPDATE](#), and [DELETE](#).

DML statements for an [InnoDB](#) table operate in the context of a **transaction**, so their effects can be **committed** or **rolled back** as a single unit.

Contrast with **DDL** and **DCL**.

See Also [commit](#), [DCL](#), [DDL](#), [locking](#), [rollback](#), [SQL](#), [transaction](#).

#### document id

In the [InnoDB full-text search](#) feature, a special column in the table containing the **FULLTEXT index**, to uniquely identify the document associated with each **ilist** value. Its name is [FTS\\_DOC\\_ID](#) (uppercase required). The column itself must be of [BIGINT UNSIGNED NOT NULL](#) type, with a unique index named [FTS\\_DOC\\_ID\\_INDEX](#). Preferably, you define this column when creating the table. If [InnoDB](#) must add the column to the table while creating a [FULLTEXT](#) index, the indexing operation is considerably more expensive.

See Also [full-text search](#), [FULLTEXT index](#), [ilist](#).

#### doublewrite buffer

[InnoDB](#) uses a file flush technique called doublewrite. Before writing **pages** to the **data files**, [InnoDB](#) first writes them to a storage area called the doublewrite buffer. Only after the write and the flush to the doublewrite buffer have completed, does [InnoDB](#) write the pages to their proper positions in the data file. If there is an operating system, storage subsystem, or [mysqld](#) process crash in the middle of a page write, [InnoDB](#) can later find a good copy of the page from the doublewrite buffer during **crash recovery**.

Although data is always written twice, the doublewrite buffer does not require twice as much I/O overhead or twice as many I/O operations. Data is written to the buffer itself as a large sequential chunk, with a single [fsync\(\)](#) call to the operating system.

To turn off the doublewrite buffer, specify the option [innodb\\_doublewrite=0](#).

See Also [crash recovery](#), [data files](#), [page](#), [purge](#).

#### drop

A kind of **DDL** operation that removes a schema object, through a statement such as [DROP TABLE](#) or [DROP INDEX](#). It maps internally to an [ALTER TABLE](#) statement. From an [InnoDB](#) perspective, the performance considerations of such operations involve the time that the **data dictionary** is locked to ensure that interrelated

---

objects are all updated, and the time to update memory structures such as the **buffer pool**. For a **table**, the drop operation has somewhat different characteristics than a **truncate** operation (`TRUNCATE TABLE` statement). See Also [buffer pool](#), [data dictionary](#), [DDL](#), [table](#), [truncate](#).

## DSN

Acronym for “Database Source Name”. It is the encoding for **connection** information within **Connector/ODBC**. See [Configuring a Connector/ODBC DSN on Windows](#) for full details. It is the equivalent of the **connection string** used by **Connector/NET**.

See Also [connection](#), [connection string](#), [Connector/NET](#), [Connector/ODBC](#).

## dynamic cursor

A type of **cursor** supported by **ODBC** that can pick up new and changed results when the rows are read again. Whether and how quickly the changes are visible to the cursor depends on the type of table involved (transactional or non-transactional) and the isolation level for transactional tables. Support for dynamic cursors must be explicitly enabled.

See Also [cursor](#), [ODBC](#).

## dynamic row format

An **InnoDB** row format. Because long variable-length column values are stored outside of the page that holds the row data, it is very efficient for rows that include large objects. Since the large fields are typically not accessed to evaluate query conditions, they are not brought into the **buffer pool** as often, resulting in fewer I/O operations and better utilization of cache memory.

As of MySQL 5.7.9, the default row format is defined by `innodb_default_row_format`, which has a default value of `DYNAMIC`.

For additional information about **InnoDB DYNAMIC** row format, see [DYNAMIC Row Format](#).

See Also [buffer pool](#), [file format](#), [row format](#).

## dynamic SQL

A feature that lets you create and execute **prepared statements** using more robust, secure, and efficient methods to substitute parameter values than the naive technique of concatenating the parts of the statement into a string variable.

See Also [prepared statement](#).

## dynamic statement

A **prepared statement** created and executed through **dynamic SQL**.

See Also [dynamic SQL](#), [prepared statement](#).

# E

## early adopter

A stage similar to **beta**, when a software product is typically evaluated for performance, functionality, and compatibility in a non-mission-critical setting.

See Also [beta](#).

## Eiffel

A programming language including many object-oriented features. Some of its concepts are familiar to **Java** and **C#** developers. For the open-source Eiffel **API** for MySQL, see [Section 28.13, “MySQL Eiffel Wrapper”](#).

See Also [API](#), [C#](#), [Java](#).

## embedded

The embedded MySQL server library (**libmysqld**) makes it possible to run a full-featured MySQL server inside a **client** application. The main benefits are increased speed and more simple management for embedded applications.

See Also [client](#), [libmysqld](#).

---

error log

A type of **log** showing information about MySQL startup and critical runtime errors and **crash** information. For details, see [Section 5.4.2, “The Error Log”](#).

See Also [crash](#), [log](#).

eviction

The process of removing an item from a cache or other temporary storage area, such as the [InnoDB buffer pool](#). Often, but not always, uses the **LRU** algorithm to determine which item to remove. When a **dirty page** is evicted, its contents are **flushed** to disk, and any dirty **neighbor pages** might be flushed also.

See Also [buffer pool](#), [dirty page](#), [flush](#), [LRU](#), [neighbor page](#).

exception interceptor

A type of **interceptor** for tracing, debugging, or augmenting SQL errors encountered by a database application. For example, the interceptor code could issue a [SHOW WARNINGS](#) statement to retrieve additional information, and add descriptive text or even change the type of the exception returned to the application. Because the interceptor code is only called when SQL statements return errors, it does not impose any performance penalty on the application during normal (error-free) operation.

In **Java** applications using **Connector/J**, setting up this type of interceptor involves implementing the [com.mysql.jdbc.ExceptionInterceptor](#) interface, and adding a [exceptionInterceptors](#) property to the **connection string**.

In **Visual Studio** applications using **Connector/NET**, setting up this type of interceptor involves defining a class that inherits from the [BaseExceptionInterceptor](#) class and specifying that class name as part of the connection string.

See Also [Connector/J](#), [Connector/NET](#), [interceptor](#), [Java](#), [Visual Studio](#).

exclusive lock

A kind of **lock** that prevents any other **transaction** from locking the same row. Depending on the transaction **isolation level**, this kind of lock might block other transactions from writing to the same row, or might also block other transactions from reading the same row. The default [InnoDB](#) isolation level, **REPEATABLE READ**, enables higher **concurrency** by allowing transactions to read rows that have exclusive locks, a technique known as **consistent read**.

See Also [concurrency](#), [consistent read](#), [isolation level](#), [lock](#), [REPEATABLE READ](#), [shared lock](#), [transaction](#).

extent

A group of **pages** within a **tablespace**. For the default **page size** of 16KB, an extent contains 64 pages. In MySQL 5.6, the page size for an [InnoDB](#) instance can be 4KB, 8KB, or 16KB, controlled by the [innodb\\_page\\_size](#) configuration option. For 4KB, 8KB, and 16KB pages sizes, the extent size is always 1MB (or 1048576 bytes).

Support for 32KB and 64KB [InnoDB](#) page sizes was added in MySQL 5.7.6. For a 32KB page size, the extent size is 2MB. For a 64KB page size, the extent size is 4MB.

[InnoDB](#) features such as **segments**, **read-ahead** requests and the **doublewrite buffer** use I/O operations that read, write, allocate, or free data one extent at a time.

See Also [doublewrite buffer](#), [page](#), [page size](#), [read-ahead](#), [segment](#), [tablespace](#).

## F

.frm file

A file containing the metadata, such as the table definition, of a MySQL table. [.frm](#) files were removed in MySQL 8.0 but are still used in earlier MySQL releases. In MySQL 8.0, data previously stored in [.frm](#) files is stored in **data dictionary** tables.

See Also [data dictionary](#), [MySQL Enterprise Backup](#), [system tablespace](#).

---

## failover

The ability to automatically switch to a standby server in the event of a failure. In the MySQL context, failover involves a standby database server. Often supported within **J2EE** environments by the application server or framework.

See Also [Connector/J](#), [J2EE](#).

## Fast Index Creation

A capability first introduced in the InnoDB Plugin, now part of MySQL in 5.5 and higher, that speeds up creation of **InnoDB secondary indexes** by avoiding the need to completely rewrite the associated table. The speedup applies to dropping secondary indexes also.

Because index maintenance can add performance overhead to many data transfer operations, consider doing operations such as `ALTER TABLE ... ENGINE=INNODB` or `INSERT INTO ... SELECT * FROM ...` without any secondary indexes in place, and creating the indexes afterward.

In MySQL 5.6, this feature becomes more general. You can read and write to tables while an index is being created, and many more kinds of `ALTER TABLE` operations can be performed without copying the table, without blocking **DML** operations, or both. Thus in MySQL 5.6 and higher, this set of features is referred to as **online DDL** rather than Fast Index Creation.

For related information, see [Section 15.12, “InnoDB and Online DDL”](#).

See Also [DML](#), [index](#), [online DDL](#), [secondary index](#).

## fast shutdown

The default **shutdown** procedure for **InnoDB**, based on the configuration setting `innodb_fast_shutdown=1`. To save time, certain **flush** operations are skipped. This type of shutdown is safe during normal usage, because the flush operations are performed during the next startup, using the same mechanism as in **crash recovery**. In cases where the database is being shut down for an upgrade or downgrade, do a **slow shutdown** instead to ensure that all relevant changes are applied to the **data files** during the shutdown.

See Also [crash recovery](#), [data files](#), [flush](#), [shutdown](#), [slow shutdown](#).

## file format

The file format for **InnoDB** tables.

See Also [file-per-table](#), [.ibd file](#), [ibdata file](#), [row format](#).

## file-per-table

A general name for the setting controlled by the `innodb_file_per_table` option, which is an important configuration option that affects aspects of **InnoDB** file storage, availability of features, and I/O characteristics. As of MySQL 5.6.7, `innodb_file_per_table` is enabled by default.

With the `innodb_file_per_table` option enabled, you can create a table in its own **.ibd file** rather than in the shared **ibdata files** of the **system tablespace**. When table data is stored in an individual **.ibd file**, you have more flexibility to choose **row formats** required for features such as data **compression**. The `TRUNCATE TABLE` operation is also faster, and reclaimed space can be used by the operating system rather than remaining reserved for **InnoDB**.

The **MySQL Enterprise Backup** product is more flexible for tables that are in their own files. For example, tables can be excluded from a backup, but only if they are in separate files. Thus, this setting is suitable for tables that are backed up less frequently or on a different schedule.

See Also [compressed row format](#), [compression](#), [file format](#), [.ibd file](#), [ibdata file](#), [innodb\\_file\\_per\\_table](#), [MySQL Enterprise Backup](#), [row format](#), [system tablespace](#).

## fill factor

In an **InnoDB index**, the proportion of a **page** that is taken up by index data before the page is split. The unused space when index data is first divided between pages allows for rows to be updated with longer string

---

values without requiring expensive index maintenance operations. If the fill factor is too low, the index consumes more space than needed, causing extra I/O overhead when reading the index. If the fill factor is too high, any update that increases the length of column values can cause extra I/O overhead for index maintenance. See [Section 15.6.2.2, “The Physical Structure of an InnoDB Index”](#) for more information. See Also [index](#), [page](#).

#### fixed row format

This row format is used by the [MyISAM](#) storage engine, not by [InnoDB](#). If you create an [InnoDB](#) table with the option `ROW_FORMAT=FIXED` in MySQL 5.7.6 or earlier, [InnoDB](#) uses the **compact row format** instead, although the `FIXED` value might still show up in output such as `SHOW TABLE STATUS` reports. As of MySQL 5.7.7, [InnoDB](#) returns an error if `ROW_FORMAT=FIXED` is specified. See Also [compact row format](#), [row format](#).

#### flush

To write changes to the database files, that had been buffered in a memory area or a temporary disk storage area. The [InnoDB](#) storage structures that are periodically flushed include the **redo log**, the **undo log**, and the **buffer pool**.

Flushing can happen because a memory area becomes full and the system needs to free some space, because a **commit** operation means the changes from a transaction can be finalized, or because a **slow shutdown** operation means that all outstanding work should be finalized. When it is not critical to flush all the buffered data at once, [InnoDB](#) can use a technique called **fuzzy checkpointing** to flush small batches of pages to spread out the I/O overhead.

See Also [buffer pool](#), [commit](#), [fuzzy checkpointing](#), [redo log](#), [slow shutdown](#), [undo log](#).

#### flush list

An internal [InnoDB](#) data structure that tracks **dirty pages** in the **buffer pool**: that is, **pages** that have been changed and need to be written back out to disk. This data structure is updated frequently by [InnoDB](#) internal **mini-transactions**, and so is protected by its own **mutex** to allow concurrent access to the buffer pool. See Also [buffer pool](#), [dirty page](#), [LRU](#), [mini-transaction](#), [mutex](#), [page](#), [page cleaner](#).

#### foreign key

A type of pointer relationship, between rows in separate [InnoDB](#) tables. The foreign key relationship is defined on one column in both the **parent table** and the **child table**.

In addition to enabling fast lookup of related information, foreign keys help to enforce **referential integrity**, by preventing any of these pointers from becoming invalid as data is inserted, updated, and deleted. This enforcement mechanism is a type of **constraint**. A row that points to another table cannot be inserted if the associated foreign key value does not exist in the other table. If a row is deleted or its foreign key value changed, and rows in another table point to that foreign key value, the foreign key can be set up to prevent the deletion, cause the corresponding column values in the other table to become **null**, or automatically delete the corresponding rows in the other table.

One of the stages in designing a **normalized** database is to identify data that is duplicated, separate that data into a new table, and set up a foreign key relationship so that the multiple tables can be queried like a single table, using a **join** operation.

See Also [child table](#), [FOREIGN KEY constraint](#), [join](#), [normalized](#), [NULL](#), [parent table](#), [referential integrity](#), [relational](#).

#### FOREIGN KEY constraint

The type of **constraint** that maintains database consistency through a **foreign key** relationship. Like other kinds of constraints, it can prevent data from being inserted or updated if data would become inconsistent; in this case, the inconsistency being prevented is between data in multiple tables. Alternatively, when a **DML** operation is performed, [FOREIGN KEY](#) constraints can cause data in **child rows** to be deleted, changed to different values, or set to **null**, based on the `ON CASCADE` option specified when creating the foreign key.

---

See Also [child table](#), [constraint](#), [DML](#), [foreign key](#), [NULL](#).

## FTS

In most contexts, an acronym for **full-text search**. Sometimes in performance discussions, an acronym for **full table scan**.

See Also [full table scan](#), [full-text search](#).

## full backup

A **backup** that includes all the **tables** in each MySQL **database**, and all the databases in a MySQL **instance**. Contrast with **partial backup**.

See Also [backup](#), [database](#), [instance](#), [partial backup](#), [table](#).

## full table scan

An operation that requires reading the entire contents of a table, rather than just selected portions using an **index**. Typically performed either with small lookup tables, or in data warehousing situations with large tables where all available data is aggregated and analyzed. How frequently these operations occur, and the sizes of the tables relative to available memory, have implications for the algorithms used in query optimization and managing the **buffer pool**.

The purpose of indexes is to allow lookups for specific values or ranges of values within a large table, thus avoiding full table scans when practical.

See Also [buffer pool](#), [index](#).

## full-text search

The MySQL feature for finding words, phrases, Boolean combinations of words, and so on within table data, in a faster, more convenient, and more flexible way than using the SQL [LIKE](#) operator or writing your own application-level search algorithm. It uses the SQL function [MATCH\(\)](#) and **FULLTEXT indexes**.

See Also [FULLTEXT index](#).

## FULLTEXT index

The special kind of **index** that holds the **search index** in the MySQL **full-text search** mechanism. Represents the words from values of a column, omitting any that are specified as **stopwords**. Originally, only available for [MyISAM](#) tables. Starting in MySQL 5.6.4, it is also available for **InnoDB** tables.

See Also [full-text search](#), [index](#), [InnoDB](#), [search index](#), [stopword](#).

## fuzzy checkpointing

A technique that **flushes** small batches of **dirty pages** from the **buffer pool**, rather than flushing all dirty pages at once which would disrupt database processing.

See Also [buffer pool](#), [dirty page](#), [flush](#).

# G

## GA

“Generally available”, the stage when a software product leaves **beta** and is available for sale, official support, and production use.

See Also [beta](#).

## GAC

Acronym for “Global Assembly Cache”. A central area for storing libraries (**assemblies**) on a **.NET** system. Physically consists of nested folders, treated as a single virtual folder by the **.NET CLR**.

See Also [.NET](#), [assembly](#).

## gap

A place in an [InnoDB index](#) data structure where new values could be inserted. When you lock a set of rows with a statement such as [SELECT ... FOR UPDATE](#), [InnoDB](#) can create locks that apply to the gaps as well as

---

the actual values in the index. For example, if you select all values greater than 10 for update, a gap lock prevents another transaction from inserting a new value that is greater than 10. The **supremum record** and **infimum record** represent the gaps containing all values greater than or less than all the current index values. See Also [concurrency](#), [gap lock](#), [index](#), [infimum record](#), [isolation level](#), [supremum record](#).

#### gap lock

A **lock** on a **gap** between index records, or a lock on the gap before the first or after the last index record. For example, `SELECT c1 FROM t WHERE c1 BETWEEN 10 and 20 FOR UPDATE;` prevents other transactions from inserting a value of 15 into the column `t.c1`, whether or not there was already any such value in the column, because the gaps between all existing values in the range are locked. Contrast with **record lock** and **next-key lock**.

Gap locks are part of the tradeoff between performance and **concurrency**, and are used in some transaction **isolation levels** and not others.

See Also [gap](#), [infimum record](#), [lock](#), [next-key lock](#), [record lock](#), [supremum record](#).

#### general log

See [general query log](#).

#### general query log

A type of **log** used for diagnosis and troubleshooting of SQL statements processed by the MySQL server. Can be stored in a file or in a database table. You must enable this feature through the `general_log` configuration option to use it. You can disable it for a specific connection through the `sql_log_off` configuration option.

Records a broader range of queries than the **slow query log**. Unlike the **binary log**, which is used for replication, the general query log contains `SELECT` statements and does not maintain strict ordering. For more information, see [Section 5.4.3, “The General Query Log”](#).

See Also [binary log](#), [log](#), [slow query log](#).

#### general tablespace

A shared **InnoDB tablespace** created using `CREATE TABLESPACE` syntax. General tablespaces can be created outside of the MySQL data directory, are capable of holding multiple **tables**, and support tables of all row formats. General tablespaces were introduced in MySQL 5.7.6.

Tables are added to a general tablespace using `CREATE TABLE tbl_name ... TABLESPACE [=] tablespace_name` or `ALTER TABLE tbl_name TABLESPACE [=] tablespace_name` syntax.

Contrast with **system tablespace** and **file-per-table** tablespace.

For more information, see [Section 15.6.3.3, “General Tablespaces”](#).

See Also [file-per-table](#), [system tablespace](#), [table](#), [tablespace](#).

#### generated column

A column whose values are computed from an expression included in the column definition. A generated column can be **virtual** or **stored**.

See Also [base column](#), [stored generated column](#), [virtual generated column](#).

#### generated stored column

See [stored generated column](#).

#### generated virtual column

See [virtual generated column](#).

#### Glassfish

See Also [J2EE](#).

---

global temporary tablespace

A *temporary tablespace* that stores *rollback segments* for changes made to user-created temporary tables.  
See Also [temporary tablespace](#).

global transaction

A type of **transaction** involved in **XA** operations. It consists of several actions that are transactional in themselves, but that all must either complete successfully as a group, or all be rolled back as a group. In essence, this extends **ACID** properties “up a level” so that multiple ACID transactions can be executed in concert as components of a global operation that also has ACID properties.  
See Also [ACID](#), [transaction](#), [XA](#).

group commit

An [InnoDB](#) optimization that performs some low-level I/O operations (log write) once for a set of **commit** operations, rather than flushing and syncing separately for each commit.  
See Also [binary log](#), [commit](#).

GUID

Acronym for “globally unique identifier”, an ID value that can be used to associate data across different databases, languages, operating systems, and so on. (As an alternative to using sequential integers, where the same values could appear in different tables, databases, and so on referring to different data.) Older MySQL versions represented it as [BINARY\(16\)](#). Currently, it is represented as [CHAR\(36\)](#). MySQL has a [UUID\(\)](#) function that returns GUID values in character format, and a [UUID\\_SHORT\(\)](#) function that returns GUID values in integer format. Because successive GUID values are not necessarily in ascending sort order, it is not an efficient value to use as a primary key for large InnoDB tables.

## H

hash index

A type of **index** intended for queries that use equality operators, rather than range operators such as greater-than or [BETWEEN](#). It is available for [MEMORY](#) tables. Although hash indexes are the default for [MEMORY](#) tables for historic reasons, that storage engine also supports **B-tree** indexes, which are often a better choice for general-purpose queries.

MySQL includes a variant of this index type, the **adaptive hash index**, that is constructed automatically for [InnoDB](#) tables if needed based on runtime conditions.

See Also [adaptive hash index](#), [B-tree](#), [index](#), [InnoDB](#).

HDD

Acronym for “hard disk drive”. Refers to storage media using spinning platters, usually when comparing and contrasting with **SSD**. Its performance characteristics can influence the throughput of a **disk-based** workload.  
See Also [disk-based](#), [SSD](#).

heartbeat

A periodic message that is sent to indicate that a system is functioning properly. In a **replication** context, if the **source** stops sending such messages, one of the **replicas** can take its place. Similar techniques can be used between the servers in a cluster environment, to confirm that all of them are operating properly.

See Also [replication](#), [source](#).

high-water mark

A value representing an upper limit, either a hard limit that should not be exceeded at runtime, or a record of the maximum value that was actually reached. Contrast with **low-water mark**.

See Also [low-water mark](#).

history list

A list of **transactions** with delete-marked records scheduled to be processed by the [InnoDB](#) **purge** operation. Recorded in the **undo log**. The length of the history list is reported by the command [SHOW ENGINE INNODB](#)

---

**STATUS.** If the history list grows longer than the value of the `innodb_max_purge_lag` configuration option, each **DML** operation is delayed slightly to allow the purge operation to finish **flushing** the deleted records.

Also known as **purge lag**.

See Also [DML](#), [flush](#), [purge](#), [purge lag](#), [rollback segment](#), [transaction](#), [undo log](#).

#### hole punching

Releasing empty blocks from a page. The **InnoDB transparent page compression** feature relies on hole punching support. For more information, see [Section 15.9.2, “InnoDB Page Compression”](#).

See Also [sparse file](#), [transparent page compression](#).

#### host

The network name of a database server, used to establish a **connection**. Often specified in conjunction with a **port**. In some contexts, the IP address `127.0.0.1` works better than the special name `localhost` for accessing a database on the same server as the application.

See Also [connection](#), [localhost](#), [port](#).

#### hot

A condition where a row, table, or internal data structure is accessed so frequently, requiring some form of locking or mutual exclusion, that it results in a performance or scalability issue.

Although “hot” typically indicates an undesirable condition, a **hot backup** is the preferred type of backup.

See Also [hot backup](#).

#### hot backup

A backup taken while the database is running and applications are reading and writing to it. The backup involves more than simply copying data files: it must include any data that was inserted or updated while the backup was in process; it must exclude any data that was deleted while the backup was in process; and it must ignore any changes that were not committed.

The Oracle product that performs hot backups, of **InnoDB** tables especially but also tables from **MyISAM** and other storage engines, is known as **MySQL Enterprise Backup**.

The hot backup process consists of two stages. The initial copying of the data files produces a **raw backup**. The **apply** step incorporates any changes to the database that happened while the backup was running. Applying the changes produces a **prepared** backup; these files are ready to be restored whenever necessary.

See Also [apply](#), [MySQL Enterprise Backup](#), [prepared backup](#), [raw backup](#).

## I

#### .ibd file

The data file for **file-per-table** tablespaces and general tablespaces. File-per-table tablespace `.ibd` files contain a single table and associated index data. **General tablespace** `.ibd` files may contain table and index data for multiple tables.

The `.ibd` file extension does not apply to the **system tablespace**, which consists of one or more **ibdata files**.

If a file-per-table tablespace or general tablespace is created with the `DATA DIRECTORY =` clause, the `.ibd` file is located at the specified path, outside the normal data directory.

When a `.ibd` file is included in a compressed backup by the **MySQL Enterprise Backup** product, the compressed equivalent is a `.ibz` file.

See Also [database](#), [file-per-table](#), [general tablespace](#), [ibdata file](#), [.ibz file](#), [innodb\\_file\\_per\\_table](#), [MySQL Enterprise Backup](#), [system tablespace](#).

---

#### .ibz file

When the **MySQL Enterprise Backup** product performs a **compressed backup**, it transforms each **tablespace** file that is created using the **file-per-table** setting from a **.ibd** extension to a **.ibz** extension.

The compression applied during backup is distinct from the **compressed row format** that keeps table data compressed during normal operation. A compressed backup operation skips the compression step for a tablespace that is already in compressed row format, as compressing a second time would slow down the backup but produce little or no space savings.

See Also [compressed backup](#), [compressed row format](#), [file-per-table](#), [.ibd file](#), [MySQL Enterprise Backup](#), [tablespace](#).

#### I/O-bound

See [disk-bound](#).

#### ib-file set

The set of files managed by **InnoDB** within a MySQL database: the **system tablespace**, **file-per-table** tablespace files, and **redo log** files. Depending on MySQL version and **InnoDB** configuration, may also include **general tablespace**, **temporary tablespace**, and **undo tablespace** files. This term is sometimes used in detailed discussions of **InnoDB** file structures and formats to refer to the set of files managed by **InnoDB** within a MySQL database.

See Also [database](#), [file-per-table](#), [general tablespace](#), [redo log](#), [system tablespace](#), [temporary tablespace](#), [undo tablespace](#).

#### ibbackup\_logfile

A supplemental backup file created by the **MySQL Enterprise Backup** product during a **hot backup** operation. It contains information about any data changes that occurred while the backup was running. The initial backup files, including [ibbackup\\_logfile](#), are known as a **raw backup**, because the changes that occurred during the backup operation are not yet incorporated. After you perform the **apply** step to the raw backup files, the resulting files do include those final data changes, and are known as a **prepared backup**. At this stage, the [ibbackup\\_logfile](#) file is no longer necessary.

See Also [apply](#), [hot backup](#), [MySQL Enterprise Backup](#), [prepared backup](#), [raw backup](#).

#### ibdata file

A set of files with names such as [ibdata1](#), [ibdata2](#), and so on, that make up the **InnoDB system tablespace**. For information about the structures and data that reside in the system tablespace [ibdata](#) files, see [Section 15.6.3.1, “The System Tablespace”](#).

Growth of the [ibdata](#) files is influenced by the [innodb\\_autoextend\\_increment](#) configuration option.

See Also [change buffer](#), [data dictionary](#), [doublewrite buffer](#), [file-per-table](#), [.ibd file](#), [innodb\\_file\\_per\\_table](#), [system tablespace](#), [undo log](#).

#### ibttmp file

The **InnoDB temporary tablespace data file** for non-compressed **InnoDB temporary tables** and related objects. The configuration file option, [innodb\\_temp\\_data\\_file\\_path](#), allows users to define a relative path for the temporary tablespace data file. If [innodb\\_temp\\_data\\_file\\_path](#) is not specified, the default behavior is to create a single auto-extending 12MB data file named [ibttmp1](#) in the data directory, alongside [ibdata1](#).

See Also [data files](#), [temporary table](#), [temporary tablespace](#).

#### ib\_logfile

A set of files, typically named [ib\\_logfile0](#) and [ib\\_logfile1](#), that form the **redo log**. Also sometimes referred to as the **log group**. These files record statements that attempt to change data in **InnoDB** tables. These statements are replayed automatically to correct data written by incomplete transactions, on startup following a crash.

This data cannot be used for manual recovery; for that type of operation, use the **binary log**.

See Also [binary log](#), [log group](#), [redo log](#).

---

## ilist

Within an [InnoDB FULLTEXT index](#), the data structure consisting of a document ID and positional information for a token (that is, a particular word).

See Also [FULLTEXT index](#).

## implicit row lock

A row lock that [InnoDB](#) acquires to ensure consistency, without you specifically requesting it.

See Also [row lock](#).

## in-memory database

A type of database system that maintains data in memory, to avoid overhead due to disk I/O and translation between disk blocks and memory areas. Some in-memory databases sacrifice durability (the “D” in the **ACID** design philosophy) and are vulnerable to hardware, power, and other types of failures, making them more suitable for read-only operations. Other in-memory databases do use durability mechanisms such as logging changes to disk or using non-volatile memory.

MySQL features that address the same kinds of memory-intensive processing include the [InnoDB buffer pool](#), [adaptive hash index](#), and [read-only transaction](#) optimization, the [MEMORY](#) storage engine, the [MyISAM](#) key cache, and the MySQL query cache.

See Also [ACID](#), [adaptive hash index](#), [buffer pool](#), [disk-based](#), [read-only transaction](#).

## incremental backup

A type of **hot backup**, performed by the **MySQL Enterprise Backup** product, that only saves data changed since some point in time. Having a full backup and a succession of incremental backups lets you reconstruct backup data over a long period, without the storage overhead of keeping several full backups on hand. You can restore the full backup and then apply each of the incremental backups in succession, or you can keep the full backup up-to-date by applying each incremental backup to it, then perform a single restore operation.

The granularity of changed data is at the **page** level. A page might actually cover more than one row. Each changed page is included in the backup.

See Also [hot backup](#), [MySQL Enterprise Backup](#), [page](#).

## index

A data structure that provides a fast lookup capability for **rows** of a **table**, typically by forming a tree structure (**B-tree**) representing all the values of a particular **column** or set of columns.

[InnoDB](#) tables always have a **clustered index** representing the **primary key**. They can also have one or more **secondary indexes** defined on one or more columns. Depending on their structure, secondary indexes can be classified as **partial**, **column**, or **composite** indexes.

Indexes are a crucial aspect of **query** performance. Database architects design tables, queries, and indexes to allow fast lookups for data needed by applications. The ideal database design uses a **covering index** where practical; the query results are computed entirely from the index, without reading the actual table data. Each **foreign key** constraint also requires an index, to efficiently check whether values exist in both the **parent** and **child** tables.

Although a B-tree index is the most common, a different kind of data structure is used for **hash indexes**, as in the [MEMORY](#) storage engine and the [InnoDB adaptive hash index](#). **R-tree** indexes are used for spatial indexing of multi-dimensional information.

See Also [adaptive hash index](#), [B-tree](#), [child table](#), [clustered index](#), [column index](#), [composite index](#), [covering index](#), [foreign key](#), [hash index](#), [parent table](#), [partial index](#), [primary key](#), [query](#), [R-tree](#), [row](#), [secondary index](#), [table](#).

## index cache

A memory area that holds the token data for [InnoDB full-text search](#). It buffers the data to minimize disk I/O when data is inserted or updated in columns that are part of a **FULLTEXT index**. The token data is written to disk when the index cache becomes full. Each [InnoDB FULLTEXT index](#) has its own separate index cache, whose size is controlled by the configuration option `innodb_ft_cache_size`.

---

See Also [full-text search](#), [FULLTEXT index](#).

#### index condition pushdown

Index condition pushdown (ICP) is an optimization that pushes part of a [WHERE](#) condition down to the storage engine if parts of the condition can be evaluated using fields from the **index**. ICP can reduce the number of times the **storage engine** must access the base table and the number of times the MySQL server must access the storage engine. For more information, see [Section 8.2.1.6, “Index Condition Pushdown Optimization”](#).

See Also [index](#), [storage engine](#).

#### index hint

Extended SQL syntax for overriding the **indexes** recommended by the optimizer. For example, the [FORCE INDEX](#), [USE INDEX](#), and [IGNORE INDEX](#) clauses. Typically used when indexed columns have unevenly distributed values, resulting in inaccurate **cardinality** estimates.

See Also [cardinality](#), [index](#).

#### index prefix

In an **index** that applies to multiple columns (known as a **composite index**), the initial or leading columns of the index. A query that references the first 1, 2, 3, and so on columns of a composite index can use the index, even if the query does not reference all the columns in the index.

See Also [composite index](#), [index](#).

#### index statistics

See [statistics](#).

#### infimum record

A **pseudo-record** in an **index**, representing the **gap** below the smallest value in that index. If a transaction has a statement such as `SELECT ... FROM ... WHERE col < 10 FOR UPDATE;`, and the smallest value in the column is 5, it is a lock on the infimum record that prevents other transactions from inserting even smaller values such as 0, -10, and so on.

See Also [gap](#), [index](#), [pseudo-record](#), [supremum record](#).

#### INFORMATION\_SCHEMA

The name of the **database** that provides a query interface to the MySQL **data dictionary**. (This name is defined by the ANSI SQL standard.) To examine information (metadata) about the database, you can query tables such as [INFORMATION\\_SCHEMA.TABLES](#) and [INFORMATION\\_SCHEMA.COLUMNS](#), rather than using [SHOW](#) commands that produce unstructured output.

The [INFORMATION\\_SCHEMA](#) database also contains tables specific to **InnoDB** that provide a query interface to the [InnoDB](#) data dictionary. You use these tables not to see how the database is structured, but to get real-time information about the workings of [InnoDB](#) tables to help with performance monitoring, tuning, and troubleshooting.

See Also [data dictionary](#), [database](#), [InnoDB](#).

#### InnoDB

A MySQL component that combines high performance with **transactional** capability for reliability, robustness, and concurrent access. It embodies the **ACID** design philosophy. Represented as a **storage engine**; it handles tables created or altered with the [ENGINE=INNODB](#) clause. See [Chapter 15, The InnoDB Storage Engine](#) for architectural details and administration procedures, and [Section 8.5, “Optimizing for InnoDB Tables”](#) for performance advice.

In MySQL 5.5 and higher, [InnoDB](#) is the default storage engine for new tables and the [ENGINE=INNODB](#) clause is not required.

[InnoDB](#) tables are ideally suited for **hot backups**. See [Section 29.2, “MySQL Enterprise Backup Overview”](#) for information about the **MySQL Enterprise Backup** product for backing up MySQL servers without interrupting normal processing.

---

See Also [ACID](#), [hot backup](#), [MySQL Enterprise Backup](#), [storage engine](#), [transaction](#).

#### `innodb_autoinc_lock_mode`

The `innodb_autoinc_lock_mode` option controls the algorithm used for **auto-increment locking**. When you have an auto-incrementing **primary key**, you can use statement-based replication only with the setting `innodb_autoinc_lock_mode=1`. This setting is known as *consecutive* lock mode, because multi-row inserts within a transaction receive consecutive auto-increment values. If you have `innodb_autoinc_lock_mode=2`, which allows higher concurrency for insert operations, use row-based replication rather than statement-based replication. This setting is known as *interleaved* lock mode, because multiple multi-row insert statements running at the same time can receive **auto-increment** values that are interleaved. The setting `innodb_autoinc_lock_mode=0` should not be used except for compatibility purposes.

Consecutive lock mode (`innodb_autoinc_lock_mode=1`) is the default setting prior to MySQL 8.0.3. As of MySQL 8.0.3, interleaved lock mode (`innodb_autoinc_lock_mode=2`) is the default, which reflects the change from statement-based to row-based replication as the default replication type.

See Also [auto-increment](#), [auto-increment locking](#), [mixed-mode insert](#), [primary key](#).

#### `innodb_file_per_table`

An important configuration option that affects many aspects of **InnoDB** file storage, availability of features, and I/O characteristics. In MySQL 5.6.7 and higher, it is enabled by default. The `innodb_file_per_table` option turns on **file-per-table** mode. With this mode enabled, a newly created **InnoDB** table and associated indexes can be stored in a file-per-table **.ibd file**, outside the **system tablespace**.

This option affects the performance and storage considerations for a number of SQL statements, such as `DROP TABLE` and `TRUNCATE TABLE`.

Enabling the `innodb_file_per_table` option allows you to take advantage of features such as table **compression** and named-table backups in **MySQL Enterprise Backup**.

For more information, see `innodb_file_per_table`, and [Section 15.6.3.2, “File-Per-Table Tablespaces”](#).

See Also [compression](#), [file-per-table](#), [.ibd file](#), [MySQL Enterprise Backup](#), [system tablespace](#).

#### `innodb_lock_wait_timeout`

The `innodb_lock_wait_timeout` option sets the balance between **waiting** for shared resources to become available, or giving up and handling the error, retrying, or doing alternative processing in your application. Rolls back any **InnoDB** transaction that waits more than a specified time to acquire a **lock**. Especially useful if **deadlocks** are caused by updates to multiple tables controlled by different storage engines; such deadlocks are not **detected** automatically.

See Also [deadlock](#), [deadlock detection](#), [lock](#), [wait](#).

#### `innodb_strict_mode`

The `innodb_strict_mode` option controls whether **InnoDB** operates in **strict mode**, where conditions that are normally treated as warnings, cause errors instead (and the underlying statements fail).

See Also [strict mode](#).

#### `insert`

One of the primary **DML** operations in **SQL**. The performance of inserts is a key factor in **data warehouse** systems that load millions of rows into tables, and **OLTP** systems where many concurrent connections might insert rows into the same table, in arbitrary order. If insert performance is important to you, you should learn about **InnoDB** features such as the **insert buffer** used in **change buffering**, and **auto-increment** columns.

See Also [auto-increment](#), [change buffering](#), [data warehouse](#), [DML](#), [InnoDB](#), [insert buffer](#), [OLTP](#), [SQL](#).

#### `insert buffer`

The former name of the **change buffer**. In MySQL 5.5, support was added for buffering changes to secondary index pages for `DELETE` and `UPDATE` operations. Previously, only changes resulting from `INSERT` operations were buffered. The preferred term is now *change buffer*.

---

See Also [change buffer](#), [change buffering](#).

#### insert buffering

The technique of storing changes to secondary index pages, resulting from [INSERT](#) operations, in the **change buffer** rather than writing the changes immediately, so that the physical writes can be performed to minimize random I/O. It is one of the types of **change buffering**; the others are **delete buffering** and **purge buffering**.

Insert buffering is not used if the secondary index is **unique**, because the uniqueness of new values cannot be verified before the new entries are written out. Other kinds of change buffering do work for unique indexes.

See Also [change buffer](#), [change buffering](#), [delete buffering](#), [insert buffer](#), [purge buffering](#), [unique index](#).

#### insert intention lock

A type of **gap lock** that is set by [INSERT](#) operations prior to row insertion. This type of **lock** signals the intent to insert in such a way that multiple transactions inserting into the same index gap need not wait for each other if they are not inserting at the same position within the gap. For more information, see [Section 15.7.1, “InnoDB Locking”](#).

See Also [gap lock](#), [lock](#), [next-key lock](#).

#### instance

A single **mysqld** daemon managing a **data directory** representing one or more **databases** with a set of **tables**. It is common in development, testing, and some **replication** scenarios to have multiple instances on the same **server** machine, each managing its own data directory and listening on its own port or socket. With one instance running a **disk-bound** workload, the server might still have extra CPU and memory capacity to run additional instances.

See Also [data directory](#), [database](#), [disk-bound](#), [mysqld](#), [replication](#), [server](#), [table](#).

#### instrumentation

Modifications at the source code level to collect performance data for tuning and debugging. In MySQL, data collected by instrumentation is exposed through an SQL interface using the [INFORMATION\\_SCHEMA](#) and [PERFORMANCE\\_SCHEMA](#) databases.

See Also [INFORMATION\\_SCHEMA](#), [Performance Schema](#).

#### intention exclusive lock

See [intention lock](#).

#### intention lock

A kind of **lock** that applies to the table, used to indicate the kind of lock the **transaction** intends to acquire on rows in the table. Different transactions can acquire different kinds of intention locks on the same table, but the first transaction to acquire an *intention exclusive* (IX) lock on a table prevents other transactions from acquiring any S or X locks on the table. Conversely, the first transaction to acquire an *intention shared* (IS) lock on a table prevents other transactions from acquiring any X locks on the table. The two-phase process allows the lock requests to be resolved in order, without blocking locks and corresponding operations that are compatible. For more information about this locking mechanism, see [Section 15.7.1, “InnoDB Locking”](#).

See Also [lock](#), [lock mode](#), [locking](#), [transaction](#).

#### intention shared lock

See [intention lock](#).

#### interceptor

Code for instrumenting or debugging some aspect of an application, which can be enabled without recompiling or changing the source of the application itself.

See Also [command interceptor](#), [Connector/J](#), [Connector/NET](#), [exception interceptor](#).

#### intrinsic temporary table

An optimized internal [InnoDB](#) temporary table used by the *optimizer*.

See Also [optimizer](#).

---

## inverted index

A data structure optimized for document retrieval systems, used in the implementation of [InnoDB full-text search](#). The [InnoDB FULLTEXT index](#), implemented as an inverted index, records the position of each word within a document, rather than the location of a table row. A single column value (a document stored as a text string) is represented by many entries in the inverted index.

See Also [full-text search](#), [FULLTEXT index](#), [ilist](#).

## IOPS

Acronym for **I/O operations per second**. A common measurement for busy systems, particularly **OLTP** applications. If this value is near the maximum that the storage devices can handle, the application can become **disk-bound**, limiting **scalability**.

See Also [disk-bound](#), [OLTP](#), [scalability](#).

## isolation level

One of the foundations of database processing. Isolation is the **I** in the acronym **ACID**; the isolation level is the setting that fine-tunes the balance between performance and reliability, consistency, and reproducibility of results when multiple **transactions** are making changes and performing queries at the same time.

From highest amount of consistency and protection to the least, the isolation levels supported by InnoDB are: **SERIALIZABLE**, **REPEATABLE READ**, **READ COMMITTED**, and **READ UNCOMMITTED**.

With [InnoDB](#) tables, many users can keep the default isolation level (*REPEATABLE READ*) for all operations. Expert users might choose the **READ COMMITTED** level as they push the boundaries of scalability with **OLTP** processing, or during data warehousing operations where minor inconsistencies do not affect the aggregate results of large amounts of data. The levels on the edges (**SERIALIZABLE** and **READ UNCOMMITTED**) change the processing behavior to such an extent that they are rarely used.

See Also [ACID](#), [OLTP](#), [READ COMMITTED](#), [READ UNCOMMITTED](#), [REPEATABLE READ](#), [SERIALIZABLE](#), [transaction](#).

# J

## J2EE

Java Platform, Enterprise Edition: Oracle's enterprise Java platform. It consists of an API and a runtime environment for enterprise-class Java applications. For full details, see <http://www.oracle.com/technetwork/java/javaee/overview/index.html>. With MySQL applications, you typically use **Connector/J** for database access, and an application server such as **Tomcat** or **JBoss** to handle the middle-tier work, and optionally a framework such as **Spring**. Database-related features often offered within a J2EE stack include a **connection pool** and **failover** support.

See Also [connection pool](#), [Connector/J](#), [failover](#), [Java](#), [JBoss](#), [Spring](#), [Tomcat](#).

## Java

A programming language combining high performance, rich built-in features and data types, object-oriented mechanisms, extensive standard library, and wide range of reusable third-party modules. Enterprise development is supported by many frameworks, application servers, and other technologies. Much of its syntax is familiar to **C** and **C++** developers. To write Java applications with MySQL, you use the **JDBC** driver known as **Connector/J**.

See Also [C](#), [Connector/J](#), [C++](#), [JDBC](#).

## JBoss

See Also [J2EE](#).

## JDBC

Abbreviation for “Java Database Connectivity”, an **API** for database access from **Java** applications. Java developers writing MySQL applications use the **Connector/J** component as their JDBC driver.

---

See Also [API](#), [Connector/J](#), [J2EE](#), [Java](#).

## JNDI

See Also [Java](#).

## join

A **query** that retrieves data from more than one table, by referencing columns in the tables that hold identical values. Ideally, these columns are part of an [InnoDB foreign key](#) relationship, which ensures **referential integrity** and that the join columns are **indexed**. Often used to save space and improve query performance by replacing repeated strings with numeric IDs, in a **normalized** data design.

See Also [foreign key](#), [index](#), [normalized](#), [query](#), [referential integrity](#).

# K

## keystore

See Also [SSL](#).

## KEY\_BLOCK\_SIZE

An option to specify the size of data pages within an [InnoDB](#) table that uses **compressed row format**. The default is 8 kilobytes. Lower values risk hitting internal limits that depend on the combination of row size and compression percentage.

For [MyISAM](#) tables, [KEY\\_BLOCK\\_SIZE](#) optionally specifies the size in bytes to use for index key blocks. The value is treated as a hint; a different size could be used if necessary. A [KEY\\_BLOCK\\_SIZE](#) value specified for an individual index definition overrides a table-level [KEY\\_BLOCK\\_SIZE](#) value.

See Also [compressed row format](#).

# L

## latch

A lightweight structure used by [InnoDB](#) to implement a **lock** for its own internal memory structures, typically held for a brief time measured in milliseconds or microseconds. A general term that includes both **mutexes** (for exclusive access) and **rw-locks** (for shared access). Certain latches are the focus of [InnoDB](#) performance tuning. Statistics about latch use and contention are available through the **Performance Schema** interface.

See Also [lock](#), [locking](#), [mutex](#), [Performance Schema](#), [rw-lock](#).

## libmysql

Informal name for the **libmysqlclient** library.

See Also [libmysqlclient](#).

## libmysqlclient

The library file, named [libmysqlclient.a](#) or [libmysqlclient.so](#), that is typically linked into **client** programs written in **C**. Sometimes known informally as **libmysql** or the **mysqlclient** library.

See Also [client](#), [libmysql](#), [mysqlclient](#).

## libmysqld

This **embedded** MySQL server library makes it possible to run a full-featured MySQL server inside a **client** application. The main benefits are increased speed and more simple management for embedded applications. You link with the [libmysqld](#) library rather than **libmysqlclient**. The API is identical between all three of these libraries.

See Also [client](#), [embedded](#), [libmysql](#), [libmysqlclient](#).

---

## lifecycle interceptor

A type of **interceptor** supported by **Connector/J**. It involves implementing the interface `com.mysql.jdbc.ConnectionLifecycleInterceptor`.  
See Also [Connector/J](#), [interceptor](#).

## list

The **InnoDB buffer pool** is represented as a list of memory **pages**. The list is reordered as new pages are accessed and enter the buffer pool, as pages within the buffer pool are accessed again and are considered newer, and as pages that are not accessed for a long time are **evicted** from the buffer pool. The buffer pool is divided into **sublists**, and the replacement policy is a variation of the familiar **LRU** technique.  
See Also [buffer pool](#), [eviction](#), [LRU](#), [page](#), [sublist](#).

## load balancing

A technique for scaling read-only connections by sending query requests to different slave servers in a replication or Cluster configuration. With **Connector/J**, load balancing is enabled through the `com.mysql.jdbc.ReplicationDriver` class and controlled by the configuration property `loadBalanceStrategy`.  
See Also [Connector/J](#), [J2EE](#).

## localhost

See Also [connection](#).

## lock

The high-level notion of an object that controls access to a resource, such as a table, row, or internal data structure, as part of a **locking** strategy. For intensive performance tuning, you might delve into the actual structures that implement locks, such as **mutexes** and **latches**.  
See Also [latch](#), [lock mode](#), [locking](#), [mutex](#).

## lock escalation

An operation used in some database systems that converts many **row locks** into a single **table lock**, saving memory space but reducing concurrent access to the table. **InnoDB** uses a space-efficient representation for row locks, so that **lock** escalation is not needed.  
See Also [locking](#), [row lock](#), [table lock](#).

## lock mode

A shared (S) **lock** allows a **transaction** to read a row. Multiple transactions can acquire an S lock on that same row at the same time.

An exclusive (X) lock allows a transaction to update or delete a row. No other transaction can acquire any kind of lock on that same row at the same time.

**Intention locks** apply to the table, and are used to indicate what kind of lock the transaction intends to acquire on rows in the table. Different transactions can acquire different kinds of intention locks on the same table, but the first transaction to acquire an intention exclusive (IX) lock on a table prevents other transactions from acquiring any S or X locks on the table. Conversely, the first transaction to acquire an intention shared (IS) lock on a table prevents other transactions from acquiring any X locks on the table. The two-phase process allows the lock requests to be resolved in order, without blocking locks and corresponding operations that are compatible.  
See Also [intention lock](#), [lock](#), [locking](#), [transaction](#).

## locking

The system of protecting a **transaction** from seeing or changing data that is being queried or changed by other transactions. The **locking** strategy must balance reliability and consistency of database operations (the principles of the **ACID** philosophy) against the performance needed for good **concurrency**. Fine-tuning the locking strategy often involves choosing an **isolation level** and ensuring all your database operations are safe and reliable for that isolation level.

---

See Also [ACID](#), [concurrency](#), [isolation level](#), [locking](#), [transaction](#).

#### locking read

A `SELECT` statement that also performs a **locking** operation on an `InnoDB` table. Either `SELECT ... FOR UPDATE` or `SELECT ... LOCK IN SHARE MODE`. It has the potential to produce a **deadlock**, depending on the **isolation level** of the transaction. The opposite of a **non-locking read**. Not allowed for global tables in a **read-only transaction**.

`SELECT ... FOR SHARE` replaces `SELECT ... LOCK IN SHARE MODE` in MySQL 8.0.1, but `LOCK IN SHARE MODE` remains available for backward compatibility.

See [Section 15.7.2.4, “Locking Reads”](#).

See Also [deadlock](#), [isolation level](#), [locking](#), [non-locking read](#), [read-only transaction](#).

#### log

In the `InnoDB` context, “log” or “log files” typically refers to the **redo log** represented by the `ib_logfileN` files. Another type of `InnoDB` log is the **undo log**, which is a storage area that holds copies of data modified by active transactions.

Other kinds of logs that are important in MySQL are the **error log** (for diagnosing startup and runtime problems), **binary log** (for working with replication and performing point-in-time restores), the **general query log** (for diagnosing application problems), and the **slow query log** (for diagnosing performance problems).

See Also [binary log](#), [error log](#), [general query log](#), [ib\\_logfile](#), [redo log](#), [slow query log](#), [undo log](#).

#### log buffer

The memory area that holds data to be written to the **log files** that make up the **redo log**. It is controlled by the `innodb_log_buffer_size` configuration option.

See Also [log file](#), [redo log](#).

#### log file

One of the `ib_logfileN` files that make up the **redo log**. Data is written to these files from the **log buffer** memory area.

See Also [ib\\_logfile](#), [log buffer](#), [redo log](#).

#### log group

The set of files that make up the **redo log**, typically named `ib_logfile0` and `ib_logfile1`. (For that reason, sometimes referred to collectively as **ib\_logfile**.)

See Also [ib\\_logfile](#), [redo log](#).

#### logical

A type of operation that involves high-level, abstract aspects such as tables, queries, indexes, and other SQL concepts. Typically, logical aspects are important to make database administration and application development convenient and usable. Contrast with **physical**.

See Also [logical backup](#), [physical](#).

#### logical backup

A **backup** that reproduces table structure and data, without copying the actual data files. For example, the `mysqldump` command produces a logical backup, because its output contains statements such as `CREATE TABLE` and `INSERT` that can re-create the data. Contrast with **physical backup**. A logical backup offers flexibility (for example, you could edit table definitions or insert statements before restoring), but can take substantially longer to **restore** than a physical backup.

See Also [backup](#), [mysqldump](#), [physical backup](#), [restore](#).

#### loose\_

A prefix added to `InnoDB` configuration options after server **startup**, so any new configuration options not recognized by the current level of MySQL do not cause a startup failure. MySQL processes configuration options

---

that start with this prefix, but gives a warning rather than a failure if the part after the prefix is not a recognized option.

See Also [startup](#).

#### low-water mark

A value representing a lower limit, typically a threshold value at which some corrective action begins or becomes more aggressive. Contrast with **high-water mark**.

See Also [high-water mark](#).

#### LRU

An acronym for “least recently used”, a common method for managing storage areas. The items that have not been used recently are **evicted** when space is needed to cache newer items. [InnoDB](#) uses the LRU mechanism by default to manage the **pages** within the **buffer pool**, but makes exceptions in cases where a page might be read only a single time, such as during a **full table scan**. This variation of the LRU algorithm is called the **midpoint insertion strategy**. For more information, see [Section 15.5.1, “Buffer Pool”](#).

See Also [buffer pool](#), [eviction](#), [full table scan](#), [midpoint insertion strategy](#), [page](#).

#### LSN

Acronym for “log sequence number”. This arbitrary, ever-increasing value represents a point in time corresponding to operations recorded in the **redo log**. (This point in time is regardless of **transaction** boundaries; it can fall in the middle of one or more transactions.) It is used internally by [InnoDB](#) during **crash recovery** and for managing the **buffer pool**.

Prior to MySQL 5.6.3, the LSN was a 4-byte unsigned integer. The LSN became an 8-byte unsigned integer in MySQL 5.6.3 when the redo log file size limit increased from 4GB to 512GB, as additional bytes were required to store extra size information. Applications built on MySQL 5.6.3 or later that use LSN values should use 64-bit rather than 32-bit variables to store and compare LSN values.

In the **MySQL Enterprise Backup** product, you can specify an LSN to represent the point in time from which to take an **incremental backup**. The relevant LSN is displayed by the output of the [mysqlbackup](#) command. Once you have the LSN corresponding to the time of a full backup, you can specify that value to take a subsequent incremental backup, whose output contains another LSN for the next incremental backup.

See Also [buffer pool](#), [crash recovery](#), [incremental backup](#), [MySQL Enterprise Backup](#), [redo log](#), [transaction](#).

## M

#### .MRG file

A file containing references to other tables, used by the [MERGE](#) storage engine. Files with this extension are always included in backups produced by the [mysqlbackup](#) command of the **MySQL Enterprise Backup** product.

See Also [MySQL Enterprise Backup](#), [mysqlbackup command](#).

#### .MYD file

A file that MySQL uses to store data for a [MyISAM](#) table.

See Also [.MYI file](#), [MySQL Enterprise Backup](#), [mysqlbackup command](#).

#### .MYI file

A file that MySQL uses to store indexes for a [MyISAM](#) table.

See Also [.MYD file](#), [MySQL Enterprise Backup](#), [mysqlbackup command](#).

#### master

See [source](#).

#### master thread

An [InnoDB thread](#) that performs various tasks in the background. Most of these tasks are I/O related, such as writing changes from the **change buffer** to the appropriate secondary indexes.

---

To improve **concurrency**, sometimes actions are moved from the master thread to separate background threads. For example, in MySQL 5.6 and higher, **dirty pages** are **flushed** from the **buffer pool** by the **page cleaner** thread rather than the master thread.

See Also [buffer pool](#), [change buffer](#), [concurrency](#), [dirty page](#), [flush](#), [page cleaner](#), [thread](#).

## MDL

Acronym for “metadata lock”.

See Also [metadata lock](#).

## medium trust

Synonym for **partial trust**. Because the range of trust settings is so broad, “partial trust” is preferred, to avoid the implication that there are only three levels (low, medium, and full).

See Also [Connector/NET](#), [partial trust](#).

## memcached

A popular component of many MySQL and **NoSQL** software stacks, allowing fast reads and writes for single values and caching the results entirely in memory. Traditionally, applications required extra logic to write the same data to a MySQL database for permanent storage, or to read data from a MySQL database when it was not cached yet in memory. Now, applications can use the simple [memcached](#) protocol, supported by client libraries for many languages, to communicate directly with MySQL servers using [InnoDB](#) or [NDB](#) tables. These NoSQL interfaces to MySQL tables allow applications to achieve higher read and write performance than by issuing SQL statements directly, and can simplify application logic and deployment configurations for systems that already incorporate [memcached](#) for in-memory caching.

The [memcached](#) interface to [InnoDB](#) tables is available in MySQL 5.6 and higher; see [Section 15.20, “InnoDB memcached Plugin”](#) for details. The [memcached](#) interface to [NDB](#) tables is available in NDB Cluster 7.2 and later; see <http://dev.mysql.com/doc/ndbapi/en/ndbmemcache.html> for details.

See Also [InnoDB](#), [NoSQL](#).

## merge

To apply changes to data cached in memory, such as when a page is brought into the **buffer pool**, and any applicable changes recorded in the **change buffer** are incorporated into the page in the buffer pool. The updated data is eventually written to the **tablespace** by the **flush** mechanism.

See Also [buffer pool](#), [change buffer](#), [flush](#), [tablespace](#).

## metadata lock

A type of **lock** that prevents **DDL** operations on a table that is being used at the same time by another **transaction**. For details, see [Section 8.11.4, “Metadata Locking”](#).

Enhancements to **online** operations, particularly in MySQL 5.6 and higher, are focused on reducing the amount of metadata locking. The objective is for DDL operations that do not change the table structure (such as [CREATE INDEX](#) and [DROP INDEX](#) for [InnoDB](#) tables) to proceed while the table is being queried, updated, and so on by other transactions.

See Also [DDL](#), [lock](#), [online](#), [transaction](#).

## metrics counter

A feature implemented by the [INNODB\\_METRICS](#) table in the **INFORMATION\_SCHEMA**, in MySQL 5.6 and higher. You can query **counts** and totals for low-level [InnoDB](#) operations, and use the results for performance tuning in combination with data from the **Performance Schema**.

See Also [counter](#), [INFORMATION\\_SCHEMA](#), [Performance Schema](#).

## midpoint insertion strategy

The technique of initially bringing **pages** into the [InnoDB](#) **buffer pool** not at the “newest” end of the list, but instead somewhere in the middle. The exact location of this point can vary, based on the setting of the [innodb\\_old\\_blocks\\_pct](#) option. The intent is that pages that are only read once, such as during a **full table**

---

**scan**, can be aged out of the buffer pool sooner than with a strict **LRU** algorithm. For more information, see [Section 15.5.1, “Buffer Pool”](#).  
See Also [buffer pool](#), [full table scan](#), [LRU](#), [page](#).

#### mini-transaction

An internal phase of [InnoDB](#) processing, when making changes at the **physical** level to internal data structures during **DML** operations. A mini-transaction (mtr) has no notion of **rollback**; multiple mini-transactions can occur within a single **transaction**. Mini-transactions write information to the **redo log** that is used during **crash recovery**. A mini-transaction can also happen outside the context of a regular transaction, for example during **purge** processing by background threads.  
See Also [commit](#), [crash recovery](#), [DML](#), [physical](#), [purge](#), [redo log](#), [rollback](#), [transaction](#).

#### mixed-mode insert

An [INSERT](#) statement where **auto-increment** values are specified for some but not all of the new rows. For example, a multi-value [INSERT](#) could specify a value for the auto-increment column in some cases and [NULL](#) in other cases. [InnoDB](#) generates auto-increment values for the rows where the column value was specified as [NULL](#). Another example is an [INSERT ... ON DUPLICATE KEY UPDATE](#) statement, where auto-increment values might be generated but not used, for any duplicate rows that are processed as [UPDATE](#) rather than [INSERT](#) statements.

Can cause consistency issues between **source** and **replica** servers in a **replication** configuration. Can require adjusting the value of the [innodb\\_autoinc\\_lock\\_mode](#) configuration option.  
See Also [auto-increment](#), [innodb\\_autoinc\\_lock\\_mode](#), [replica](#), [replication](#), [source](#).

#### MM.MySQL

An older JDBC driver for MySQL that evolved into **Connector/J** when it was integrated with the MySQL product.  
See Also [Connector/J](#).

#### Mono

An Open Source framework developed by Novell, that works with **Connector/NET** and **C#** applications on Linux platforms.  
See Also [Connector/NET](#), [C#](#).

#### mtr

See [mini-transaction](#).

#### multi-core

A type of processor that can take advantage of multithreaded programs, such as the MySQL server.

#### multiversion concurrency control

See [MVCC](#).

#### mutex

Informal abbreviation for “mutex variable”. (Mutex itself is short for “mutual exclusion”.) The low-level object that [InnoDB](#) uses to represent and enforce exclusive-access **locks** to internal in-memory data structures. Once the lock is acquired, any other process, thread, and so on is prevented from acquiring the same lock. Contrast with **rw-locks**, which [InnoDB](#) uses to represent and enforce shared-access **locks** to internal in-memory data structures. Mutexes and rw-locks are known collectively as **latches**.  
See Also [latch](#), [lock](#), [Performance Schema](#), [Pthreads](#), [rw-lock](#).

#### MVCC

Acronym for “multiversion concurrency control”. This technique lets [InnoDB](#) **transactions** with certain **isolation levels** perform **consistent read** operations; that is, to query rows that are being updated by other transactions, and see the values from before those updates occurred. This is a powerful technique to increase **concurrency**, by allowing queries to proceed without waiting due to **locks** held by the other transactions.

---

This technique is not universal in the database world. Some other database products, and some other MySQL storage engines, do not support it.

See Also [ACID](#), [concurrency](#), [consistent read](#), [isolation level](#), [lock](#), [transaction](#).

my.cnf

The name, on Unix or Linux systems, of the MySQL **option file**.

See Also [my.ini](#), [option file](#).

my.ini

The name, on Windows systems, of the MySQL **option file**.

See Also [my.cnf](#), [option file](#).

MyODBC drivers

Obsolete name for **Connector/ODBC**.

See Also [Connector/ODBC](#).

mysql

The [mysql](#) program is the command-line interpreter for the MySQL database. It processes **SQL** statements, and also MySQL-specific commands such as [SHOW TABLES](#), by passing requests to the [mysqld](#) daemon.

See Also [mysqld](#), [SQL](#).

MySQL Enterprise Backup

A licensed product that performs **hot backups** of MySQL databases. It offers the most efficiency and flexibility when backing up [InnoDB](#) tables, but can also back up [MyISAM](#) and other kinds of tables.

See Also [hot backup](#), [InnoDB](#).

mysqlbackup command

A command-line tool of the **MySQL Enterprise Backup** product. It performs a **hot backup** operation for [InnoDB](#) tables, and a [warm backup](#) for [MyISAM](#) and other kinds of tables. See [Section 29.2, “MySQL Enterprise Backup Overview”](#) for more information about this command.

See Also [hot backup](#), [MySQL Enterprise Backup](#), [warm backup](#).

mysqlclient

The informal name for the library that is implemented by the file **libmysqlclient**, with extension [.a](#) or [.so](#).

See Also [libmysqlclient](#).

mysqld

[mysqld](#), also known as MySQL Server, is a single multithreaded program that does most of the work in a MySQL installation. It does not spawn additional processes. MySQL Server manages access to the MySQL data directory that contains databases, tables, and other information such as log files and status files.

[mysqld](#) runs as a Unix daemon or Windows service, constantly waiting for requests and performing maintenance work in the background.

See Also [instance](#), [mysql](#).

MySQLdb

The name of the open-source **Python** module that forms the basis of the MySQL **Python API**.

See Also [Python](#), [Python API](#).

mysqldump

A command that performs a **logical backup** of some combination of databases, tables, and table data. The results are SQL statements that reproduce the original schema objects, data, or both. For substantial amounts of data, a **physical backup** solution such as **MySQL Enterprise Backup** is faster, particularly for the **restore** operation.

See Also [logical backup](#), [MySQL Enterprise Backup](#), [physical backup](#), [restore](#).

---

# N

## .NET

See Also [ADO.NET](#), [ASP.net](#), [Connector/NET](#), [Mono](#), [Visual Studio](#).

## native C API

Synonym for **libmysqlclient**.

See Also [libmysql](#).

## natural key

An indexed column, typically a **primary key**, where the values have some real-world significance. Usually advised against because:

- If the value should ever change, there is potentially a lot of index maintenance to re-sort the **clustered index** and update the copies of the primary key value that are repeated in each **secondary index**.
- Even seemingly stable values can change in unpredictable ways that are difficult to represent correctly in the database. For example, one country can change into two or several, making the original country code obsolete. Or, rules about unique values might have exceptions. For example, even if taxpayer IDs are intended to be unique to a single person, a database might have to handle records that violate that rule, such as in cases of identity theft. Taxpayer IDs and other sensitive ID numbers also make poor primary keys, because they may need to be secured, encrypted, and otherwise treated differently than other columns.

Thus, it is typically better to use arbitrary numeric values to form a **synthetic key**, for example using an **auto-increment** column.

See Also [auto-increment](#), [clustered index](#), [primary key](#), [secondary index](#), [synthetic key](#).

## neighbor page

Any **page** in the same **extent** as a particular page. When a page is selected to be **flushed**, any neighbor pages that are **dirty** are typically flushed as well, as an I/O optimization for traditional hard disks. In MySQL 5.6 and up, this behavior can be controlled by the configuration variable [innodb\\_flush\\_neighbors](#); you might turn that setting off for SSD drives, which do not have the same overhead for writing smaller batches of data at random locations.

See Also [dirty page](#), [extent](#), [flush](#), [page](#).

## next-key lock

A combination of a **record lock** on the index record and a [gap lock](#) on the gap before the index record.

See Also [gap lock](#), [locking](#), [record lock](#).

## non-locking read

A **query** that does not use the [SELECT ... FOR UPDATE](#) or [SELECT ... LOCK IN SHARE MODE](#) clauses. The only kind of query allowed for global tables in a **read-only transaction**. The opposite of a **locking read**. See [Section 15.7.2.3, “Consistent Nonlocking Reads”](#).

[SELECT ... FOR SHARE](#) replaces [SELECT ... LOCK IN SHARE MODE](#) in MySQL 8.0.1, but [LOCK IN SHARE MODE](#) remains available for backward compatibility.

See Also [locking read](#), [query](#), [read-only transaction](#).

## non-repeatable read

The situation when a query retrieves data, and a later query within the same **transaction** retrieves what should be the same data, but the queries return different results (changed by another transaction committing in the meantime).

This kind of operation goes against the **ACID** principle of database design. Within a transaction, data should be consistent, with predictable and stable relationships.

---

Among different **isolation levels**, non-repeatable reads are prevented by the **serializable read** and **repeatable read** levels, and allowed by the **consistent read**, and **read uncommitted** levels.  
See Also [ACID](#), [consistent read](#), [isolation level](#), [READ UNCOMMITTED](#), [REPEATABLE READ](#), [SERIALIZABLE](#), [transaction](#).

#### nonblocking I/O

An industry term that means the same as **asynchronous I/O**.  
See Also [asynchronous I/O](#).

#### normalized

A database design strategy where data is split into multiple tables, and duplicate values condensed into single rows represented by an ID, to avoid storing, querying, and updating redundant or lengthy values. It is typically used in **OLTP** applications.

For example, an address might be given a unique ID, so that a census database could represent the relationship **lives at this address** by associating that ID with each member of a family, rather than storing multiple copies of a complex value such as **123 Main Street, Anytown, USA**.

For another example, although a simple address book application might store each phone number in the same table as a person's name and address, a phone company database might give each phone number a special ID, and store the numbers and IDs in a separate table. This normalized representation could simplify large-scale updates when area codes split apart.

Normalization is not always recommended. Data that is primarily queried, and only updated by deleting entirely and reloading, is often kept in fewer, larger tables with redundant copies of duplicate values. This data representation is referred to as **denormalized**, and is frequently found in data warehousing applications.  
See Also [denormalized](#), [foreign key](#), [OLTP](#), [relational](#).

#### NoSQL

A broad term for a set of data access technologies that do not use the **SQL** language as their primary mechanism for reading and writing data. Some NoSQL technologies act as key-value stores, only accepting single-value reads and writes; some relax the restrictions of the **ACID** methodology; still others do not require a pre-planned **schema**. MySQL users can combine NoSQL-style processing for speed and simplicity with SQL operations for flexibility and convenience, by using the **memcached** API to directly access some kinds of MySQL tables. The **memcached** interface to **InnoDB** tables is available in MySQL 5.6 and higher; see [Section 15.20, “InnoDB memcached Plugin”](#) for details. The **memcached** interface to **NDB** tables is available in NDB Cluster 7.2 and later; see [ndbmemcache—Memcache API for NDB Cluster \(DEPRECATED\)](#).  
See Also [ACID](#), [InnoDB](#), [memcached](#), [schema](#), [SQL](#).

#### NOT NULL constraint

A type of **constraint** that specifies that a **column** cannot contain any **NULL** values. It helps to preserve **referential integrity**, as the database server can identify data with erroneous missing values. It also helps in the arithmetic involved in query optimization, allowing the optimizer to predict the number of entries in an index on that column.  
See Also [column](#), [constraint](#), [NULL](#), [primary key](#), [referential integrity](#).

#### NULL

A special value in **SQL**, indicating the absence of data. Any arithmetic operation or equality test involving a **NULL** value, in turn produces a **NULL** result. (Thus it is similar to the IEEE floating-point concept of NaN, “not a number”.) Any aggregate calculation such as [AVG\(\)](#) ignores rows with **NULL** values, when determining how many rows to divide by. The only test that works with **NULL** values uses the SQL idioms [IS NULL](#) or [IS NOT NULL](#).

**NULL** values play a part in **index** operations, because for performance a database must minimize the overhead of keeping track of missing data values. Typically, **NULL** values are not stored in an index, because a query that tests an indexed column using a standard comparison operator could never match a row with a **NULL** value for

---

that column. For the same reason, unique indexes do not prevent [NULL](#) values; those values simply are not represented in the index. Declaring a [NOT NULL](#) constraint on a column provides reassurance that there are no rows left out of the index, allowing for better query optimization (accurate counting of rows and estimation of whether to use the index).

Because the **primary key** must be able to uniquely identify every row in the table, a single-column primary key cannot contain any [NULL](#) values, and a multi-column primary key cannot contain any rows with [NULL](#) values in all columns.

Although the Oracle database allows a [NULL](#) value to be concatenated with a string, [InnoDB](#) treats the result of such an operation as [NULL](#).

See Also [index](#), [primary key](#), [SQL](#).

## O

### .OPT file

A file containing database configuration information. Files with this extension are included in backups produced by the [mysqlbackup](#) command of the **MySQL Enterprise Backup** product.

See Also [MySQL Enterprise Backup](#), [mysqlbackup command](#).

### ODBC

Acronym for Open Database Connectivity, an industry-standard API. Typically used with Windows-based servers, or applications that require ODBC to communicate with MySQL. The MySQL ODBC driver is called **Connector/ODBC**.

See Also [Connector/ODBC](#).

### off-page column

A column containing variable-length data (such as [BLOB](#) and [VARCHAR](#)) that is too long to fit on a **B-tree** page. The data is stored in **overflow pages**. The **DYNAMIC** row format is more efficient for such storage than the older **COMPACT** row format.

See Also [B-tree](#), [compact row format](#), [dynamic row format](#), [overflow page](#).

### OLTP

Acronym for “Online Transaction Processing”. A database system, or a database application, that runs a workload with many **transactions**, with frequent writes as well as reads, typically affecting small amounts of data at a time. For example, an airline reservation system or an application that processes bank deposits. The data might be organized in **normalized** form for a balance between **DML** (insert/update/delete) efficiency and **query** efficiency. Contrast with **data warehouse**.

With its **row-level locking** and **transactional** capability, **InnoDB** is the ideal storage engine for MySQL tables used in OLTP applications.

See Also [data warehouse](#), [DML](#), [InnoDB](#), [query](#), [row lock](#), [transaction](#).

### online

A type of operation that involves no downtime, blocking, or restricted operation for the database. Typically applied to **DDL**. Operations that shorten the periods of restricted operation, such as **fast index creation**, have evolved into a wider set of **online DDL** operations in MySQL 5.6.

In the context of backups, a **hot backup** is an online operation and a **warm backup** is partially an online operation.

See Also [DDL](#), [Fast Index Creation](#), [hot backup](#), [online DDL](#), [warm backup](#).

### online DDL

A feature that improves the performance, concurrency, and availability of [InnoDB](#) tables during **DDL** (primarily [ALTER TABLE](#)) operations. See [Section 15.12, “InnoDB and Online DDL”](#) for details.

---

The details vary according to the type of operation. In some cases, the table can be modified concurrently while the `ALTER TABLE` is in progress. The operation might be able to be performed without a table copy, or using a specially optimized type of table copy. DML log space usage for in-place operations is controlled by the `innodb_online_alter_log_max_size` configuration option.

This feature is an enhancement of the **Fast Index Creation** feature in MySQL 5.5.  
See Also [DDL](#), [Fast Index Creation](#), [online](#).

#### optimistic

A methodology that guides low-level implementation decisions for a relational database system. The requirements of performance and **concurrency** in a relational database mean that operations must be started or dispatched quickly. The requirements of consistency and **referential integrity** mean that any operation could fail: a transaction might be rolled back, a **DML** operation could violate a constraint, a request for a lock could cause a deadlock, a network error could cause a timeout. An optimistic strategy is one that assumes most requests or attempts will succeed, so that relatively little work is done to prepare for the failure case. When this assumption is true, the database does little unnecessary work; when requests do fail, extra work must be done to clean up and undo changes.

**InnoDB** uses optimistic strategies for operations such as **locking** and **commits**. For example, data changed by a transaction can be written to the data files before the commit occurs, making the commit itself very fast, but requiring more work to undo the changes if the transaction is rolled back.

The opposite of an optimistic strategy is a **pessimistic** one, where a system is optimized to deal with operations that are unreliable and frequently unsuccessful. This methodology is rare in a database system, because so much care goes into choosing reliable hardware, networks, and algorithms.

See Also [commit](#), [concurrency](#), [DML](#), [locking](#), [pessimistic](#), [referential integrity](#).

#### optimizer

The MySQL component that determines the best **indexes** and **join** order to use for a **query**, based on characteristics and data distribution of the relevant **tables**.

See Also [index](#), [join](#), [query](#), [table](#).

#### option

A configuration parameter for MySQL, either stored in the **option file** or passed on the command line.

For the **options** that apply to **InnoDB** tables, each option name starts with the prefix `innodb_`.

See Also [InnoDB](#), [option](#), [option file](#).

#### option file

The file that holds the configuration **options** for the MySQL instance. Traditionally, on Linux and Unix this file is named `my.cnf`, and on Windows it is named `my.ini`.

See Also [configuration file](#), [my.cnf](#), [my.ini](#), [option](#).

#### overflow page

Separately allocated disk **pages** that hold variable-length columns (such as **BLOB** and **VARCHAR**) that are too long to fit on a **B-tree** page. The associated columns are known as **off-page columns**.

See Also [B-tree](#), [off-page column](#), [page](#).

## P

#### .par file

A file containing partition definitions. Files with this extension are included in backups produced by the `mysqlbackup` command of the **MySQL Enterprise Backup** product.

With the introduction of native partitioning support for **InnoDB** tables in MySQL 5.7.6, `.par` files are no longer created for partitioned **InnoDB** tables. Partitioned **MyISAM** tables continue to use `.par` files in MySQL 5.7. In

---

MySQL 8.0, partitioning support is only provided by the [InnoDB](#) storage engine. As such, [.par](#) files are no longer used as of MySQL 8.0.

See Also [MySQL Enterprise Backup](#), [mysqlbackup](#) command.

#### page

A unit representing how much data [InnoDB](#) transfers at any one time between disk (the **data files**) and memory (the **buffer pool**). A page can contain one or more **rows**, depending on how much data is in each row. If a row does not fit entirely into a single page, [InnoDB](#) sets up additional pointer-style data structures so that the information about the row can be stored in one page.

One way to fit more data in each page is to use **compressed row format**. For tables that use BLOBs or large text fields, **compact row format** allows those large columns to be stored separately from the rest of the row, reducing I/O overhead and memory usage for queries that do not reference those columns.

When [InnoDB](#) reads or writes sets of pages as a batch to increase I/O throughput, it reads or writes an **extent** at a time.

All the [InnoDB](#) disk data structures within a MySQL instance share the same **page size**.

See Also [buffer pool](#), [compact row format](#), [compressed row format](#), [data files](#), [extent](#), [page size](#), [row](#).

#### page cleaner

An [InnoDB](#) background **thread** that **flushes dirty pages** from the **buffer pool**. Prior to MySQL 5.6, this activity was performed by the **master thread**. The number of page cleaner threads is controlled by the [innodb\\_page\\_cleaners](#) configuration option, introduced in MySQL 5.7.4.

See Also [buffer pool](#), [dirty page](#), [flush](#), [master thread](#), [thread](#).

#### page size

For releases up to and including MySQL 5.5, the size of each [InnoDB](#) **page** is fixed at 16 kilobytes. This value represents a balance: large enough to hold the data for most rows, yet small enough to minimize the performance overhead of transferring unneeded data to memory. Other values are not tested or supported.

Starting in MySQL 5.6, the page size for an [InnoDB](#) **instance** can be either 4KB, 8KB, or 16KB, controlled by the [innodb\\_page\\_size](#) configuration option. As of MySQL 5.7.6, [InnoDB](#) also supports 32KB and 64KB page sizes. For 32KB and 64KB page sizes, [ROW\\_FORMAT=COMPRESSED](#) is not supported and the maximum record size is 16KB.

Page size is set when creating the MySQL instance, and it remains constant afterward. The same page size applies to all [InnoDB](#) **tablespaces**, including the **system tablespace**, **file-per-table** tablespaces, and **general tablespaces**.

Smaller page sizes can help performance with storage devices that use small block sizes, particularly for **SSD** devices in **disk-bound** workloads, such as for **OLTP** applications. As individual rows are updated, less data is copied into memory, written to disk, reorganized, locked, and so on.

See Also [disk-bound](#), [file-per-table](#), [general tablespace](#), [instance](#), [OLTP](#), [page](#), [SSD](#), [system tablespace](#), [tablespace](#).

#### parent table

The table in a **foreign key** relationship that holds the initial column values pointed to from the **child table**. The consequences of deleting, or updating rows in the parent table depend on the [ON UPDATE](#) and [ON DELETE](#) clauses in the foreign key definition. Rows with corresponding values in the child table could be automatically deleted or updated in turn, or those columns could be set to [NULL](#), or the operation could be prevented.

See Also [child table](#), [foreign key](#).

#### partial backup

A **backup** that contains some of the **tables** in a MySQL database, or some of the databases in a MySQL instance. Contrast with **full backup**.

---

See Also [backup](#), [full backup](#), [table](#).

#### partial index

An **index** that represents only part of a column value, typically the first N characters (the **prefix**) of a long [VARCHAR](#) value.

See Also [index](#), [index prefix](#).

#### partial trust

An execution environment typically used by hosting providers, where applications have some permissions but not others. For example, applications might be able to access a database server over a network, but be “sandboxed” with regard to reading and writing local files.

See Also [Connector/NET](#).

#### Performance Schema

The [performance\\_schema](#) schema, in MySQL 5.5 and up, presents a set of tables that you can query to get detailed information about the performance characteristics of many internal parts of the MySQL server. See [Chapter 26, MySQL Performance Schema](#).

See Also [INFORMATION\\_SCHEMA](#), [latch](#), [mutex](#), [rw-lock](#).

#### Perl

A programming language with roots in Unix scripting and report generation. Incorporates high-performance regular expressions and file I/O. Large collection of reusable modules available through repositories such as CPAN.

See Also [Perl API](#).

#### Perl API

An open-source **API** for MySQL applications written in the **Perl** language. Implemented through the [DBI](#) and [DBD::mysql](#) modules. For details, see [Section 28.9, “MySQL Perl API”](#).

See Also [API](#), [Perl](#).

#### persistent statistics

A feature that stores **index** statistics for [InnoDB tables](#) on disk, providing better **plan stability** for **queries**. For more information, see [Section 15.8.10.1, “Configuring Persistent Optimizer Statistics Parameters”](#).

See Also [index](#), [optimizer](#), [plan stability](#), [query](#), [table](#).

#### pessimistic

A methodology that sacrifices performance or concurrency in favor of safety. It is appropriate if a high proportion of requests or attempts might fail, or if the consequences of a failed request are severe. [InnoDB](#) uses what is known as a pessimistic **locking** strategy, to minimize the chance of **deadlocks**. At the application level, you might avoid deadlocks by using a pessimistic strategy of acquiring all locks needed by a transaction at the very beginning.

Many built-in database mechanisms use the opposite **optimistic** methodology.

See Also [deadlock](#), [locking](#), [optimistic](#).

#### phantom

A row that appears in the result set of a query, but not in the result set of an earlier query. For example, if a query is run twice within a **transaction**, and in the meantime, another transaction commits after inserting a new row or updating a row so that it matches the [WHERE](#) clause of the query.

This occurrence is known as a phantom read. It is harder to guard against than a **non-repeatable read**, because locking all the rows from the first query result set does not prevent the changes that cause the phantom to appear.

Among different **isolation levels**, phantom reads are prevented by the **serializable read** level, and allowed by the **repeatable read**, **consistent read**, and **read uncommitted** levels.

---

See Also [consistent read](#), [isolation level](#), [non-repeatable read](#), [READ UNCOMMITTED](#), [REPEATABLE READ](#), [SERIALIZABLE](#), [transaction](#).

## PHP

A programming language originating with web applications. The code is typically embedded as blocks within the source of a web page, with the output substituted into the page as it is transmitted by the web server. This is in contrast to applications such as CGI scripts that print output in the form of an entire web page. The PHP style of coding is used for highly interactive and dynamic web pages. Modern PHP programs can also be run as command-line or GUI applications.

MySQL applications are written using one of the **PHP APIs**. Reusable modules can be written in **C** and called from PHP.

Another technology for writing server-side web pages with MySQL is **ASP.net**.

See Also [ASP.net](#), [C](#), [PHP API](#).

## PHP API

Several **APIs** are available for writing MySQL applications in the **PHP** language: the original MySQL API ([Mysql](#)) the MySQL Improved Extension ([Mysqli](#)) the MySQL Native Driver ([Mysqlnd](#)) the MySQL functions ([PDO\\_MYSQL](#)), and Connector/PHP. For details, see [MySQL and PHP](#).

See Also [API](#), [PHP](#).

## physical

A type of operation that involves hardware-related aspects such as disk blocks, memory pages, files, bits, disk reads, and so on. Typically, physical aspects are important during expert-level performance tuning and problem diagnosis. Contrast with **logical**.

See Also [logical](#), [physical backup](#).

## physical backup

A **backup** that copies the actual data files. For example, the [mysqlbackup](#) command of the **MySQL Enterprise Backup** product produces a physical backup, because its output contains data files that can be used directly by the [mysqld](#) server, resulting in a faster **restore** operation. Contrast with **logical backup**.

See Also [backup](#), [logical backup](#), [MySQL Enterprise Backup](#), [restore](#).

## PITR

Acronym for **point-in-time recovery**.

See Also [point-in-time recovery](#).

## plan stability

A property of a **query execution plan**, where the optimizer makes the same choices each time for a given **query**, so that performance is consistent and predictable.

See Also [query](#), [query execution plan](#).

## point-in-time recovery

The process of restoring a **backup** to recreate the state of the database at a specific date and time. Commonly abbreviated “PITR”. Because it is unlikely that the specified time corresponds exactly to the time of a backup, this technique usually requires a combination of a **physical backup** and a **logical backup**. For example, with the **MySQL Enterprise Backup** product, you restore the last backup that you took before the specified point in time, then replay changes from the **binary log** between the time of the backup and the PITR time.

See Also [backup](#), [binary log](#), [logical backup](#), [MySQL Enterprise Backup](#), [physical backup](#).

## port

The number of the TCP/IP socket the database server listens on, used to establish a **connection**. Often specified in conjunction with a **host**. Depending on your use of network encryption, there might be one port for unencrypted traffic and another port for **SSL** connections.

---

See Also [connection](#), [host](#), [SSL](#).

prefix

See [index prefix](#).

prepared backup

A set of backup files, produced by the **MySQL Enterprise Backup** product, after all the stages of applying **binary logs** and **incremental backups** are finished. The resulting files are ready to be **restored**. Prior to the apply steps, the files are known as a **raw backup**.

See Also [binary log](#), [hot backup](#), [incremental backup](#), [MySQL Enterprise Backup](#), [raw backup](#), [restore](#).

prepared statement

An SQL statement that is analyzed in advance to determine an efficient execution plan. It can be executed multiple times, without the overhead for parsing and analysis each time. Different values can be substituted for literals in the [WHERE](#) clause each time, through the use of placeholders. This substitution technique improves security, protecting against some kinds of SQL injection attacks. You can also reduce the overhead for converting and copying return values to program variables.

Although you can use prepared statements directly through SQL syntax, the various **Connectors** have programming interfaces for manipulating prepared statements, and these APIs are more efficient than going through SQL.

See Also [client-side prepared statement](#), [connector](#), [server-side prepared statement](#).

primary key

A set of columns—and by implication, the index based on this set of columns—that can uniquely identify every row in a table. As such, it must be a unique index that does not contain any [NULL](#) values.

[InnoDB](#) requires that every table has such an index (also called the **clustered index** or **cluster index**), and organizes the table storage based on the column values of the primary key.

When choosing primary key values, consider using arbitrary values (a **synthetic key**) rather than relying on values derived from some other source (a **natural key**).

See Also [clustered index](#), [index](#), [natural key](#), [synthetic key](#).

process

An instance of an executing program. The operating system switches between multiple running processes, allowing for a certain degree of **concurrency**. On most operating systems, processes can contain multiple **threads** of execution that share resources. Context-switching between threads is faster than the equivalent switching between processes.

See Also [concurrency](#), [thread](#).

pseudo-record

An artificial record in an index, used for **locking** key values or ranges that do not currently exist.

See Also [infimum record](#), [locking](#), [supremum record](#).

Pthreads

The POSIX threads standard, which defines an API for threading and locking operations on Unix and Linux systems. On Unix and Linux systems, [InnoDB](#) uses this implementation for **mutexes**.

See Also [mutex](#).

purge

A type of garbage collection performed by one or more separate background threads (controlled by [innodb\\_purge\\_threads](#)) that runs on a periodic schedule. Purge parses and processes **undo log** pages from the **history list** for the purpose of removing clustered and secondary index records that were marked for deletion (by previous [DELETE](#) statements) and are no longer required for **MVCC** or **rollback**. Purge frees undo log pages from the history list after processing them.

---

See Also [history list](#), [MVCC](#), [rollback](#), [undo log](#).

#### purge buffering

The technique of storing changes to secondary index pages, resulting from [DELETE](#) operations, in the **change buffer** rather than writing the changes immediately, so that the physical writes can be performed to minimize random I/O. (Because delete operations are a two-step process, this operation buffers the write that normally purges an index record that was previously marked for deletion.) It is one of the types of **change buffering**; the others are **insert buffering** and **delete buffering**.

See Also [change buffer](#), [change buffering](#), [delete buffering](#), [insert buffer](#), [insert buffering](#).

#### purge lag

Another name for the [InnoDB history list](#). Related to the [innodb\\_max\\_purge\\_lag](#) configuration option.

See Also [history list](#), [purge](#).

#### purge thread

A **thread** within the [InnoDB](#) process that is dedicated to performing the periodic **purge** operation. In MySQL 5.6 and higher, multiple purge threads are enabled by the [innodb\\_purge\\_threads](#) configuration option.

See Also [purge](#), [thread](#).

#### Python

A programming language used in a broad range of fields, from Unix scripting to large-scale applications. Includes runtime typing, built-in high-level data types, object-oriented features, and an extensive standard library. Often used as a “glue” language between components written in other languages. The MySQL **Python API** is the open-source **MySQLdb** module.

See Also [MySQLdb](#), [Python API](#).

#### Python API

See Also [API](#), [Python](#).

## Q

#### query

In **SQL**, an operation that reads information from one or more **tables**. Depending on the organization of data and the parameters of the query, the lookup might be optimized by consulting an **index**. If multiple tables are involved, the query is known as a **join**.

For historical reasons, sometimes discussions of internal processing for statements use “query” in a broader sense, including other types of MySQL statements such as **DDL** and **DML** statements.

See Also [DDL](#), [DML](#), [index](#), [join](#), [SQL](#), [table](#).

#### query execution plan

The set of decisions made by the optimizer about how to perform a **query** most efficiently, including which **index** or indexes to use, and the order in which to **join** tables. **Plan stability** involves the same choices being made consistently for a given query.

See Also [index](#), [join](#), [plan stability](#), [query](#).

#### query log

See [general query log](#).

#### quiesce

To reduce the amount of database activity, often in preparation for an operation such as an [ALTER TABLE](#), a **backup**, or a **shutdown**. Might or might not involve doing as much **flushing** as possible, so that **InnoDB** does not continue doing background I/O.

---

In MySQL 5.6 and higher, the syntax `FLUSH TABLES ... FOR EXPORT` writes some data to disk for [InnoDB](#) tables that make it simpler to back up those tables by copying the data files.  
See Also [backup](#), [flush](#), [InnoDB](#), [shutdown](#).

## R

### R-tree

A tree data structure used for spatial indexing of multi-dimensional data such as geographical coordinates, rectangles or polygons.  
See Also [B-tree](#).

### RAID

Acronym for “Redundant Array of Inexpensive Drives”. Spreading I/O operations across multiple drives enables greater **concurrency** at the hardware level, and improves the efficiency of low-level write operations that otherwise would be performed in sequence.  
See Also [concurrency](#).

### random dive

A technique for quickly estimating the number of different values in a column (the column's **cardinality**). [InnoDB](#) samples pages at random from the index and uses that data to estimate the number of different values.  
See Also [cardinality](#).

### raw backup

The initial set of backup files produced by the **MySQL Enterprise Backup** product, before the changes reflected in the **binary log** and any **incremental backups** are applied. At this stage, the files are not ready to **restore**. After these changes are applied, the files are known as a **prepared backup**.  
See Also [binary log](#), [hot backup](#), [ibbackup\\_logfile](#), [incremental backup](#), [MySQL Enterprise Backup](#), [prepared backup](#), [restore](#).

### READ COMMITTED

An **isolation level** that uses a **locking** strategy that relaxes some of the protection between **transactions**, in the interest of performance. Transactions cannot see uncommitted data from other transactions, but they can see data that is committed by another transaction after the current transaction started. Thus, a transaction never sees any bad data, but the data that it does see may depend to some extent on the timing of other transactions.

When a transaction with this isolation level performs `UPDATE ... WHERE` or `DELETE ... WHERE` operations, other transactions might have to wait. The transaction can perform `SELECT ... FOR UPDATE`, and `LOCK IN SHARE MODE` operations without making other transactions wait.

`SELECT ... FOR SHARE` replaces `SELECT ... LOCK IN SHARE MODE` in MySQL 8.0.1, but `LOCK IN SHARE MODE` remains available for backward compatibility.

See Also [ACID](#), [isolation level](#), [locking](#), [REPEATABLE READ](#), [SERIALIZABLE](#), [transaction](#).

### read phenomena

Phenomena such as **dirty reads**, **non-repeatable reads**, and **phantom** reads which can occur when a transaction reads data that another transaction has modified.  
See Also [dirty read](#), [non-repeatable read](#), [phantom](#).

### READ UNCOMMITTED

The **isolation level** that provides the least amount of protection between transactions. Queries employ a **locking** strategy that allows them to proceed in situations where they would normally wait for another transaction. However, this extra performance comes at the cost of less reliable results, including data that has been changed by other transactions and not committed yet (known as **dirty read**). Use this isolation level with great caution, and be aware that the results might not be consistent or reproducible, depending on what other transactions are doing

---

at the same time. Typically, transactions with this isolation level only do queries, not insert, update, or delete operations.

See Also [ACID](#), [dirty read](#), [isolation level](#), [locking](#), [transaction](#).

#### read view

An internal snapshot used by the **MVCC** mechanism of [InnoDB](#). Certain **transactions**, depending on their **isolation level**, see the data values as they were at the time the transaction (or in some cases, the statement) started. Isolation levels that use a read view are **REPEATABLE READ**, **READ COMMITTED**, and **READ UNCOMMITTED**.

See Also [isolation level](#), [MVCC](#), [READ COMMITTED](#), [READ UNCOMMITTED](#), [REPEATABLE READ](#), [transaction](#).

#### read-ahead

A type of I/O request that prefetches a group of **pages** (an entire **extent**) into the **buffer pool** asynchronously, in anticipation that these pages will be needed soon. The linear read-ahead technique prefetches all the pages of one extent based on access patterns for pages in the preceding extent. The random read-ahead technique prefetches all the pages for an extent once a certain number of pages from the same extent are in the buffer pool. Random read-ahead is not part of MySQL 5.5, but is re-introduced in MySQL 5.6 under the control of the [innodb\\_random\\_read\\_ahead](#) configuration option.

See Also [buffer pool](#), [extent](#), [page](#).

#### read-only transaction

A type of **transaction** that can be optimized for [InnoDB](#) tables by eliminating some of the bookkeeping involved with creating a **read view** for each transaction. Can only perform **non-locking read** queries. It can be started explicitly with the syntax `START TRANSACTION READ ONLY`, or automatically under certain conditions. See [Section 8.5.3, “Optimizing InnoDB Read-Only Transactions”](#) for details.

See Also [non-locking read](#), [read view](#), [transaction](#).

#### record lock

A **lock** on an index record. For example, `SELECT c1 FROM t WHERE c1 = 10 FOR UPDATE;` prevents any other transaction from inserting, updating, or deleting rows where the value of `t.c1` is 10. Contrast with **gap lock** and **next-key lock**.

See Also [gap lock](#), [lock](#), [next-key lock](#).

#### redo

The data, in units of records, recorded in the **redo log** when **DML** statements make changes to [InnoDB](#) tables. It is used during **crash recovery** to correct data written by incomplete **transactions**. The ever-increasing **LSN** value represents the cumulative amount of redo data that has passed through the redo log.

See Also [crash recovery](#), [DML](#), [LSN](#), [redo log](#), [transaction](#).

#### redo log

A disk-based data structure used during **crash recovery**, to correct data written by incomplete **transactions**. During normal operation, it encodes requests to change [InnoDB](#) table data, which result from SQL statements or low-level API calls through NoSQL interfaces. Modifications that did not finish updating the **data files** before an unexpected **shutdown** are replayed automatically.

The redo log is physically represented as a set of files, typically named `ib_logfile0` and `ib_logfile1`. The data in the redo log is encoded in terms of records affected; this data is collectively referred to as **redo**. The passage of data through the redo logs is represented by the ever-increasing **LSN** value. The original 4GB limit on maximum size for the redo log is raised to 512GB in MySQL 5.6.3.

The disk layout of the redo log is influenced by the configuration options [innodb\\_log\\_file\\_size](#), [innodb\\_log\\_group\\_home\\_dir](#), and (rarely) [innodb\\_log\\_files\\_in\\_group](#). The performance of redo log operations is also affected by the **log buffer**, which is controlled by the [innodb\\_log\\_buffer\\_size](#) configuration option.

---

See Also [crash recovery](#), [data files](#), [ib\\_logfile](#), [log buffer](#), [LSN](#), [redo](#), [shutdown](#), [transaction](#).

#### redo log archiving

An [InnoDB](#) feature that, when enabled, sequentially writes redo log records to an archive file to avoid potential loss of data than can occur when a backup utility fails to keep pace with redo log generation while a backup operation is in progress. For more information, see [Redo Log Archiving](#).

See Also [redo log](#).

#### redundant row format

The oldest [InnoDB](#) **row format**. Prior to MySQL 5.0.3, it was the only row format available in [InnoDB](#). From MySQL 5.0.3 to MySQL 5.7.8, the default row format is **COMPACT**. As of MySQL 5.7.9, the default row format is defined by the [innodb\\_default\\_row\\_format](#) configuration option, which has a default setting of **DYNAMIC**. You can still specify the **REDUNDANT** row format for compatibility with older [InnoDB](#) tables.

For more information, see [Section 15.10, “InnoDB Row Formats”](#).

See Also [compact row format](#), [dynamic row format](#), [row format](#).

#### referential integrity

The technique of maintaining data always in a consistent format, part of the **ACID** philosophy. In particular, data in different tables is kept consistent through the use of **foreign key constraints**, which can prevent changes from happening or automatically propagate those changes to all related tables. Related mechanisms include the **unique constraint**, which prevents duplicate values from being inserted by mistake, and the **NOT NULL constraint**, which prevents blank values from being inserted by mistake.

See Also [ACID](#), [FOREIGN KEY constraint](#), [NOT NULL constraint](#), [unique constraint](#).

#### relational

An important aspect of modern database systems. The database server encodes and enforces relationships such as one-to-one, one-to-many, many-to-one, and uniqueness. For example, a person might have zero, one, or many phone numbers in an address database; a single phone number might be associated with several family members. In a financial database, a person might be required to have exactly one taxpayer ID, and any taxpayer ID could only be associated with one person.

The database server can use these relationships to prevent bad data from being inserted, and to find efficient ways to look up information. For example, if a value is declared to be unique, the server can stop searching as soon as the first match is found, and it can reject attempts to insert a second copy of the same value.

At the database level, these relationships are expressed through SQL features such as **columns** within a table, unique and [NOT NULL constraints](#), **foreign keys**, and different kinds of join operations. Complex relationships typically involve data split between more than one table. Often, the data is **normalized**, so that duplicate values in one-to-many relationships are stored only once.

In a mathematical context, the relations within a database are derived from set theory. For example, the [OR](#) and [AND](#) operators of a [WHERE](#) clause represent the notions of union and intersection.

See Also [ACID](#), [column](#), [constraint](#), [foreign key](#), [normalized](#).

#### relevance

In the **full-text search** feature, a number signifying the similarity between the search string and the data in the **FULLTEXT index**. For example, when you search for a single word, that word is typically more relevant for a row where it occurs several times in the text than a row where it appears only once.

See Also [full-text search](#), [FULLTEXT index](#).

#### REPEATABLE READ

The default **isolation level** for [InnoDB](#). It prevents any rows that are queried from being changed by other **transactions**, thus blocking **non-repeatable reads** but not **phantom** reads. It uses a moderately strict **locking** strategy so that all queries within a transaction see data from the same snapshot, that is, the data as it was at the time the transaction started.

---

When a transaction with this isolation level performs `UPDATE ... WHERE`, `DELETE ... WHERE`, `SELECT ... FOR UPDATE`, and `LOCK IN SHARE MODE` operations, other transactions might have to wait.

`SELECT ... FOR SHARE` replaces `SELECT ... LOCK IN SHARE MODE` in MySQL 8.0.1, but `LOCK IN SHARE MODE` remains available for backward compatibility.

See Also [ACID](#), [consistent read](#), [isolation level](#), [locking](#), [phantom](#), [transaction](#).

#### repertoire

Repertoire is a term applied to character sets. A character set repertoire is the collection of characters in the set. See [Section 10.2.1, “Character Set Repertoire”](#).

#### replica

A database **server** machine in a **replication** topology that receives changes from another server (the **source**) and applies those same changes. Thus it maintains the same contents as the source, although it might lag somewhat behind.

In MySQL, replicas are commonly used in disaster recovery, to take the place of a source that fails. They are also commonly used for testing software upgrades and new settings, to ensure that database configuration changes do not cause problems with performance or reliability.

Replicas typically have high workloads, because they process all the **DML** (write) operations relayed from the source, as well as user queries. To ensure that replicas can apply changes from the source fast enough, they frequently have fast I/O devices and sufficient CPU and memory to run multiple database instances on the same server. For example, the source might use hard drive storage while the replicas use **SSDs**.

See Also [DML](#), [replication](#), [server](#), [source](#), [SSD](#).

#### replication

The practice of sending changes from a **source**, to one or more **replicas**, so that all databases have the same data. This technique has a wide range of uses, such as load-balancing for better scalability, disaster recovery, and testing software upgrades and configuration changes. The changes can be sent between the databases by methods called **row-based replication** and **statement-based replication**.

See Also [replica](#), [row-based replication](#), [source](#), [statement-based replication](#).

#### restore

The process of putting a set of backup files from the **MySQL Enterprise Backup** product in place for use by MySQL. This operation can be performed to fix a corrupted database, to return to some earlier point in time, or (in a **replication** context) to set up a new **replica**. In the **MySQL Enterprise Backup** product, this operation is performed by the `copy-back` option of the `mysqlbackup` command.

See Also [hot backup](#), [MySQL Enterprise Backup](#), [mysqlbackup command](#), [prepared backup](#), [replica](#), [replication](#).

#### rollback

A **SQL** statement that ends a **transaction**, undoing any changes made by the transaction. It is the opposite of **commit**, which makes permanent any changes made in the transaction.

By default, MySQL uses the **autocommit** setting, which automatically issues a commit following each SQL statement. You must change this setting before you can use the rollback technique.

See Also [ACID](#), [autocommit](#), [commit](#), [SQL](#), [transaction](#).

#### rollback segment

The storage area containing the **undo logs**. Rollback segments have traditionally resided in the **system tablespace**. As of MySQL 5.6, rollback segments can reside in **undo tablespaces**. As of MySQL 5.7, rollback segments are also allocated to the *global temporary tablespace*.

See Also [global temporary tablespace](#), [system tablespace](#), [undo log](#), [undo tablespace](#).

#### row

The logical data structure defined by a set of **columns**. A set of rows makes up a **table**. Within **InnoDB data files**, each **page** can contain one or more rows.

---

Although [InnoDB](#) uses the term **row format** for consistency with MySQL syntax, the row format is a property of each table and applies to all rows in that table.  
See Also [column](#), [data files](#), [page](#), [row format](#), [table](#).

#### row format

The disk storage format for **rows** of an [InnoDB table](#). As [InnoDB](#) gains new capabilities such as **compression**, new row formats are introduced to support the resulting improvements in storage efficiency and performance.

The row format of an [InnoDB](#) table is specified by the [ROW\\_FORMAT](#) option or by the [innodb\\_default\\_row\\_format](#) configuration option (introduced in MySQL 5.7.9). Row formats include [REDUNDANT](#), [COMPACT](#), [COMPRESSED](#), and [DYNAMIC](#). To view the row format of an [InnoDB](#) table, issue the [SHOW TABLE STATUS](#) statement or query [InnoDB](#) table metadata in the [INFORMATION\\_SCHEMA](#).  
See Also [compact row format](#), [compressed row format](#), [compression](#), [dynamic row format](#), [redundant row format](#), [row](#), [table](#).

#### row lock

A **lock** that prevents a row from being accessed in an incompatible way by another **transaction**. Other rows in the same table can be freely written to by other transactions. This is the type of **locking** done by **DML** operations on [InnoDB](#) tables.

Contrast with **table locks** used by [MyISAM](#), or during **DDL** operations on [InnoDB](#) tables that cannot be done with **online DDL**; those locks block concurrent access to the table.  
See Also [DDL](#), [DML](#), [InnoDB](#), [lock](#), [locking](#), [online DDL](#), [table lock](#), [transaction](#).

#### row-based replication

A form of **replication** where events are propagated from the **source** specifying how to change individual rows on the **replica**. It is safe to use for all settings of the [innodb\\_autoinc\\_lock\\_mode](#) option.  
See Also [auto-increment locking](#), [innodb\\_autoinc\\_lock\\_mode](#), [replica](#), [replication](#), [source](#), [statement-based replication](#).

#### row-level locking

The **locking** mechanism used for [InnoDB](#) tables, relying on **row locks** rather than **table locks**. Multiple **transactions** can modify the same table concurrently. Only if two transactions try to modify the same row does one of the transactions wait for the other to complete (and release its row locks).  
See Also [InnoDB](#), [locking](#), [row lock](#), [table lock](#), [transaction](#).

#### Ruby

A programming language that emphasizes dynamic typing and object-oriented programming. Some syntax is familiar to **Perl** developers. There are two popular **Ruby APIs** for developing MySQL applications. (This manual does not cover higher-level Ruby frameworks.)  
See Also [API](#), [Perl](#), [Ruby API](#).

#### Ruby API

Two APIs are available for Ruby programmers developing MySQL applications. The MySQL/Ruby API is based on the [libmysqlclient](#) API library. The Ruby/MySQL API is written to use the native MySQL network protocol (a native driver). For full details, see [Section 28.11, “MySQL Ruby APIs”](#).  
See Also [libmysql](#), [Ruby](#).

#### rw-lock

The low-level object that [InnoDB](#) uses to represent and enforce shared-access **locks** to internal in-memory data structures following certain rules. Contrast with **mutexes**, which [InnoDB](#) uses to represent and enforce exclusive access to internal in-memory data structures. Mutexes and rw-locks are known collectively as **latches**.

[rw-lock](#) types include [s-locks](#) (shared locks), [x-locks](#) (exclusive locks), and [sx-locks](#) (shared-exclusive locks).

- An [s-lock](#) provides read access to a common resource.
- An [x-lock](#) provides write access to a common resource while not permitting inconsistent reads by other threads.
- An [sx-lock](#) provides write access to a common resource while permitting inconsistent reads by other threads. [sx-locks](#) were introduced in MySQL 5.7 to optimize concurrency and improve scalability for read-write workloads.

The following matrix summarizes rw-lock type compatibility.

	<a href="#">S</a>	<a href="#">SX</a>	<a href="#">X</a>
<a href="#">S</a>	Compatible	Compatible	Conflict
<a href="#">SX</a>	Compatible	Conflict	Conflict
<a href="#">X</a>	Conflict	Conflict	Conflict

See Also [latch](#), [lock](#), [mutex](#), [Performance Schema](#).

## S

### savepoint

Savepoints help to implement nested **transactions**. They can be used to provide scope to operations on tables that are part of a larger transaction. For example, scheduling a trip in a reservation system might involve booking several different flights; if a desired flight is unavailable, you might **roll back** the changes involved in booking that one leg, without rolling back the earlier flights that were successfully booked.

See Also [rollback](#), [transaction](#).

### scalability

The ability to add more work and issue more simultaneous requests to a system, without a sudden drop in performance due to exceeding the limits of system capacity. Software architecture, hardware configuration, application coding, and type of workload all play a part in scalability. When the system reaches its maximum capacity, popular techniques for increasing scalability are **scale up** (increasing the capacity of existing hardware or software) and **scale out** (adding new servers and more instances of MySQL). Often paired with **availability** as critical aspects of a large-scale deployment.

See Also [availability](#), [scale out](#), [scale up](#).

### scale out

A technique for increasing **scalability** by adding new servers and more instances of MySQL. For example, setting up replication, NDB Cluster, connection pooling, or other features that spread work across a group of servers. Contrast with **scale up**.

See Also [scalability](#), [scale up](#).

### scale up

A technique for increasing **scalability** by increasing the capacity of existing hardware or software. For example, increasing the memory on a server and adjusting memory-related parameters such as [innodb\\_buffer\\_pool\\_size](#) and [innodb\\_buffer\\_pool\\_instances](#). Contrast with **scale out**.

See Also [scalability](#), [scale out](#).

### schema

Conceptually, a schema is a set of interrelated database objects, such as tables, table columns, data types of the columns, indexes, foreign keys, and so on. These objects are connected through SQL syntax, because the columns make up the tables, the foreign keys refer to tables and columns, and so on. Ideally, they are also

---

connected logically, working together as part of a unified application or flexible framework. For example, the **INFORMATION\_SCHEMA** and **performance\_schema** databases use “schema” in their names to emphasize the close relationships between the tables and columns they contain.

In MySQL, physically, a **schema** is synonymous with a **database**. You can substitute the keyword [SCHEMA](#) instead of [DATABASE](#) in MySQL SQL syntax, for example using [CREATE SCHEMA](#) instead of [CREATE DATABASE](#).

Some other database products draw a distinction. For example, in the Oracle Database product, a **schema** represents only a part of a database: the tables and other objects owned by a single user.

See Also [database](#), [INFORMATION\\_SCHEMA](#), [Performance Schema](#).

## SDI

Acronym for “serialized dictionary information”.

See Also [serialized dictionary information \(SDI\)](#).

## search index

In MySQL, **full-text search** queries use a special kind of index, the **FULLTEXT index**. In MySQL 5.6.4 and up, [InnoDB](#) and [MyISAM](#) tables both support [FULLTEXT](#) indexes; formerly, these indexes were only available for [MyISAM](#) tables.

See Also [full-text search](#), [FULLTEXT index](#).

## secondary index

A type of [InnoDB index](#) that represents a subset of table columns. An [InnoDB](#) table can have zero, one, or many secondary indexes. (Contrast with the **clustered index**, which is required for each [InnoDB](#) table, and stores the data for all the table columns.)

A secondary index can be used to satisfy queries that only require values from the indexed columns. For more complex queries, it can be used to identify the relevant rows in the table, which are then retrieved through lookups using the clustered index.

Creating and dropping secondary indexes has traditionally involved significant overhead from copying all the data in the [InnoDB](#) table. The **fast index creation** feature makes both [CREATE INDEX](#) and [DROP INDEX](#) statements much faster for [InnoDB](#) secondary indexes.

See Also [clustered index](#), [Fast Index Creation](#), [index](#).

## segment

A division within an [InnoDB tablespace](#). If a tablespace is analogous to a directory, the segments are analogous to files within that directory. A segment can grow. New segments can be created.

For example, within a **file-per-table** tablespace, table data is in one segment and each associated index is in its own segment. The **system tablespace** contains many different segments, because it can hold many tables and their associated indexes. Prior to MySQL 8.0, the system tablespace also includes one or more **rollback segments** used for **undo logs**.

Segments grow and shrink as data is inserted and deleted. When a segment needs more room, it is extended by one **extent** (1 megabyte) at a time. Similarly, a segment releases one extent's worth of space when all the data in that extent is no longer needed.

See Also [extent](#), [file-per-table](#), [rollback segment](#), [system tablespace](#), [tablespace](#), [undo log](#).

## selectivity

A property of data distribution, the number of distinct values in a column (its **cardinality**) divided by the number of records in the table. High selectivity means that the column values are relatively unique, and can be retrieved efficiently through an index. If you (or the query optimizer) can predict that a test in a [WHERE](#) clause only matches a small number (or proportion) of rows in a table, the overall **query** tends to be efficient if it evaluates that test first, using an index.

---

See Also [cardinality](#), [query](#).

#### semi-consistent read

A type of read operation used for [UPDATE](#) statements, that is a combination of **READ COMMITTED** and **consistent read**. When an [UPDATE](#) statement examines a row that is already locked, [InnoDB](#) returns the latest committed version to MySQL so that MySQL can determine whether the row matches the [WHERE](#) condition of the [UPDATE](#). If the row matches (must be updated), MySQL reads the row again, and this time [InnoDB](#) either locks it or waits for a lock on it. This type of read operation can only happen when the transaction has the **READ COMMITTED isolation level**.

See Also [consistent read](#), [isolation level](#), [READ COMMITTED](#).

#### SERIALIZABLE

The **isolation level** that uses the most conservative locking strategy, to prevent any other **transactions** from inserting or changing data that was read by this transaction, until it is finished. This way, the same query can be run over and over within a transaction, and be certain to retrieve the same set of results each time. Any attempt to change data that was committed by another transaction since the start of the current transaction, cause the current transaction to wait.

This is the default isolation level specified by the SQL standard. In practice, this degree of strictness is rarely needed, so the default isolation level for [InnoDB](#) is the next most strict, **REPEATABLE READ**.

See Also [ACID](#), [consistent read](#), [isolation level](#), [locking](#), [REPEATABLE READ](#), [transaction](#).

#### serialized dictionary information (SDI)

Dictionary object metadata in serialized form. SDI is stored in [JSON](#) format.

As of MySQL 8.0.3, SDI is present in all [InnoDB](#) tablespace files except for temporary tablespace and undo tablespace files. The presence of SDI in tablespace files provides metadata redundancy. For example, dictionary object metadata can be extracted from tablespace files using the [ibd2sdi](#) utility if the data dictionary becomes unavailable.

For a [MyISAM](#) table, SDI is stored in a [.sdi](#) metadata file in the schema directory. An SDI metadata file is required to perform an [IMPORT TABLE](#) operation.

See Also [file-per-table](#), [general tablespace](#), [system tablespace](#), [tablespace](#).

#### server

A type of program that runs continuously, waiting to receive and act upon requests from another program (the **client**). Because often an entire computer is dedicated to running one or more server programs (such as a database server, a web server, an application server, or some combination of these), the term **server** can also refer to the computer that runs the server software.

See Also [client](#), [mysqld](#).

#### server-side prepared statement

A **prepared statement** managed by the MySQL server. Historically, issues with server-side prepared statements led **Connector/J** and **Connector/PHP** developers to sometimes use **client-side prepared statements** instead. With modern MySQL server versions, server-side prepared statements are recommended for performance, scalability, and memory efficiency.

See Also [client-side prepared statement](#), [Connector/J](#), [Connector/PHP](#), [prepared statement](#).

#### servlet

See Also [Connector/J](#).

#### session temporary tablespace

A *temporary tablespace* that stores user-created *temporary tables* and internal temporary tables created by the *optimizer* when [InnoDB](#) is configured as the on-disk storage engine for internal temporary tables.

---

See Also [optimizer](#), [temporary table](#), [temporary tablespace](#).

#### shared lock

A kind of **lock** that allows other **transactions** to read the locked object, and to also acquire other shared locks on it, but not to write to it. The opposite of **exclusive lock**.

See Also [exclusive lock](#), [lock](#), [transaction](#).

#### shared tablespace

Another way of referring to the **system tablespace** or a **general tablespace**. General tablespaces were introduced in MySQL 5.7. More than one table can reside in a shared tablespace. Only a single table can reside in a *file-per-table* tablespace.

See Also [general tablespace](#), [system tablespace](#).

#### sharp checkpoint

The process of **flushing** to disk all **dirty** buffer pool pages whose redo entries are contained in certain portion of the **redo log**. Occurs before [InnoDB](#) reuses a portion of a log file; the log files are used in a circular fashion. Typically occurs with write-intensive **workloads**.

See Also [dirty page](#), [flush](#), [redo log](#), [workload](#).

#### shutdown

The process of stopping the MySQL server. By default, this process cleans up operations for **InnoDB** tables, so [InnoDB](#) can be **slow** to shut down, but fast to start up later. If you skip the cleanup operations, it is **fast** to shut down but the cleanup must be performed during the next restart.

The shutdown mode for [InnoDB](#) is controlled by the `innodb_fast_shutdown` option.

See Also [fast shutdown](#), [InnoDB](#), [slow shutdown](#), [startup](#).

#### slave

See [replica](#).

#### slow query log

A type of **log** used for performance tuning of SQL statements processed by the MySQL server. The log information is stored in a file. You must enable this feature to use it. You control which categories of “slow” SQL statements are logged. For more information, see [Section 5.4.5, “The Slow Query Log”](#).

See Also [general query log](#), [log](#).

#### slow shutdown

A type of **shutdown** that does additional [InnoDB](#) flushing operations before completing. Also known as a **clean shutdown**. Specified by the configuration parameter `innodb_fast_shutdown=0` or the command `SET GLOBAL innodb_fast_shutdown=0`; . Although the shutdown itself can take longer, that time will be saved on the subsequent startup.

See Also [clean shutdown](#), [fast shutdown](#), [shutdown](#).

#### snapshot

A representation of data at a particular time, which remains the same even as changes are **committed** by other **transactions**. Used by certain **isolation levels** to allow **consistent reads**.

See Also [commit](#), [consistent read](#), [isolation level](#), [transaction](#).

#### sort buffer

The buffer used for sorting data during creation of an [InnoDB](#) index. Sort buffer size is configured using the `innodb_sort_buffer_size` configuration option.

#### source

A database server machine in a **replication** scenario that processes the initial insert, update, and delete requests for data. These changes are propagated to, and repeated on, other servers known as **replicas**.

See Also [replica](#), [replication](#).

---

## space ID

An identifier used to uniquely identify an [InnoDB tablespace](#) within a MySQL instance. The space ID for the **system tablespace** is always zero; this same ID applies to all tables within the system tablespace or within a general tablespace. Each **file-per-table** tablespace and **general tablespace** has its own space ID.

Prior to MySQL 5.6, this hardcoded value presented difficulties in moving [InnoDB](#) tablespace files between MySQL instances. Starting in MySQL 5.6, you can copy tablespace files between instances by using the **transportable tablespace** feature involving the statements `FLUSH TABLES ... FOR EXPORT`, `ALTER TABLE ... DISCARD TABLESPACE`, and `ALTER TABLE ... IMPORT TABLESPACE`. The information needed to adjust the space ID is conveyed in the **.cfg file** which you copy along with the tablespace. See [Section 15.6.1.3, “Importing InnoDB Tables”](#) for details.

See Also [.cfg file](#), [file-per-table](#), [general tablespace](#), [.ibd file](#), [system tablespace](#), [tablespace](#), [transportable tablespace](#).

## sparse file

A type of file that uses file system space more efficiently by writing metadata representing empty blocks to disk instead of writing the actual empty space. The [InnoDB transparent page compression](#) feature relies on sparse file support. For more information, see [Section 15.9.2, “InnoDB Page Compression”](#).

See Also [hole punching](#), [transparent page compression](#).

## spin

A type of **wait** operation that continuously tests whether a resource becomes available. This technique is used for resources that are typically held only for brief periods, where it is more efficient to wait in a “busy loop” than to put the thread to sleep and perform a context switch. If the resource does not become available within a short time, the spin loop ceases and another wait technique is used.

See Also [latch](#), [lock](#), [mutex](#), [wait](#).

## Spring

A Java-based application framework designed for assisting in application design by providing a way to configure components.

See Also [J2EE](#).

## SQL

The Structured Query Language that is standard for performing database operations. Often divided into the categories **DDL**, **DML**, and **queries**. MySQL includes some additional statement categories such as **replication**. See [Chapter 9, Language Structure](#) for the building blocks of SQL syntax, [Chapter 11, Data Types](#) for the data types to use for MySQL table columns, [Chapter 13, SQL Statements](#) for details about SQL statements and their associated categories, and [Chapter 12, Functions and Operators](#) for standard and MySQL-specific functions to use in queries.

See Also [DDL](#), [DML](#), [query](#), [replication](#).

## SQLState

An error code defined by the **JDBC** standard, for exception handling by applications using **Connector/J**.

See Also [Connector/J](#), [JDBC](#).

## SSD

Acronym for “solid-state drive”. A type of storage device with different performance characteristics than a traditional hard disk drive (**HDD**): smaller storage capacity, faster for random reads, no moving parts, and with a number of considerations affecting write performance. Its performance characteristics can influence the throughput of a **disk-bound** workload.

See Also [disk-bound](#), [HDD](#).

## SSL

Acronym for “secure sockets layer”. Provides the encryption layer for network communication between an application and a MySQL database server.

---

See Also [keystore](#), [truststore](#).

#### startup

The process of starting the MySQL server. Typically done by one of the programs listed in [Section 4.3, “Server and Server-Startup Programs”](#). The opposite of **shutdown**.

See Also [shutdown](#).

#### statement interceptor

A type of **interceptor** for tracing, debugging, or augmenting SQL statements issued by a database application. Sometimes also known as a **command interceptor**.

In **Java** applications using **Connector/J**, setting up this type of interceptor involves implementing the `com.mysql.jdbc.StatementInterceptorV2` interface, and adding a `statementInterceptors` property to the **connection string**.

In **Visual Studio** applications using **Connector/NET**, setting up this type of interceptor involves defining a class that inherits from the `BaseCommandInterceptor` class and specifying that class name as part of the connection string.

See Also [command interceptor](#), [connection string](#), [Connector/J](#), [Connector/NET](#), [interceptor](#), [Java](#), [Visual Studio](#).

#### statement-based replication

A form of **replication** where SQL statements are sent from the **source** and replayed on the **replica**. It requires some care with the setting for the `innodb_autoinc_lock_mode` option, to avoid potential timing problems with **auto-increment locking**.

See Also [auto-increment locking](#), [innodb\\_autoinc\\_lock\\_mode](#), [replica](#), [replication](#), [row-based replication](#), [source](#).

#### statistics

Estimated values relating to each **InnoDB table** and **index**, used to construct an efficient **query execution plan**. The main values are the **cardinality** (number of distinct values) and the total number of table rows or index entries. The statistics for the table represent the data in its **primary key** index. The statistics for a **secondary index** represent the rows covered by that index.

The values are estimated rather than counted precisely because at any moment, different **transactions** can be inserting and deleting rows from the same table. To keep the values from being recalculated frequently, you can enable **persistent statistics**, where the values are stored in **InnoDB** system tables, and refreshed only when you issue an `ANALYZE TABLE` statement.

You can control how **NULL** values are treated when calculating statistics through the `innodb_stats_method` configuration option.

Other types of statistics are available for database objects and database activity through the **INFORMATION\_SCHEMA** and **PERFORMANCE\_SCHEMA** tables.

See Also [cardinality](#), [index](#), [INFORMATION\\_SCHEMA](#), [NULL](#), [Performance Schema](#), [persistent statistics](#), [primary key](#), [query execution plan](#), [secondary index](#), [table](#), [transaction](#).

#### stemming

The ability to search for different variations of a word based on a common root word, such as singular and plural, or past, present, and future verb tense. This feature is currently supported in **MyISAM full-text search** feature but not in **FULLTEXT indexes** for **InnoDB** tables.

See Also [full-text search](#), [FULLTEXT index](#).

#### stopword

In a **FULLTEXT index**, a word that is considered common or trivial enough that it is omitted from the **search index** and ignored in search queries. Different configuration settings control stopwords processing for **InnoDB** and **MyISAM** tables. See [Section 12.10.4, “Full-Text Stopwords”](#) for details.

---

See Also [FULLTEXT index](#), [search index](#).

#### storage engine

A component of the MySQL database that performs the low-level work of storing, updating, and querying data. In MySQL 5.5 and higher, **InnoDB** is the default storage engine for new tables, superceding [MyISAM](#). Different storage engines are designed with different tradeoffs between factors such as memory usage versus disk usage, read speed versus write speed, and speed versus robustness. Each storage engine manages specific tables, so we refer to [InnoDB](#) tables, [MyISAM](#) tables, and so on.

The **MySQL Enterprise Backup** product is optimized for backing up [InnoDB](#) tables. It can also back up tables handled by [MyISAM](#) and other storage engines.

See Also [InnoDB](#), [MySQL Enterprise Backup](#), [table type](#).

#### stored generated column

A column whose values are computed from an expression included in the column definition. Column values are evaluated and stored when rows are inserted or updated. A stored generated column requires storage space and can be indexed.

Contrast with **virtual generated column**.

See Also [base column](#), [generated column](#), [virtual generated column](#).

#### stored object

A stored program or view.

#### stored program

A stored routine (procedure or function), trigger, or Event Scheduler event.

#### stored routine

A stored procedure or function.

#### strict mode

The general name for the setting controlled by the [innodb\\_strict\\_mode](#) option. Turning on this setting causes certain conditions that are normally treated as warnings, to be considered errors. For example, certain invalid combinations of options related to **file format** and **row format**, that normally produce a warning and continue with default values, now cause the [CREATE TABLE](#) operation to fail. [innodb\\_strict\\_mode](#) is enabled by default in MySQL 5.7.

MySQL also has something called strict mode. See [Section 5.1.11, “Server SQL Modes”](#).

See Also [file format](#), [innodb\\_strict\\_mode](#), [row format](#).

#### sublist

Within the list structure that represents the **buffer pool**, pages that are relatively old and relatively new are represented by different portions of the **list**. A set of parameters control the size of these portions and the dividing point between the new and old pages.

See Also [buffer pool](#), [eviction](#), [list](#), [LRU](#).

#### supremum record

A **pseudo-record** in an index, representing the **gap** above the largest value in that index. If a transaction has a statement such as [SELECT ... FROM ... WHERE col > 10 FOR UPDATE;](#), and the largest value in the column is 20, it is a lock on the supremum record that prevents other transactions from inserting even larger values such as 50, 100, and so on.

See Also [gap](#), [infimum record](#), [pseudo-record](#).

#### surrogate key

Synonym name for **synthetic key**.

See Also [synthetic key](#).

---

synthetic key

An indexed column, typically a **primary key**, where the values are assigned arbitrarily. Often done using an **auto-increment** column. By treating the value as completely arbitrary, you can avoid overly restrictive rules and faulty application assumptions. For example, a numeric sequence representing employee numbers might have a gap if an employee was approved for hiring but never actually joined. Or employee number 100 might have a later hiring date than employee number 500, if they left the company and later rejoined. Numeric values also produce shorter values of predictable length. For example, storing numeric codes meaning “Road”, “Boulevard”, “Expressway”, and so on is more space-efficient than repeating those strings over and over.

Also known as a **surrogate key**. Contrast with **natural key**.

See Also [auto-increment](#), [natural key](#), [primary key](#), [surrogate key](#).

system tablespace

One or more data files (**ibdata files**) containing the metadata for [InnoDB](#)-related objects, and the storage areas for the **change buffer**, and the **doublewrite buffer**. It may also contain table and index data for [InnoDB](#) tables if tables were created in the system tablespace instead of **file-per-table** or **general tablespaces**. The data and metadata in the system tablespace apply to all **databases** in a MySQL **instance**.

Prior to MySQL 5.6.7, the default was to keep all [InnoDB](#) tables and indexes inside the system tablespace, often causing this file to become very large. Because the system tablespace never shrinks, storage problems could arise if large amounts of temporary data were loaded and then deleted. In MySQL 8.0, the default is **file-per-table** mode, where each table and its associated indexes are stored in a separate **.ibd file**. This default makes it easier to use [InnoDB](#) features that rely on [DYNAMIC](#) and [COMPRESSED](#) row formats, such as table **compression**, efficient storage of **off-page columns**, and large index key prefixes.

Keeping all table data in the system tablespace or in separate **.ibd** files has implications for storage management in general. The **MySQL Enterprise Backup** product might back up a small set of large files, or many smaller files. On systems with thousands of tables, the file system operations to process thousands of **.ibd** files can cause bottlenecks.

[InnoDB](#) introduced general tablespaces in MySQL 5.7.6, which are also represented by **.ibd** files. General tablespaces are shared tablespaces created using [CREATE TABLESPACE](#) syntax. They can be created outside of the data directory, are capable of holding multiple tables, and support tables of all row formats.

See Also [change buffer](#), [compression](#), [data dictionary](#), [database](#), [doublewrite buffer](#), [dynamic row format](#), [file-per-table](#), [general tablespace](#), [.ibd file](#), [ibdata file](#), [innodb\\_file\\_per\\_table](#), [instance](#), [MySQL Enterprise Backup](#), [off-page column](#), [tablespace](#), [undo log](#).

## T

table

Each MySQL table is associated with a particular **storage engine**. [InnoDB](#) tables have particular **physical** and **logical** characteristics that affect performance, **scalability**, **backup**, administration, and application development.

In terms of file storage, an [InnoDB](#) table belongs to one of the following tablespace types:

- The shared [InnoDB](#) **system tablespace**, which is comprised of one or more **ibdata files**.
- A **file-per-table** tablespace, comprised of an individual **.ibd file**.
- A shared **general tablespace**, comprised of an individual **.ibd** file. General tablespaces were introduced in MySQL 5.7.6.

**.ibd** data files contain both table and **index** data.

[InnoDB](#) tables created in file-per-table tablespaces can use **DYNAMIC** or **COMPRESSED** row format. These row formats enable [InnoDB](#) features such as **compression**, efficient storage of **off-page columns**, and large index key prefixes. General tablespaces support all row formats.

---

The system tablespace supports tables that use **REDUNDANT**, **COMPACT**, and **DYNAMIC** row formats. System tablespace support for the **DYNAMIC** row format was added in MySQL 5.7.6.

The **rows** of an [InnoDB](#) table are organized into an index structure known as the **clustered index**, with entries sorted based on the **primary key** columns of the table. Data access is optimized for queries that filter and sort on the primary key columns, and each index contains a copy of the associated primary key columns for each entry. Modifying values for any of the primary key columns is an expensive operation. Thus an important aspect of [InnoDB](#) table design is choosing a primary key with columns that are used in the most important queries, and keeping the primary key short, with rarely changing values.

See Also [backup](#), [clustered index](#), [compact row format](#), [compressed row format](#), [compression](#), [dynamic row format](#), [Fast Index Creation](#), [file-per-table](#), [.ibd file](#), [index](#), [off-page column](#), [primary key](#), [redundant row format](#), [row](#), [system tablespace](#), [tablespace](#).

#### table lock

A lock that prevents any other **transaction** from accessing a table. [InnoDB](#) makes considerable effort to make such locks unnecessary, by using techniques such as **online DDL**, **row locks** and **consistent reads** for processing **DML** statements and **queries**. You can create such a lock through SQL using the [LOCK TABLE](#) statement; one of the steps in migrating from other database systems or MySQL storage engines is to remove such statements wherever practical.

See Also [consistent read](#), [DML](#), [lock](#), [locking](#), [online DDL](#), [query](#), [row lock](#), [table](#), [transaction](#).

#### table scan

See [full table scan](#).

#### table statistics

See [statistics](#).

#### table type

Obsolete synonym for **storage engine**. We refer to [InnoDB](#) tables, [MyISAM](#) tables, and so on.

See Also [InnoDB](#), [storage engine](#).

#### tablespace

A data file that can hold data for one or more [InnoDB tables](#) and associated **indexes**.

The **system tablespace** contains the [InnoDB data dictionary](#), and prior to MySQL 5.6 holds all other [InnoDB](#) tables by default.

The [innodb\\_file\\_per\\_table](#) option, enabled by default in MySQL 5.6 and higher, allows tables to be created in their own tablespaces. File-per-table tablespaces support features such as efficient storage of **off-page columns**, table compression, and transportable tablespaces. See [Section 15.6.3.2, “File-Per-Table Tablespaces”](#) for details.

[InnoDB](#) introduced general tablespaces in MySQL 5.7.6. General tablespaces are shared tablespaces created using [CREATE TABLESPACE](#) syntax. They can be created outside of the MySQL data directory, are capable of holding multiple tables, and support tables of all row formats.

MySQL NDB Cluster also groups its tables into tablespaces. See [Section 22.5.10.1, “NDB Cluster Disk Data Objects”](#) for details.

See Also [compressed row format](#), [data dictionary](#), [data files](#), [file-per-table](#), [general tablespace](#), [index](#), [innodb\\_file\\_per\\_table](#), [system tablespace](#), [table](#).

#### Tcl

A programming language originating in the Unix scripting world. Sometimes extended by code written in **C**, **C++**, or **Java**. For the open-source Tcl **API** for MySQL, see [Section 28.12, “MySQL Tcl API”](#).

See Also [API](#).

---

#### temporary table

A **table** whose data does not need to be truly permanent. For example, temporary tables might be used as storage areas for intermediate results in complicated calculations or transformations; this intermediate data would not need to be recovered after a crash. Database products can take various shortcuts to improve the performance of operations on temporary tables, by being less scrupulous about writing data to disk and other measures to protect the data across restarts.

Sometimes, the data itself is removed automatically at a set time, such as when the transaction ends or when the session ends. With some database products, the table itself is removed automatically too.

See Also [table](#).

#### temporary tablespace

[InnoDB](#) uses two types of temporary tablespace. *Session temporary tablespaces* store user-created temporary tables and internal temporary tables created by the optimizer. The *global temporary tablespace* stores *rollback segments* for changes made to user-created temporary tables.

See Also [global temporary tablespace](#), [session temporary tablespace](#), [temporary table](#).

#### text collection

The set of columns included in a **FULLTEXT index**.

See Also [FULLTEXT index](#).

#### thread

A unit of processing that is typically more lightweight than a **process**, allowing for greater **concurrency**.

See Also [concurrency](#), [master thread](#), [process](#), [Pthreads](#).

#### Tomcat

An open source **J2EE** application server, implementing the Java Servlet and JavaServer Pages programming technologies. Consists of a web server and Java servlet container. With MySQL, typically used in conjunction with **Connector/J**.

See Also [J2EE](#).

#### torn page

An error condition that can occur due to a combination of I/O device configuration and hardware failure. If data is written out in chunks smaller than the [InnoDB page size](#) (by default, 16KB), a hardware failure while writing could result in only part of a page being stored to disk. The [InnoDB doublewrite buffer](#) guards against this possibility.

See Also [doublewrite buffer](#).

#### TPS

Acronym for “**transactions** per second”, a unit of measurement sometimes used in benchmarks. Its value depends on the **workload** represented by a particular benchmark test, combined with factors that you control such as the hardware capacity and database configuration.

See Also [transaction](#), [workload](#).

#### transaction

Transactions are atomic units of work that can be **committed** or **rolled back**. When a transaction makes multiple changes to the database, either all the changes succeed when the transaction is committed, or all the changes are undone when the transaction is rolled back.

Database transactions, as implemented by [InnoDB](#), have properties that are collectively known by the acronym **ACID**, for atomicity, consistency, isolation, and durability.

See Also [ACID](#), [commit](#), [isolation level](#), [lock](#), [rollback](#).

#### transaction ID

An internal field associated with each **row**. This field is physically changed by [INSERT](#), [UPDATE](#), and [DELETE](#) operations to record which **transaction** has locked the row.

See Also [implicit row lock](#), [row](#), [transaction](#).

---

### transparent page compression

A feature added in MySQL 5.7.8 that permits page-level compression for [InnoDB](#) tables that reside in **file-per-table** tablespaces. Page compression is enabled by specifying the [COMPRESSION](#) attribute with [CREATE TABLE](#) or [ALTER TABLE](#). For more information, see [Section 15.9.2, “InnoDB Page Compression”](#).

See Also [file-per-table](#), [hole punching](#), [sparse file](#).

### transportable tablespace

A feature that allows a **tablespace** to be moved from one instance to another. Traditionally, this has not been possible for [InnoDB](#) tablespaces because all table data was part of the **system tablespace**. In MySQL 5.6 and higher, the [FLUSH TABLES ... FOR EXPORT](#) syntax prepares an [InnoDB](#) table for copying to another server; running [ALTER TABLE ... DISCARD TABLESPACE](#) and [ALTER TABLE ... IMPORT TABLESPACE](#) on the other server brings the copied data file into the other instance. A separate **.cfg file**, copied along with the **.ibd file**, is used to update the table metadata (for example the **space ID**) as the tablespace is imported. See [Section 15.6.1.3, “Importing InnoDB Tables”](#) for usage information.

See Also [.cfg file](#), [.ibd file](#), [space ID](#), [system tablespace](#), [tablespace](#).

### troubleshooting

The process of determining the source of a problem. Some of the resources for troubleshooting MySQL problems include:

- [Section 2.10.2.1, “Troubleshooting Problems Starting the MySQL Server”](#)
- [Section 6.2.21, “Troubleshooting Problems Connecting to MySQL”](#)
- [Section B.3.3.2, “How to Reset the Root Password”](#)
- [Section B.3.2, “Common Errors When Using MySQL Programs”](#)
- [Section 15.21, “InnoDB Troubleshooting”](#).

### truncate

A **DDL** operation that removes the entire contents of a table, while leaving the table and related indexes intact. Contrast with **drop**. Although conceptually it has the same result as a [DELETE](#) statement with no [WHERE](#) clause, it operates differently behind the scenes: [InnoDB](#) creates a new empty table, drops the old table, then renames the new table to take the place of the old one. Because this is a DDL operation, it cannot be **rolled back**.

If the table being truncated contains **foreign keys** that reference another table, the truncation operation uses a slower method of operation, deleting one row at a time so that corresponding rows in the referenced table can be deleted as needed by any [ON DELETE CASCADE](#) clause. (MySQL 5.5 and higher do not allow this slower form of truncate, and return an error instead if foreign keys are involved. In this case, use a [DELETE](#) statement instead.

See Also [DDL](#), [drop](#), [foreign key](#), [rollback](#).

### truststore

See Also [SSL](#).

### tuple

A technical term designating an ordered set of elements. It is an abstract notion, used in formal discussions of database theory. In the database field, tuples are usually represented by the columns of a table row. They could also be represented by the result sets of queries, for example, queries that retrieved only some columns of a table, or columns from joined tables.

See Also [cursor](#).

### two-phase commit

An operation that is part of a distributed **transaction**, under the **XA** specification. (Sometimes abbreviated as 2PC.) When multiple databases participate in the transaction, either all databases **commit** the changes, or all databases **roll back** the changes.

---

See Also [commit](#), [rollback](#), [transaction](#), [XA](#).

## U

### undo

Data that is maintained throughout the life of a **transaction**, recording all changes so that they can be undone in case of a **rollback** operation. It is stored in **undo logs** either within the **system tablespace** (in MySQL 5.7 or earlier) or in separate **undo tablespaces**. As of MySQL 8.0, undo logs reside in undo tablespaces by default. See Also [rollback](#), [rollback segment](#), [system tablespace](#), [transaction](#), [undo log](#), [undo tablespace](#).

### undo buffer

See [undo log](#).

### undo log

A storage area that holds copies of data modified by active **transactions**. If another transaction needs to see the original data (as part of a **consistent read** operation), the unmodified data is retrieved from this storage area.

In MySQL 5.6 and MySQL 5.7, you can use the `innodb_undo_tablespaces` variable have undo logs reside in **undo tablespaces**, which can be placed on another storage device such as an **SSD**. In MySQL 8.0, undo logs reside in two default undo tablespaces that are created when MySQL is initialized, and additional undo tablespaces can be created using `CREATE UNDO TABLESPACE` syntax.

The undo log is split into separate portions, the **insert undo buffer** and the **update undo buffer**.

See Also [consistent read](#), [rollback segment](#), [SSD](#), [system tablespace](#), [transaction](#), [undo tablespace](#).

### undo log segment

A collection of **undo logs**. Undo log segments exists within **rollback segments**. An undo log segment might contain undo logs from multiple transactions. An undo log segment can only be used by one transaction at a time but can be reused after it is released at transaction **commit** or **rollback**. May also be referred to as an “undo segment”.

See Also [commit](#), [rollback](#), [rollback segment](#), [undo log](#).

### undo tablespace

An undo tablespace contains **undo logs**. Undo logs exist within **undo log segments**, which are contained within **rollback segments**. Rollback segments have traditionally resided in the system tablespace. As of MySQL 5.6, rollback segments can reside in undo tablespaces. In MySQL 5.6 and MySQL 5.7, the number of undo tablespaces is controlled by the `innodb_undo_tablespaces` configuration option. In MySQL 8.0, two default undo tablespaces are created when the MySQL instance is initialized, and additional undo tablespaces can be created using `CREATE UNDO TABLESPACE` syntax.

For more information, see [Section 15.6.3.4, “Undo Tablespaces”](#).

See Also [rollback segment](#), [system tablespace](#), [undo log](#), [undo log segment](#).

### Unicode

A system for supporting national characters, character sets, code pages, and other internationalization aspects in a flexible and standardized way.

Unicode support is an important aspect of the **ODBC** standard. **Connector/ODBC 5.1** is a Unicode driver, as opposed to Connector/ODBC 3.51, which is an **ANSI** driver.

See Also [ANSI](#), [Connector/ODBC](#), [ODBC](#).

### unique constraint

A kind of **constraint** that asserts that a column cannot contain any duplicate values. In terms of **relational algebra**, it is used to specify 1-to-1 relationships. For efficiency in checking whether a value can be inserted (that

---

is, the value does not already exist in the column), a unique constraint is supported by an underlying **unique index**.

See Also [constraint](#), [relational](#), [unique index](#).

#### unique index

An index on a column or set of columns that have a **unique constraint**. Because the index is known not to contain any duplicate values, certain kinds of lookups and count operations are more efficient than in the normal kind of index. Most of the lookups against this type of index are simply to determine if a certain value exists or not. The number of values in the index is the same as the number of rows in the table, or at least the number of rows with non-null values for the associated columns.

**Change buffering** optimization does not apply to unique indexes. As a workaround, you can temporarily set `unique_checks=0` while doing a bulk data load into an [InnoDB](#) table.

See Also [cardinality](#), [change buffering](#), [unique constraint](#), [unique key](#).

#### unique key

The set of columns (one or more) comprising a **unique index**. When you can define a [WHERE](#) condition that matches exactly one row, and the query can use an associated unique index, the lookup and error handling can be performed very efficiently.

See Also [cardinality](#), [unique constraint](#), [unique index](#).

## V

#### variable-length type

A data type of variable length. [VARCHAR](#), [VARBINARY](#), and [BLOB](#) and [TEXT](#) types are variable-length types.

[InnoDB](#) treats fixed-length fields greater than or equal to 768 bytes in length as variable-length fields, which can be stored **off-page**. For example, a `CHAR(255)` column can exceed 768 bytes if the maximum byte length of the character set is greater than 3, as it is with `utf8mb4`.

See Also [off-page column](#), [overflow page](#).

#### victim

The **transaction** that is automatically chosen to be **rolled back** when a **deadlock** is detected. [InnoDB](#) rolls back the transaction that has updated the fewest rows.

**Deadlock detection** can be disabled using the `innodb_deadlock_detect` configuration option.

See Also [deadlock](#), [deadlock detection](#), [innodb\\_lock\\_wait\\_timeout](#), [transaction](#).

#### view

A stored query that when invoked produces a result set. A view acts as a virtual table.

#### virtual column

See [virtual generated column](#).

#### virtual generated column

A column whose values are computed from an expression included in the column definition. Column values are not stored, but are evaluated when rows are read, immediately after any [BEFORE](#) triggers. A virtual generated column takes no storage. [InnoDB](#) supports secondary indexes on virtual generated columns.

Contrast with **stored generated column**.

See Also [base column](#), [generated column](#), [stored generated column](#).

#### virtual index

A virtual index is a **secondary index** on one or more **virtual generated columns** or on a combination of virtual generated columns and regular columns or stored generated columns. For more information, see [Section 13.1.20.9, “Secondary Indexes and Generated Columns”](#).

---

See Also [secondary index](#), [stored generated column](#), [virtual generated column](#).

## Visual Studio

For supported versions of Visual Studio, see the following references:

- Connector/NET: [Connector/NET Versions](#)
- Connector/C++ 8.0: [Platform Support and Prerequisites](#)

See Also [Connector/C++](#), [Connector/NET](#).

## W

### wait

When an operation, such as acquiring a **lock**, **mutex**, or **latch**, cannot be completed immediately, [InnoDB](#) pauses and tries again. The mechanism for pausing is elaborate enough that this operation has its own name, the **wait**. Individual threads are paused using a combination of internal [InnoDB](#) scheduling, operating system [wait\(\)](#) calls, and short-duration **spin** loops.

On systems with heavy load and many transactions, you might use the output from the [SHOW INNODB STATUS](#) command or **Performance Schema** to determine whether threads are spending too much time waiting, and if so, how you can improve **concurrency**.

See Also [concurrency](#), [latch](#), [lock](#), [mutex](#), [Performance Schema](#), [spin](#).

### warm backup

A **backup** taken while the database is running, but that restricts some database operations during the backup process. For example, tables might become read-only. For busy applications and websites, you might prefer a **hot backup**.

See Also [backup](#), [cold backup](#), [hot backup](#).

### warm up

To run a system under a typical **workload** for some time after startup, so that the **buffer pool** and other memory regions are filled as they would be under normal conditions. This process happens naturally over time when a MySQL server is restarted or subjected to a new workload.

Typically, you run a workload for some time to warm up the buffer pool before running performance tests, to ensure consistent results across multiple runs; otherwise, performance might be artificially low during the first run.

In MySQL 5.6, you can speed up the warmup process by enabling the [innodb\\_buffer\\_pool\\_dump\\_at\\_shutdown](#) and [innodb\\_buffer\\_pool\\_load\\_at\\_startup](#) configuration options, to bring the contents of the buffer pool back into memory after a restart. These options are enabled by default in MySQL 5.7. See [Section 15.8.3.6, “Saving and Restoring the Buffer Pool State”](#).

See Also [buffer pool](#), [workload](#).

### workload

The combination and volume of **SQL** and other database operations, performed by a database application during typical or peak usage. You can subject the database to a particular workload during performance testing to identify **bottlenecks**, or during capacity planning.

See Also [bottleneck](#), [CPU-bound](#), [disk-bound](#), [SQL](#).

### write combining

An optimization technique that reduces write operations when **dirty pages** are **flushed** from the [InnoDB buffer pool](#). If a row in a page is updated multiple times, or multiple rows on the same page are updated, all of those changes are stored to the data files in a single write operation rather than one write for each change.

See Also [buffer pool](#), [dirty page](#), [flush](#).

---

## X

### XA

A standard interface for coordinating distributed **transactions**, allowing multiple databases to participate in a transaction while maintaining **ACID** compliance. For full details, see [Section 13.3.8, “XA Transactions”](#).

XA Distributed Transaction support is enabled by default.

See Also [ACID](#), [binary log](#), [commit](#), [transaction](#), [two-phase commit](#).

## Y

### young

A characteristic of a **page** in the [InnoDB buffer pool](#) meaning it has been accessed recently, and so is moved within the buffer pool data structure, so that it will not be **flushed** soon by the **LRU** algorithm. This term is used in some **INFORMATION\_SCHEMA** column names of tables related to the buffer pool.

See Also [buffer pool](#), [flush](#), [INFORMATION\\_SCHEMA](#), [LRU](#), [page](#).
